There belonged to Liverpool, on the first of Jan., 1840, 1123 ships, of the registered burden of 208,176 tons, manned by 13,938 seamen.

The gross customs revenue of Liverpool, in 1840, amounted to £4,604,144, while that of London, in the same year, 300

amounted to £11,088,053. But it would be a great error to suppose that the trade of the metropolis exceeded that of Liverpool in this proportion. Cotton wool, and other raw materials for manufactures, on which low duties are paid, form the principal part of the foreign imports at Liverpool;

LIVERPOOL.

whereas London imports comparatively few of these articles, her trade being principally in articles of direct consumption, as sugar, tea, coffee, wines, corn, &c., on which high duties are paid. This circumstance accounts, in part

at least, for the comparatively large amount of the customs revenue received in the latter; and, allowing for it, we doubt whether the foreign trade of London very materially exceeds that of Liverpool. We subjoin an

Account of the Number of Ships, and their Tonnage, that entered the Ports of London and Liverpool, from foreign parts, during each of the Three Years ending the 5th of January, 1841.

Years ended 5th January.	London.				Liverpool.

Next to the consequence of Liverpool as a trading port, is its high importance as a packet station, second probably to none in the world, except London. The packet-ships, or *hackers*, to New-York and other parts of the United States, which, for size, excellent accommodation, and speed, are justly the objects of general admiration, leave the port weekly; and five large steamships of unexampled magnitude are engaged in the same service. Packets are also regularly sent to the E. Indies, Rio de Janeiro, Laguayra, Buenos Ayres, Lima, Lisbon, Oporto, and the Mediterranean; and a steamer trades regularly between Liverpool and Havre. Of the numerous steam-vessels engaged in the home service, no fewer than 94 sail to and from Dublin; three are on the Waterford, and three on the Belfast sta-

tion; seven ply to and from Glasgow; and several others connect Liverpool with the Isle of Man, Drogheda, Wexford, Cork, Bristol, Dumfries, Carlisle, Whitehaven, &c. A host of river-steamers, also, are constantly plying for passengers at the various ferries of the Mersey, or running up and down the stream. In short, nothing can be more striking, or better convince the stranger of the gigantic scale on which the entire business of Liverpool is conducted, than the view from the Cheshire shore of the forest of masts, extending upwards of 2 m. along the opposite banks; the activity ever visible in all the docks; the towering warehouses along the quays, instinct with life and labour; the ships constantly entering and leaving the Mersey, and the almost innumerable steamers of every size and

LIVERPOOL

quality, packets, ferry-boats, and tugs, rapidly coursing up and down the river to their several destinations.

A noteworthy town like Liverpool must necessarily have many joint-stock banking companies and private banks. Among the former are the Branch bank of England, the Royal Bank of Liverpool, the Bank of Liverpool, the Borough bank, the Liverpool Union bank, the Commercial bank of England, the Liverpool Commercial bank, the Manchester and Liverpool district banking company, the Liverpool banking company, the Albion bank, the N. and S. Wales bank, and the Central bank of Liverpool; there are, also, four private banks and a savings' bank.

Manufactures.—Liverpool is not, properly speaking, a manufacturing town; but the vast magnitude of its foreign commerce necessarily demands the practice of a great number of domestic trades, some connected with the shipping, and others dependent on the peculiar nature of the traffic of the port. There are several large sugar refineries, an extensive pottery conducted by the Herculaneum company, iron and brass foundries, public breweries, ropries, glass-staining works, and alkali works. The manufacture of soap is more extensively carried on here than in any town of the kingdom, the quantity produced in 1839 being 43,546,119 lbs. of hard, and 6,380,930 lbs. of soft, soap. Ship-building is also carried on to a great extent; and not only capital merchant ships and steamers have been launched from the slips in different places of the town, but many large ships of war have been built for the government.

There are several wind-mills, and steam-engines for grinding corn, colours, dye-works, &c., and numerous and large manufactories of chain cables, anchors, &c. The making of watches and watch-movements employs a great number of hands, and large quantities of these articles are exported, with files and tools, produced on a large scale and in and near the town. Steam-engines of the best and most powerful kind are made in four establishments, from which the principal occurrences of the business are exported to the largest steamships; and this business is every year increasing in importance.

the Liverpool and Manchester Railroads.—The commerce of Liverpool has been greatly promoted by the facilities which it enjoys for inland transport, greater perhaps than those belonging to any other town of Great Britain, except Manchester. The Irwell and Mersey navigation (for which an act was obtained in 1790), was the first effort to improve on the resources of nature, almost contemporary with which was the Weaver navigation. By means of the former, raw cotton and cotton goods were conveyed by water to and from Manchester, while, by the latter, the salt of Cheshire was furnished with equal facilities for its transit to Liverpool. The Saakey-brook navigation, completed in 1793, the duke of Bridgewater's canals, the Trent and Mersey or Grand Trunk canals, and the Leeds and Liverpool canal, were finished in rapid succession, so that, in 1814, the port of Liverpool had complete water communication, directly or indirectly, not only with the great manufacturing towns of Lancashire, Cheshire, and Yorkshire, from which it derives its chief articles of export, but likewise with the 8. counties, and, in fact, with nearly every part of England. The following table, drawn up from "Priestley's History of Canals," exhibits some particulars respecting the size, levels, &c., of the above-mentioned undertakings.

15th September of that year, a day that will be long remembered from its connection with the melancholy death of Mr. Huskisson, one of our most enlightened commercial statesmen. This railway, which is 33 m. in length, has inclined planes at Sutton, Rainhill, and Liverpool; the last two through two tunnels, both commencing at Edgehill, where are stationary engines for drawing the trains up the inclined plane. The tunnel, for the conveyance of goods down to Wapping, close by the King's Dock, is 2950 yds. long, with a rise of 1 in 53, and the interior, which is lighted with gas, has a height of 16 ft., with a breadth of 22 ft. Another tunnel, for passengers, comes out in the open space at Lime-street: it was opened in 1836, and has a length of 2825 yds., with a rise of 1 in 62, a width of 25 ft., and a height of 17 ft. This station has a Corinthian facade of 330 ft. in length, built at a cost of nearly £7000. The whole is in a very elegant style, and will bear to be compared with the terminus of the London and Birmingham railway in the Metropolis. This undertaking has been of immense advantage to the trade of Liverpool and Manchester, and the profits to the shareholders have been such as to allow, for some years back, dividends of 10 per cent., exclusive of the accumulation of a surplus fund. The traffic on this railway during the six years ending with 1838, was as follows:

Year.	Merchandise.	Cash.	Number of Passengers.
	Tons.	Tons.	
1881	104,558	11,895	445,947
1882	129,445	49,505	505,945
1883	185,794	61,330	595,692
1884	210,738	99,387	628,537
1885	230,636	116,546	672,947
1886	285,617	185,595	692,948
Total of 6 years.	1,140,077	614,658	3,651,216

This return, which does not include immense quantities of cattle, sheep, and hogs, conveyed from Liverpool into the interior of the country, authorizes the appointment of the present yearly average may be estimated to cost 500,000 pounds sterling, or £50,000 a ton of merchandise, besides about 150,000 tons of coals; and these numbers will no doubt be very much higher, as soon as the completion of the Manchester and Leeds, and the Sheffield and Manchester railways shall have established a connexion of this nature between Liverpool, the clothing district of Yorkshire, and the important hardware manufacturing town of Sheffield. The Grand Junction railway, running S. to Birmingham, leaves the line between Liverpool and Manchester at Newtown bridge: it is 97½ m. long, and was constructed at a cost of £1,800,000: the expenses have been found to average 35 per cent. on the gross returns, and the last dividends were £7 10s. per £100 share. A railway is opened to Birkenhead and Chester. The North Union railway connects Liverpool northward with Bolton, Blackburn, Preston, and Lancaster: nor, it is probable, will many years elapse before there be a railway communication with Glasgow and Edinburgh through Carlisle, thus bringing the great commercial port of W. England within 10 hours' distance, both of the English and Scotch metropolis, and within a much smaller distance of all the great manufacturing towns S. of the Tweed.

Corporate establishment, &c.—Liverpool received its first charter of Incorporation in 1303, with others from subsequent monarchs. William III. granted it a new charter in 1693, which was confirmed, with a few alterations, by George II. and III.; and by the provisions of this charter the town was governed down to the passing of the Municipal Reform Act in 1835. The borough is now divided into 16 wards, the corporate officers comprising a mayor, with 15 other aldermen, and 48 councillors. Corporation revenues, in 1839 (exclusive of £43,701, the amount of interest and money borrowed, and £13,696 accruing from the sale of property), £207,537. The corporation has the right, under an act passed in 1835, of nominating persons to all subordinate corporate offices, and is empowered to make "laws for regulating the police of the town, the docks and the port generally, for lighting and watching the town, and for the suppression of disorderly and immoral practices." Quarter and petty sessions are held by the recorder, who is appointed by the crown, and a few years ago the assizes for W. Derby and Salford were removed here from Lancaster. The police, conducted under a commissioner, is formed, like that of the metropolis, into divisions, with subordinate inspectors, sergeants, &c., and is said to be extremely efficient in suppressing crime, and maintaining order both in the town and port. This, indeed, is fully proved by two reports (1830-40), of the Watch Committee of Liverpool, to which the reader is referred for full information. The force at present comprises about 600 men, including inspectors, &c., the expense of maintaining which somewhat exceeds £50,000 a year. Liverpool has three prisons: the borough jail, erected on the plan of Howard, and formerly for some years a *depot* for French prisoners, is airy, well

* The cost of the above seems to have somewhat exceeded \$20,000.

Very large fortunes have been realized by the above undertakings, and notwithstanding the successful competition of railways, the act still bring in large incomes to the proprietors. The facilities for travelling, both of passengers and goods, has been vastly increased since the opening of the railways, by which Liverpool is brought within an hour's distance of Manchester, and both are brought within four hours of Birmingham, and nine hours of the metropolis! The act for the Liverpool and Manchester railway was obtained in 1825; the works were completed in 1830, at a cost of £278,000, or more than double the estimate laid before parliament, and the line was finally opened on the

LIVERPOOL.

constructed, and most efficiently managed; the Bridewell is also well spoken of by the inspectors, who, however, give a very unfavourable account of the county House of Correction in Kirkdale, which, though well built and excellently arranged for the accommodation of prisoners, is alleged to be most inefficiently conducted. (*See Inspector's Reports, 1857-58-59.*)

The provision for the poor, in so populous a town as Liverpool, is, of course, on a large scale. The total poor-rates of the borough in 1839 amounted to £41,394, of which, £38,354 were expended solely for the relief and maintenance of the poor. The poorhouse, which, from its extent, might well be called a little town, is one of the largest in the kingdom; and the building arrangements admit at the same time of perfect classification, according to the principles of the Poor Law Amendment Act, while at the same time they allow of considerable indulgence to the sick and aged; most of the common trades are pursued within the building, and the pauper mechanics instruct the children in different branches of handicraft. In fact, it would be difficult to find a more complete and more efficiently conducted workhouse than that of Liverpool. The borough has enjoyed the privilege of sending two members to the House of Commons, since the 25th of Edward I. Down to the passing of the Reform Act, the elective franchise was vested in the freemen and free burgesses. The Boundary Act enlarged the borough so as to include the out-townships of Kirkdale, Everton, W. Derby, and Toxteth park. Registered electors, in 1839-40, 14,976.

Condition of the People, &c.—Owing to the rapid rise of Liverpool, its population consists, in a great degree, of adventurers, not merely from all parts of the United Kingdom, but of the world, attracted to it in the expectation, which, in many instances, has not been disappointed, of making a fortune. In such a society there is necessarily less prejudice, and fewer conventional and established observances, than in other and differently constituted towns. There is here, in fact, the greatest toleration for all sorts of individuals, and all sorts of opinions. Exclusiveness in Liverpool is, speaking generally, entirely out of the question; and you meet everywhere with people of all grades, all occupations, and all countries. It would be idle in such a place to look for that polish, and careful avoidance of debatable or irritating topics, that distinguish more aristocratic societies; but, on the other hand, it is free from the sameness and insipidity which characterizes the latter. The ostentatious display of wealth made by a lucky hit or successful speculation, is, sometimes, no doubt, offensive enough; but, on the whole, society in Liverpool is, from its variety and ease, superior to that in most other purely mercantile towns. The higher class of merchants, having connections and correspondents in most parts of the world, are generally very well informed; and some of them are honourably distinguished by their taste in literature, science, and the fine arts. All classes are eminently enterprising (sometimes, perhaps, to excess), vigilant, and industrious; and persons, in a high degree, the qualities that go to form successful merchants and traders.

The situation of the lower or labouring classes in Liverpool, is, in many respects, less satisfactory than could be wished. Owing to the intimate intercourse it has with Ireland, and the small expense at which an individual may be brought over from Dublin, vast crowds of Irish labourers land at Liverpool, where they constitute a large proportion of the labouring population. Many of these persons are often especially on their landing from Ireland, and before they find employment, reduced to a state bordering on destitution; and even after they obtain employment, they are frequently in a very depressed condition. In the departments of skilled labour, such as those of carpenters, smiths, blacksmiths, &c., which are not interfered with by the Irish, wages are high; and employment being pretty constant, such workmen as are sober and industrious are in comfortable circumstances.

In consequence partly of the unfavourable condition of so many of the lower classes, but partly, also, of the vast amount of property that is here, always, as it were, in a state of transition, passing from the warehouses to the shops, and from the warehouses to the conveyances by which it is to be carried to its ultimate destination, there is at once a great incentive to indulge in dishonest practices, and great opportunities for depredation. It is estimated in the *Report on the Constabulary Force* (p. 18), that the cost of those who live on the public by other than honest practices in Liverpool, amounts to not less than £700,000 a year! But though, no doubt, the amount is very large, we are strongly inclined to think that this statement is grossly ex-

aggerated: supposing each of these thimble-riggers to make, at an average, £30 a year, which, probably, is beyond the mark, this sum would give an aggregate number of above 33,000, which must obviously be very far above the real number.

In Liverpool, as in Manchester and Glasgow, a very large proportion of the labouring classes are miserably lodged. It is certain that there are in Liverpool no fewer than about 8000 cellars, all of which are ill ventilated, and most of them, at the same time, dark, damp, and filthy. It is supposed that from 38,000 to 40,000 of the lower classes are lodged in these wretched abodes; and when such is the case, the wonder is not that fever and epidemics occasionally prevail in Liverpool, but that they are not incomparably more frequent and fatal.

Exclusive of cellars, there are supposed to be in Liverpool about 2400 courts. These, which are of very contracted dimensions, have a narrow entrance from the street, and are built all round, except at the entrance: the number of houses in courts varies very much, but at an average they may be taken at about six, though, as some of the families occasionally receive lodgers, the population is often much greater; but taking it at only 30 persons to a court (six families of five individuals each), it follows that about 73,000 persons must be lodged in these dark and noisome recesses! Courts are found in a great variety of places, and many have recently been constructed in Toxteth Park. All the fifth of the different families is collected in the court, whence it is not usually removed, though often producing an intolerable stench, above once a year, if so frequently; and the contiguous houses being neither sufficiently supplied with water, nor sufficiently ventilated, nor kept clean, they are but little better, and, in many cases, even worse than the cellars. Indeed, not a few of the courts are seldom or never free from fever, and other pestilential diseases! (*See the valuable Evidence of Dr. Duncan before the Committee on the Health of Towns.*)

Such a state of things calls for the immediate interference not merely of the local authorities, but of the legislature; and the most effective measures should be adopted for improving, and, in certain cases, shutting up and pulling down such residences.

The general healthiness of Liverpool is evinced by the fact that, notwithstanding the powerful countervailing influence of the circumstances now alluded to, the mortality is not supposed to exceed 1 in 32: in 1837, it was as high as 1 in 38, but that was an unusually unhealthy year. No doubt, with proper sanitary regulations, properly enforced, the average mortality might be reduced to 1 in 37 or 38, or perhaps less.

The northern part of the town, as far S. as Whitechapel and Dale-street, is seated on a coarse, red, diluvial clay; the remainder is the new red sandstone; and, having a gentle declivity, it has every facility for drainage. It is also protected by hills from the cold, withering N.E. winds; the climate, in fact, though humid, is more equable than in most other places; the sea breezes temper the heat of summer, and the cold of winter is usually from six to eight degrees below that under the same latitude on the E. coast of the island. Its situation is, therefore, one of the healthiest that can be imagined, and to this must be attributed the lightness of the mortality, despite the powerful countervailing influences noticed above.

The suburbs of Liverpool are of great extent, and increasing rapidly in population and importance. Everton and Edgehill are pretty thickly covered with neat rows of houses and handsome villas; Bootle is becoming a large place, and the Spa of Waterloo is rising in favour as a suburban residence. At the same time the W. shores of the Mersey are becoming densely peopled: Birkenhead; Woodside; Royal Dock Ferry, and Park; New Ferry, opposite which the lazarettes are moored; Seacombe, and Egremont, have risen in a few years, from the meanest hamlets, to towns of considerable size and regular construction. Eastham Hotel is delightfully situated, and has long been a great thoroughfare for coaches to all parts of Cheshire and Wales. Close to the river's mouth, a watering place, called New Brighton, has been formed, the streets of which are regular and handsome. The rise of suburbs so extensive and beautiful, almost wholly during the last 30 years, furnishes another indication of the vast resources of Liverpool, derived from its great and constantly increasing commercial consequence. (*Enfield's History of Liverpool; Baines's Lancashire, 4to ed.; Stranger in Liverpool; and valuable private information.*)

LIVERPOOL, p. h. and L. Ferry on, Pa. 30 m. N. by W. Hartshead, 130 W. Bounded E. by Susquehanna river. The borough is situated at the mouth of a creek, on the W. bank of Susquehanna river, where are extensive iron works. It contains several stores, two schools, 108 scholars, and 451 inhabitants. The township contains three stores, one falling-mill, one woollen factory, six flouring-

* It should be observed, indeed, that the 700,000 includes the supposed earnings of a certain class of females. It is, however, to say the least, inaccurate and absurd to class them with thieves and pickpockets. They make an income, but not necessarily a dishonest livelihood. But with all this, we believe the statement to be unparaph of merit.

LIVINGSTON.

mills, 16 saw-mills, one tannery, two distilleries; five schools, 196 scholars. Pop. 763.

LIVARPOOL, p. t., Medina co., O., 125 m. N.E. by N. Columbus, 356 W. Watered by Rocky river, and its branches. It has a sulphur spring, a rich petroleum spring, supposed to indicate the existence of bituminous coal, salt springs, and iron ore. It contains two stores, one fulling-mill, two grist-mills, three saw-mills, two tanneries, one distillery; three schools, 196 scholars. Pop. 1500.

LIVINGSTON, county, N. Y., centrally situated towards the W. part of the state, and contains 509 sq. m. Watered by Genesee river and Chautauque creek. Gypsum and bog iron ore, and salt and sulphur springs are found. The latter, at Avoca, are much frequented. It contained in 1840, 99,849 neat cattle, 163,306 sheep, 37,856 swine; and produced 823,650 bushels of wheat, 2684 of rye, 164,730 of Indian corn, 26,488 of buckwheat, 84,976 of barley, 305,619 of oats, 348,369 of potatoes, 119,430 pounds of sugar. It had 121 stores, 19 furnaces, 14 fulling-mills, four woolen factories, six flouring-mills, 56 grist-mills, 66 saw-mills, four paper-mills, one oil-mill, two rope-walks, 13 tanneries, eight distilleries, two breweries, one pottery, four printing-offices, two binderies, four weekly newspapers; six academies, 788 students; 178 schools, 6708 scholars. Pop. 35,146. Capital, Genesee.

LIVINGSOON, parish, La. Situated towards the S.E. part of the state, and contains 730 sq. m. Bounded W. and S. by Amite river. Watered by Tickfaw river, and its branches. It contained in 1840, 4361 neat cattle, 898 sheep, 10,373 swine; and produced 36,719 bushels of Indian corn, 1500 of oats, 90,497 of potatoes, 83,930 pounds of rice, 290,445 of cotton. It had four stores, 19 grist-mills, two saw-mills, one tannery; one academy, 60 students; one school, 71 scholars. Pop.: whites, 1533; slaves, 730; free coloured, 43; total, 2315. Capital, Springfield.

LIVINGSOON, county, Ky. Situated in the N. part of the state, and contains 330 sq. m. Bounded N. and W. by Ohio river, S.W. by Tennessee river, N.E. by Tradewater creek. Watered by Cumberland river. It contained in 1840, 9984 neat cattle, 7623 sheep, 20,095 swine; and produced 57,748 bushels of wheat, 421,415 of Indian corn, 50,140 of oats, 10,695 of potatoes, 1,223,500 pounds of tobacco. It had 19 stores, one forge, nine grist-mills, four saw-mills, three tanneries, four distilleries; two academies, 63 students; 10 schools, 261 scholars. Pop.: whites, 7338; slaves, 1368; free coloured, 90; total, 9035. Capital, Smithland.

LIVINGSOON, county, Mich. Situated a little E. of the central part of the settled portion of the peninsula, and contains 576 sq. m. Drained by head branches of Shiawassee, Cedar, and Huron rivers. Iron ore is found in the S.E. part, and Saline springs near the centre. It contained in 1840, 7931 neat cattle, 1903 sheep, 10,952 swine; and produced 84,943 bushels of wheat, 92,081 of Indian corn, 77,943 of oats, 93,647 of potatoes. It had 12 stores, three flouring-mills, five grist-mills, 14 saw-mills; 60 schools, 1777 scholars. Pop. 7430. Capital, Howell.

LIVINGSOON, county, Ill. Situated in the N.E. part of the state, and contains 1096 sq. m. Drained by Vermilion river, and its branches. It contained in 1840, 1015 neat cattle, 1119 sheep, 4268 swine; and produced 12,014 bushels of wheat, 55,695 of Indian corn, 14,990 of oats, 3576 of potatoes, 10,501 pounds of sugar. It had one store, one woolen factory, one grist-mill, three saw-mills; three schools, 44 scholars. Pop. 789. Capital, Pontiac.

LIVINGSOON, county, Mo. Situated towards the N.W. part of the state, and contains 510 sq. m. Watered by Grand river and its branches. It contained in 1840, 5639 neat cattle, 1883 sheep, 17,925 swine; and produced 1768 bushels of wheat, 123,398 of Indian corn, 4099 of oats, 3597 of potatoes. It had 12 stores; five schools, 90 scholars. Pop.: whites, 4093; slaves, 941; free coloured, 9; total, 4325. Capital, Chillicothe.

LIVINGSOON, p. t., Columbia co., N. Y., 37 m. S. Albany, 334 W. Bounded W. by Hudson river. Watered by Roskill-Janssen's or Ancrum creek. It belongs to Livingston's Manor and contains a Dutch Reformed Church, six stores, two fulling-mills, one woolen factory, two furnaces, four flouring-mills, four grist-mills; 10 schools, 447 scholars. Pop. 2190.

LIVINGSOON, p. t., Essex co., N. J., 9 m. N.W. Newark, 56 m. N. E. Trenton, 294 W. Bounded W. by Passaic river, by small tributaries of which it is drained. It contains three stores, one saw-mill; five schools, 158 scholars. Pop. 1081.

LIVINGSTON, p. v., capital of Sumpter co., Ala., 68 m. S.W. Tuscaloosa, 896 W. Situated on the E. side of Sachanochee river, a branch of Tombigbee river. It contains a courthouse, jail, and several stores and dwellings. Next proceeds to the post-office, 91292.

LIVONIA (Russ. *Ливонія*, Germ. *Livland*, or *Lief-land*), a mark. gov. of European Russia, on the Baltic, having N. the gov. of Revel, E. the lake Peipus, separating it from

LIZARD'S POINT.

the gov. of Petersburg, and the gov. of Pskov and Vittebk, S. the latter and Courland, and W. the gulf of Livonia. Length N. to S., about 159 m.; average breadth, 117 m. Area, including the island Gzeel, in the Baltic, 17,300 sq. m. Pop. in 1836, 740,100. The coast and the greater part of the surface are flat and marshy; but in the districts of Venden and Dorpat are some hills of considerable elevation; Elarberg, one of these, being nearly 1100 ft. in height. There are several extensive lakes: the principal, Viltser, 94 m. in length, by from 3 to 6 m. in breadth, communicates with the lake Peipus by the Embach. Besides the last named, the chief rivers are the Dwina, which forms the S. boundary, the Evet, and the Bolder-Aa. The soil, though in some parts loamy, is in general sandy, but, being abundantly watered, it is, by proper manuring, rendered very productive. Rye and barley are the principal crops, and more of both is grown than is required for home consumption. Wheat and oats are less cultivated; buckwheat is raised on sandy soils; flax, hops, and pulse are also produced; and the potato culture is on the increase: fruits are of very indifferent quality. In some districts, agriculture is tolerably well conducted. The forests are an important source of wealth, and supply excellent timber; they abound, not only with game, but also with wolves, which are sometimes very destructive to the cattle. The rearing of live stock, though not altogether neglected, does not receive adequate attention; the breed of black cattle is, however, in the course of being improved. Horses and sheep are very inferior. The fisheries, both on the coast and in the fresh waters, are important. Chalk, alabaster, and other calcareous materials are abundant.

Rural industry and the distillation of spirits are by far the most important occupations. The manufactures of this government are, however, more extensive than those in its vicinity. The paunstry spin linen yarn, and weave their own cloths; and in the towns, especially Riga, there are sugar refineries, and tobacco, woolen cloth, cotton, linen, glass, and other factories, which employed, in 1837, about 3800 hands, and produce goods to the amount of 11,000,000 roubles a year. (*Passert*.) The N. part of Livonia formerly constituted a portion of Esthonia, and the S. a part of Lithuania. The population consists of Esthonians, Lithuanians, Russians, Germans, and (along a portion of the coast) Livs, the most ancient inhabitants of the country, and from whom it has derived its name. About 62,000 of the inhabitants reside in the towns, and these, as well as the nobles, clergy, &c., are chiefly of German descent. Until 1894, the Esthonians and Lithuanians were in a state of feudal slavery; now, however, they are free, but without the right to hold real property. The prevailing religion is the Lutheran; there are only about 12,000 individuals of the Greek Church, and other professions of faith. Education is tolerably advanced in the towns, and the university of Dorpat, in this government, is the first in the empire. But, after all, only 1 in 143 of the inhabitants is said to be receiving public instruction. Livonia has a governor-general, whose authority extends over the government Pskov, and the other Baltic provinces; but it has its own provincial assembly, magistracy, &c., and has preserved many peculiar privileges, among which is that of exemption from the state monopoly of ardent spirits. It was divided into nine districts by Catherine II.: Riga is the capital and centre of its commerce; the other chief towns are Dorpat, Pernau, Fellin, and Arensburg in the island Gzeel. Livonia was conquered by the Danes in the 12th century, and held by the Teutonic knights from 1246 to 1561. It afterward belonged to Poland, and next to Sweden; but was definitively annexed to Russia, by the treaty of Nystradt, in 1721. (*Schmidt's La Russie*, 598-365; *Passert*; *Das Kaiserth. Russland*.)

LIVONIA, p. t., Livingston co., N. Y., 8 m. E. Genesee, 294 m. W. Albany, 353 W. Organized in 1808. Bounded S.W. by Oneonta lake. Watered by the outlet of Hemlock lake, which latter enters it S. border. It contains four churches, two Presbyterian, a Methodist, and Baptist; nine stores, four fulling-mills, one woolen factory, two flouring-mills, one grist-mill, three saw-mills, one tannery, two distilleries; one academy, 40 students; 15 schools, 861 scholars. Pop. 2719.

LIVONIA, p. t., Wayne co., Mich., 16 m. S.W. Detroit, 540 W. Watered by branches of Rouge river. It has one store, four saw-mills; nine schools, 286 scholars. Pop. 1160.

LIXURI. See **CYPHALONIA**.
LIZARD'S POINT, a bold headland, on the British channel, being the most southerly promontory of England, on the S. coast of Cornwall, 23 m. E.S.E. the Land's End, lat. of highest lighthouse, 49° 57' 41" N., long. 5° 11' 3' W. The Lizard is famous in navigation, from its being the point whence ships usually take their departure from the channel, and being, also, the best place for a land-fall when homeward bound. It is surmounted by two lighthouses

LLAMPETER.

with fixed lights, at a short distance from each other, the bottom of the one being 235 ft. and of the other 231 ft. above the level of the sea. Some steep rocks, called the Stags, lie to the S. of the Lizard.

LLAMPETER, or LLAN-BEDR, a pari. bor., market town, and par. of S. Wales, co. Cardigan, hund. Moyddyn, 25 m. E. by N. Cardigan, and 180 m. W. by N. London. Pop. of pari. bor., which is contributory to Cardigan, about 1600, that of the entire parish being, in 1831, 1197. The town, which stands on a slope about 1-2 m. N. of the Telfy (crossed here by a stone bridge), appears to have been larger formerly than at present, when a score of tolerably built houses, and about 100 cottages comprise the whole of its private dwellings. The church, which stands on an eminence at the N. end of the town, is very ancient, and, being shaded with venerable yews, has a very picturesque appearance: there are also two chapels for Calvinistic Methodists and Presbyterians. The chief ornament of the place is the College of St. David's, a handsome Gothic structure, erected in 1835. This institution, founded by George IV. in 1832, at the suggestion of the late Dr. Burgess, then bishop of St. David's, and endowed with six livings, is intended to furnish clerical instruction for the clergy of the E. part of the principality, and has already done much to raise a profession, which, owing partly to the misconduct and partly to the poverty and ignorance of its members, had fallen into merited disrepute. The students reside within the college, the business of which is conducted by the principal, who gives theological instruction, and is assisted by Greek, Hebrew, Welsh, and other professors. The course of instruction lasts during two years, and is attended, at an average, by about 60 students, whose necessary expenses do not exceed £55 a year. The bishop of the diocese, who is the visitor, ordains none except graduates of the English universities, or certificated students of Llampeter College. The town is of little trading importance. Markets on Saturday. Fairs, well attended, for horses, cattle, and hogs, Jan. 11, Wednesday in Whitson-week, July 10, first Saturdays in Aug. and Sept., Oct. 10, and first Saturday in Nov. The town is incorporate, governed by a portreeve, and sessions are held annually by the county magistrate on the second Wednesday in October.

LLANDEILO-FAWR, a market town and parish of S. Wales, co. Caermarthen, hunds. Caro and Perfedd, on the Towy, 13 m. E. by N. Caermarthen, and 160 m. W. by N. London. Pop. of parish (including 10 hamlets), in 1841, 5471: do. of township, in 1831, 1908. The town, situated in the beautiful and interesting vale of the Towy, is small and ill-built, the only public buildings being an old church, and four places of worship for dissenters. Newton Park, the residence of Lord Dynevor, and Golden Grove, belonging to Earl Cawdor, are the principal country-seats of the neighbourhood, which is very productive, and has some rich mines of coal and iron. A railway connects this coal-field with the port of Llanelly. Quarter sessions are held here; and Llandeilo-fawr is one of the polling places for the county. Markets well supplied with corn, &c., on Saturday: fairs, Feb. 30, May 5, and 12, June 21, Aug. 23, and Nov. 12.

LLANDOVERY, a mun. bor. and market town of S. Wales, par. Llandinog, co. Caermarthen, hund. Perfedd, 28 m. E.N.E. Caermarthen, and 169 m. W. by N. London. Pop. of bor. in 1841, 1709. The town, agreeably situated in the upper part of the vale of the Towy, at a short distance from that river, has one principal avenue, and eight other streets lined with respectable houses. The keep of an old castle, destroyed by Cromwell, occupies the summit of an insulated rock, and forms a chief feature of the place. The parish church stands a little S. of the town, and there are likewise four places of worship for dissenters, with attached Sunday schools. National and Lancasterian schools are established, and there are almshouses and other charities for the aged poor. There is little trade or traffic of any kind in Llandoverly; but it is a municipal borough, governed, since the Municipal Reform Act, by a mayor and three other aldermen, with 19 councillors. The petty sessions for the hundred of Perfedd are held here, and Llandoverly is one of the polling places at the elections for the county. Markets on Wednesday and Saturday: cattle fairs Wednesday after Jan. 17, the 3d Wednesday after Easter, Whit-Tuesday, July 31, and Nov. 30.

LLANELLY, a pari. bor., seaport, market town, and par. of S. Wales, co. Caermarthen, hund. Caernwallon, 13 m. S.E. Caermarthen, 104 m. W.N.W. Swansea, and 174 m. W. by N. London. Pop. of pari. bor. in 1841, 11,155. The town is irregularly built, on a creek near the sea shore; but some of the houses are good, and the place, on the whole, appears to be thriving. The church is an old, irregular structure, remarkable as having two towers, one embedded, and the other surmounted by a steeple: the living is a vicarage, and within the parish are two chapels-of-ease. Dissenters also of different denominations have several pla-

LLANIDLOES.

ces of worship. A free school and two other schools, chiefly supported by subscription, furnish instruction to the children of the poor; and there are four charities for the relief of the sick and aged. Llanelly is situated in the midst of the rich mineral basin of S. Wales. Four large collieries at Llangenneck employ upwards of 500 persons; and the abundance of excellent coal, a part of which is exported to France, Spain, and the Mediterranean, for the use of steam-boats, has caused the establishment of the Llanelly and Cambria copper-works. The ore is imported chiefly from Cornwall; and the copper-cakes and sheathing are sent to Liverpool, and other ports of the kingdom. There are also two iron-foundries, but both are air furnaces, and of no great importance. The town has four docks, two of which are floating basins, the largest being capable of accommodating no less than 50 vessels of 500 tons register. This port had, in 1836, 73 ships, of the aggregate burden of 3637 tons, and the register tonnage cleared out averaged, for the five years preceding 1832, 54,000 tons. The gross customs' revenue in 1830, amounted to £3650.

The interests of the town have been recently much promoted by the construction of a railway, with branches into different parts of the fine coal-field near Llandidlo; and it is probable that Llanelly will, at no distant period, become one of the principal trading ports of the principality. The parliamentary borough, which is contributory to that of Caermarthen, includes the borough hamlet, with some additions. Registered electors in both boroughs, in 1830-40, 907. The borough is governed by a portreeve and burgesses, and had formerly both civil and criminal jurisdiction. Markets on Thursday and Saturday: fairs on Ascension-day and September 30.

LLANGADOG-FAWR, a market town and par. of S. Wales, co. Caermarthen, hund. Perfedd, on the Towy, here crossed by a handsome stone bridge, 19 m. E. by N. Caermarthen, and 167 m. W. by N. London. Pop. of parish, in 1841, 2604. The town has two pretty wide streets, with a few well-built houses and numerous cottages, an old church, and three dissenting places of worship, being the only public buildings, besides a ruinous old castle. Woollen stockings, and coarse woollen cloths, are made here; but the chief business is the sale of farm produce at the fairs and markets, which are very considerable. Markets on Thursday: fairs, March 12, July 9, Thursday after September 11, and 2d Thursday after October 10.

LLANGOLLEN, a town of N. Wales, co. Denbigh, hund. Chirk, on the Dee, 90 m. S.W. Chester, and 166 m. N.W. London. Pop. of par., in 1841, 4006. The town, beautifully situated in a deep, narrow vale, enclosed by lofty mountains, and watered by the Dee, which is crossed here by a good stone bridge, consists of one principal and a few smaller streets, lined with old and mean houses, interspersed with a few handsome modern dwellings, among which are three large and commodious inns. The church, in the early English style has service performed in it both in English and Welsh; there is a chapel of ease at a hamlet within the parish, and the dissenters have three places of worship. The inhabitants derive their chief support from summer visitors, who, in making the tour of N. Wales, usually make some stay here, in order to enjoy the fine scenery of this vale, which in some respects exceeds that of the vales of Clwyd and Festiniog. Many families, also, reside here during summer, so that Llangollen may be considered as a sort of watering place. The Reform Act made it a polling place for the co. Markets on Saturdays. Fairs, March 17, May 31, and Aug. 31.

About 1 m. from Llangollen, situated on a high and steep conical hill, are the ruins of the castle of Dinas Bran, once a fortress of considerable strength; and about 1 m. beyond, nearly in the same direction, are the majestic remains of Vale-crucis abbey, still in tolerable preservation: the name of this abbey is derived from a pillar or cross, situated in an adjoining field, supposed to be of high antiquity. Four miles from the town, and in another direction is the Cwylltan aqueduct, by which the Ellesmere canal is conveyed across the Dee, a noble structure of 19 arches, raised 196 ft. above the river, at a cost of £47,000.

LLANIDLOES, a pari. bor., market town and par. of N. Wales, co. Montgomery, hund. Llandidloes, at the confluence of the Clevedon with the Severn, 37 m. W.S.W. Shrewsbury, and 153 W.N.W. London. Pop. of town in 1841, 4361. It is situated in a valley on the E. bank of the Severn (crossed here by a handsome stone bridge of three arches), and is surrounded on all sides by lofty hills: the buildings have increased rapidly, and several respectable houses have been substituted for others composed of wood and plaster, which formerly gave the place a mean appearance. A new town-hall stands nearly in the centre of the town. The church, built in 1529 on the site of an older structure, and very recently repaired, is chiefly remarkable for a ceiling of delicately carved oak, and for a square tower of great antiquity. There are also places of worship for

LLANRWST.

Independents, Wesleyans, Calvinistic Methodist, Baptists, and the Society of Friends. Instruction is furnished in day-schools to about 70 children; but education is little valued, and the mass of the population are described, we hope too strongly, as being "cradled in ignorance, and laured to vice both by habit and example."

Flannel and other woollens are the principal articles manufactured in Llanidloes, and the present improved condition of the town is wholly attributable to its trade in these articles. The spinning of wool is conducted in six mills, employing 160 hands; but the cloth is wholly made by hand-looms. The quantity of flannel annually manufactured averages 4360 pieces: there were 815 looms at work in 1836, which employed 680 men, 176 women, and 106 children. The wages of the best weavers are 18s. a week; but the average is about 7s. Spinners earn about 12s. The weavers are stated to be drunken, improvident, dishonest, and in subordination: "in fact, between poverty on the one hand, and want of education on the other, the condition of Llanidloes presents a picture darker, by many shades, than any town of its size in the principality, except Merthyr-Tydfil." (*Standard Rep.*) Within the parish is the lofty mountain of Plinlimon, or more properly, *Fawntwys*, "the five-peaked hill," on which are the sources of the Severn, Wye, and Rhodri; and at the foot of the range there are slate quarries and lead mines, the produce of which contributes to the support of the place.

Llanidloes is a corporate town having a mayor, coroner, and other officers, elected at a court-leet; it was not considered sufficiently important to be included in the provisions of the Municipal Reform Act. The Reform Act made it a part borough, contributory to Montgomery, which sends one member to the House of Commons, and the electoral limits comprise, besides the town, a considerable extent of surface on both sides the Severn. Registered electors, in 1836-40, 67. Markets on Saturdays: fairs April 5, May 11, June 21, July 17, September 13, October 2, and 26.

LLANRWST, a town of N. Wales, partly in co. Caernarvon and partly also in co. Denbigh, on the Conway, 37 m. W. Chester, and 183 m. N.W. London. Pop. of par. in 1831, 3801. The town, in a spacious vale, surrounded by lofty and well-wooded hills, stands chiefly on the E., but partly also on the W. bank of the Conway, which is crossed here by an elegant bridge, constructed in 1836, from the designs of Inigo Jones. Three considerable streets, lined with tolerably built houses, branch from a spacious market-place, in the middle of which is the town-hall, a substantial brick structure. The church, an old and small building, has adjoining to it the Gwydir chapel, a square castellated edifice, originally erected as a family mausoleum by the Wynne family, and now used as a place of worship. It has many monuments; but its chief celebrity is owing to its containing the remains of the great Llewellyn, removed thither from the abbey of Aberconway, in which they were originally interred. There are also 11 chapels for dissenters within the parish, and some good Sunday schools. Llanrwst formerly noted for its harp manufacture, depends at present almost entirely on its retail trade; for the spinning and knitting of wool is become quite insignificant. It derives considerable advantages from its position on the Conway, which brings up vessels of 60 tons burden to Trefriw with coal, lime, timber, &c., in return for slate and iron. Gwydir castle, a rather large and very elegant modern structure, is situated about ½ m. from the town. Markets on Tuesdays and Saturdays. Fairs on March 8, April 25, June 10, Aug. 10, Sept. 17, Oct. 25, and Dec. 11.

LLANTYSSANT, a par. bor., market town, and par. of S. Wales, co. Glamorgan, hund. Miskin, 10 m. N.W. Cardiff, and 140 m. W. London. Pop. of par. bor. in 1831, 966; ditto of par. 3769. The town, which stands on a commanding eminence overlooking the vale of Glamorgan, consists only of three or four narrow and irregular streets, lined with old and ill-built houses. The town-hall and market-house were erected by the Bute family, who are lords of the manor, and the principal landowners in the parish. The church is a large structure in the Norman style, the living being a vicarage in the gift of the dean and chapter of Gloucester cathedral. There are also two chapels of ease in the out-townships, and several places of worship for dissenters, with attached Sunday schools. The ruins of an old castle with a high tower stands close to the town; and, at a short distance, are some interesting remains of an old monastery. Llantyssant has a very little trade: but coal, lead, and iron are found in considerable quantities, in the hamlet of Pentrych, and sent to Cardiff for exportation. The charter of the borough was granted by Edward III., and the government is vested in a portreeve, constable, and 12 aldermen, whose privileges were left untouched by the Municipal Reform Act. Llantyssant is a parliamentary borough, contributory with Cowbridge to Cardiff, which sends one member to the House of Commons. Registered electors in 1836-40, 765, of whom 183 belonged to Llantris-

LOCHES.

sent. Markets on Friday: fairs, Feb. 13, May 12, Aug. 12, and Oct. 29.

LLERENA, a town of Spain prov. Estremadura, 39 m. N. Seville, and 200 m. S.W. Madrid. Pop., according to Mifano, 6465. It stands on a plain at the foot of the Sierra San Bernardo, which separates Estremadura from Seville; and has two parish churches, four convents, and a hospital. The inhabitants are chiefly engaged in grazing sheep and cattle on the rich pastures of the vicinity, and in collecting oak-bark, galls, and timber from the neighbouring forests.

LO (ST.), (an. *Briviers*), a town of France, dep. La Manche, of which it is the cap., on the Vire, and on the high road between Paris and Cherbourg, 156 m. W. by N. the former. Pop. (1836) ex. com., 8993. It is ill laid out; streets steep and irregular; they mostly lead from a square in the highest and central part of the town, which has several of the principal public buildings: among these the few that deserve notice are, the church of Notre-dame, with two lofty spires; that of St. Croix, built in 985, and considered the best specimen of Saxon architecture in France; the prefecture, a handsome new edifice; a bridge of six arches over the Vire. The environs are picturesque and agreeable. St. Lo is the seat of tribunals of original jurisdiction and commerce, a chamber of manufactures, and a communal college. It has a public library with 2500 vols., a philharmonic society, societies of agriculture and commerce, manufactures of fine woollen cloths, druggists, canyars, serge, calicoes, lace, cutlery, &c., and considerable trade in thread, iron, salt, butter, cider, honey, cattle, &c. It derives its present name from a bishop of Coutances in the sixth century. (*Hugo, art. Manche.*)

LOANGO, a kingdom of W. Africa, on the Atlantic ocean, bounded N. by Mayombe, and S. by Congo, from which it is separated by the Zaire. The coast is high and abrupt, but the hills are covered with earth and luxuriant vegetation. The soil is generally a stiff loam, and very productive; but near the coast is an extremely fine sand, that is carried about by the lightest breeze. The lakes and rivers, of which there is a considerable number, abound with fish, and in the forests are found tiger-cats, ousses, hyenas, monkeys, antelopes, hares, and other game. The climate is excessively hot: it sometimes rains, but the dews are sufficient for vegetation. Almost the only grains are manioc, maize, and a species of pulse called *manzanga*, rarely cultivated by women, who merely stir the ground to the depth of an inch, and cover up the grain, to prevent its being devoured by birds; and even this slender culture is confined to small patches round the villages. The rest of the country is covered with luxuriant herbage, rising to the height of eight feet, allowed by the people to grow, ripen, and wither, without being applied to any use. Sometimes, however, they set fire to it, producing a wide extended conflagration over the whole country, the coast appearing from the sea to be on fire. The finest fruits grow wild, and the sugar-cane attains an extraordinary size. The tree called the mapou is distinguished, like the baobab, by the enormous dimensions of its trunk. Palm trees are very plentiful, particularly that species from which the natives extract their favourite liquor. The potato and yam are also abundant. The Chinese hog is the only animal reared for domestic use, the natives having altogether neglected the breeding of sheep, cattle, and horses, formerly introduced by the Portuguese, and still abundant at their settlement of Paul de Loanda. The inhabitants usually reside in villages or clusters of straw huts in the midst of palm groves. They seem to be in the lowest state of degradation, being incorrigibly indolent, debauched, filthy, cowardly, and superstitious in the extreme. The country is divided among several chiefs, who, though often at war with each other, acknowledge the supreme authority of the king of Loango, the capital. The latter is elective and absolute; but the judicial power is vested in the *cabals* or assemblies of the different villages. Loango, called *Borai* by the natives, about 2 m. from the coast, in lat. 4° 36' S., long. 19° W. E., has been said to have a population of 15,000 persons. It is nothing more than a collection of huts. This and the ports of Kabenda and Majumba, also, in Loango, were formerly among the principal slave markets on the coast of Guinea; and notwithstanding the efforts that have been made for the suppression of the traffic, we doubt whether it be materially diminished. (For farther and ample information as to this country, see *Voyage à la Côte Occidentale de l'Afrique*, by Degrandpre, passim; and *Procès, Histoire Générale des Voyages*, vol. iv. 579-610.)

LOCHES, a town of France, dep. Indre-et-Loire, cap. around on a hill beside the Indre, 23½ m. S.E. Tours. Pop. (1836), ex. com., 3600. It is irregularly laid out, and its streets are narrow; but it is clean, and has many good houses. Its castle, on a plateau, at the summit of the hill on which the town is situated, has gained considerable notori-

LOCHMABEN.

city in French history. It appears to have been built in the last ages of the western empire, and is one of the most remarkable remains of that period now existing in France. Charles VII. defended it successfully against the English; Louis XI. made it a state prison; and here, Cardinal Beaufort, of infamous memory, was confined in an iron cage for 11 years. It is now mostly destroyed, what remains being occupied by the sub-prefecture, prison, &c. The palace of Charles VII., now the municipality, is a large oblong building on the bank of the Indre; it was long the residence of Agnes Sorel, whose remains are deposited in a chapel in a tower of her erection. The church of Loches, originally founded circa anno 480, is a singular piece of architecture, with four steeples, two of which are about 160 ft. high. Loches communicates with the little town of Beaulieu by several bridges over the Indre. It is the seat of a tribunal of primary jurisdiction, and a communal college; and has manufactures of linen and coarse woollen cloths, paper, leather, &c. (*Hugo, art. Indre-et-Loire.*)

LOCHMABEN, a royal and parl. bor. and market town of Scotland, co. Dumfriesshire, is a level country, surrounded by several lochs, or lakes, 10 m. N.E. Dumfries, and 36 m. N.W. Carlisle. Pop. 1013. The town consists of one extremely wide street, more or less overgrown with grass. The public buildings are a town-house, parish church, and a dissenting chapel. It has no manufactures. The schools are good; and there is a subscription library; but it is altogether about the poorest royal bor. in Scotland. Lochmaben owes its origin to the protection afforded by a castle of the same name, built in the 12th century by the Bruce, lords of Annandale, from whence King Robert Bruce was descended. The site of this fortress, surrounded by a deep fosse and moat, is still called the Castle-hill. Robert Bruce built another strong castle on a peninsula on the S.E. side of the Castle loch, which, with its outworks, covered nearly 16 acres. The walls, in the few places where they are still entire, are 19 ft. thick. It was preserved as a border fortress till the union of the crowns; since which it has gradually gone to decay. Bruce parcelled out the barony of Lochmaben, called the "Four Towns," as it contains four villages, among his retainers, in small patches, on the condition that the occupants should furnish a certain amount of provisions for the use of the royal fortress. These persons, who are called the "king's kindly tenants," had no written title to the lands; and at present, in case of a sale, a simple deed of conveyance is sufficient; and the succession is taken up without any feudal service. Owing to a misunderstanding between these tenants and the keeper of Lochmaben palace, Charles II., in 1684, guaranteed to them the perpetuity of their leases, and relieved them from every burden, except the rents and services paid by their ancestors in 1603, which are nominal merely. The tenants are a poor but contented class, having little intercourse with the rest of the community. Johnstone, of Annandale, is the hereditary keeper of the royal palace, and, as such, receives the nominal rents in question. Many of the inhabitants of the borough, like the "king's kindly tenants," are owners of small patches of land, there being within the borough no fewer than 141 small proprietors! Lochmaben unites with Annan, Sanquhar, Dumfries, and Kirkcudbright in sending a member to the House of Commons. Registered voters in 1840-41, 41. (*New Stat. Acc. of Scotland, & Dumfriesshire, p. 376-387; Chalmers's Calendar, & Dumfriesshire; Forreth's Pictures of Scotland.*)

LOCHWINNOCH, a manufacturing town of Scotland, co. Renfrew, on the Calder, a stream which terminates in castle Sempie loch, 154 m. S.W. Glasgow, and 364 m. N. Ayr. Pop. in 1831, 3643. The town, which is sheltered in every direction, except the S.E., either by rising grounds, or thick plantations, has a main street ($\frac{1}{2}$ m. long), with several streets crossing it at right angles. There are, in the town, the parish church, a chapel belonging to the Associate synod, several public libraries, and various friendly societies. Manufactures were early introduced into Lochwinnoch, but those of linen and silk have disappeared. Thread-making was introduced in 1733; at one time there were about 30 thread-mills in the place, but the business is now nearly discontinued. Cotton is the staple manufacture. Three cotton-mills employ about 600 persons, and there are above 218 weavers employed by the manufactures of Glasgow and Paisley. There is a small power-loom factory, a small mill for carding and spinning wool, and one of the best corn-mills in Scotland. The line of the Glasgow and Ayr railroad, opened in 1840, passes close to Lochwinnoch. (*Ibid.; and Factory Reports, 1839, p. 308, 307.*)

LOCKE, p. t., Cayuga co., N. Y., 30 m. S. Auburn, 155 m. W. Albany, 319 W. Organized in 1808. Watered by the inlet of Oswego lake. It contains two churches, a Presbyterian and Baptist; four stores, two fulling-mills, one woollen factory, three grist-mills, seven saw-mills; 13 schools, 516 scholars. Pop. 1654.

LOCK HAVEN, p. v., cap. of Clinton co., Pa., 167 m.

LODI.

N.W. by N. Harrisburg, 199 W. Situated on the S. side of the W. branch of Susquehanna river. It contains a court-house, jail, four stores, and about 150 inhabitants.

LOCKERBIE, a market town of Scotland, co. Dumfriesshire, is the centre of a rich and fertile country, on the road between Carlisle and Glasgow, 37 m. N.W. the former, and 66 m. S.E. the latter. Pop. in 1831, 1414. It is neat and regularly built: its only public buildings are the parish church, and a chapel belonging to the Associate synod. Lockerbie has long been distinguished for its excellent schools. There are two public libraries and a reading room. There are two fairs and 10 markets annually. The fairs are exclusively, or at least principally for lambs and wool. When the border feuds had so far ceased (after the union of the crowns) as to allow a slight intercourse between the English and Scotch, the sheep farmers of the S. of Scotland assembled here to meet the English dealers. This was the origin of these fairs, which have been long very important. The Lammass fair (second Monday in August) is the largest lamb fair in Scotland. The 10 markets have each a somewhat different object: one of them being for hiring servants, another for black cattle and horses; while those in winter are principally for pork, which is largely produced in the vicinity. There are two branch banks in the town. (*New Stat. Acc. of Scotland, & Dumfriesshire, p. 451.*)

LOCKPORT, p. t., Niagara co., N. Y., 377 m. W. by N. Albany, 402 W. Organized in 1804. Bounded S. by Tonawanda creek, and watered by streams flowing into lake Ontario. It contains one commission house in foreign trade, 65 stores, five flouring-mills, nine grist-mills, 45 saw-mills, one oil-mill, one paper-mill, three tanneries, one distillery, one brewery, one pottery, four printing-offices, one bindery, three academies, 203 students; 30 schools, 2379 scholars. Pop. 9125. The village is situated on the Erie canal, and was founded in 1821, became the capital of the county in 1822, was incorporated in 1830, and is included in a parcel of 18 m. long and $\frac{1}{4}$ m. wide, containing 1690 acres. It is laid out with considerable regularity, on both sides of the canal, which here rises or descends by five double locks, of 19 feet lift each. W. of the village, the canal is excavated through the mountain ridge for the distance of 3 m., at an average depth of 30 feet, in limestone rock. This gives the waters of lake Erie an uninterrupted flow of 30 m. to this place, creating, by the fall at the village, a great water-power. It contains a stone courthouse, including a jail, and a fire-proof county clerk's office; an academy, a female seminary, a lyceum, 11 churches, two Presbyterian, two Episcopal, a Methodist, Baptist, Lutheran, two Friends', and a Roman Catholic, mostly of stone or brick, and an African; most of the above stores and manufacturing establishments, with many mechanic shops, 750 dwellings, and about 6000 inhabitants.

LOCKPORT, p. v., Will co., Ill., 170 m. N.E. by N. Springfield, 747 W. Situated on the Illinois and Michigan canal, at the termination of the lake level, 344 m. from Chicago. The canal has here a fall of 90 feet, by two locks, producing, by its surplus water, great water-power. Des Plaines river has also, in the vicinity, a fall of 15 feet, affording to the place great facilities for manufacturing.

LODEVÉ, a town of France, dep. Hérault, cap. arrond., on the Ergue, at the foot of the Cevennes, 37 m. W.N.W. Montpellier. Pop. in 1836, ex. com., 11,071. It is ill built; is surrounded by old fortifications; and has an old cathedral, formerly a bishop's see. In Lodève and its neighbourhood, from 7000 to 8000 work-people are employed in the manufacture of woollen cloth for the army, and nearly all the inhabitants of the town are in some manner connected with this business, at least three fourths of the population belonging to weavers' families. About 60,000 pieces of broadcloth are made annually. The government demand for this cloth being pretty constant, the people engaged in its manufacture have also pretty constant employment, and their condition is consequently better than that of most of those in the ordinary departments of industry. Wages are high; the men getting from 1 fr. 75 c. to 3 fr. a day; women from 75 c. to $\frac{1}{4}$ fr.; and children from 50 to 80 c. The work-people are said to be active, industrious, and particularly sober; and the proportion of illegitimate to the total births in Lodève is said not to be more than one in 30, while in the department generally it is one in 19. This singular statement, the accuracy of which seems at first sight very questionable, is partly, at least, accounted for by the fact that the weavers usually marry early, that there is no garrison in the town, that some of the females lie in at Montpellier, Béziers, and elsewhere, and that there is no foundling asylum in the whole arrondissement. (*Hugo, art. Hérault; Villermé; Tableau Physique, &c., des Départemens, l., 318-325.*)

LODI, a city of Lombardy, cap. deleg. Lodi and Crema, on the Adda, here crossed by a wooden bridge, and on the road from Milan to Piacenza, 18 m. S.E. Milan. Lat. 45° 18' 31" N., long. 9° 30' 58" E. Pop. (1836) 15,962. It is sit-

LOFFODEN ISLES.

uated on slightly rising ground, and surrounded by old walls, and entered by four gates. It is generally well built, and has broad and regular streets, an old citadel, now dismantled, and converted into barracks by the emperor Joseph II., numerous churches, a large hospital, a theatre, several handsome palaces, and a large market-place, surrounded with arcades. The church *della Incarnata* is said to have been designed by Bramante; it has a fine rotunda, and is ornamented with frescoes and paintings by Callisto, a pupil of Titian. In the cathedral is the "Murder of the Innocents," by the same artist. Lodi is bishop's see; and the seat of the governor, assembly, and superior judicial courts for the delegates; it has a royal and ecclesiastical gymnasium, a public library, a normal school, founded by Joseph II., orphan and foundling asylums, a workhouse, a *mont de piété*, a large porcelain factory, and manufactures of linen fabrics, &c. It is the centre of the trade in Parmesan cheese. (See ITALY, AUSTRIAN, in this vol., p. 58.)

Lodi is famous in modern history for the victory achieved here on the 10th of May, 1796, by Napoleon, in his first Italian campaign. The cannon of the Austrians swept the bridge behind which they were drawn up; but it was, notwithstanding, forced by the French at the point of the bayonet, and the Austrian army totally defeated. On this occasion, the intrepidity and gallantry of Napoleon shone as conspicuously as his skill as a tactician. (*Oester., Nat. Encycl.; Berghaus; Oander's Italy, &c.*)

Lodi, p. t., Seneca co., N. Y., 185 m. W. Albany, 318 W. Bounded W. by Seneca lake. Watered by streams flowing into it, and by others flowing E. into Cayuga lake. It contains a Dutch Reformed church, six stores, three fulling-mills, one woollen factory, one flouring-mill, five grist-mills, eight saw-mills, one oil-mill, two tanneries; 15 schools, 670 scholars. Pop. 3236.

Lodi, t., Bergen co., N. J., 5 m. S.W. Hackensack. Bounded E. and S.E. by Hackensack river, W. and S.W. by Passaic river. Along the latter are many fine country seats. It has one store, one dyeing and printing works, three grist-mills, three saw-mills; two schools, 52 scholars. Pop. 687.

Lodi, p. t., Washtenaw co., Mich., 43 m. W. Detroit, 520 W. Pop. 1077.

LOFFODEN ISLES, a group of islands on the coast of Norway, between lat. 67° 40' and 69° 30' N., and long. 11° 40' and 16° 30' E. There are five larger and several smaller islands, having in all from 3000 to 4000 inhabitants. The principal are (taking a S.W. direction) Andøen, Langøen, and Hildøen, which is the largest of the whole group, and with six others, forms, on the side of the Norwegian continent, the great gulf of West Fjord. The coasts of these islands are extremely irregular, and they rise into lofty and rugged mountains, covered with perpetual snow, and in some places with glaciers. There are no trees, but only a few stunted shrubs, grass, and cryptogamous plants; nor are these islands of any importance, except on account of the fisheries, which are very extensive and valuable. "In the beginning of February the cod-fish set in from the ocean, and occupy the banks in West fjord. These banks are from 3 to 10 m. out in the fjord, at a depth of from 60 to 80 fathoms; and the fish crowd so much together while depositing their spawn that it is said a deep sea lead is often interrupted in its descent to the bottom through these *fish-hills*. The fishermen assemble in the month of January at the different stations, and the fish are caught by nets and long lines, set at night and taken up in the morning. An outfit or company consists of two boats, each having five men, and provided with six or eight nets; and every 30 or 30 of these companies have a large tender to bring out their provisions, nets and lines, and to take the produce to market. The fish are cured as round or stock fish till April, after which they are split, salted, and carried to Drontheim, or other places, to be dried on the rocks, like the Scotch dried cod. The stock-fish are merely gutted and hung up, two together, across poles, and are dried, without salt, in the wind. In a medium year (1857) there were 3916 boats fishing in 83 different stations, accompanied by 194 tenders, the number of men in all being 15,324. The produce amounted to 16,458,630 fish, which, when dried, would weigh 8800 tons; there were, also, 21,330 barrels of cod-oil, and 8000 barrels of cod-roe. This important winter-fishery ends in the middle of April. The herring fishery on these shores is of much less consequence. (*Leising's Norway*, p. 309-403.)

LOGAN, co., Va. Situated in the W. part of the state, and contains 9930 sq. m. Drained by Guyandotte and Coal rivers. It contained in 1840, 5431 neat cattle, 9454 sheep, 10,300 swine; and produced 7138 bushels of wheat, 870,630 of Indian corn, 23,044 of oats, 10,852 of potatoes, 9363 pounds of tobacco, 5946 of sugar. It had five stores, five flouring-mills, 52 grist-mills, four saw-mills, seven tanneries, two distilleries; 19 schools, 370 scholars. Pop.: whites, 4150; slaves, 150; total, 4300. Capital, Logan.

LOIR-ET-CHER.

LOGAN, co., Ky. Situated in the S., towards the W. part of the state, and contains 600 sq. m. Drained by tributaries of Green and Cumberland rivers. It contained in 1840, 2693 neat cattle, 4634 sheep, 11,578 swine; and produced 62,775 bushels of wheat, 1197 of rye, 305,440 of Indian corn, 65,517 of oats, 4438 of potatoes, 263,597 pounds of tobacco, 24,597 of cotton. It had eight stores, two woollen factories, 13 cotton factories with 180 spindles, four flouring-mills, 11 grist-mills, seven saw-mills, one oil-mill, one tannery, six distilleries, two potteries; four academies, 146 students; 15 schools, 360 scholars. Pop.: whites, 8479; slaves, 628; free coloured, 310; total, 12,615. Capital, Russellville.

LOGAN, co., O. Situated a little N.W. of the centre of the state, and contains 428 sq. m. Organized in 1818. Watered by Miami river, and its branches. It contained in 1840, 6379 neat cattle, 7839 sheep, 9333 swine; and produced 24,164 bushels of wheat, 9406 of rye, 232,235 of Indian corn, 1544 of buckwheat, 70,135 of oats, 8663 of potatoes, 24,305 pounds of sugar. It had 17 stores, one fulling-mill, two flouring-mills, 11 grist-mills, 13 saw-mills, two tanneries, one pottery, one printing-office, one weekly newspaper; 59 schools, 1806 scholars. Pop. 14,015. Capital, Bellefontaine.

LOGAN, co., Ill. Situated near the centre of the state, and contains 590 sq. m. Drained by Sugar creek, and other branches of Sangamon river. It contained in 1840, 3273 neat cattle, 3661 sheep, 16,604 swine; and produced 12,629 bushels of wheat, 234,460 of Indian corn, 23,239 of oats, 6090 of potatoes. It had five stores, six grist-mills, six saw-mills; seven schools, 150 scholars. Pop. 2333. Capital, Postville.

LOGAN, t., Clinton co., Pa., 90 m. N.E. Bellefonte. Drained by Big Fishing creek. It has two stores, four saw-mills, one tannery; one school, 30 scholars. Pop. 1187.

LOGAN, p. t., Dearborn co., Ia., 87 m. S.E. Indianapolis, 388 W. It has six stores, one fulling-mill, two flouring-mills, two grist-mills, six saw-mills, two tanneries, one distillery, five schools, 140 scholars. Pop. 1308.

LOGAN C.H., p. v., cap. of Logan co., Va., 351 m. W. Richmond, 398 W. Situated on the E. side of Guyandotte river. It contains a courthouse, jail, and several stores and dwellings.

LOGANSFORD, city and p. v., cap. of Cass co., Ia., 72 m. N. Indianapolis, 610 W. Situated on Wabash river, at the junction of Eel river, and has a fine water-power. It contains a courthouse, jail, an academy; six churches, two Presbyterian, a Methodist, an Episcopal, a Baptist, and a Roman Catholic; 12 stores, several flouring and saw mills, 400 dwellings, and about 3000 inhabitants. A fine bridge crosses the Wabash river, and another crosses Eel river. The Wabash and Erie canal passes through it, and its location for business is highly promising.

LOGHUR (*Lokhur*, "the iron fort"), a strong hill fort of Hindostan, prov. Aungmyeth, in the British territories, 30 m. N.W. Poonah. From the perpendicular height of the rock on which it is built, this fortress could not if properly defended, be taken by storm. It is supplied with water by numerous tanks and springs, and has extensive magazines. It came into the possession of the British in 1818.

LOGRONO (an. *Julio-briga*), a town of Spain, in Old Castile, prov. Soria, on a spacious plain on the Ebro, which is here crossed by a handsome bridge, 57 m. W.S.W. Pampeluna, and 158 m. N.E. Madrid. Pop., according to Miana, 6210. It comprises, besides several good streets, two fine squares, with a collegiate church, five parish churches, eight convents, and two hospitals. It has tanneries, distilleries, and fabrics of saddles, hats, and candles.

LOHEIA, a seaport town of Arabia, the most northerly in the territ. of Yemen, on the Red sea, 175 m. N.W. Mocha, lat. 15° 41' 30", long. 49° 46' 14". It stands on low ground, sometimes inundated by the sea. Its port is so shallow that vessels of even small burden are obliged to anchor at a considerable distance off shore. The environs are arid and sterile, and the town is ill supplied with water. It is not walled, but is defended by several towers at equal distances round it, though only one of these is defensible by cannon. A few houses are of stone, but a straw mat are mere mud huts, thatched with grass, with a straw mat for the door, and rarely any windows. The chief edifices are, a mosque, with the tomb of the Mohammedan saint who founded the town; the governor's residence; the custom-house, and some coffee warehouses. The coffee shipped at Loheia is inferior to that of Mocha; but it, notwithstanding, carries on a considerable trade in it with Cairo, through Djidda. Lime is prepared in the neighbourhood by the calcination of coral, and near the town is a salt mine. (*Nichols, Voyage de l'Arabie*, l. 242; *Geographical Journal*, &c.)

LOIR-ET-CHER, a dep. of France, reg. centre, between lat. 47° 15' and 49° 10' N., and long. 0° 30' and 9° 15' E., having N. Eure-et-Loire, E. Loiret and Cher, S. Indre and

LOIRE.

Indre-et-Loire, and W. the latter and Sarthe. Length, N.W. to S.E., 80 m.; breadth varying from 30 to 45 m. Area, 635,971 hectares. Pop. (1836) 944,043. Surface mostly plain, with a general inclination towards the W. The Loire intersects the department nearly in its centre in a direction from S. to W.; the other chief rivers are, in the N. the Loir, a tributary of the Sarthe; and in the S. the Cher, Bouches, and Cosson, affluents of the Loire. In the S. of the department are numerous pools and marishes, which in the arrondissement of Romorantin cover nearly 3400 hectares. In 1834, it was estimated that 369,637 hectares of the surface were arable, 31,634 occupied with pastures, 36,501 with vineyards, 70,810 with woods, and 50,086 with heaths, wastes, &c. More corn is grown than is required for home consumption; in 1835, 1,861,398 hectolitres were harvested, chiefly oats and wheat. The annual produce of wine is estimated at above 900,000 hectolitres, some of which is of a pretty tolerable quality; the wines are principally made into brandy and vinegar; but a peculiar variety, of a very deep, dark hue, is extensively employed to deepen the colour of other red wines, and to give a reddish tint to white wines. (*Julien, Topographie*, p. 84.) Beans and peas, fruit, hemp, liquorice, and beet-root, are raised in considerable quantities. In 1830, about 377,000 sheep were kept in the department, the annual production of their wool being estimated at 795,000 kilog. A good many poultry and bees also are reared. The rural population is, however, in a very depressed condition; the labouring class occupy miserable huts, and in one village the habitations are said to be mere caves dug in the rock. In 1835, of 95,651 properties subject to the *contribution foncière*, 46,780 were assessed at less than 5 fr., and 14,364 at from 5 to 10 fr. Iron, turf, and alabaster are met with, but the most valuable mineral product is flint: the most extensive beds of which in France are in the S. part of this department, which has furnished the greater part of the gun flints used in France. A good workman produces in a day 400 staves of the first, and 600 of the second quality; and it is accordingly estimated that 100 workmen, assisted by their families, will probably send to market in a year 30,000,000 staves of all descriptions. The employment is very injurious to the health, and it is alleged that most workmen die of chest diseases before they attain to 30 years of age. The department has several iron forges, tile and glass factories, potteries, &c., with manufactures, though on a small scale, of serge, woollen cloth, and other woollen fabrics, cotton and hempen cloths, paper, leather, chemical products, &c. It is divided into three arrondissements; chief towns, Blois, the capital, Romorantin, and Vendôme. It sends three members to the chamber of deputies. Number of electors in 1836-39, 1570. Total public revenue in 1831, 5,968,150 fr. (*Hugo, art. Loire-et-Cher; Official Tables*, &c.)

LOIRE (an. Liger), the principal river of France, through the central part of which it flows in a W. direction to its embouchure in the Atlantic. Its basin, which comprises nearly one fourth part of the kingdom, has the basin of the Seine on the N.E., that of the Garonne on the S.W., and that of the Rhone on the E. It rises in mount Gerbier de Jonca, on the W. declivity of the Cevennes, in the department Ardèche, about lat. 44° 38' N., long. 4° 30' E., at an elevation of 4593 ft. above the sea. (*Bruguiera*.) Its general direction is N.N.W. to near Orleans, after which it flows mostly W.S.W. to its mouth near Palmbeuf, in about lat. 47° 15' N., and long. 9° 15' W. Its entire course is estimated at 670 m., of which 519 are navigable. Before losing itself in the ocean, it spreads out into a considerable estuary; below Nantes it is between 9 and 3 m. in width; but its navigation in the lower part of its course is rendered difficult by shallows and numerous islands. Ships of 800 tons, though built at Nantes, are loaded at Palmbeuf or St. Nazaire; and all ships of considerable burden unload nearly 20 m. below Nantes, their cargoes being conveyed to that city by lighters. During the first 40 m. of its course, the Loire has an average descent of more than 30 ft. a mile; its rate of descent afterward averages 4 ft. a mile. Its current is everywhere rapid, and its inundations are frequently productive of much damage; to prevent which, extensive embankments have been erected along its banks below Orleans.

The tide rises to about 5 m. below Nantes. Its chief tributaries are the Maine, Endre, and Brive from the N.; and the Allier, Lotet, Cher, Indre, Vienne, and Sèvre-Nantaise from the S. It is connected with the Seine by means of the Orleans, Briare, and Nivernais canals; with the Rhone by the canal du Centre; and with Brest harbour and the English channel by the Nantes and Brest canal. To obviate the impediments to navigation from sandbanks, &c., above Orleans, a lateral canal, commenced in 1823, has been constructed along the river: it begins opposite the mouth of the Briare canal, in the department of Lotet, and runs along its S.W. bank till it terminates opposite the canal du Centre, in the department of Allier. The entire

LOIRE-INFERIEURE.

length of this canal is 123 m. The scenery along the Loire, though in parts very fine, is generally surpassed by that of the Rhone. Some very important cities stand on its banks, among which, reckoning from its source, may be specified, Roanne, Nevers, Orleans, Blois, Tours, Saumur, Ancenis, and Nantes. (*Dict. Géog.*, &c.)

LOIRE-HAUTE, an inland dep. of France, between lat. 44° 45' and 45° 34' N., and long. 3° and 4° 30' E., having N. Puy-de-Dôme and Loire, S.E. Ardèche, and S.W. Lozère and Cantal. Area, 498,560 hectares. Pop. 395,381. It is generally mountainous, with a slope to the N. The Cevennes mountains run along its S.W. border, and a range, passing off laterally from them, intersects the department about its centre, and afterward bounds the department of Loire on the W. But most of its mountains belong to the volcanic system of France. The Loire and Allier are the principal rivers, and receive numerous small streams within the department: there are many small lakes and pools around Le Puy, and elsewhere. The bottoms of the valleys are fertile, but not the other parts of the department; by far the greater portion of the surface being stony or sandy. In 1834, it was estimated that there were 326,073 hectares of arable land, 79,438 ditto meadow, 14,030 ditto woods and forests, and 90,339 ditto heaths, &c. Agriculture is extremely backward; half the arable land is constantly in fallow, and the occupiers are miserably poor. Sufficient corn, chiefly rye, with some wheat, is, however, grown for home consumption; but about 50,000 hectol. of wine are annually imported. The natural pastures are good, and their irrigation is pretty well conducted. In 1830, there were about 188,000 head of cattle, and 378,000 sheep in the department; the latter yielding about 350,000 kilog. a year of wool. The rural population is, in general, very poor; and about 3080 individuals annually leave the department in search of employment in the other departments, as reapers, road-makers, day labourers, &c.; and usually return, after about six months' absence, with sums supposed to average about 70 fr. each. The land is very much subdivided. In 1835, of 95,839 properties subject to the *contribution foncière*, 45,587 were assessed at less than 5 fr., and there are fewer large properties in this than in any other department of France, Corrèze only excepted. Haute-Loire yields annually about 900,000 metrical quintals of coal, worth as many francs, and a little iron, zinc, and antimony. Manufactures either do not exist at all, or are confined to common linen fabrics, lace, tiles, bricks, earthenware, silk riband, and organzine in small quantities. Le Puy has a small lace manufacture, and is the great entrepôt for the small bells (*grelots*) used by the muleteers and waggoners of the S. of France. Haute-Loire is divided into three arrondissements; chief towns, Le Puy, the capital, Brionde, and Yssengeaux. It sends three members to the chamber of deputies. Number of electors (1838-39) 1219. This department is said to be taxed in a disproportionately high degree as compared with its means: in 1831, the public revenue derived from it was 4,319,731 francs; expenditure, 2,524,380 francs. (*Hugo, art. Haute-Loire; French Official Tables*.)

LOIRE-INFERIEURE, a maritime dep. of France, formerly included in the prov. of Brittany, between lat. 46° 50' and 47° 50' N., and long. 10° and 9° 30' W., having N. Morbihan and Ile-et-Vilaine, E. Maine-et-Loire, S. Vendée, and W. the Atlantic. Area, 661,704 hectares. Pop. in 1836, 470,768. The Loire has its mouth in this department, which it intersects from E. to W. near its centre. The Erdre, Sèvre-Nantaise, Maine, Moine, &c., affluents of the Loire, are the other chief rivers, all of them being navigable for some distance. The Vilaine skirts the N.W. extremity of the department, and communicates with the Loire by the canal between Nantes and Brest. Lakes and pools are estimated to cover 7200 hectares; the chief of these is the *Grand Lieu*, in the S., 4 m. in length by about the same in breadth. There are only a few hills of insignificant elevation in the N.E.; but along a part of the coast is a succession of sandy downs (*dunes*), which, not having been fixed by any artificial method, are gradually extending themselves, and have quite buried the old village of Escoublac. On various parts of the shore, as at Guerande, &c., the sea has receded to a considerable extent. The Isles of Noir-Moutiers and Bacin belong to this department. In 1834, about 331,600 hectares were arable, and 105,082 in pasture; vineyards occupied 36,346 hectares, orchards 10,964 hect., woods 33,075 hect., and heaths, wastes, &c., 129,352 hect., or nearly one fifth part of the entire surface. The country, on the S. bank of the Loire, is much superior in fertility to that on the N., and it is nearly all under culture; but agriculture is everywhere in the most backward state. There are a great number of little proprietors, many of whom engage themselves as labourers on the larger farms, who hold from 1 to 10 acres of land, farmed by their families. Very few properties yield a rental of 6000 francs (£1500) a year. The largest farms seldom extend beyond

LOIRET.

300 acres; the greater number varying from 160 to 300. In 1835, of 198,069 properties subject to the *contribution foncière*, 67,796 were assessed at less than 5 fr., and 19,814 at from 5 to 10 fr. In the vicinity of Nantes there are lands which let as high as £3 10s. an acre; while in the vicinity of Châteaubriant the average rent is under 10s., and in other parts of the department it is still less. Leases generally run from three to five and seven years; seldom beyond the latter term. Few farms are let for a money rent. Some farmers pay a stipulated quantity of grain for the arable, and money for the pasture land; but the far greater number hold on the metayer principle, paying half the gross produce to the proprietor. The reader will not, consequently, be surprised to learn that the farmers are without capital or intelligence, that their implements and cattle are very inferior, and that the land, which is not half tilled, is usually left fallow every other year, and frequently for several years together. The usual wages of farm labourers vary from 7s. to 9s. a day; women get from 4s. to 7s. During harvest, wages are about half as much higher. Little butchers' meat is consumed by the agricultural population. Their food consists principally of bread, butter, or fat, cabbage soup, buckwheat, pascakes and potatoes. Paupers are very numerous in winter, and in the rural districts there is no adequate provision for their support. The occupiers are in general miserably lodged, frequently sleeping in the same apartment with their cattle. They are not in debt, but have no money; are strongly attached to routine practices, and move on without an effort to improve their condition. (*Consular Report.*)

The produce of corn is estimated at about 1,400,000 hectolitres a year, principally wheat, buckwheat, and rye; a good many turnips are raised as food for cattle and sheep. The produce of wine is estimated by Jaillon at 900,000 hectolitres, but the quality is inferior; about 300,000 hectolitres are consumed in the department, the rest being principally converted into brandy. The annual produce of cider may be about 130,000 hectolitres. The pastures on the banks of the Loire are excellent, and feed great numbers of cattle. The cows are good milkers, and the vicinity of Nantes is famous for its butter. In 1830, the stock of sheep amounted to 230,000 head, producing 250,000 kilog. of wool. The horses, though not large, are strong and handsome. The forests, which abound with oaks, feed a good many hogs. Bees are numerous, and the honey and wax of the department have a high reputation. The pichard and herring fisheries are important: the former employs 3000 fishermen on the water, and a great many women in salting and barrelling the pichards on shore. The manufacture of salt, from the extensive salt-pans at Noirmoutiers, Guérande, Crolac, &c., employs about 7000 hands, and furnishes produce worth above 900,000 fr. a year. Bog iron is plentiful, and is smelted in the arrondissements of Ancenis and Châteaubriant. A tin mine is wrought at Piriac. Granite, coal, turf, porcelain, clay, &c., are the other chief mineral products. There are two royal cannon foundries and several building docks in the department, and manufactures of sail-cloth, rope, glass, porcelain, tiles, paper, leather, &c. The trade of this department centres almost entirely in Nantes (which see). It is divided into five arrondissements; chief towns, Nantes, the capital, Châteaubriant, Ancenis, Palmbeuf, and Savenay. It sends seven members to the chamber of deputies. Registered electors (1838-39) 9208. Total public revenue in 1831, 77,040,854 fr.; expenditure, 10,880,664 fr. (*Hugo, art. Loire Inférieure, French Official Tables; Parl. Report.*)

LOIRET, a dep. of France, region centre, between lat. 45° 13' and 46° 18' N. and long. 2° 42' and 4° 45' E., having N. Euro-et-Loir, Seine-et-Oise, and Seine-et-Marne, E. Yonne, E. Nièvre, Cher, and Loiret-Cher, W. the unnamed department. Area, 667,679 hecres. Pop. (1836) 319,189. Surface for the most part level, but in the N. is a chain of hills separating the basins of the Loire and the Seine. The Loire traverses the S. half of the department, generally in a W. direction. It receives the Loiret, which rises within the department, and joins the Loire after a short course; being, however, navigable for boats nearly to its source. S. of the Loire, the country is marshy, uncultivated, and infertile; but, in other parts, it is very productive, particularly in the W. districts. In 1835, the arable lands were said to comprise 304,590 hectares, meadows 24,464 ditto, vineyards 39,892 ditto, and forests 90,474 ditto. Agriculture is in a comparatively forward state. The corn grown, which is chiefly oats and wheat, exceeds the quantity required for home consumption. The annual produce of wine is estimated at 1,900,000 hectolitres; two thirds of which is exported, under the name of *vins d'Orléans*, and the rest consumed at home, or converted into brandy or vinegar. None of the wine is of a superior quality, but the better sorts are esteemed as *vins ordinaires*. Cider is made in the arrondissement of Montargis. Various fruits, with flax, hemp, saffron, &c., are grown; and of late the culture

LOMOND (LOCH).

of beet-root for sugar has gained ground. The different branches of rural industry are all pursued by the same individuals who simultaneously grow corn, garden produce, and wine; and rear cattle, sheep, poultry, &c. In 1830, it was estimated that there were in the department nearly 100,000 head of black cattle, and 400,000 sheep. The latter have been improved by crossing with English breeds. In 1835, of 118,143 properties subject to the *contribution foncière*, 56,061 were assessed at less than 5 fr., and 15,457 at between 5 and 10 fr.; but there were, at the same time, a considerable number of large properties. The manufacture of coarse broadcloths and other woollen fabrics are said to employ a large number of hands; and Orléans has manufactures of fine cloth, flannels, woollen yarn, &c.; but the commerce of that city has latterly declined. Cotton yarn, vinegar, white lead, paper, parchment, earthenware, &c., are also produced; and there are numerous distilleries. Meung is celebrated for its leather; Montargis and Pithiviers are the chief seats of the French saffron trade; and the latter town is celebrated for its *gâteaux d'amandes*, and *petits d'aloettes*. The department is divided into four arrondissements: chief towns, Orléans, Gien, Montargis, and Pithiviers. It sends five members to the chamber of deputies. Number of electors (1838-39) 3993. Total public revenue (1831), 14,001,284 fr.; expenditure, 5,370,135 fr. (*Hugo, art. Loiret; Official Tables, &c.*)

LOKEREN, a town of Belgium, prov. E. Flanders, cap. canton, on the Deurne, and on the road from Ghent to Antwerp, 12 m. E.N.E. Ghent. Population, in 1836, 16,133. Its appearance is that of a "large, quiet, Flemish village." It is celebrated for its linen fabrics; and has also manufactures of cotton goods, flannels, lace, hats, and soap, with cotton printing establishments, bleaching grounds, breweries, distilleries, oil-mills, &c. It has large weekly markets, and a considerable trade in its native products, and those of the adjacent country. (*De Cleet; Henschling, &c.*)

LOMBARDY. See ITALY (AUSTRIAN).

LOMBOK, an island of the eastern archipelago, between lat. 8° and 9° N., and long. 116° and 117° E., separated on the W. from Bali by the strait of Lombok, and on the E. from Sumbawa by the strait of Alas, the last being the most commodious passage through the Sunda chain of islands.

Lombok is of a rhomboidal shape; its length may be estimated at 53 m.; average breadth, 45 m. Area, probably 2400 sq. m. A mountain chain covered with forests, runs W. to E. through the S. portion of the island, and an isolated height, the peak of Lombok, rises in the N. to 8000 feet above the sea. Several rivers disembogue on the N., E., and W. coasts. The country is populous, fertile, and well cultivated. Rice is raised by artificial irrigation, as in the Carnatic; and abundant supplies of bullocks, hogs, poultry, vegetables, &c. may be obtained at the commodious port of Ampannan, on the W. coast. The inhabitants are Mohammedans, and more civilized than the E. islanders in general. They carry on a considerable trade with Java, Borneo, and other Malay islands. Lombok and Mataram are the chief towns; the last is the residence of the rajah, who is tributary to the sultan of Bali. (*Crawford's Indian Archipelago; Hamilton's E. I. Gazetteer.*)

LOMOND (BEN), this mountain attains to an elevation of 3185 feet above the level of the sea. From its vicinity to Glasgow, from which it is distant N.W. 27 m., and its position between lochs Lomond and Katrine, it is by far the best known and most frequently visited of any of the highland mountains. Its summit, which is composed of micaceous slate, mixed with quartz, commands a great extent of view. The whole extent of loch Lomond, with its wooded isles, appears just beneath. Loch Long, loch Katrine, loch Earn, and the river Clyde, form the principal waters. The mountains of Arran appear very distinct; and to the N. alps upon alps fill up the amazing view." (*Pemart's Tour in Scotland*, li. 176, ed. 1790.)

LOMOND (LOCH), a lake of Scotland, between the coasts of Stirling and Dumfries, its most southerly extremity being 64 m. N. from the town of Dumfries. This, which is the largest of the Scotch, and indeed, of the British lakes, is a noble sheet of water, of a triangular shape, about 94 m. in length N.N.W. and S.S.E., and where broadest, along its S. shore, it is from 7 to 8 m. across; but its upper portion, from Rowderdian Inn, N. to Ardsch, is comparatively narrow, being only about 1 m. in breadth. Its area is estimated at about 35,000 acres: its most usual depth is about 30 fathoms; but in some places it has a depth of 80, and even of 120 fathoms. It is studded with numerous islands, some of which are of considerable size, and finely wooded. The scenery of this lake is varied and magnificent. Its N. extremity stretches into a wild, rugged, and dreary country. On the E. side Ben Lomond, one of the most stupendous of the Grampian mountains, rises from its margin; but on descending the

LONDON.

lake, the character of the scenery changes; the mountains become less precipitous; the glens between them are well wooded, and filled with gentlemen's seats; and on the S. it is bounded by a low, rich, fertile, and well cultivated country. Its surface level is from three to five feet higher in winter than in summer: and it is generally about 23 feet above the sea level. It receives several streams, of which the Enrick, which flows into its S.E. corner is the most considerable. Its surplus waters are conveyed away by the river Leven, which, issuing from its S. extremity, falls into the frith of Clyde, close to Dumbarton. In summer it is much resorted to by tourists; and a steamer is established on the lake for their accommodation. It may be worth while to state that the waters of this lake were violently agitated at the period of the great earthquake at Lisbon in 1755.

LONATO, a town of Lombardy, deleg. Brescia, cap. distr. on the summit of a hill, 13 m. E.S.E. Brescia. Population 5000. It is walled and defended by a castle, has four churches, a hospital, a *mona di piatà*, cavalry barracks, and manufactures of silk twist and saltpetre.

LONDON (Lat. *Londonium*, Fr. *London*), the metropolis of the U. Kingdom of Great Britain and Ireland, and the most populous, wealthy, and commercial city, of which we have any accounts, is situated partly and principally on the N. bank of the Thames, in the county of Middlesex, and partly on its S. bank, in the county of Surrey, about 45 m. above the river's mouth at the Nore, and 15 below the highest tideway. The site on the N. side is high and dry, but on the S. it is so low as to be under the level of the highest tides; though by a well constructed system of drainage it is kept perfectly free from wet. The subsoil is a hard clay, known to geologists by the name of London clay, lying in the middle of the great chalk basin, extending from Berkhire to the E. coast. In several places the clay is covered by thick beds of gravel. Lat. of St. Paul's Cathedral, 51° 30' 45" N. long. 3° 48' W. Greenwich. Exclusive of the city of London, properly so called, the metropolis comprises the city of Westminster, the boroughs of Southwark, Lambeth, and Marylebone, and other contiguous districts, which, though formerly distinct, are now combined into one vast mass of houses.

The population of the metropolis (including the cities of London and Westminster, and the five parliamentary boroughs as determined by the Boundary Act, with the parish of Chelsea,) has been as follows, according to the last four decennial returns:—

Divisions.	1901.	1811.	1821.	1831.	Rate of increase in 30 Years
London, city of Westminster, and city and 11b. . .	158,269	136,505	125,484	122,850	27.4
Marylebone . . .	153,511	102,085	122,035	201,312	27.5
Chelsea . . .	97,642	126,505	174,255	245,594	44.0
Thamesbury . . .	134,616	167,180	201,731	235,123	32.4
Tower Hamlets . . .	184,568	237,487	291,650	327,546	35.5
Chanc. par. of . . .	11,694	18,263	25,590	32,271	187.6
part. par. . .	94,513	108,765	128,605	134,117	41.5
Lambeth par. . .	49,390	76,405	102,561	160,613	301.8
Metropolis . . .	882,184	1,013,005	1,224,280	1,502,490	49.0

The population of London, including the whole metropolis, according to the census of 1841, was 2,560,981; viz. within the walls, 54,696; without the walls, 70,322; London and suburbs, 1,873,676; London and Westminster, 367,061; Southwark, 93,648; Lambeth, 115,868.

London is of great antiquity. It is said by Tacitus to have been in the days of Nero, *capit negotiorum et commercium maximè celebre*. (*Annal.* lib. 9. § 33.) It suffered severely in the revolt of Boadicea; but it speedily recovered from that disaster, and has always been the largest and most important of the British towns. It is indebted for its early and long-continued prosperity to its admirable situation. Though 45 m. from the sea, it enjoys, owing to its position on a great navigable river, all the advantages of an excellent seaport, vessels of 800 tons burden coming up to London bridge. Had it been built lower down, it would have been less healthy and more exposed to hostile attacks; and had it been higher up, it would have been deprived of the inestimable advantage of a deep-water harbour.

The Romans surrounded London with walls. It is probable that its limits were then commensurate with the part of the city said to be "within the walls," reaching from the end of Leadenhall-street to the top of Ludgate hill, and from the Thames to London Wall and Little Britain. The wall appears to have inclosed it along the water as well as on the land sides. The great Roman roads called Watling-street and Ermin-street, as well as the *via vicinæ*, centred in London.

The continued and rapid increase of buildings renders it difficult to ascertain the extent of the metropolis at any particular period. If we include in it those parts only that present a solid mass of houses, its length, from E. to W., may be taken at 5½ m., and its breadth, from N. to S., at about 3½ m. There is, however, a nearly continuous line of houses from Blackwall to Chelsea, a distance of nearly 7 m., and from Walworth to Holloway of 4½ m. The extent of surface covered by buildings is estimated at about 15 sq. m., or nearly 10,000 acres, so that M. Say, the celebrated French economist, did not really indulge in hyperbole when he said, *London est plus una villa: c'est une province couverte de maisons!*

Notwithstanding its immense size, it is not difficult for strangers to make their way in London. The Thames runs through it lengthwise from W. to E., and most of the great lines of the streets are parallel to the river, being intersected at variable distances by lines of cross streets, or of streets running N. and S. Of the former, or of the longitudinal streets parallel to the river, there are two principal lines: the most northerly of these enters London on the W. by the Bayswater-road, passing in front of the fine terraces facing the N. side of Hyde Park; it then passes through Oxford street, about 1½ m. in length, to St. Giles's, where it bends through a mass of inferior buildings; leaving this, it is prolonged by Holborn, a wide and handsome street about 1 m. in length; whence it proceeds through Skinner-street, Snowhill, and Newgate-street, till it reaches Cheapside, one of the greatest thoroughfares in the city. It next passes through the Poultry, having the Bank and the Exchange on the one hand, and the Mansion-House on the other, along Cornhill, to Leadenhall-street; and is thence continued, by Whitechapel and the Mile-end-road, into the country. Its entire length, from Hyde park to the Regent's canal, Mile-end, is above six miles.

The other great longitudinal street to the S. of that now traced, enters London on the W. at Hyde park corner. This is by far the most splendid of the entrances into the metropolis. Kensington gardens appear like an ornamental forest; Hyde park gradually rises to the splendid terraces on the N., and is bordered on the E. by magnificent houses, or rather palaces: on the left is the handsome entrance to Hyde park and the W. front of Apsley House, the town residence of the Duke of Wellington; *domus de totalem patriæ*; and on the right the bold arch and gate leading to the Queen's palace; the Green park, apparently stretching to the towers of Westminster Abbey; and a long line of splendid buildings, with the Norwood hills in the distance. The promise of a magnificent city is not belied by an advance through Piccadilly. This, which is the first street of London traversed by the traveller from the W., is 1 m. in length, and is principally built only on one side, being open on the other to the Green park. It contains many magnificent private residences, and shops. On reaching the E. end of Piccadilly, the continuous line of street defects to the right through the Haymarket, whence it proceeds to the E. along the splendid line of E. Pall-mall, through Trafalgar square, and past St. Martin's Church, till it unites with the Strand; this, though formerly in many places narrow and encumbered, is now a truly magnificent street: it follows pretty closely the line of the river, from which it is not far distant; and, besides two churches in its centre, has Exeter hall on its N., and Somerset house on its S. side. Contiguous to the latter is Wellington-street, leading to Waterloo bridge. The Strand terminates at the ancient gate, called Temple Bar, the boundary of the city on the W.; the great line of street being thence prolonged through Fleet-street, at the E. end of which, on the right, is a fine street, leading to Blackfriars bridge; and on the left Farringdon-street, one of the widest in the city, which it is intended to prolong to Islington: from Fleet-street the grand line continues up Ludgate hill, till it reaches St. Paul's, the noblest edifice in the kingdom.

At the E. end of St. Paul's Churchyard, the wider channel of communication joins in Cheapside the grand northern line already traced, coming from Oxford-street, Holborn, &c.; but another branch of the former line runs nearer the river, through Watling-street, Eastcheap, and Tower-street, to the wide and airy area of Tower hill, whence it may be traced either in a straight line through Ratcliffe-highway, N. of the London docks, or close by the river along Wapping and Shadwell, where the lines again form a single street leading to the W. India docks. The streets E. of the Tower are narrow, and lined with mean houses mostly occupied by persons connected with shipping. This line is altogether about 6 m. in length.

Another line of street which unites with that last described, may be considered as beginning at Vauxhall bridge, close to which is an open quay, ½ m. long, exhibiting a view of the river and of the archiepiscopal palace of Lambeth. The line of road is, however, soon separated from the river by ranges of buildings, along which it passes, till

LONDON.

It reaches Abingdon-street. At the termination of the latter it runs on, having Westminster Abbey on the left, and the Houses of Parliament and Westminster Hall on the right: after leaving these and Westminster bridge on the right, it connects with Parliament-street, and then with the spacious street called Whitehall, in which are the Treasury, Horse Guards, and Admiralty, separating it from St. James's park on the left, and the Banqueting Hall, with other handsome mansions shutting out the view of the river. The magnificence of the buildings in this short line of street is unequalled, except by those at the W. entrance of Piccadilly, and by the splendid terraces of the Regent's Park. Beyond Whitehall is Charing Cross, with the National Gallery, College of Physicians, &c., forming three sides of Trafalgar square, surrounding the site of the intended Nelson monument. Here the line, bending E. with the river, unites with the Strand, already noticed.

Among the principal streets running from N. to S., the first and most westerly is the Edgeware-road, with its continuations, Park-lane, Grosvenor-place, and Vauxhall-bridge road, which, for the most part, bound the metropolis westward. The second, proceeding eastward, is the line formed of Portland-place, Regent-street, and Waterloo-place, extending between the Regent's and St. James's parks, and forming by far the noblest public thoroughfare in London, as well from the width of road as from the beauty of the houses and shops on either side. At its S. termination is a granite column, surmounted by a bronze statue of the duke of York, brother to George IV. A little N. of Piccadilly the line curves through the Quadrant, a handsome range of buildings, bordered on each side by colonnades, of fluted Doric pillars forming an arcade over the footways: from this point it continues northward to Oxford-street, where it expands into a circus, and then, resuming its former dimensions, proceeds to the church in Langham-place: here, by a slight curve westward, it opens into Portland-place, which, from its containing the residences of the principal ambassadors, may be called the diplomatic quarter of London: the architecture of its houses is less showy than that seen in Regent-street; but the magnificent scale on which they are built sufficiently indicates the rank of their occupants. Park-crescent and Park-square, opening into the Regent's park, form a noble finish to the whole. The third great N. and S. line is a continuation southward of the road from Hampstead: it passes through Tottenham-court-road to the E. end of Oxford-street, from which point its course may be traced through narrow streets down St. Martin's-lane to Charing-cross; but, though a busy, it is an intricate thoroughfare, and is devoid of architectural interest. The other principal N. and S. lines consist of Grey's Inn-lane and Chancery-lane; Goswell-street and Aldersgate-street; and the line of street commencing at the Regent's canal on the N., successively called Kingsland-road, Shoreditch, Norton-Folgate, Bishopsgate-street, and Gracechurch-street: at the S. termination of the latter this line passes over London bridge, and is thence prolonged across the borough as far as Kennington church in Surrey: its length is about 4 m., which may be considered the breadth of London in this quarter. The portion of this line at and near London bridge affords some of the finest points for viewing London and the animated scenery on the river. Exclusive of the above, there are an infinite number of cross streets, some of which are of great importance. Among others, a splendid line has recently been opened from Finsbury-square through Moor-gate-street, Princes-street, and King William-street, to London bridge.

In addition to the various routes intersecting each other in different directions, a grand line of road embraces the greater part of London on the N., in a manner not unlike that in which the Boulevards encircle Paris. It commences in the Uxbridge-road, and has a N.E. course as far as King's cross, St. Pancras, where, turning eastward, it ascends Pentonville hill, and, entering the City-road, terminates in Finsbury-square.

In Southwark the great roads from the different bridges unite at the well-known posting-house called the Elephant and Castle. They are generally wide and well-built streets, though, with the exception of Blackfriars'-road, inferior to the principal thoroughfares N. of the river. A line of street, extending from Westminster-road to the borough, connects these several roads with each other.

Unlike Edinburgh and many other great towns, the houses in London are not, with the exception of those in the Temple and Inns of Court, divided into stories (*Scottish "flats"*); but in the vast majority of instances belong to or are hired by one individual, by whom, however, portions of them are frequently let to lodgers. They have usually a story sunk below the level of the street, comprising the kitchen and other offices, above which are usually four stories. The smaller, and by far the most numerous, class of houses have narrow fronts, containing one room or shop in the front of the street floor and that immediately above it, the stair and

a smaller apartment occupying the back part: the two upper floors are frequently divided into smaller apartments. Every house has the inestimable advantage of having an abundant supply of water; and in all the better class of houses it is supplied to the top as well as to the under story. Except in the very worst parts of the town, all the refuse water and drainage of the house is conveyed by a covered drain to the sewer, or grand receptacle in the centre of the street, sunk below the line of the lateral drains. Most houses have cellars opposite to them under the street, for the storage of coal and such like articles. No flitch is ever laid down upon the streets, which have universally flagged footpaths along each side; and, notwithstanding the concourse of horses, and the grinding of the pavement by carriages, the streets are, speaking generally, extremely well kept.

But until a comparatively late period the architecture of the streets and houses of London was but little in harmony with the wealth of the inhabitants and the richness of the interior of the houses. Internal comfort was long the only, as it still is (and it is to be hoped will long continue to be) the grand object of the Londoner. Provided his house were clean, commodious, and well and handsomely furnished, he cared little about its external appearance. Hence it was that the interminable rows of dull-looking brick houses, erected with little or no regard to uniformity, led strangers to remark that the best streets resembled long walls pierced with holes for doors and windows. Even Bond-street was said, in 1810, by an intelligent foreigner, to be "an ugly, inconvenient street, the attractions of which it is difficult to understand." But the same author (*Simens*) adds: "You cannot pass the threshold without being struck with the look of order and neatness of the interior. Instead of the abominable filth of the common entrance and common stairs of a French house, here you step from the very street on a neat floorcloth or carpet, the wall painted or papered, a lamp in its glass ball hanging from the ceiling, and every apartment in the same style. All is neat, compact, and independent."

With the exception, indeed, of St. Paul's, Westminster Abbey, Somerset house, and a few other churches and public buildings, London displayed, till within the last few years, little architectural elegance. In our own times, however, the erection of immense and splendid ranges of buildings in every direction has made our metropolis as superior to most other capitals in appearance as it has long been in wealth, cleanliness, and comfort. The line of Regent-street has been already mentioned, to which may be added the Regent's park, "affording an enchanting landscape bounded by hills, and more than half surrounded by a large circuit of magnificent buildings, worthy the capital of the world." Belgrave and Eaton squares, and the adjoining streets and squares on the estate of the marquis of Westminster, with the terraces in Carlton gardens, have all been raised within the last 30 years, and are probably unequalled for symmetry and magnificence. Within a still shorter space a splendid city has been built on the elevated ground on the N. side of Hyde park; and these, with the magnificent new buildings in Pall-mall and St. James's-street, Trafalgar-square, &c., render the W. end of the city of London a residence worthy the wealthiest aristocracy in the world. But the improvements effected of late years in the city, or oldest part of the town, have been equally great and striking. The new streets that lead from the bank to London bridge on the one hand, and to Moorfields on the other, are on a grand scale; and when it is borne in mind that the ground which they traverse was previously occupied by a dense mass of houses, which had to be purchased at a high price, it will be seen that they do as much credit to the public spirit as to the taste of the citizens. Four new and noble bridges over the Thames form no small addition to the improvements of the last 30 years. On the whole, therefore, though it cannot be said of George IV., that, like Augustus, he found a capital of brick, and left one of marble, it is certain that during his reign an extraordinary impulse was given to architectural improvement, which, so far from being exhausted, promises to give the metropolis still greater splendour and convenience.

With extremely few exceptions, almost all the houses in London are built of brick. But within the last few years those in the principal streets have been mostly plastered or stuccoed over, and their fronts made so exactly to imitate the finest freestone, that it is sometimes no easy matter to distinguish between them. This method of dressing up houses has contributed most materially to the improved appearance of the town. Those, indeed, who have been accustomed to stone structures, are apt to associate ideas of insecurity and of rapid decay with stuccoed fabrics; but, provided the walls be well built, and the plaster be kept in repair by occasional painting, stuccoed houses are, in fact, all but imperishable. The cheapness of stucco, too, allows it to be applied to the inferior class of houses; while, from the facility with which it may be moulded, it permits an

LONDON.

elaborateness of ornament that could not be executed in stone at many times the cost. Belgrave-square, and the magnificent terraces of Carlton gardens, Hyde park, &c., owe most part of their elegance to the judicious application of stucco.

It is much to be regretted that the Thames, which, from its breadth and depth, might be the greatest ornament of the city, as well as the principal source of its wealth and prosperity, is so closely pent up by wharfs, warehouses, and other buildings, that its banks are almost shut out from the view, except where it is crossed. It is, however, fronted by the custom-house and Somerset house, the Adelphi terrace, and by the Temple gardens, and some private houses in Whitehall. But the most magnificent views of the river, and, indeed, in some respects, of the city, are obtained from the bridges.

Divisions.—The most popular division of London is into three parts—the city, the west end, and the borough; Temple Bar dividing the city from the west end, and the river separating both these portions from the borough. This division is necessarily vague, and, for specific purposes, different divisions are made. The city of London, strictly considered, is situated nearly in the centre of the metropolis, and is the seat of commerce on the largest scale. The city of Westminster in W. of the city of London: it contains the royal palaces, the houses of parliament, the law courts, most of the public offices, and the town residences of nearly all the nobility and aristocracy. The cities of London and Westminster, however, do not comprise above an eighth part of the area, or a fourth part of the population of the whole of what may be considered the metropolis. For the purpose of parliamentary elections, the metropolis is divided into seven districts: the cities of London and Westminster, as above stated; the borough of Finsbury, N. of the city of London; the Tower hamlets, E. of Finsbury and the city; Marylebone, N. of the city of Westminster; and two districts S. of the river, Southwark on the E. and Lambeth on the W. side.

The area of the city of London, which comprises only a small portion of the metropolis, is roughly estimated at about 600 acres. Its boundary line leaving the Thames at Temple-lane, passes northward, crossing Fleet-street at Temple Bar, and Holborn at "Holborn Bars." Turning eastward, it thence takes an undulating course, enclosing Smithfield, Finsbury circus, and Bishopsgate-street, S. of Spital-square. It thence passes S.E. through Petticoat-lane, to Aldgate, from which point the boundary, pursuing a S.W. course, reaches the Thames by a very irregular line, excluding the tower. The city is divided into 106 parishes, of which 97 are said to be "within," and 11 "without," the walls. This division is now merely nominal, the ancient city boundary having long disappeared, although the city gates, where the walls passed the great thoroughfares, were standing in the last half of the 18th century.

The E. boundary of the city of Westminster coincides with the W. boundary of London at the Thames and Temple: it thence runs N.W. to the junction of Tottenham-court-road and Oxford-street. The latter street constitutes the whole N. boundary as far as the W. extremity at Kensington gardens. From this point a very irregular line, running to Chelsea hospital, forms the W. boundary. It then turns to the S.W. along the Serpentine, on leaving which it goes S. until it reaches the Thames near Chelsea hospital.

The five metropolitan boroughs, being parliamentary only, and not municipal, need not be minutely described. Marylebone includes the three parishes of Marylebone, Paddington, and St. Pancras; Finsbury comprises nine parishes and the Rolls' liberty; and the Tower hamlets include fifteen; Southwark embraces not only the municipal borough, but the parishes of Bermondsey and Rotherhithe; and Lambeth comprises Camberwell and Newington, as well as the parish of its own name.

Parks, Squares, &c.—The W. end of the town is beautified and rendered healthy by four extensive parks, appropriately called the lungs of London. They are open to the public; and, though each has a different character, they all afford ample scope for healthy amusement and exercise to those resident in their vicinity. Hyde park (once the manor of Hyde, and belonging to the abbey of Westminster), lying W. of the road leading from Piccadilly and Oxford-street, contains about 400 acres, and has a large and deep artificial lake, crossed by a handsome bridge of five arches; this lake, which is nearly straight, is, by an absurd misnomer, called the Serpentine river. The whole of this park is an open field of much beauty, dotted with trees, and traversed by carriage-ways, which, in fine weather, during the season, are covered with many and fashionable equipages. Kensington gardens, lying W. of the park, and separated from it by a brack and wall, are open to the public, and constitute a fine shady promenade. St. James's park, extending from Whitehall to Buckingham palace, is less than one fifth part of Hyde park, and not so open; its site being low, damp, and

marshy. Within these few years, however, the central part has been tastefully laid out, and what was a dirty, straight canal, running through a marsh, has become a handsome, varied sheet of water, dotted with islands forming the abode of numerous aquatic birds, and surrounded by lawns, shrubberies, and lofty trees. The avenues on the N. side of this park are open to all pedestrians, but only to the horses and carriages of some privileged members of the aristocracy. The E. drive is open to all private and hackney carriages. The Green park is a triangular piece of ground, about as large as St. James's, from which it gradually rises to Piccadilly: it is an open and pleasant promenade, and forms a sort of miniature Hyde park, but at present (1841) it is undergoing extensive alterations, for it remains to be seen whether they will be improvements. The Regent's park, which is as large as Hyde park, is perhaps the handsomest of all: it was formed during the regency in the last years of the reign of George III. It is situated to the N. of Portland place, on high ground, surrounded by splendid buildings, and is tastefully laid out. This park is not, however, what it professes to be, a place for the accommodation and recreation of the public: on the contrary, the public is shut out from three fourths of its extent; and some even of its finest portions have been let to individuals, who have built villas upon them! This is a scandalous abuse of the public property; and it is really astonishing that it should have been allowed to be perpetrated, almost without notice. The gardens of the Zoological Society are situated on the N. side of this park; and it is said that the central portion is about to be laid out as a garden for the Botanic Society. The probability, indeed, seems to be that the public will, at no distant period, be shut entirely out from this park, and left to admire its beauties from the dusty drive by which it is surrounded.

On the E. side of the Regent's park, near Park-square, is the large building most happily styled the Colosseum. It is a 16 sided polygonal structure, with a magnificent portico and cupola. It is principally occupied by an immense panoramic view of the metropolis, taken from the ball on the top of St. Paul's cathedral. But though the patience and elaborate exactness of the artist (Mr. Horner) be entitled to every praise, little else can be said in favour of his undertaking.

The squares of London are pretty numerous in all parts, though the largest and handsomest are in the W. end. In many the houses are in the first style of architecture, and the central gardens beautifully laid out. Grosvenor, Berkeley, and Hanover squares lie between Oxford-street and Piccadilly, and are, on the whole, the most fashionable; though the newly-formed Belgrave-square, in Piccadilly, bids fair to rival, and even surpass, them as a favourite residence of the aristocracy. St. James's-square, S. of Piccadilly, with Portman, Manchester, and Cavendish squares, N. of Oxford-street, are mostly occupied by the nobility and gentry. Farther E. are Russell and Bedford squares, and a cluster of squares to the N. of these, chiefly the residences of wealthy merchants. Lincoln's-inn-fields, S. of Holborn, is one of the largest and best-built squares, and its enclosure is more beautifully laid out than any other in the metropolis. Finsbury-square lies N. of the city, and near it is Finsbury circus, a round enclosure with a pretty garden. Many other squares, formed of good houses, respectably inhabited, are to be found in all parts of the town and neighbourhood.

Several of the best squares are decorated with statues; among which may be remarked that of Pitt, by Chantrey, in Hanover-square; of Fox, by Westmacott, in Bloomsbury-square; of the dukes of Bedford, by the same sculptor, in Russell-square; and those of William III., Anne, and George I. in St. James's, Queen's, and Leicester squares. Other statues are placed in different parts of the metropolis, among which are the equestrian statue of Charles I., by Le Sueur, at Charing-cross; of James II., by Gibbons, behind Whitehall; of George III., by Wyatt, Pall-mall; of the late duke of Kent, in Park crescent; and of Canning, in Palace-yard, adjoining the House of Commons. Near the E. entrance to Hyde park is a statue, copied from a figure at Rome, said, but without any authority, to be that of Achilles. It is of brass and was formed out of cannon captured by the duke of Wellington, in whose honour it was erected, and to whom it is inscribed, by the ladies of England! But with all due deference, it is not easy to imagine anything more absurd. What has the duke of Wellington, by far the most illustrious Englishman of his age, in common with a colossal gladiator, that a statue of the latter should be erected in his honour?

The monument on Fish-street hill, built in 1671-77, to commemorate the burning of London, is a slated Doric column, 303 feet in height, designed by Sir Christopher Wren. The pedestal is decorated by a representation, in relief, of the destruction of the city, sculptured by Cibber: at the top of the column is a gallery affording a view of the E. part of the metropolis, and on the summit is a blazing urn, recently regilt. It is a noble column, and, had it been better situated

LONDON.

steel, would have been one of the greatest ornaments of the city. A short English inscription on the pedestal ascribed, without the slightest foundation, the conflagration it is designed to commemorate to the treachery and malice of a popish faction. Pope alluded to this when he says,

"Where London's columns pointing to the skies,
Like a tall bully, lifts the head and lies."

But, in 1830, this offensive inscription was obliterated, in pursuance of a resolution of the Court of Common Council.

The York column is a plain Doric pillar of granite, surmounted by a bronze colossal statue of the duke of York. The height of the column is 124 feet, and above the capital is an iron gallery, from which a good view is obtained of the W. end of the town. This column, erected in 1833, is situated on the N. side of St. James's park, at the lower end of Waterloo-place.

Bridges.—The Thames, averaging 1000 feet in width, is crossed by six bridges, built at an aggregate expense of more than £5,000,000. A wooden structure had been thrown across the river early in the 11th century; but the frequent and costly repairs indispensable for its maintenance led to the construction of one of more durable materials. A stone bridge, of pointed architecture, was completed in 1300, which, by means of occasional renovations, was kept standing till 1894. Down to the middle of last century, this was the only bridge between London and Southwark. The great inconvenience of a circuitous journey from the west end of the town to the city before the river could be crossed by carriages, induced parliament, in 1738, to make a grant for the erection of Westminster bridge at the court end of the metropolis. Blackfriars bridge (intended by its projectors to have been called Pitt bridge) was built about 90 years after, the expense of its construction being defrayed by a toll exacted during 19 years. Westminster and Blackfriars bridges were built of Portland stone, which being too soft to resist the constant attrition of the water, and of the ice in winter, their piers were so much worn as to threaten their entire destruction: latterly, however, their piers have been ceased with granite, and they have been otherwise thoroughly repaired at a very heavy expense. The three bridges erected within the present century have completed the connexion of all the important districts N. and S. of the Thames. Two of these, Vauxhall and Southwark bridges, have iron arches, the centre arch of the latter being 340 feet in width. Waterloo bridge, which Canova said was itself "worth a visit from the remotest corner of the earth," is of granite, and has nine elliptical arches, each 137 feet wide. This fine bridge was built by a joint-stock company; but, owing to the want of any great thoroughfare leading to or from it through the city, and to the influence of the toll on passengers and carriages crossing the river by its means, it is very little frequented, and has turned out a most unprofitable undertaking. The demolition of the old London bridge was owing less to its decayed state than to the defects of its original construction. The piers and starlings between its numerous arches (31 at the period of its removal) occupied so large a portion of the water-way as to obstruct the course of the water both during the flow and ebb of the tide, especially the latter. At low water, indeed, there was a difference of nearly 5 feet between the level of the water on the upper and lower sides of the bridge. This, by occasioning a dangerous fall and eddy in the water for a considerable time both before and after low water, interrupted the navigation, and occasioned every now and then fatal accidents. At length it was determined to abate the nuisance, by pulling down the old bridge, and erecting in its stead a new structure, whose arches should be of such a size as not sensibly to affect the flow of the water. The new London bridge, like the Southwark and Waterloo bridges, was planned by the late John Rennie. It is built of granite, the span of the centre arch being 159 feet; and, whether we consider its magnitude, or the beauty and simplicity of its structure, it is certainly one of the finest specimens of bridge architecture in the world. The heavy expense of this fabric has been partly defrayed by a duty on all coal brought into the pool, and partly from the revenues of property appropriated for the support of "London bridges."

The following table comprises a statement of the principal particulars connected with the different bridges belonging to the city:

Name.	Date of Completion.	Cost.	No. of Arches.	Length.	Breadth.	Span of Central Arch.
London bridge	1591	£24,000,000	5	924 ft.	53 ft.	148 ft.
Southwark	1819	800,000	3	708	44	340
Blackfriars	1776	500,000	9	908	42	100
Waterloo	1817	1,150,000	9	1,353	43	17
Westminster	1781	300,000	15	1,233	44	76
Vauxhall	1814	850,000	9	909	43	178

The tunnel, which, unlike the bridges, passes under, and not over, the stream, effects a connexion between its banks nearly 9 m. below London bridge. The erection of a bridge in the centre of the port of London was of course impracticable, and the mode of uniting the two shores, without injury to the shipping interest, was long a difficult problem for engineers. It was at length solved by Mr. Brunel, who designed the tunnel, and has so nearly brought it to a close, that its completion may be looked upon as certain. It consists of a hollow brick cylinder, or pipe, subdivided into two roadways, each 15 feet high and 13 feet broad. Notwithstanding the danger attending the performance of the work, owing to the perpetual oozing through and occasional bursting in of the river, the loss of life during the 15 years it has occupied has been very inconsiderable. But how curious soever in other respects, we incline to think that the tunnel never will be of much practical utility. The difficulty of the descent will always be a considerable obstacle to its extensive use. It was begun by a private company, but has been mostly carried on by grants of public money.

Palaces and Houses of Parliament.—St. James's at the W. end of Pall-mall, is an irregular, mean-looking brick building, totally unworthy the name of palace: it was erected by Henry VIII., on the site of a hospital for female lepers, which existed in the 11th century. The interior, however, is handsomely fitted up and it is well adapted for court levees and drawing-rooms, which are mostly held in it. The chapel attached to this edifice is substantially the same that was used for the ancient hospital.

Buckingham Palace, at the W. end of St. James's Park is remarkable only for its extravagant cost, amounting nearly to £1,000,000, though perhaps the pooriness of its effects is in some measure attributable to its depressed situation. It occupies the site of Arlington house, pulled down by John Sheffield duke of Buckingham, who erected in its stead a plain, but handsome residence. Having been purchased by George III. in 1763, it became the favourite abode of Queen Charlotte. Under George IV., whose rage for building was as decided as his taste was equivocal, Buckingham House was entirely rebuilt; and became, in 1837, the town-residence of the Queen. The principal front, to the east, forms three sides of a square, its narrow, projecting wings inclosing a space about 80 yards in width, in front of which is a marble arch (a miniature imitation of that of Constantine at Rome), with a bronzed iron gate. This arch does not, however, harmonize with the rest of the building; and the front is not only destitute of all grandeur, but is mean and paltry. The garden facade, an elevation of the Corinthian order, resting on a rustic basement, is, in better taste. The interior is magnificently fitted up. A staircase of white marble leads to the picture gallery, drawing-rooms, and throne room, the latter of which is enriched with well executed bass-reliefs. The picture-gallery, above 160 ft. in length, is filled with works of the best masters. The library and private rooms of the queen are in the basement story; but owing to the singular taste of George IV. for low rooms, the stories are not sufficiently high, and many of the apartments are badly lighted.

This, perhaps, is the only palace surrounded by what is frequently a puddle. Such, however, is really the case: for the ground in front of the palace not being paved, but merely covered with a compound, half gravel and half clay, it becomes, in wet weather, a most offensive puddle.

The old houses of Parliament stood upon ground formerly occupied by the palace of Westminster. Their appearance was far from imposing; but a certain degree of antiquated splendour, the associations connected with their history, and the importance of the purposes to which they were appropriated, made them respectable in the eyes of Englishmen. They were, however, wholly destroyed on the 16th October, 1834, by a fire, which for some time endangered the contiguous edifices of Westminster Hall and Abbey. A building, expected to be one of the finest ornaments of the metropolis, is now in the course of erection on the same spot, from the designs of Mr. Barry. It is to have a splendid river front, nearly 700 ft. in length, with a terrace and stairs leading down to the water; and at the S.W. angle, over the royal entrance, is to be erected a lofty tower, in the perpendicular English style, which, judging by the design, will be a fine specimen of modern architecture. It is to be hoped that the opportunity now offered, and so unlikely to recur, of raising a building worthy a great nation, may not be neglected, and that the new houses of Parliament may, when completed not only form a striking feature in the metropolis, but supply those accommodations for the despatch of the business of the legislature, the want of which was so much felt in the old buildings.

The government offices are, generally speaking, handsome edifices. The Council-office, on the western side of Whitehall, a modern structure of Palladian architecture, is generally admired. The Treasury, which joins that last mentioned, is an old brick edifice, which once formed part of

LONDON.

Durham Wolsley's palace. The Board of Control has a fine Ionic portico, but is, otherwise, a plain building. The Ordnance and Admiralty offices make no pretensions to display; and the "Horse Guards," which does pretend to it, is in very bad taste. Many of the public offices are in Somerset House, once a palace, occupied by Edward VI. and Elizabeth. The old building was taken down in 1775; and the present quadrangular structure, designed by Sir William Chambers, was completed in 1782, and divided into government offices. The street front is only 300 ft. in length but that facing the river is 800 ft. in length and is one of the noblest elevations in London. An eastern wing was added by King's college, in 1830, in completion of the architect's design.

On the river bank, in the E. part of the city, is the *Tower*,

"With many a foul and midnight murder fed."

This rude fortress, about quarter of a mile below London bridge, was begun by William the Conqueror in 1078. The original building, now called the White tower, was completed in 1086. Additions were made by Henry III. in 1240, by Edward IV. in 1465, and the whole was substantially repaired by Charles II. in 1663. The Grand storehouse, a large building N. of the White tower, begun by James II., was completed by William III.; and numerous houses have been erected in it for the residence of officers connected with the establishment. The tower was a royal palace during more than five centuries. It was long, also, and still is fact, a state prison; and several royal personages, and some of our highest nobles, and most distinguished commanders, have perished in this edifice, some by the hand of the public executioner, and some by the dagger and bowl of the assassin. It anciently contained several detached masses of building, most of which have now disappeared.

The original tower, now called the White tower, still remains the principal edifice. The Martin tower is now called the Jewel tower. The Lantern tower, the Royal palace and the Mint, have been pulled down. Of the remainder of the old building vestiges may be traced under altered names. The present edifices consist of the church of St. Peter ad vincula, the Ordnance office, the record office, the jewel office, armouries, and barracks. In the small-arm armory complete stands of arms for 150,000 men are kept in constant readiness. The whole is surrounded by a moat, filled with water from the Thames, and the outer bank has been recently turned into pleasure grounds. The tower is open to visitors, who pay 6d. to see the armouries and a similar sum to inspect the regalia. The menagerie, formerly the best in England, having been superseded by that belonging to the Zoological Society in the Regent's park, was broken up a few years ago.

The *Mint*, formerly in the Tower, but now on Tower-hill, is a stone building of Greek architecture, consisting of a centre and wings. The workshops and officers occupy about 8000 square yards, and the machinery for coining is complete and efficient. The salaries of the officers and workmen amount to £15,000 a year, and the money coined in 1836 consisted of £2,835,365 in gold, £301,170 in silver, and £1508 in copper. The gold is computed at the Mint price of £3 17s. 10½d. per oz. Troy, or 467 svs. to the lb. Troy; the silver at 5s. 6d. per oz., or 66s. to the lb. Troy; and the copper at £224 per ton, or 34 pence to the lb. avoird.

Postoffice.—The Postoffice, in the centre of the metropolis, near St. Paul's, a large, handsome building, completed in 1826, of Portland stone, is 390 ft. long, 130 ft. wide, and 64 ft. high. The façade is adorned with three Ionic porticoes, over the central and largest of which is a plain pediment. Within this portico is the great hall, 80 ft. by 60 ft., divided into three compartments by rows of Ionic columns on granite pedestals; passages lead from it to the principal offices.

This establishment consists of three branches, to each of which separate clerks are attached: viz. the general or inland, the foreign, and the district post, until lately termed the twopenny post. The business of the district post extends to a distance of 12 m. from the general postoffice.

There are at least two deliveries each day at every place within this line, and seven at all places within 2 m. of the chief office: intermediate places have three, four, or five deliveries. The general postoffice extends its operations all over the world, and letters are despatched by it every day. Twenty-five mails leave London every evening at 8 P.M., several of which are forwarded by railway, and there are 8 morning mails. No letters leave London on Sundays. Most of the evening mails reach town on their return between 6 and 7 o'clock in the morning. Early enough for the delivery of the letters before 10 A.M. in the city, and 11 A.M. in the other parts of London. Within 3 m. of the Postoffice are 228 receiving-houses, of which three are exclusively for the district post letters; the other houses receive all letters without distinction. Till 1839 there were two classes of receiving-houses, one for general and the other for twopenny post letters; but that distinction has

now ceased. There are about 166 country receiving-houses belonging to the district postoffice. In 1836, the last year of the old rates of postage, the gross revenue of the London postoffice amounted to £706,964.

Religious Establishments and Buildings.—London is a bishop's see, the highest in rank in the kingdom under the archbishops. The diocese till very lately comprehended 190 parishes in Middlesex, 308 in Essex, 56 in Hertfordshire, and four in Buckinghamshire, in all 550, containing a population of 1,723,685 persons; but, by the new ecclesiastical arrangements of 1836, it will in future comprise all the parishes of Middlesex, 23 in Surrey, 10 only in Essex, and nine in Kent, making a total of 241 parishes. The nett revenue of the diocese, at an average of the three years ending with 1831, is £12,925 per annum, and owing to the building now going on upon the bishop's estate, it will, at no distant period, amount to three or four times that sum; but, on the death of the present incumbent, the income of the see is to be fixed at £10,000 a year nett; the number of benefices returned to the commissioners (640), averaging a nett income of nearly £400 per annum. The number of curates was 358, whose income averaged something less than £100. Of the benefices, 75 were crown livings, 68 were in the gift of archbishops and bishops, and 277 belonged to private persons; the remainder were in the possession of corporate or ecclesiastical bodies. The number of parishes in the city of London is 113, of which 97 are within the walls, and 16 in the liberties: the 97 parishes are very small, and only 57 of them have churches; those belonging to the others either having been burned down at the great fire of 1666, and not rebuilt, or having been since removed to make room for improvements. Three additional churches have been built in the liberties, making the whole number now in the city, 76. Westminster contains 10 parishes, four of which were formed early in the last century, in consequence of the great increase of population at the W. end of the town, and one very recently; two only of these parishes, St. Margaret's and St. John's, are considered to form the city of Westminster, the other eight being denominated the liberties. Westminster was erected into a bishopric by Henry VIII. in 1541; and the whole of Middlesex, exclusive of the city of London and the parish of Fulham, was assigned as its diocese; but this bishopric existed only nine years, at the expiration of which the ecclesiastical government reverted to its former channel. Within the present century 13 district churches have been built, making the whole number 22. The other parishes of the metropolis amount to 46; the districts, which are partially, but not wholly, divided from the larger parishes, being those in which the incumbent is not endowed with a portion of the tithes, amount to 45, making the number of churches 91. This will make the whole of the churches in the metropolis amount to 169, without including chapels of ease. It is right, however, to state that those numbers may not exactly agree with other accounts; for so many parishes extend into two districts, so many are partly in the city and partly in the suburbs, that no two estimates of their number are found to agree. Besides the churches and chapels belonging to the establishment, there are nine chapels of the kirk of Scotland, 14 Roman Catholic chapels, 18 foreign Protestant churches and chapels, seven synagogues, and above 250 places of worship for dissenters and separatists of all denominations.

St. Paul's, the cathedral church of London, is not only the great architectural glory of the metropolis, but of the empire. This noble structure stands in an elevated situation at the top of Ludgate Hill, on the site of the former cathedral, destroyed during the great fire of 1666. Its foundations were laid on the 21st of June, 1675; and Sir Christopher Wren, by whom it was designed, and under whose direction the work was carried on, lived to complete the stupendous edifice, the last stone of which was laid by his son in 1710. It is built in the form of a Latin cross, with an additional arm or transept at the W. end to give breadth to the front, and has a semicircular projection at the E. end for the altar, and semicircular porticoes at either end of the transept. It is 510 feet in length, E. to W., the length of the cross, exclusive of the circular porticoes, is 250 feet, the breadth of the W. façade with the towers, 180 feet, and the height of the walls 110 feet. An immense dome, or cupola, rising over the centre, is surmounted by a lantern, ball, and cross, the latter being elevated 363 feet above the level of the floor, and 370 feet above the pavement of the churchyard. The two towers, or belltowers, in the W. front, are each, 222 feet in height. The walls are decorated by two stories of coupled pilasters arranged at regular distances, those below being of the Corinthian and those above of the Composite order. The whole building is of Portland stone; and the excellence of its foundations, and the massive solidity of its walls and piers, warrant the inference that it will be as lasting as it is magnificent.

St. Paul's, it is frequently said, is copied, or at least closely imitated from St. Peter's at Rome; and to some extent

LONDON.

this is true. But it is a copy that bears the impress of transcendent genius; and may be said to be to St. Peter's what the *Æneid* is to the *Iliad* and *Odyssey*. The fronts of both cathedrals are the parts, perhaps, in which they are most deficient; but in neither instance was the architect allowed to follow out his own conceptions. Bramante and Michael Angelo wished to have the portion of St. Peter's formed on the plan of the Pantheon, and Wren was obliged to modify his masterly designs so as to make them acceptable to those to whom he was obliged to defer. The bellries of St. Paul's gives it a character very different from that of St. Peter's. Neither is the dome of the latter so spherical as that of the British cathedral, nor is it so striking a feature of the building, being placed so far behind the lofty facade as to be almost invisible to a person standing near the edifice. But in the vastness of its proportions St. Peter's as far exceeds St. Paul's as the latter does the largest of the English churches. Perhaps, also, it is superior to St. Paul's in the harmony of its parts; the dome, though so grand a feature in the latter, being, it is very generally admitted, too large for the other parts of the building. But the English cathedral is, though *longe intervallo*, second only to St. Peter's; and is unquestionably the noblest of transalpine and of Protestant temples.

The interior of St. Paul's is chaste and imposing; but, owing to the want of ornament, it has rather a naked and austere appearance. Latterly it has been attempted to obviate this defect by placing within the cathedral monuments erected at the public expense to eminent individuals, among whom may be specified Lord Nelson, Abercrombie, Dr. Johnson, Howard the philanthropist, Sir William Jones, Sir Joshua Reynolds, &c. But these, with very few exceptions, do no credit either to the artists or the country, and are totally unworthy the temple they do nothing but encumber.

The remains of Sir Christopher Wren are deposited in one of the vaults of the cathedral; and before the entrance to the choir is the following appropriate inscription to his memory:

SUBTUS. CONDITOR. HUIUS. ECCLESIE. ET. URBS.
CONDITOR. CHRISTOPHORUS WREN. QUI VIXIT.
ANNOS. ULTRA. NONAGINTA. NON. SIBI. SED.
BONO. PUBLICO. LECTOR. SI. MONUMENTUM. REQUIRIS.
CIRCUMSPICE.
OBITI. XIV. FEB. ANNO. MDCCXXXII.
STAT. 91.

Individuals ascend by an inside stair to the stone gallery which surrounds the exterior gallery above the colonnade; and by a more difficult ascent they reach the Golden Gallery, which crowns the apex of the dome, at the base of the lantern. The view from this latter point, on a clear day, is certainly unrivalled. The entire metropolis, vast as it is, appears to be spread out at the spectator's feet. The broad and silvery line of the river, crossed by numerous bridges, and bearing on its bosom thousands of vessels, gives infinite grandeur and variety to the scene. At this height, the people, houses, and carriages in the streets, and everything else on the surface, appear so greatly diminished, that the bustle of the crowd has been, not inaptly, compared to that of a swarm of emmetts. Owing to the usual density of the smoke, this splendid view is seldom seen in perfection. It appears to the greatest advantage early in a clear summer morning, before the fires are lighted.

The more adventurous visitors not only ascend to the top of the cupola, but enter the lantern, and thence make their way into the copper ball by which it is crowned. The diameter of the latter is 6 feet 2 inches.

The whole cost of this noble structure amounted to £747,944, being less than the sum that has been thrown away on Buckingham Palace! It was, as has been often remarked, finished in 35 years, under the superintendence of one architect, by one master mason (Mr. Strong), and during the incumbency of one Bishop of London (Dr. Henry Compton). St. Peter's, on the contrary, was 145 years in building, during which time no fewer than 19 architects were employed upon it, and 19 popes sat in the papal chair! (See *Brayley's Account of St. Paul's*, in the *Survey of London and Middlesex*, II., 248-310; *Aikin's Essay on St. Paul's*; *Britton's Account of St. Paul's*; *Elm's Life of Sir Christopher Wren*, &c.)

It is greatly to be regretted that St. Paul's is so much hemmed in by the surrounding buildings. The view of the grand facade, with the dome rising above it, from the E. end of Ludgate-street, is, however, uncommonly fine; and a good view of a portion of the building is now obtained from the opening made at the S. end of the new Postoffice. The dome appears to great advantage from the bridges and the river; and is seen at a great distance from all parts of the surrounding country, towering above the smoke by which the city is generally enveloped.

The effect of the smoke on the structure is not a little curious. In the parts protected from the weather it ad-

hances, and the building has, in consequence, a black and sooty appearance; while, on the other hand, the parts exposed to the weather seem bleached or whitened. But this sort of pie-bald aspect has not the bad effect that might *a priori* have been expected.

Westminster Abbey, which, next to St. Paul's, is the grand ecclesiastical edifice of London, dates from the 13th century, though portions of the edifice, erected by Edward the Confessor, may still form part of the building. Great additions were made to it by Henry VII., who built the splendid chapel that still bears his name; and at the beginning of the last century the two towers at the W. front were added, from designs furnished by Sir Christopher Wren. In 1803, a considerable part of the building was destroyed by fire; but it has since been completely repaired, and Henry VIII's chapel renovated in its original style. It is 360 feet long, and 195 wide, within the walls. Though built at many different times between the reigns of Henry III. and Henry VII., and never quite completed, it offers one of the finest specimens of the pointed style in England. It is in the form of a cross, the shape of which, externally at least, at the E. end, is almost obliterated by 19 small chapels, of which that of Henry VII. is the most magnificent and beautiful. The great variety of the abbey renders anything like a general description impossible. The N. side, with its beautiful gate, may be considered the principal front; though the view is much injured by the interference of St. Margaret's church. It presents a line of ornamented turreted buttresses and pointed windows, with a fanciful sculptured porch, decorated with immense flying buttresses, lofty pinnacles, and a large wheel window 32 feet in diameter. The most striking view of the interior is from the W. entrance, where the lofty pointed aisles, clustered columns, rich tracery work, and monumental decorations, judiciously lighted by painted windows, present a harmonious effect well calculated to arrest the attention of the most inattentive. Many of the most illustrious statesmen, orators, warriors, philosophers, divines, poets, and distinguished individuals of all sorts, celebrated in the annals of the empire, are buried within its precincts; and their monuments, which are distributed all over the Abbey, give it the highest interest, and deeply impress the mind with feelings of awe and veneration. Since its restoration, in 1850, Henry VII.'s chapel has formed one of the most beautiful adjuncts to the Abbey; it is universally considered a gem, and is, undoubtedly, a most beautiful specimen of its style.

The other churches of London have no pretensions to be compared with those last mentioned. Of those which escaped the great fire of 1666, St. Saviour's in the borough, and the Temple church, deserve special mention. The former, recently restored to much of its ancient freshness, is a good specimen of the architecture of the 14th century; the latter is still more ancient, the greater portion being of the 13th century, and some parts very probably of the 12th: it is remarkable for its peculiar architecture, and particularly for the beautiful Roman arch forming the entrance to the building. It is now under repair. After the fire, several churches were built by Sir Christopher Wren, but the fame of St. Paul's has obscured the lustre of his other works. Bow church, in Chesham-street, St. Bride's, Fleet-street, and St. Stephen's, Walbrook, are the most admired of Sir Christopher's churches. The latter is entitled to the highest praise. "He has not omitted a single beauty of which the design was capable; but has supplied them all with infinite grace." (*Dallaway's Anecdotes*, p. 142.) In the early part of last century several churches were erected, of which St. Martin's, St. George's, Hanover-square, and St. George's, Bloomsbury, have very fine porticoes, especially St. Martin's, which is a noble structure. Within the last 30 years, however, a complete change, and, which is worse, a great deterioration, has taken place in our ecclesiastical architecture. St. Pancras church, and some others, may, perhaps, be excepted from this censure; but an extreme poverty of architectural talent has been shown in designing the new churches of London, which are quite unworthy of those formerly erected, and of the city. The places of worship for dissenters are, with three or four exceptions, plain brick buildings, well arranged for the accommodation of large congregations, but constructed with little attention to ornament or taste.

Lambeth Palace.—One of the most extensive and handsome buildings S. of the Thames is Lambeth palace, on the river bank, nearly opposite the new houses of parliament. The original building, erected in 1191, was first intended for a college of canons; but as the pope refused his consent to its establishment, it was converted into an archiepiscopal palace, and has ever since been the town residence of the primate of all England. Great additions were made to it about 1550, and in the 15th century Archbishop Chichele built a square stone tower towards the river, called the Lollard's Tower, from the fact of some of those early reformers having been confined in it. Subsequent additions were

LONDON.

made by Cranmer, Pole, Parker, Juxon, Sancroft, and Tillotson; but the whole, as seen from the outside, is a heavy, dull-looking brick structure, little interesting except from its solidity. The late additions, however, completed in 1833, at a cost, including internal fittings, of nearly £80,000, are executed in much better taste. The new buildings, of Bath stone, stand in the gardens, E. of the old palace: the principal edifice is a beautiful and imposing structure, the ornamental portions, which are particularly rich, being copied from Westminster and St. Alban's abbey. The entrance front, flanked with square towers, is 160 feet in length, the opposite or garden front being 30 feet longer. The principal rooms are of fine proportions, and richly though chastely embellished, the wood-work being almost wholly of oak. The library is perhaps one of the finest features of the interior; and though remarkably plain in its decorations and furniture, produces, from its great size, a very imposing effect. It contains upwards of 95,000 volumes, among which are many rare works in classics, divinity, &c.; and the MSS., some connected with the history of the age, and others of a miscellaneous character, are extremely valuable. In the older parts of the building the chief rooms are the long gallery, containing a curious collection of paintings, chiefly portraits of former prelates, the great hall, with an open roof of oak, presenting on the whole one of the finest specimens in the country of internal Gothic decorations; and the chapel, a small but extremely elegant apartment, fitted up with oak stalls, pews, and an exquisitely carved pulpit and screen. The altar-piece, however, ill accords with the rest of the fittings, being of the Corinthian order, painted and gilt! The park and gardens belonging to the palace occupy about 18 acres: they are completely walled round; nearly four acres are appropriated to the kitchen garden, the rest being tastefully planted, and laid out in shrubberies.

Cemeteries.—The crowded state of most of the metropolitan churchyards, and the growing conviction of their injurious influence on the health of the neighbourhoods in which they are placed, have, within these few years, suggested the establishment of public cemeteries at some distance from town. The first of these, at Kensal green, occupying a piece of ground of 48 acres in extent, tastefully planted and laid out, was opened in 1832. It is situated about 2 m. N.W. London; and has chapels for the performance of the funeral service according to the rites of the Church of England, or of those whose friends profess a different creed. The success of this undertaking, which was long opposed by ignorant prejudice, has since led to the construction of other cemeteries. That at Highgate, consecrated in 1833, and occupying about 90 acres, is in a beautiful situation N. of London, offering a splendid view, of great extent; but the decorations, though handsome, are too showy to be in keeping with the destination of the spot. The Norwood cemetery is 6 m. S. of the city, and is double the size of that last mentioned. The buildings in this cemetery are of a superior character; and an ingenious machinery is used to lower the coffins slowly and silently into the vaults beneath. Two cemeteries have been recently completed, at Abney park, Stoke Newington, and Earl's court, Brompton; and others are contemplated. Hitherto, however, the new cemeteries have been too far from town, and too expensive, to be used by the poorer classes; and the formation of more convenient cemeteries, for the accommodation of the latter, is a matter eminently deserving the attention of the authorities.

Commerce.—London is not only the capital of a great empire, but is the first commercial city of the world. Her intercourse extends to the remotest countries, and her merchants are pre-eminent for wealth, enterprise, and integrity. The establishments connected with commerce are on a scale commensurate with the vast amount of business to be transacted. The public buildings for commercial purposes consist chiefly of the Bank of England, East India House, Royal Exchange, Excise Office, Custom-house, and Cornmarket.

The Bank of England, from its first incorporation in 1694 to the year 1794, transacted its affairs at Grocers' hall, in the Poultry. The first stone of the present building was laid in 1732; 40 years afterward the E. and W. wings were added, and in 1781 the church of St. Christopher was taken down to make room for farther additions. Until 1895 this edifice exhibited a great variety of incongruous styles; but endeavours have since been made, and with some success, to produce uniformity. The building is insulated, and covers eight acres: its shape is an irregular parallelogram, the longest side measuring 440 ft. Many of the rooms in the interior, such as the court-room, pay-hall, and dividend-office, are spacious and well proportioned; but the largest and finest of all is the rotunda, a circular hall, 57 ft. in diameter, and crowned by a handsome cupola and lantern. The chief transactions connected with the funds take place in this apartment. The affairs of the bank of England are

managed by a governor, deputy-governor, and 94 directors, elected annually. The business is conducted by about 900 clerks, whose salaries amount to about £190,000.

In 1833 the charter of the bank was continued till 1845, its capital being then also fixed at about £11,000,000 lent to government at 3 per cent. Branch banks in connexion with the bank of England have, since 1693, been established in most large towns, the chief business of which is to discount bills, issue notes, and transmit money to and from London. The profits of the bank accrue from interest on exchequer bills, discounts of commercial bills, interest on the capital lent to government, an allowance of about £130,000 a year for managing the public debt, and some other sources. The dividend received by the proprietors is 8 per cent.

Statement of the Liabilities and Assets of the Bank of England, on the 31st of March, 1840, that is, of the Bank Notes in circulation, and the public and private Deposits held by the Bank, on the one hand, and of the Securities and Bullion in her possession, on the other.

Liabilities.		Assets.	
£.		£.	
Circulation.		Public Securities . . .	12,083,000

			\$5,778,000

Of about 80 private banking-houses at present in London, three were in existence before the bank of England, viz., those of Messrs. Child, Temple Bar, Messrs. Hoare, Fleet-street, and Messrs. Snow, in the Strand. Within the last few years various joint stock banking companies have been established in the city, on the model of the Scotch banks; and the fair presumption seems to be that they will, at no distant period, entirely supersede the private bankers.

The Royal Exchange, originally erected by Sir T. Gresham, in 1566, was burnt down in the great fire; having been rebuilt within three years, and extensively repaired between 1830 and 1832. It was again destroyed by fire on the 10th of January, 1838. Latterly it formed a spacious quadrangle, surrounded by lofty stone buildings, with a covered colonnade running round the whole interior, and the N. and S. sides of the exterior. In the centre was a statue of Charles II. by Spillier, and in niches of the inner wall were statues of most of our monarchs, from the time of Edward I. A new exchange, on a grand scale, from a design by Mr. Tite, is now (1841) in the course of being constructed, which, when completed, will be one of the greatest ornaments of the city. At present the business usually transacted in the Exchange is carried on in the large court of the Excise-office in Broad-street. At a rough estimate, 3000 merchants and brokers have their places of business within half a mile of the Exchange, and meet there to carry on operations by which the commercial affairs of the world are powerfully influenced. Several houses, together with two churches, have been removed, to make room for the new edifice, the chief front of which is to face the Poultry and Mansion-house.

The East India House, in Loodenhall-street, is the place where the East India Company's business is chiefly transacted: it was first built in 1726, but has been subsequently so much altered and enlarged, that scarcely any part of the old edifice now remains. It has a stone front, with a portico supported by six fluted Ionic columns, above which are a frieze and pediment ornamented with sculpture. The interior comprises numerous and handsome apartments, of which the largest are the court-room, the committee-room, and the two sale-rooms; in the E. wing are the library and museum, the former rich in Asiatic literature and rare Oriental MSS., the latter abounding with Indian curiosities, the spoils of successful wars waged with the native monarchs. The museum is open every Saturday. The East India Company has now, however, become exclusively a political institution; the act 3 & 4 Will. 4, prolonging the charter till 1854, having debarred the company from the privilege of trading.

River and Port.—What is legally termed the port of London extends 6½ m. below London bridge to Bugsby's hole, beyond Blackwall; though the actual port, consisting of the upper, middle, and lower pools, does not reach beyond Limehouse. The whole of the latter space is generally covered with vessels; a channel, only 300 ft. wide, being left clear for craft passing up and down the river. The port having been long insufficient for the proper accommodation of the shipping resorting to London, and being often block-

LONDON.

ed up by fleets of merchantmen, the quays also being heaped with bales, boxes, bags, and barrels, in such confusion that the most barefaced robberies were committed with impunity, the necessity of farther protection for merchandise became evident. Accordingly, at the close of last century, it was determined to excavate wet docks, capable of accommodating a large number of ships, with contiguous warehouses, the whole being enclosed by high walls. The West India docks, the first of these establishments, and the largest belonging to the port, were opened in 1803. They are situated about 4 m. down the river: including the City canal, a work intended for another object, but now a part of this establishment, they comprise about 295 acres, one fourth part of which is covered with water, the rest being occupied with quays and warehouse, the latter of great magnitude, and furnished with every convenience. They have an import and an export dock, with sufficient accommodation for 500 large merchantmen. The London docks, about 1½ m. from London bridge, were opened in 1805. They cover about 100 acres of ground, of which nearly a third is water. The vaults beneath the warehouses contain cellars for 63,000 pipes of wine, and one of them has an area of seven acres. The tobacco warehouses are very extensive. The East India docks, smaller than those above described, and farther down the river, were opened in 1803. Their water-area is 30 acres, and their great depth (23 ft.) enables them to accommodate vessels of very large size. About the same time the Commercial docks were constructed on the S. side of the river, or rather the old docks for the Greenland ships were enlarged and provided with warehouses for bonding foreign corn. This dock covers 49 acres, 40 of which are water: they are used for vessels engaged in the Baltic and E. country commerce. The St. Katharine's docks, opened in 1808, are the nearest to London bridge, being just below the Tower. They enclose 34 acres, of which 11½ are water. The warehouses, which are on a very extensive scale, are close to the quays, having the lower or basement story open for the purpose of receiving or delivering goods from and to vessels that are being laden or unladen: the arcades are supported by iron columns of great strength. These docks have all been constructed, at a vast expense, by joint stock companies; and have on the whole been profitable concerns, though they have redounded infinitely more to the advantage of the port than to that of their projectors.

The number of colliers frequenting the port has often suggested the idea of excavating docks for their accommodation in the Isle of Dogs, opposite Greenwich; but nothing has yet been effected towards the execution of this plan. According to the present system, that part of the port below the lower pool serves as a place of anchorage for the colliers, only a certain number of which are allowed to be in the pool at once, and a flag is hoisted to notify when it is full. On the flag being hauled down, the first collier in rank enters the pool, and the others follow until the number is completed, when the flag is again hoisted; the rest wait their turn. The following statement of the quantities of coal and culm brought into the port at different periods, from 1890 to 1840, both inclusive, shows the consumption of coal in London. The great increase within the last dozen years is chiefly owing to the introduction of steam navigation and gas lighting.

	Tons.		Tons.

Total . . .	9,132	2,666,560

The new Custom-house, a handsome building by the river-side, between London bridge and the Tower, was opened for business in 1817. The old one was burnt down in 1814, though not before the present building was begun, the former having been found inconveniently small. The river-front, 460 ft. in length, is built of Portland stone, and though rather plain, is decorated by three porticoes, each

supported by six Ionic columns. The long room, where the public business is transacted, is 126 ft. in length, and 60 ft. in width and height.

The vast extent of the trade of London will be apparent from the subjoined statement of the gross customs revenues from 1834 to 1840, both inclusive:

1834 . . .	£16,697,963	1838 . . .	£11,354,734
1835 . . .	11,773,616	1839 . . .	11,431,945
1836 . . .	12,158,970	1840 . . .	11,068,663
1837 . . .	11,106,636		

Now, as the total gross customs revenue of the United Kingdom amounted, in 1839, to £23,496,486, it would seem, from this statement, that the trade of London only equalled that of all the rest of the kingdom! This, however, would be a fallacious inference. The imports into several of the other great trading ports, including those of Liverpool, Hull, Dundee, &c., consist principally of cotton, wool, flax, and other raw materials of our manufactures, which are mostly admitted at low duties; whereas the imports into London consist principally of articles of consumption, as sugar, sea, coffee, wine, corn, &c., on which high duties are paid. But after making every allowance for the circumstances now stated, still the foreign trade of London is of prodigious and unparalleled extent. She may truly be said to be *universis orbis terrarum imperatrix*; and owing to her being the grand mart of all the rich, extensive, and densely-peopled districts included within the basin of the Thames, we do not think, provided the country continue to prosper, that there is any ground for apprehending any falling off in the commerce of London. It is impossible to form any accurate estimate of the total value of the produce conveyed into and from London; but including the home and foreign markets, we believe it will not be overrated at the prodigious sum of eighty millions sterling.

Some idea, however imperfect, may be formed of the extent and distribution of the trade of London from the following statements.

ACCOUNT OF THE SHIPS ENTERING THE PORT OF LONDON FROM 1823 TO 1840, BOTH INCLUSIVE, DISTINGUISHING BETWEEN BRITISH AND FOREIGN SHIPS FROM FOREIGN PARTS, AND COASTERS.

Years.	British.		Foreign.		Coasters.	
	Vessels.	Tonnage.	Vessels.	Tonnage.	Vessels.	Tonnage.
1823	3,031	641,131	665	161,705	16,079	2,19,256
1824	3,132	607,106	813	204,129	18,445	2,2,83,665

West Indies	26	2,510
The Whale Fisheries	645	47,130
Iles of Guernsey, Jersey, and Man	1,653	417,140

There belonged to the port of London, in 1840, 2930 ships, of the total burden of 361,000 tons, manned by 33,000 seamen: This, which is by far the greatest amount of shipping that ever belonged to any single port, will appear the more extraordinary when it is recollected that the colliers almost all belong to Newcastle, Sunderland, and other ports in the N. An immense number of barges are employed in the loading and unloading of colliers and other vessels in the river. The out-of-doors establishment of the customs, which is mostly all employed in the business of the port, comprises about 1350 individuals.

Insurance of houses, ships, lives, &c., is carried on to a far greater extent in London than anywhere else in the world. Marine insurances are mostly effected by private parties; but other insurances are generally made by joint stock companies. Some of these have been most successful, and have accumulated vast sums. It is believed, however, that not a few of these companies are of a very questionable description; and the conviction seems to be gradually gaining ground, that some public regulations should be laid down for the formation and guidance of insurance companies, so as to protect the insured against the extravagance, mismanagement, or bad faith of the directors.

Regent's Canal.—The port of London is connected with the Irish sea by a chain of canals of which only the Regent's canal, begun in 1813 and opened in 1820, comes within the scope of this account. The Regent's canal, which is 45 feet wide at the surface, 5 feet in depth, and 8½ m. long, begins on the N.W. side of London, at the Paddington branch of the Grand Junction canal, and proceeds in an irregular semi-circle to Limehouse, where is a large basin connected with the Thames. This canal has two tunnels, one of which, passing under Islington, is 5 furlongs in length. The descent, amounting to 90 feet, is effected by means of 13 locks; and it is crossed by 37 bridges. Five branches, terminating in basins, extend into different parts of the town.

Manufactures, retail trade, and markets.—London presents itself under too many points of view to be called a manufacturing city; yet it is the seat of many, and of some very extensive manufactures, several of which have their distinct quarters.

The silk manufacture is conducted on a very large scale in Spitalfields, Bethnal Green, and Mile-end town, and employs about 10,500 looms, belonging to 4300 families, the total population supported by the business being about 23,000. The trade fluctuates extremely, owing chiefly to the caprices of fashion, and great numbers of workmen are often thrown out of employment; but the distress, so often said to prevail in this densely-peopled district, is owing at least as much to the drunken and improvident habits of many of the weavers as to any falling off in the demand for labour. The net wages of plain silk weavers, when fully employed, range from 9s. to 11s. 6d., and those of velvet weavers from 15s. to 25s. a week. With respect to physical condition, this numerous body are a diminutive, impoverished, and feeble race, unable to withstand disease, and not long lived, circumstances attributable to close in-door employment, bad air, bad lodging, and bad food. We have elsewhere noticed the tendency to epidemic fevers in close and ill-drained neighbourhoods, and in no part of London are the fatal effects of lodging in close courts and cellars more visible than in Spitalfields and Bethnal Green. (See Dr. S. Smith's Evidence before the Committee on Health of Towns, p. 1-7.)

Porter is the favourite beverage of the lower and also of

a considerable proportion of the middle classes of London. The breweries in which this favourite liquor is prepared are mostly on a very great scale; and are, indeed, by far the most gigantic manufacturing establishments in the metropolis, greatly exceeding anything of the kind to be found anywhere else. The capital vested in a first-rate brewery, and its dependent public houses in different parts of the town, is usually quite immense. The principal establishments produce from 160,000 to 360,000 barrels a year, principally porter, but partly also ale. It has been estimated, that nearly 3,000,000 barrels, or 72,000,000 gallons of porter and ale are brewed for consumption in London only, besides which great quantities are sent to different parts of the United Kingdom, and exported to the E. and W. Indies, the United States, and continental Europe. The splendid teams of horses in the drays belonging to the chief breweries of London are among the objects most worthy of admiration in the metropolis. There are several very extensive distilleries, vinegar factories, chemical works, soap-boiling houses, most of which are situated on the S. side of the river. The quantity of soap made in London in 1839 amounted 38,065,175 lbs. of hard and 690,893 lbs. of soft soap. About 30 large engineering establishments employ several hundred workmen in making steam-engines and other machinery, chiefly in Lambeth and Southwark.

The principal sugar refineries are in Whitechapel, E. of the city. Watchmakers, who are numerous, reside principally about Clerkenwell. The finest cutlery and hardware is made in London, and the manufacture of metals of all kinds is carried on to a great extent. Coach-building is an important business; and the carriages of London are not only the handsomest, but the best built and most durable of any in the empire. Great numbers are made for exportation. Upward of 1500 hands are employed in constructing musical instruments, and in engraving music. Ship-building, and many trades connected with shipping, are extensively carried on E. of London bridge. Owing to the extent to which the division of labour is carried, the tradesmen and artisans of London have attained to the greatest proficiency in their respective callings; and there cannot be a question that the cabinet-makers, printers, tailors, shoemakers, &c., of the metropolis are quite unrivalled.

The following list of professional men and tradesmen is compiled from Pigot's Directory for 1840:

Physicians	980	Brokers	700
Burgome and apothec.	1,690	Tailors and clothiers	3,940
Druggists	475	Drapers and hosiers	1,320
Barriers	1,060	Hat and bonnet mak.	1,360
Attorneys	2,000	Dress and stay makers	1,900
Architects	320	Shoemakers	2,950
Artists	350	Hair-dressers	950
Engravers	500	Dyers	320
Schoolmasters, &c.	1,330	Coal merchants	620
Merchants	1,340	Hotel and tav. keepers	540
Stock-brokers	330	Publicans, &c.	5,300
Insurance and general brokers	930	Coffee and eating-houses	970
Watch and clock mak.	590	Wine merchants	1,050
Jewellers, &c.	490	Livery-stable keepers	600
Booksellers	700	Butchers	1,690
Stationers	670	Fishmongers	500
Printers and type-found.	590	Poulterers	150
Musical instrument mak.	390	Corn dealers and bakers	2,500
Coachmakers	360	Confectioners	450
Builders	900	Grocers	1,520
Bricklayers and masons	900	Green grocers, &c.	1,730
Carpenters	1,500	Cheese mongers	1,030
Cabinet-makers and upholsterers	1,100	Milkmen	900
Painters and paper-hangers	1,750	Small shopkeepers	2,700
Ironmongers, &c.	630	Tobaccoists	1,080
		Pawnbrokers	330

The extent of the retail trade of London can only be conjectured. By a rough estimate, made by counting the pages of one of our most copious directories, the number of houses employed in business cannot be much under one hundred thousand, to one half of which shops are attached. The trades, generally speaking, are mixed indiscriminately, though some remains are still traceable of the ancient custom of particular trades congregating in particular places. Thus we still find coach-makers in Long-Acre, stay-makers in Holywell-street, booksellers in Paternoster-row, and bankers in Lombard-street. A good deal of business used to be transacted by itinerant vendors, who made the streets resound with their cries. Recently, however, these have been diminished by the abolition of the dustmen and muffle-boys' bells, the newsmen's horns, and the early cries of the chimney-sweepers. Fashionable shops attract attention by a magnificent and gorgeous display of wares: their windows, which in most cases comprise almost their entire front, are, in many instances, made of the finest

LONDON

plate glass, set in brass frames, and their interior is frequently lined with mirrors. Every sort of device is, as may be expected, used by the shopkeepers to attract customers.

Markets, &c.—London has about 50 markets for provisions, in nearly all of which goods are sold by retail as well as wholesale, though the majority of the inhabitants purchase at shops distinct from the markets. Smithfield is the great mart for live stock, which is sold on Mondays and Fridays. No fewer than 1,403,400 sheep were sold here in 1834, and 183,363 head of cattle. We may remark, by the way, that Smithfield market is situated in the very centre of the city; and this circumstance, by obliging the stock to be driven to and from it through crowded streets, makes it a very great nuisance. Frequent attempts have been made to have it removed to the suburbs; but hitherto without effect. London is also totally unprovided with proper slaughter-houses, or *abattoirs*. Exclusive of the stock brought to Smithfield market, a good many cattle and sheep are now imported in steamers, and privately sold; and in the colder months slaughtered cattle and sheep are extensively imported, particularly from the ports on the E. coast. Newgate and Leadenhall markets, with the Whitechapel carcass butchers, supply most of the butchers of the town and neighbourhood; and these, as well as all the other markets, also supply retail customers, and have a good supply of vegetables, poultry, game, eggs, and butter. Covent Garden market is the principal vegetable mart in London, and the immense supply of the finest fruits and vegetables, and the beauty of the plants on sale, make it well worth a visit. The Borough and Spitalfields markets are also chiefly supplied with vegetables. Billingsgate is the great fish-market, whence fish of all sorts are distributed to the shops and markets in different parts of the town. The supply of salmon, brought in ice from all parts of the kingdom, and of turbot, cod, lobsters, and oysters, is quite immense. Hungerford market is also a well-supplied fish *dépot*; but at this and Farringdon markets (both of them new and handsome establishments), butchers' meat, fruit, and vegetables are also sold. The corn market is held in Mark-lane, and is attended almost exclusively by wholesale dealers.

Different statements have, from time to time, been put forth of the consumption of the principal products brought into London; but, with the exception of coal, and one or two other articles, there are no means by which to arrive at anything like a correct conclusion in such matters. Allowing for the carcases imported by steam and otherwise, the annual consumption of butchers' meat may at present be estimated at about 190,000 bullocks, 1,500,000 sheep, 25,000 calves, and 25,000 pigs, exclusive of great quantities of bacon and hams. The consumption of poultry, game, and eggs is also immense; but there are no means by which to estimate its amount. It may, however, be mentioned, that from 70 to 75 millions of eggs are annually imported into London from France and other foreign countries, exclusive of those brought from the different parts of Great Britain! About 12,000 cows are kept in the city and its environs for the supply of milk and cream; and if we add to their value that of the cheese and butter brought into the city, the expenditure on dairy produce will appear to be enormous. The consumption of wheat may, perhaps, be estimated at about 1,300,000 quarters a year; and the vast number of horses in London, and their high keep, must occasion an immense consumption of oats. The value of the fish, vegetables, &c., consumed in the city, has been set down by some intrepid calculators; but the data on which they formed their estimates were of too loose and unsatisfactory a character, to entitle them to any credit.

External and internal Communication.—The recent introduction of railways has already effected a great alteration in the intercourse of the provincial districts with the metropolis; but so short a time has elapsed since they have come into operation, that it is difficult to estimate their ultimate results; which, however, there can be little doubt, will be advantageous alike to the metropolis and provinces.

The Birmingham railway, opened through its whole extent in Sept. 1838, commences near Euston-square, where it has a splendid terminus. Trains leave both London and Birmingham eight times in the 24 hours, and the time occupied in the transit is five hours. The line is continued N. in two directions, by the Grand Junction and North Union railways, to Liverpool and Manchester, Preston and Lancaster; and, by the Derby and N. Midland railways, to Derby and Nottingham, Sheffield, Leeds, and York. The whole distance to the last place is now accomplished in 10 hours. The Southampton railway, which cost £1,700,000, was opened in 1838; it has its London station S. of the river, close to Vauxhall bridge, whence trains set out frequently during the day, and reach Southampton in three hours. The Great Western railway, constructed at a cost of £4,561,000, very lately opened as far as Bath, has its London terminus at Farringdon, where are ample warehouses and accommodations both for passengers and goods.

The Eastern Counties railway, opened as far as Brentwood, has its London terminus in Shoreditch, and is intended to run to Great Yarmouth, through Romford, Ingatons, Chelmsford, Colchester, Ipswich, and Norwich, a total distance of 196 m. Trains leave London seven times a day. The Greenwich railway, the earliest in operation of all the lines connected with the metropolis, commences in the borough, opposite to St. Saviour's church, and ends in London-street, Greenwich: its entire length is 3½ m. Trains run from both termini every quarter of an hour, from 8 A.M. to 10 P.M. The London and Croydon railway, opened through its entire length in June, 1839, branches from the Greenwich line about 2 m. from London bridge, and thence turning S., passes by New-Cross and Sydenham to Croydon, the whole distance being 10½ m. The cost of this undertaking was £750,000, and the passengers have hitherto averaged about 1800 a day. Trains leave both ends 18 times a day. The traffic will, of course, be vastly increased, when the two extension lines to Brighton and to Dover shall have been opened. The Blackwall railway, recently opened, connects the E. and W. India docks with the metropolis: trains run from each terminus every quarter of an hour. The North Eastern railway has very lately been opened as far as Braxborough.

TABLE showing the Length of the Metropolitan Railways, and the amount of Traffic during the week ending Aug. 30, 1840. (Railway Times, Sept. 5, 1840.)

Name of Railway.	Total Length	Length opened.	Passengers.	Total Receipts.
Birmingham Railway	112½	112½	28,000	14,500
Blackwall do.	3½	3½	20,700	55
Croydon do.	10½	10½	11,100	70
Eastern Counties' do.	196	17½	6,825	542
Great Western do.	118	62	34,811	6,082
Greenwich do.	3½	3½	32,400	7,000
South-western do.	71	71	19,500	2,100
	451½	307½	198,736	25,716

In 1837, before any very extensive railway was opened, the number of stage-coaches licensed to run between London, and places above 30 m. distant, was about 800, conveying nearly 4000 passengers each day. In 1838 the average daily number of persons travelling by three railways alone, the Great Western, Birmingham, and South-western, was about 3500, and the average daily number by the Eastern Counties line was nearly 1000 in 1839. As the railways in 1840 accommodate about 25,000 passengers a day, and many stages still continue to run, the present number of passengers is at least six-fold that of 1837.

The steamboats constantly plying on the river, and making daily excursions to Margate, Ramsgate, Gravesend, and other places below London, as well as to Richmond and various intermediate places up the river, have been roughly estimated to take 10,000 passengers a day. The weather, however, very much influences the number, as the majority of steamboat passengers proceed on excursions of pleasure rather than business. Saturdays and Sundays are the grand days.

The means of internal communication and of communication with places in the immediate neighbourhood of town, are also considerable. The number of short stages and omnibuses is altogether about 900, which, reckoning to each six journeys a day, and 10 passengers to each journey, convey every day about 54,000 persons. A new mode of internal communication between the E. and W. ends of London, has lately been effected by small steamers continually traversing the river, and taking a great number of passengers. Two or three of these convenient vessels leave London bridge every quarter of an hour during the summer, for Westminster and Chelsea.

Hackney-coaches were introduced more than 200 years ago; and previously to the introduction of cabriolets, in 1820, were very numerous; but it is a singular and not easily explained fact that, with very few exceptions, the hackney-coaches of London are the dirtiest and most uncomfortable carriages imaginable. Cabriolets being cheaper and more rapidly driven than the old-lumbering hackney-coaches, speedily deprived the latter of a great part of their employment. Various improvements have been made from time to time in these one-horse carriages, and many now in use are clean, neat, and commodious.

Parcels Delivery Company.—A few years ago, a private company started under this name, which, while it has not with considerable success, has certainly been very serviceable to the public. The company have established a considerable number of vans, which traverse London in all directions with great regularity, three or four times a day, delivering parcels at more reasonable charges than had been imposed by the old private carriers. Another company, of the same kind, and conducted with equal spirit and ability, has been more recently established.

Literature.—London ranks almost as high as a library

LONDON.

as a commercial city. Notwithstanding the factitious encouragement given to learning and science in Oxford and Cambridge, London is the favourite resort of literary and scientific men. Its immense population, the wealth and intelligence of its inhabitants, and the circumstance of its being the seat of government, attract aspiring individuals from all parts of the empire, especially those ambitious to distinguish themselves in literature or politics. The practical, common-sense character of the philosophy and literature of England is probably, indeed, in no small degree owing to its being principally cultivated in London, where the writers, by mixing with the world, learn to avoid those over-refined theories and fanciful distinctions, in which recluses and speculators are so apt to indulge. With the exception of the provincial newspapers, the whole periodical literature of England centres in London. The number of persons engaged in this department, as authors, publishers, printers, &c., is quite immense. London has no fewer than 13 daily newspapers, and 67 that appear at other intervals. Many of these journals display great, and some consummate talent; and, considering the extreme rapidity with which articles for the daily journals must be written, and the want of time for revision, they are certainly extraordinary performances. So far as respects its newspaper press, London is infinitely superior to every other city; and however one-sided, prejudiced, and little to be depended on in party matters, it is not easy to imagine that it is likely to gain much in ability, variety, and interest.

It appears, from the *Stamp-office Returns*, that of 58,516,892 stamps issued to the different newspapers published in the United Kingdom during the year ended the 15th Sept., 1839, no fewer than 33,197,563, or the half of the whole, were issued to those published in London! And when the superior ability and information of the London press is taken into account, its preponderance will appear still more striking. During the same year, the total amount of the duty on advertisements paid by the newspapers of the United Kingdom amounted to £153,090, of which £46,321 was derived from the metropolitan journals.

A prodigious number of weekly, monthly, and quarterly magazines, reviews, and other publications, issue from the London press; and though many of these be of a very trashy and worthless description, a considerable number are of a widely different character, and are well fitted to amuse, instruct, and improve the reader. By far the greater number of these publications appear on the last day of every month, known among booksellers as "Magazine day;" when the great publishing houses make up and forward innumerable parcels, containing every variety of works, to their correspondents in all parts of the kingdom.

The magnitude and importance of the periodical press of the metropolis will be best seen from the following statement, drawn up from the catalogue for 1841 published by Messrs. Longman and Co.

Description of Periodical.	Number.	Price.
Weekly magazines, &c.	94	1s. to 9d.
— parts of entire works	32	3s.—1s.

The greater number of the works written in Scotland are now published in Edinburgh; but nearly the whole of the works written in England and Ireland are published in London. The latter, in fact, is to the literature of Britain what Leipzig is to that of Germany, or Paris to that of France. The London publishers have agents all over the country, to whom they send all new publications; so that in the few instances in which books are printed at Oxford or Cambridge, or other provincial towns, it is usual to send them to London to be published.

Education.—London, unlike most other European capitals, had no university empowered to grant degrees till 1838, when one was established by royal charter (renewed in 1837) for "the advancement of religion and morality, and the promotion of useful knowledge, without distinction of rank, sex, or party. This institution differs (and, as we think, advantageously) from all other universities, in its having nothing to do with the business of education, being constituted for the sole purpose of ascertaining the proficiency of candidates for academical distinctions. It is, in fact, a Board of Examiners, empowered to grant degrees in science and literature to such candidates as are found,

on examination, to have attained the required proficiency. The senate, or board, consists of a chancellor, vice-chancellor, and 33 other members. The faculties are those of arts, law, and medicine, in each of which are several examiners, amounting in the whole to 23, of whom 10 are members of the senate. The sittings are held in Somerset-house, and the examinations are half-yearly. The greatest number of candidates for degrees has hitherto been furnished by the University and King's colleges. The former of these, opened in 1530, is governed by a council and senate of professors: the course of education embraces classics, pure and mixed science, history, jurisprudence, and medicine, religion being wholly excluded. The success of the medical school, which has for some years been the largest in London, has led to the erection of a good hospital close to the college. The general classes have not been so well attended as the sanguine friends of the establishment at first expected; but the attendance is likely to be increased from the addition to it of an excellent junior school, the instruction in which forms a good preparation for higher studies. This school, which for some years has averaged 350 scholars, is conducted by the classical professors, who pay a rent for the use of apartments within the college. King's college is a similar establishment to that last mentioned, and is similarly conducted, except that religion is taught in accordance with the principles of the Church of England. The general classes are well attended, and the junior school has upwards of 400 boys. The medical school is small. The buildings of these establishments are handsome and commodious; and the portico of University college is one of the finest in London.

Among the literary and scientific establishments of the metropolis, one of the most important and best supported is the Royal Institution in Albemarle-street. The building (recently new fronted in good taste, with fourteen Corinthian columns,) is exceedingly well arranged, and comprises a good library and reading room, a theatre for lectures, capable of accommodating 900 persons, and a chemical laboratory supposed to be one of the largest and best supplied with apparatus in Europe. Lectures on various subjects are delivered by the professors and other gentlemen temporarily engaged; and the important investigations made here by the late Sir Humphry Davy, Mr. Faraday, and others, have conferred on the institution a well-merited celebrity. Next in importance to that just mentioned is the London Institution, in Finsbury Circus, Moorfields, the objects of which are very similar, though not so fully and scientifically carried out. Lectures are given on literature, the fine arts, &c., once or twice a week from November to May: the library is both large and well selected, and the reading rooms are supplied with all the English and foreign literary journals. The Russell Institution, in Great Cornhill, is similar in most respects to those just described; but, owing to the recent falling-off in its funds, its usefulness is at present very much circumscribed.

The welfare and improvement, also, of the working classes, and of young men generally, has been greatly promoted within the last 15 years by the establishment of mechanics' institutions in different parts of London. The earliest of these, called, *per excellence*, "The Mechanics' Institute," in Southampton Buildings, Holborn (opened in 1824), has about 1100 members; and the attendance on the lectures delivered in the theatre of the establishment, shows that the inhabitants of the metropolis in humble life are quite as anxious for improvement as their more wealthy neighbors. Classes are established for languages, and the library, which comprises 7000 volumes, is said to be well selected. The Western Literary Institution, the City Institution, in Aldergate-street, and other establishments of the same kind in various districts, have since been founded, and have uniformly contributed to improve the intellect and morals of the working classes.

Among the many endowed schools in the metropolis, the most celebrated are: 1. Westminster School, founded by Queen Elizabeth in 1560, for the free instruction, clothing, board, and lodgment of 40 boys, called king's scholars, and for the gratuitous education of four others called bishop's boys; this school formerly enjoyed a high reputation; but its numbers have within the last dozen years fallen from 200 to 100. The king's scholars are elected for merit, and four years after their election are sent as students to Christchurch, Oxford, or as scholars to Trinity college, Cambridge. The school forms part of the collegiate establishment of the abbey. 2. The Charterhouse (corrupted from *Charterhouse*), founded in 1611, and endowed with property, the gross rental of which in 1815 was £30,000 a year, is intended for the liberal education of 73 youths, 39 of whom are supported at the universities by exhibitions varying from £80 to £100 a year, and tenable for eight years. Besides the 44 foundation boys, the school is attended by others, whose number fluctuates according to the reputation of the masters, &c. A few years ago, after the im-

LONDON.

provements introduced by Dr. Russell, this school had a very high character, and the pupils were very successful in the competition for honours at Oxford and Cambridge; but since his retirement the school has been in a languishing condition. 3. Merchant Tailors' school, founded in 1561, in Suffolk-lane, Thames-street. The statutes provide that a classical education be furnished gratis for 100 boys, and for 150 others at rates varying from 5s. to 2s. 6d. a quarter. The scholars are examined once a year, and the most advanced are sent to St. John's College, Oxford, where 37 valuable fellowships were founded by Sir Thomas White for the encouragement of boys brought up in this school. 4. St. Paul's school, established in 1518 by Dean Colet, and placed by him under the direction of the Mercers' Company, provides a free education for 153 boys, the most advanced of whom are sent to Oxford and Cambridge, with exhibitions varying from £50 to £100 in value. Lord Camden has been a liberal benefactor to this school. The present building was erected in 1834; the gross income of the school is upwards of £2000. 5. Christ's hospital, more commonly known as the Blue-coat school, one of the noblest institutions in the city. It was incorporated by Edward VI. in 1553, and owes its origin to the active benevolence of some distinguished citizens. It was intended to maintain, clothe, and educate the young and helpless; and 390 boys and girls were admitted soon after its foundation. A second charter from Charles II., in 1673, provided for the education of 40 boys in mathematics and other learning calculated to qualify them for the sea-service. The management of the institution is vested in a body of governors (473 in 1840) who have each contributed, at least £400, to the funds of the institution; but very recently the qualification for a governor has been raised to £500. An individual, on becoming a governor, is entitled to present one boy; and he has usually a presentation once every succeeding three years. The present (1840) revenue of the hospital, arising from rents, and all other sources, amounts to about £70,000 a year, and its expenditure to nearly as much. Its establishment in London, on the site of the Old Grey Friars' monastery, accommodates at present, 787 boys; and it has attached to it a subsidiary establishment at Hertford, for the younger children, where there are now 494 boys and 76 girls; making in all 1387 children, maintained, clothed, and well educated by the establishment. There are schools for grammar, mathematics, writing, and drawing. The *Grecians*, or those most advanced in the grammar-school, are sent with valuable exhibitions to Oxford and Cambridge, and those in the mathematical school are placed with commanders of ships, and equipped with clothing and nautical instruments, at the hospital's expense. Others are apprenticed to different trades. A magnificent building, called the Great Hall, erected by public subscription, and finished in 1830, opens towards Newgate-street, and is one of the finest ornaments of the city. The hall, in which the children breakfast, dine, and sup, is 187 feet in length, 51 in width, and 44 feet high. Occasionally they sup in public, and on these occasions there is a great concourse of strangers to witness the spectacle, which is of the most interesting description. The whole interior arrangements deserve the highest praise; and every attention is paid to the health and comfort of the children. The well-known dress of the boys, which has not been changed since the formation of the institution, is, however, not merely antiquated, but inconvenient and uncomfortable; and it is certainly high time that it were modified. Presentations can only be obtained from the governors; who, speaking generally, exercise their patronage with the greatest disinterestedness. 6. The city of London school, established in 1835, may be said to have resulted from the inquiries of the charity Commissioners. A Mr. Carpenter had left an estate for a school, and the value of the property had greatly increased without any proper application of the funds. Repeated inquiries and remonstrances at length induced the corporation to establish a school on the site of Honey-lane market, Cheap-side. The system of instruction is good, and the school is attended by upwards of 400 boys. The buildings, occupying a space of 180 feet long and 80 feet broad, are commodiously contrived, and have externally some pretensions to architectural elegance. Independently of the endowed schools, almost every parish supports a free school by voluntary contributions, and thus about 12,000 children of both sexes are clothed and educated. The number of private and Sunday schools is considerable, but cannot be accurately estimated. The National society, which has its model school in the Sanctuary at Westminster, gives instruction in various schools to nearly 9000 children, and upwards of 3000 are taught in the Lancasterian method by the British and Foreign School society, which has a good normal and model school in the Borough road. Much, however, still remains to be done towards giving a sound elementary education to the children of the industrious classes; though,

at the same time, it must be admitted that more has been effected in this respect during the last 20 years than our ancestors had done during entire centuries. (*Ceriales; Educ. Rep.*)

The charges on account of education at most of the public schools in London are oppressively high, far higher, indeed, than they ought to be; and this circumstance, combined with the want of schools in many districts, and the wish to improve their health, has led to the practice, so general in London, of sending children to the outskirts of the town to be boarded and educated. But the education in very many of these boarding establishments is of a very worthless description; and it is really surprising that no effort should have been made, by subjecting the masters to examination, establishing proprietary boarding-schools, or otherwise, to improve the quality of these suburban seminaries.

British Museum.—This truly national institution, established in 1753, is a grand repository of books, MSS., statues, coins, and other antiquities specimens of animals and minerals, &c., and is, in most respects, one of the richest in Europe. It is principally deposited in Montagu-house, formerly the residence of the duke of Montagu, Green, in Russell-street, Bloomsbury. The nucleus of the collection was purchased by government of Sir Hans Sloane's executors for £20,000, and the museum was first opened to the public in January, 1759. But Montagu-house, though spacious as a private residence, has long been found inadequate to the proper accommodation of the vast and continually increasing collections that belong to the museum; and in consequence a new quadrangular building has been designed by Sir E. Blore, a part of which is already completed, and open to the public. In 1755, the Harleyan MSS. were purchased, and the Cottonian library was removed from Dean's Yard, Westminster; in 1757 the royal library, founded by Henry VIII. out of the libraries of the suppressed monasteries, and enlarged by his different successors, was presented by George II., in 1763, gave a valuable collection of pamphlets on the civil wars, and between 1806 and 1818 the Lansdowne, Hargrave, and Burney MSS. were purchased at an expense of £26,400. Various presents have been made from time to time, but the most valuable addition of late years has been the library of George III., collected at an expense of £300,000, and presented to the museum by his successor.* Modern English publications are added, free of expense, in consequence of a privilege which this establishment enjoys in common with the two universities, and some other bodies, of receiving *gratis* a copy of every book entered at Stationer's Hall; and about £3000 a year are expended in the purchase of old and foreign works, in the latter of which, however, the library is still extremely deficient. There are about 330,000 printed books, and 37,000 MSS., exclusive of charters. The want of a catalogue *raisonné* is much felt by the great majority of persons who resort to the library for study or research. The reading-rooms are open from nine till four in the winter, and till seven in the evening during four summer months. The average number of readers is about 930 a day. Admission is procured by a recommendatory letter either to one of the trustees, or to the chief librarian; and every facility is given by the numerous attendants for the most extensive research. No books are allowed to be taken out, it being supposed that such permission would lead to frequent and heavy losses; but, provided the value of the books were previously deposited, we incline to think that certain descriptions of works might be lent out with great advantage. In the department of antiquities may be mentioned the collection of Egyptian monuments, including the famous Rosetta stone (see vol. i. p. 831), acquired at the capitulation of Alexandria, in 1801; the Townley marbles, purchased at £28,000; the Phigalian and the Elgin marbles, the cost of which was £25,000; the latter include the statues of Theseus and Ilianus, and the sculptures in *alto-relievo*, from the friezes of the Parthenon. The collection of minerals was, for many years, deficient in various important particulars; but the recent additions purchased from Messrs. Hawkins and Mantell are extremely valuable; and now, both for size and classification, this department will bear to be compared with any mineralogical collection in Europe. The department of zoology is rich in birds and insects, but poor in other respects, especially in mammalia. The collection of medals, which has been accumulating since the foundation of the museum, consists of about 50,000 coins, above 6000 being purchased with the Hamilton collection of Herculanean antiquities, in 1773. The coins can only be seen by an order from a trustee, or a private introduction to the officer to whose charge they are entrusted. The public days at the museum are Mondays, Wednesdays, and Fridays, when all persons

* It is much to be regretted that this library had not been placed in an accessible situation in the W. end of the town.

LONDON.

have free admission from 10 to four, and in the summer months from 10 to seven. The building is closed during the first weeks of January, May, and September. The establishment is governed by 48 trustees, 23 of whom are official; and to these the officers are responsible. The chief acting trustees, with whom the appointment of the officers rests, are the archbishop of Canterbury, the lord chancellor, and the speaker of the House of Commons. (*Parl. Rep. on British Museum, 1835.*)

Literary and Scientific Societies.—Before the present century the learned societies of London were few in number, and very comprehensive in their objects. The great advancement of the physical sciences, in recent times, and the increased ardour with which every branch of knowledge has been cultivated, have produced a corresponding increase in the number of learned associations, and in all recent instances each body has confined its operations within a limited sphere. The following list comprises the principal societies, with the dates of their formation, the objects contemplated by them, when not sufficiently indicated by their names, and the publications made at their expense:

The Royal Society; physical and mathematical sciences. Instituted early in the 17th century; incorporated 1663. "Philosophical Transactions," from the year 1665.

The Society of Antiquaries. Instituted 1717; incorporated 1781. "Archæologia," from the year 1770. Medical Society. Established 1773. "Vetusta Monumenta," from 1747.

Society of Arts. Established 1754, for the encouragement of the arts, commerce, and manufactures of Great Britain, by granting rewards. "Transactions," from the year 1783.

Linnean Society; natural history. Established 1788; incorporated 1803. "Transactions," from the year 1791.

Royal Institution. Established 1799, for the application of science to the ordinary purposes of life. "Journal," from 1818.

Hericultural Society. Established 1804; incorporated 1808. "Transactions," from 1812.

Royal Medico-Chirurgical Society. Established 1805. Chartered 1831. "Transactions," from the year 1806.

Geological Society. Established 1807; incorporated 1826. "Transactions," from 1811.

Society of Civil Engineers. Established 1817; incorporated 1836. "Transactions," from 1834.

Royal Astronomical Society. Established 1820; incorporated 1831. "Memoria," from 1822.

Medico-Botanical Society. Established 1821. "Transactions," from 1834.

Royal Asiatic Society. Established 1823; incorporated 1824. "Transactions," from 1827 to 1833; "Journal," from 1824.

Royal Society of Literature. Founded 1821; incorporated 1825. "Transactions," from 1827.

Royal Institution. Instituted 1825; incorporated 1826. "Transactions," from 1823.

Royal Geographical Society. Chartered 1830. "Journal," from 1831.

Entomological Society. Established 1833 or 1834.

Statistical Society. Established 1834. "Journal," from 1837.

Architectural Society. Established 1831.

Royal Institute of British Architects. Established 1835; incorporated 1836. "Transactions," from 1836.

Royal Botanic Society. Chartered 1839.

Nearly all these societies hold meetings twice a month, from November to June inclusive; at which papers are read illustrative of matters connected with the objects of each association.

The following Table, taken from Gilbert's "Clerical Almanack" for 1840, supplies several details with respect to some of the more important of these societies, on which, it is believed, considerable reliance may be placed: [See top of next column.]

Picture Galleries.—The present national collection of pictures is of recent foundation, and should only be looked upon as the nucleus of one that may hereafter be worthy of the country. It occupies the W. wing of the National gallery, erected 1824-37, at the public expense, on the N.W. side of Trafalgar-square, facing Whitehall and Parliament-street, unquestionably the finest situation in the metropolis. The building has a front of 500 feet, with a portico and dome in its centre, supported by Corinthian columns. But whether it were owing to the limited means placed at the disposal of the architect, or to some imperfection on his part, the fabric is neither worthy of its site, its object, nor of the country. Unfortunately, too, the defects of its exterior are not counterbalanced by any superiority of internal economy, the apartments for the exhibition of the pictures being miserably deficient in point of size, and ill-arranged. The pictures, which consist of the Angerstein

* Those marked with an asterisk have charters.

collection, purchased in 1824, of Sir G. Beaumont's collection, given by him in 1836, and of others, partly presented and partly purchased, amounting in all to about 170, are arranged in five rooms, of such diminutive size, that they will contain only a few more pictures, and none of large size. About half the pictures belong to the Italian school; and of these the *Ecco Homo*, and the Mercury, Venus, and Cupid, of Correggio; the Raising of Lazarus, by Sebastian del Piombo; the Bacchus and Ariadne, of Titian; and the Holy Family, by Murillo, are reckoned the most valuable. The works of the two Caracci, N. and G. Poussin, and Claude, may be here seen in their highest perfection; and there are some fine specimens of the English school, by Reynolds, Hogarth, Gainsborough, Wilson, and Lawrence. The gallery is open to the public on the first four days of the week: on Friday and Saturday students are permitted to copy the pictures. The Royal academy, which at present (by permission of government) occupies the remainder of this edifice, was established in 1768, for the instruction of young artists: lectures are delivered in anatomy, painting, sculpture, and architecture, and daily instructions are given to the students by the keeper, and other academicians. The annual exhibition of this corporate society usually comprises about 1800 specimens of art, and is one of the favourite lounges during the summer months. The profits of the exhibition, besides paying all the expenses of the schools, contribute to form incomes for the most deserving artists, while studying at Rome. (See *Comm. Report on the Arts, &c., of 1836.*) The society of British artists exhibits annually a good collection of pictures; but, as a whole, they are very inferior to those exhibited by the academy. The British institution, and society of painters in water colours, have also exhibitions, and their rooms are crowded during the fashionable season.

Theatres and Music.—The great theatres of modern London present a curious contrast to the rude and confined buildings called the Globe, Blackfriars, and Old Drury, in the time of Shakespeare, in which neither scenery, decorations, nor the comfort of the audience were at all considered.

The two patent theatres, Drury Lane and Covent Garden, contiguous to each other, have handsome exteriors, and very extensive and highly decorated interiors. They enjoy or rather are supposed to enjoy, the exclusive privilege of representing tragedy and comedy, the legitimate drama; but the declining taste of those who visit the theatres, and the caprice of managers, have led to the frequent introduction of spectacles, and other pieces, to which music and scenery contribute more than the actors on the stage. Late dinner hours and other circumstances have of late years occasioned a great falling off in the taste for theatrical exhibitions, which are now visited more by strangers than by residents in London. At present few theatres are profitable. The Haymarket theatre, which has recently enjoyed more than ordinary prosperity, is of smaller size, and therefore better adapted for hearing, than the immense houses above mentioned: it is open during about eight months of the year, including the recesses of the two patent theatres. Besides these, there are several minor theatres, the names, localities and objects of which are given in the table at the top of next page.

Among these, Astley's deserves particular notice, for the excellent horsemanship displayed by M. Ducrow and his *corps dramatique*: it is certainly superior to the Franconi theatre at Paris.

The Italian Opera house, in the Haymarket is the largest theatre in London. It scarcely, however, deserves the name of a national theatre, inasmuch as the singers, dancers, and musicians are chiefly foreigners, and as it depends for its support chiefly on the patronage of the court, nobility, and higher classes, many of whom hold private boxes, at rents averaging from £190 to £400 a year. All the patronage of rank and wealth, however, cannot, owing to the enormous cost of the performances, make it a good speculation for the manager, who at the end of an anxious season has frequently to lament heavy losses. The established London concerts consist of the ancient, phil-harmonic, and sacred-harmonic concerts, all of which are well and fashionably attended: many others are given by professional persons, for their own benefit, in the different public rooms at the W. end. The promenade concerts lately introduced, in imitation of those at Paris, promise, by the high favour which they enjoy, to improve the musical taste of the people, which has undoubtedly been on the increase during the last few years.

Benevolent Institutions.—There are above 70 establishments in London for the cure of disease; of which, 27 are properly hospitals; 25 dispensaries, where medicine and advice are gratuitously administered; nine are infirmaries for special diseases; and 11 lying-in charities. There are also 18 asylums for orphans and otherwise destitute persons, and various other benevolent establishments. The principal are the following:

1. St. Bartholomew's hospital, in West Smithfield, was first founded in the 12th century, and refounded by Henry VIII. in 1546. The building, a spacious quadrangular structure, is principally modern, having been finished in 1770. It makes up 600 beds, and receives annually about 5000 in-patients, and 6000 out-patients. Necessity is the only recommendation to this institution; and patients are received without limitation. The medical staff is equal to any in the metropolis. The staircase was gratuitously painted by Hogarth.
2. Guy's hospital, St. Thomas's-street, Southwark, founded in 1721, contains accommodation for 500 in-patients, and has an excellent museum and theatre of anatomy. This magnificent hospital, which consists of two quadrangles and two wings, was founded and endowed by Thomas Guy, a bookseller, who expended £18,793 upon the building, and left £219,419 for its endowment—the largest sum, perhaps, that has ever been expended by any individual on similar purposes. Recently, however, Guy's hospital has met with another benefactor, but little inferior, in point of liberality, to its founder; a citizen, of the name of Thomas Hunt, having bequeathed to it, in 1829, the princely sum of £200,000. The medical school attached to this hospital, while under the superintendence of the late Sir Astley Cooper, was one of the most extensive, and probably, also, the best in the empire.
3. St. Thomas's hospital, in High-street, Borough, was formed out of two other charities by Edward VI. and rebuilt in 1693. Additions were made in 1739, and a large part was rebuilt in 1836. It contains 18 wards, and 485 beds. The annual expenditure is about £10,000.
4. St. George's hospital, near Hyde park corner, lately rebuilt, has a fine front, 200 feet in length, facing the Green park. It accommodates 460 in-patients.
5. The Middlesex hospital, near Oxford-street, founded in 1745, receives 300 in-patients, and relieves numerous out-patients.
6. London hospital, in Whitechapel, was founded in 1740. Its wards accommodate about 320 patients.
7. Westminster hospital, rebuilt in 1833, near the Abbey, receives 230 in-patients.
- The University College and King's College hospital, and Charing Cross hospital, are smaller establishments of the same nature, each accommodating about one hundred and twenty patients.

Medical schools are connected with the above hospitals, in which lectures are delivered by the officers, and which are attended, altogether, by about 1200 students.

Bethlehem hospital, or Bedlam, is appropriated exclusively to the insane poor; it was founded in 1675, in Moorfields, whence it was removed, in 1814, to St. George's fields. The present building, received some extensive additions in 1839, and is now 697 feet in length, being at once extensive and magnificent. The rooms are large and airy, well warmed and ventilated, and are sufficient for the ac-

commodation of an immense number of patients. St. Luke's, City-road, established for a similar purpose in 1751, accommodates 200 persons.

The Foundling hospital, Brunswick-square, was founded by Capt. Coram, in 1739, but the building was not commenced till 1743. It was established for the indiscriminate admission of deserted children; but the numbers were found to increase so rapidly, that the funds failed, and in 1760 the mode of admission was so much altered, that it is now anomalously only a Foundling hospital. The number of children averages about 450, and they are maintained till the age of 15, when they are either apprenticed or otherwise provided for. The revenue is about £13,000 per annum.

The Magdalen hospital, Blackfriars-road, was established in 1748, for the reformation of erring females: the object is said to be attained in the majority of cases, more than two thirds of the females admitted being either restored to their friends, or provided with the means of procuring an honest livelihood.

The Philanthropic institution, St. George's fields, was founded, in 1788, for the reception and reform of young criminals discharged from prison. It provides them with immediate means of subsistence, and instructs them in some trade, so as to prevent the otherwise almost inevitable necessity of their returning to their former habits.

Hotels and Taverns.—The hotels, taverns, and coffee-shops of all classes, may be reckoned at something more than 6000. There are about 36 great hotels, situated chiefly at the W. end of the town, in the neighbourhood of Piccadilly. "In these establishments," says Prince Puckler-Muskau, "everything is infinitely richer and more abundant than on the continent." The commercial and other inns, amounting to nearly 400, are scattered throughout the metropolis. They are generally respectable establishments, some of them being quite as commodious, if not so elegant, as the fashionable hotels. The establishments of licensed victuallers, under which denomination are included all places for the retail sale of spirits, amount to about 5000. Many of these are respectably conducted, though some are of an opposite character. The publicans furnish their guests not only with beer and spirits, but also with dining accommodation, &c. The gin or dram shops have been very much embellished of late years; and many of them are so handsomely, and even splendidly, fitted up, that they have acquired and are entitled to the name of "gin palaces." But notwithstanding the number and magnificence of these establishments, there is no real room or ground for the prevalent opinion, as to the increase of intemperance. No doubt it is much too widely diffused; but it nevertheless admits of demonstration, that, as compared with the population, the consumption of spirits in the metropolis is now very decidedly less than in the reign of George II., and the greater part of that of George III.; and that there has been a corresponding improvement in the habits of the lower classes.

The eating-houses and coffee-rooms, where spirits are not sold, amount to about 700; and are more numerous in the city than in Westminster. There are about 600 beer-shops. Numerous private houses are let out in lodgings, and many families receive boarders. The expense of living in these establishments varies, of course, with the quality of the house and the means of the guest. A lodger at an inn can hardly be accommodated, on a decent scale, much below 10s. a day, including all expenses of board, food, and servants; the maximum of the scale will, of course, depend on the habits or caprice of the guest. Board and lodging in private houses may be obtained at a somewhat lower rate than at hotels; but a single man in lodgings usually dines at an eating-house, and families generally prefer boarding at their own cost. A dinner (without wine) at an ordinary eating-house costs from 1s. 6d. to 2s.; and seldom exceeds 5s. at the more elegant establishments. In most cases the guest may depend on every attention; and at the superior houses he will find all the luxuries of the season.

Clubs.—There are about 40 clubs in the metropolis. A few of these establishments, such as Brooks's, Boodle's, and White's are of ancient date; but their present arrangements and constitution are of recent introduction. The accommodation they afford to gentlemen only occasionally visiting town, and to others desirous of enjoying the luxuries of a splendid establishment, at a modern expense, and of meeting with a great variety of society, has made them popular among the upper classes. The club-houses are mostly edifices of a very superior character; and add much to the magnificence of the squares and streets in which they are situated. Each club consists of a limited number of members, varying from 1000 to 1500; they are admitted by ballot, pay a certain sum at entrance, from 10 to 25 guineas, and an annual subscription, varying from 5 to 10 guineas. The club-houses are fitted up with every lux-

LONDON.

try of a fashionable hotel, have excellent libraries, take in the best periodical publications, and provide dinners, coffee, wine, &c., at reasonable prices. A large building has recently been opened, in Regent-street, in the view of supplying strangers, frequenting the clubs, with beds. Some of the clubs are avowedly of a political character, and others are devoted exclusively to certain classes. Among these may be specified the Carlton, Reform, City Conservative, United Service, Oxford and Cambridge, Traveller's, Oriental, and West India; but most clubs are open, on election, to all gentlemen without reference to party or profession. Most of the club-houses are at the W. end of the town, particularly in Pall-mall and St. James's-street. The building erected for the Reform club, by Mr. Barry, is the finest structure belonging to this class of edifices; and is fitted up with equal taste and magnificence. The city of London has two club-houses, which, in point of elegance and luxury, may vie with those of the W. end. The number of members in the different clubs may be about 30,000.

Courts of Law.—The Courts of chancery, Queen's bench, Common pleas, and exchequer (the respective provinces of which are described in the article ENGLAND AND WALES), occupy apartments on the W. side of Westminster-hall. This hall, built by William Rufus, was long supposed to be the largest room in Europe unsupported by pillars. It measures 370 feet in length by 74 in breadth, and is 90 feet high; but these dimensions have been much surpassed by the great plate-glass hall of Ravenhead, which is 336 feet long, and 155 feet broad, with a proportional height. Westminster hall has been used for coronation banquets, the last of which was given when George IV. was crowned. Parliaments have often met in it, and it is occasionally appropriated to important trials; among which may be specified, that of Charles I., and more recently those of Warren Hastings and Lord Melville. Ordinarily, however, it is a mere promenade for lawyers during the sitting of the courts. The lord chancellor sits out of term-time in the hall of Lincoln's-inn, near which is another court, occupied by the Vice-Chancellor.

The Central criminal court, the jurisdiction of which extends to all places within 10 m. of St. Paul's, was established in 1834. Its sittings are held at the Old Bailey, a stone building close to Newgate, once a month, and generally last five or six days at a time. There are two halls, of confined dimensions, in both of which the judges are engaged in trying prisoners during the sessions.

The court of Bankruptcy is in Basinghall-street, within the city of London; the court for the relief of Insolvent Debtors, in Portugal-street, Lincoln's Inn Fields; the Marshalsea and Palace courts are in Scotland-yard, Charing Cross; the Ecclesiastical and Admiralty courts, in Doctors' Commons, near St. Paul's; courts of Requests, which give summary judgment in case of small debts, are numerous in different quarters. The jurisdiction of the several courts is explained in the article ENGLAND AND WALES, vol. i, p. 854.

Inns of Court.—The Inns of court, originally colleges for legal study, are now little more than residences for lawyers, or indeed for any one who chooses to hire chambers in them. They are not incorporated, and cannot, consequently, make bye-laws; but, by prescription, their customs have obtained the force of laws. A law student, before being called to the bar, has now only to be entered as member of one of these Inns, and to dine a certain number of times in the common hall, in order to qualify himself for the exercise of his profession. This is termed "eating" his way to the bar.

The chief Inns are the Inner and Middle Temple, originally built by the knights templars in Fleet-street, in the reign of Henry II.; Lincoln's Inn, in Chancery-lane, Gray's Inn. Subordinate to the Temple, are Clifford's, Lyon's, Clement's, and New Inns. Furnival's Inn belongs to Lincoln's Inn; Staples Inn and Barnard's Inn are attached to Gray's Inn. These are called Inns of Chancery. Theatres, and some others, have become mere private residences.

Prisons.—There are 10 criminal prisons, of which three are in the city of London. 1. Newgate, under the control of the corporation, is a building, the architecture of which is singularly characteristic of its destination. Newgate was a prison early in the 13th century; but the present edifice was erected in 1779, and again repaired after the riots of 1780. This, which may be called the great metropolitan jail, contains accommodation for about 400; but occasionally upward of 1000 are crowded within its walls. In front of this prison all the criminals of London and Middlesex, capitally convicted, suffer the last penalty of the law. It is said to be one of the worst regulated jails in the kingdom, "a fruitful source of demoralization to its unhappy inmates, and a reproach to the character of the city corporation." (*Police Inspectors' 4th Report*, p. 251.) 2. The Bridewell,

near Blackfriars Bridge (once a royal palace), is a house of correction for vagrants, pilferers, or disorderly persons, summarily convicted before the lord mayor and aldermen. The number confined averages 100; the prisoners are classified, the silent system adopted, and the tread-wheel generally used. 3. Giltspur-street compter, opposite St. Sepulchre's church, a plain edifice with a stone front, is used as a place of confinement for untried prisoners, and as a house of correction for offences less grave than those of the inmates of Newgate. Its use is restricted to offenders convicted by the city magistrates. It holds about 160, and there is no classification. 4. Clerkenwell prison, belonging to the county of Middlesex, is one of a similar character with the last. It serves, also, as an auxiliary to Newgate, receiving prisoners remanded from the police courts, or committed for trial at the general sessions. Its inmates average 180, and some attempt has lately been made at classification. 5. Cold-Bath-Field prison, a very extensive brick building, near Gray's-inn-lane, is a house of correction for Middlesex; and contains felons, misdemeanants, and rogues and vagabonds. It is an insulated brick building, containing spacious courts and airy grounds. The classification is good, and the silent system is followed, connected with hard labour. A large tread-mill employs 330 prisoners at a time. This prison accommodates upward of 1300. 6. The Westminster bridewell, begun in 1831 and finished in 1834, is surrounded by a lofty wall, with a complete roadway outside: it is built on the Panopticon principle, and has a courtyard in the centre 250 ft. in diameter, with prisons round it for 600 persons; but the average number confined is 350. The arrangement of the building is said to be excellent; and the window of the governor's house commands a complete view of all the day-rooms and yards, and of the two tread-wheels. Instruction is given to juvenile offenders. The silent system is adopted, and a good classification maintained. 7. The penitentiary, at Millbank, Westminster, built on the Panopticon principle, has no peculiar connexion with the metropolis, but is intended for the confinement and reformation of criminals whose sentence of transportation or death has been commuted. It contains accommodation for 1130 prisoners; but the number of inmates averages about 600. The building is insulated, and is surrounded by a wall enclosing 18 acres of ground. The penitentiary is managed by a committee, nominated by the secretary of state, and the chaplain is the governor. 8. The Surrey county jail is in Horsemonger-lane, Newington Causeway. It contains about 250 prisoners, debtors as well as criminals; and there is little classification. The top of the building is used as a place of execution. 9. The borough compter, in Tooley-street, is also a prison for debtors and criminals. The management and discipline of this prison are stated to be exceedingly defective: the average number of inmates is about 40. 10. The Brixton House of Correction is exclusively confined to prisoners sentenced to hard labour at the assizes and sessions, or by magistrates, under summary convictions. Hard labour and the silent system are rigorously enforced. The average number of prisoners is 280. (*Inspect. of Pris. Rep.*, 1836-37.)

The following Table, drawn up from the Jail Returns and Prison Inspectors' Reports for 1839, furnishes some details respecting the economy of the Metropolitan Jails:

Prisons.	Power of Accommodation.	Prisoners, Mich. 1839.	Ann. Cost. of each Prisoner.	Total Annual Exp.
<i>City of London:</i>	<i>Prisoners.</i>		<i>£.</i>	<i>s.</i>
Newgate	500	153	6 11	6,760
Giltspur-street	240	172	10 1	5,880
Bridewell	120	96	9 6	5,106
Borough Compter	40	39	4 6	998
<i>County of Westminster:</i>				
Tollitt Fields	1,180	840	4 16	7,104
Gen. Penitentiary	1,190	454	10 8	12,394
<i>County of Middlesex:</i>				
Clerkenwell	490	180	5 7	4,153
Cold-Bath-Field	1,300	1,118	9 6	17,062
<i>County of Surrey:</i>				
Horsemonger-lane	600	230	7 1	4,405
Brixton	500	364	12 18	4,291

The principal prisons for debtors are, 1. The Queen's Bench, in the borough, chiefly used for debtors on process from the court of Queen's Bench, but also for persons committed for libels, contempts, &c. It is a spacious healthy prison, containing 234 rooms, in which 500 persons have occasionally been confined at once. The rules of the bench, a district in which prisoners may purchase the liberty of residing out of prison, include a space of nearly 1 sq. m. 2. The Fleet prison, in Farringdon-street, is chiefly for debtors under process from the court of Common Pleas, and those committed under Exchequer process, and for contempts of the court of Chancery. The rules of the Fleet are not so extensive as those of the Queen's Bench. 3. White Cross-street prison, in the street of that name, in the city, is inconveniently built and wretchedly managed.

LONDON.

Its confined extent, when compared with the average number of the inmates, and the fifth and disorder prevalent in every part of it, are not a little discreditable to the corporation of London. 4. The Marshalsea prison, in the borough of Southwark, is a small prison for persons committed by the Marshalsea court, and for debtors arrested under process in the Palace court. It is a quadrangular building, containing about 60 rooms, and accommodation for about 100 prisoners. The debtors' prisons have been comparatively deserted since the new act respecting imprisonment for debt came into active operation; but before that time they were often inconveniently and even unwholesomely crowded.

Crimes.—The crimes committed in London are both grave and numerous; but the degree of demoralization, as compared with the population, is not greater than in other places offering the same facility for successful depredation, and having an equal amount of poverty. The Report of the Constab. Comm. gives the following statement of depredations known to the metropolitan police in 1838:

Burglars and housebreakers	217
Highway-robbers	38
Pickpockets and common thieves	4,430
Coiners and utterers of base coin	345
Forgers	3
Swindlers, &c.	390
Horse and dog stealers	152
Begging-trail impostors	136
Disorderlies, habitual	2,706
Vagrants	2,995
Street prostitutes	6,371

The annual average of convictions during several late years within the metropolis amounts to 3300 (or about 1 in 415 of the entire population), more than half of which are for slight crimes demanding six or three months' imprisonment. Capital offences, except murder, are now generally punished by transportation for life to the new penal settlement, Norfolk Island. The executions in London have averaged two annually during the last seven years. The serious crimes of the metropolis are undoubtedly on the decrease; and the frequent notification of them at present is more owing to the vigilance of the police, who detect and prosecute offenders, than to any actual increase of crime. (*Constab. F. Com. Report*, i., 13.)

The following Table exhibits the Average Annual Amount of Crimes in and about London during six years (1834-1839), and the Proportion which the Convictions in Middlesex and the four Metropolitan Counties respectively, as compared with their estimated Population in 1837, bear to those in England and Wales, as compared with its Population: the Convictions in the latter being considered as 1:

Classes of Crimes.	Average Annual Convictions.				
	Middle. sex.	Ratio.	Metrop. Co.	Ratio.	Eng. & Wales.
I. Offences against the person :					
Murder	1	55	4	135	19
Man-slaughter	2.8	97	15	25	101
Attempts to main, &c.	9.6	146	18	137	70
Assault	167	218	279	194	909
Child-stealing	1.5	503	2	256	3
Sexual crimes	29	154	47	137	167
Total of Class I.	218	132	326	147	1,198
II. Offences against property, with violence :					
Housebreaking and burglary	77	119	155	129	648
Robbery and attempts at do.	18	60	37	36	231
Total of Class II.	95	109	192	115	685
III. Malignous offences against property :					
IV. Offences against prop. with- out violence :					
Horse and cattle stealing	15	43	80	98	946
Larceny, &c.	1,992	136	2,998	129	12,041
Embezzlement and fraud	104	904	155	103	808
Total of Class IV.	2,011	155	3,111	143	12,985
V. Forgery and coining :					
VI. Other offences :					
Riots, &c.	27	97	45	58	467
Swearing	all.		1	134	4
Practising	all.		7	68	113
Keeping bad houses	25	377	30	233	70
Various	14-6	190	30	140	76
Total of Class VI.	68	92	103	76	730
Average yearly amount of all con- victions	2,498	154	4,270	143	16,092

The increase of crime in and about London has been chiefly in attempts to maim and kill (83 per cent.), in sexual offences (33 per cent.), in frauds (73 per cent.), and in larcenies (24 per cent.): there has been a decrease in robberies of 22 per cent., in riots of 33 per cent., and in poaching, &c., of 117 per cent. Independently of the offences tried by juries, many others are summarily punished by the police mag-

istrates, amounting annually to about 17,000, exclusive of fines for disorder and drunkenness. (*Off. Criminal Tables*.) **Police.**—Till 1830, the police of London had the reputation of being the most defective establishment of the kind in Europe. A great reformation, however, has been effected within the last few years, and the metropolis is now, perhaps, superior in this respect to any other in Europe. There are 11 police offices, two of which are in the city, and one in Southwark. These are:

The Guildhall in the City.	Great Marlborough-street,
The Mansion House, do.	Oxford-street.
Bow-street, near Covent Garden.	Worship-street, Finsbury-square.
Hatton Garden, near Holborn.	Lambeth-street, White-chapel.
Queen-square, Westminster.	Union Office, Southwark.
High-street, Marylebone.	Thames Police, Wapping.

The first two of these offices are regulated by the city authorities; the rest are under the control of the secretary of state. Magistrates sit every day at each office, to hear and determine cases of misdemeanor and breach of the peace, as well as to examine and commit for trial all persons accused of felonies, to administer oaths, swear in constables, and to perform other magisterial functions. A number of officers is appropriated to each establishment, and to the Thames office a river police is attached.

The chief instrument of preserving the peace of the metropolis, is the metropolitan police, established in 1829. This body is dispersed over the whole of London, excepting the city, which is protected by a distinct body, of similar character, but less effective and worse disciplined. The city police is under the control of the corporation: the other force is governed by two commissioners, who communicate directly with the secretary of state for the home department. The whole body is divided into 17 companies, to each of which is attached a conveniently situated station-house: each company is placed under a superintendent, who has under him 4 inspectors, 16 sergeants, and 144 constables. Their duties reach beyond the metropolis, extending from Brentford on the W. to the borders of Essex on the E., and from Norwood on the S. to Highgate N. The expense is defrayed by an assessment limited to 8d. in the pound on the parish rates, the deficiency being made up by the treasury. The city, as before said, is not under the charge of the metropolitan police, but is protected by a body of men organized on the plan, and in imitation of the arrangements of that body, but placed under the city authorities. The city police, consisting of 500 men, is divided into six companies, to each of which belong inspectors, sergeants, and constables, and the whole is immediately under the control of a superintendent. All the constables, both of the city and metropolitan police, wear a blue uniform, with the number of each man, and a letter designating the division to which he belongs on the collar of his coat. They are constantly on duty, day and night; but the force is increased at night. The services conferred on the community by the metropolitan police may be in some measure estimated from some details furnished in the report of the constabulary force commissioners. It is there stated, that in the years 1836-38 they saved 300 lives, and prevented 152 suicides, rendered assistance at 2430 accidents and 75 fires, relieved or conducted to a place of safety, 1876 sick, insane, or otherwise helpless persons, and restored to their homes 2830 lost or strayed children: during the same period, they recovered from thieves, &c., £14,430, and from careless exposure and drunkenness, £54,312. (*Constab. Force Com. Report*, i., 292.)

Pauperism and Mendicity.—London, with all its wealth, contains much misery and indigence, a large proportion of which, however, is attributable more to demoralization than mere misfortune. Since the Poor Law Amendment Act, most of the metropolitan parishes have placed themselves under its regulations, only 11 parishes still adhering to the old system of maintaining their poor. The money expended in maintaining the poor within the metropolis in 1839 amounted, according to the last Report of the Poor Law Commissioners, to £374,744. The mendicants, a class almost wholly separate from the paupers, pursue their vocation almost as regularly and with as much success as tradesmen. The Mendicity Society have laboured usefully in exposing the impositions of mendicants; but neither their agents nor the new police have been able to suppress them. "Of the London beggars, nine out of ten are gross impostors and convicted vagrants; and of these the very worst are the blind and cripples. The records of the above society afford surprising proofs of the profligacy of the regular street-beggars, and the inveteracy of their idle and dishonest habits. The metropolitan police, in 1837, apprehended 4300 mendicants." (*Metrop. Police Off. Rep.*, 1838.) The really indigent are relieved by an excellent institution, entitled the Refuge for the Destitute, which provides a meal and a bed

LONDON.

for those who give satisfactory proof of requiring such assistance. The private lodgings of mendicants are crowded, unwholesome, and literally sinks of iniquity.

Water.—The supply of London with water was anciently procured from brooks running through the city. The increase of inhabitants made these sources insufficient; while, at the same time they became less accessible, owing to the encroachment of buildings. To remedy this inconvenience, water was brought by leaden pipes in the 13th century from Tyburn, then a mere country village, into the city, where it flowed into conduits from which the inhabitants drew it at pleasure. In the beginning of the 17th century Sir Hugh Middleton projected, and, in despite of the greatest difficulties, carried into effect, in 1613, his plan for bringing the water of two copious springs in Hertfordshire to London, by an aqueduct, called the New River, 40 m. in length, including windings. The Thames has long been one of the great sources of supply; and, as early as 1581, water-wheels and other hydraulic machinery were established at London bridge. These wheels, which at one time raised 45,000 hogsheads per day, were wholly removed when the old bridge was pulled down. The greater number, however, of the existing water companies derive their supply from the Thames, the water being filtered in immense reservoirs. In 1834 the following account of the houses supplied with water, and of the quantity furnished to each, with the different rates of charge, was laid before the House of Commons:

Water Companies.	Houses supplied.	Total yearly supply.	Daily average to each.	Charge per 1000 hhd.s.
		<i>hhd.s.</i>	<i>gall.s.</i>	<i>s. d.</i>
New River Company.	70,145	114,850,000	241	17 2
Chelsea do.	13,992	15,153,000	168	29 0
Westminster do.	8,202	11,702,507	263	48 6
W. London do.	16,000	20,800,000	195	45 6
E. London do.	46,621	37,810,584	121	28 0
S. London do.	12,918	8,100,000	100	15 0
Southwark do.	16,684	11,800,000	124	17 0
Southwark do.	7,100	7,000,000	100	21 0
Total water supply.	181,066	237,014,761		

In every street in London there are fire-plugs or cocks, at any of which a copious supply of water should be obtained in a few minutes in case of fire; though it must be admitted that the supply has sometimes, through neglect, been very long delayed, to the great injury of property. Much of the water is also used in watering the streets and improving the drainage; indeed, scarcely a third part of the supply is used for purposes strictly domestic. Abundant springs of the finest water may be procured in all parts of London, by boring below the clay strata; but no public measures have yet been taken to ensure a supply from this source. (See *Met. Water Rep.*, 1840.)

Sewers.—The sewers of London constitute a system of drainage unknown to any other modern city; and, though out of sight and hardly appreciable by others than engineers, they have excited the astonishment of all who have investigated the subject. Their depth is, in most cases, sufficient to drain the deepest cellars in each neighbourhood, and the size of the main branches rival that of the celebrated Roman Cloaca Maxima. We have no means of ascertaining their length; but that portion under the commissioners of the city is 15 m. in length, and an extent of 100,000 ft., or nearly 30 m., was constructed under the Westminster board between 1807 and 1834. The sewerage, however, is still imperfect in some low neighbourhoods, especially about Wapping, Stepney, Bethnal green, Westminster, &c., and wherever this is the case, the health of the poor is greatly deteriorated. The malignant fevers that occasionally make fearful ravages in poor districts are, indeed, mainly attributable to the absence or bad state of the drains. (See *Rep. of Commissioners on Health of Towns*, and *Dr. Arnet's Evidence*.) The sewers are under the authority of seven boards of commissioners, whose jurisdiction extends to a circle of 10 m. radius, measured from the post-office. The first sewers were constructed in 1498.

Paving.—The streets of London are not only well paved for carriages, but they have also on both sides, for the accommodation of pedestrians, smooth and usually wide flagged footways, raised some inches above the carriage way. This advantage it enjoys in common with most English towns; but few cities on the continent are provided with a similar convenience, though Paris has in some measure followed the example, in streets wide enough to admit of it. The paving is under the control of numerous boards, each of which has its particular district. It is conjectured that the amount expended in paving the streets of London exceeds £20,000 per annum. Paving was first laid down in the metropolis in 1417, in Holborn. In 1613, the plan of having footways of brown stone was begun, but it was not universal until the middle of last century. For some time past the principal streets have been paved with granite,

most brought from Aberdeen. Very recently, however, portions of them have been paved with wood; and how singular soever it may appear, it is believed that this pavement will be more durable than granite, at the same time that it will be incomparably more advantageous, by lessening the wear and tear of carriages, the quantity of dust, and the noise.

Lighting.—The metropolis is excellently lighted with gas, even in its most remote and secluded parts. Without going back to the year 1416, when lanterns were first hung out before citizens' houses, or even three centuries later, when an act passed to compel housekeepers to light up a lamp for five hours during the dark nights; many may remember the old oil lamps, which were sold by a foreigner to "edge the streets with two long lines of brightish little dots indicative of light, but yielding very little."

M. Simond somewhat exaggerated the deficiency; but still the difference between the old and present plan of lighting is so great as to make it difficult to believe that the inhabitants could have been satisfied with the oil lamps, "few and far between," that are still to be seen in the less populous parts of the suburbs. Gas was first tried in London in 1807, but with little success, as no means had then been discovered for removing its impurities. Pall-mall had been for some years the only street thus lighted, when, in 1816, a charter was obtained by a gas company, which slowly but certainly extended its operations. The profit of this speculation led to the formation of other companies; but it was not till 1830 that any considerable portion of the metropolis adopted gas. From that period, however, public bodies and private traders began rapidly to introduce it into their establishments, and parochial boards adopted the luminous gas-jets in lieu of the sickly, glimmering oil-lanterns. There are now 19 gas companies, who may probably produce, at an average, 10,000,000 cubic feet of gas every 24 hours. The number of lights is variously estimated: in 1833 it was stated before a committee of the House of Commons, that the number was nearly 60,000. Several companies have since been formed, and some of the old ones have doubled and trebled their produce, so that the whole number at present may, perhaps, be reckoned at 100,000.

Fires.—London has suffered from fire oftener, perhaps, than any other capital, except Constantinople; but the precautions taken in rebuilding the city, after the great fire of 1666, were calculated to prevent the recurrence of such a calamity. The streets were made much wider, bricks and stones were substituted for wood, and party walls were built between adjacent buildings. As a subsequent period the Building Act (14 Geo. 3, c. 78) compelled the erection of thick party walls between the separate tenements, and obliged each parish to keep one or more fire-engines always ready for service. The various insurance offices also began to maintain fire-engines at their own expense, attended by bodies of well-disciplined firemen; and in 1833 some of the largest of these establishments entered into an arrangement, by which all their force was put under one superintendent. The fire-brigade association was gradually joined by the other offices, and at present all the London insurance offices contribute to support this most efficient establishment. One superintendent now guides the whole, aided by about 200 foremen and engineers, who are placed at 18 different stations in all parts of the town and suburbs. The firemen, who are all numbered, wear a uniform of dark gray and a strong leather helmet; a third part of their body is always on duty, and they are provided with the best means of extinguishing fires, and rescuing persons in danger. The average number of fires for the five years ending with 1837, was 495 per annum; of which number 340 were slight, and 50 only extremely destructive.

Health.—"The metropolis has in itself all the elements of a healthy city. If the tides leave the banks of the Thames exposed, that great river sweeps through the city from W. to E., and the winds rush fresh over its waters. The land rises in undulations to Hampstead Heath, and the Surrey hills; pure water is abundant, and would flow under almost every street; the artificial heat and gas, nowhere as it sometimes is, ascends in a vast column to the sky, and is replaced by under-currents from the surrounding country." (*App. to Regist. Gen. 2d Rep.*)

But notwithstanding these favourable circumstances, London was long exceedingly unhealthy, and down to 1666 was hardly ever free from the plague. This excess of mortality was, no doubt, occasioned by the wretched state of the town. The streets were then narrow, crooked, many of them unpaved, and generally filthy: the houses, built of wood and lofty, were dark, irregular, and ill-ventilated; each story projected over the one below, so that they almost met at the top, thereby precluding, as much as possible, the escape of foul and the access of pure air: the shops were also furnished with enormous signs, which being suspended crosswise in the middle of the street, tended still farther to prevent ventilation: the sewers were, at the

LONDON.

same time, in a very imperfect state, the drains which conveyed away the filth not being arched over, but running above ground; and if we add to this the deficiency of water, and the prevalence of stinkiness in-doors, which then existed to an extent not easily to be imagined,* we need not wonder at the ravages made by the plague and other diseases. (See *Maitland's Hist. of London*, passim; and *Heberden's Treatise on Diseases*, p. 71.)

In 1593, the deaths by the plague within the bills of mortality amounted to 11,503; in 1603 to 30,561; in 1623 to 35,403; in 1636, to 10,400; and in the dreadful pestilence of 1665 they rose to 68,596! And it is impossible to say how soon it might have again burst forth, had it not been for the severe but providential visitation of the great fire by which it was immediately followed, and which, by destroying the most crowded and ill-built parts of the city, afforded an opportunity, which was luckily embraced, of rebuilding them on a better and more commodious plan. Very severe regulations were then also laid down for the enforcement of cleanliness; and the supply of water being at the same time augmented and better distributed, and the drains greatly improved and arched over, London has not since been visited by any very destructive epidemics. Still, however, the mortality during the first half of last century was very great; and Short, Corbyn Morris, Price, and other well-informed writers of the period, indulge in bitter complaints of the severe drain on the country, occasioned by the waste of life in London. The population appears, indeed, to have declined between 1740 and 1750; and during the 30 years ending with 1768, the deaths appear to have amounted at an average to 92,506 a year, while the births did not exceed 15,710. (Price, vol. ii., p. 86.) Probably, however, some portion of this enormous discrepancy is apparent only, and may be accounted for by omissions in the registers of births. But it is, notwithstanding, abundantly certain that the deaths very materially exceeded the births at the period referred to; and that they preserved this ascendancy down to a much later period. The mortality in 1765-1775 was estimated at about 1 in 90, or 5 per cent. of the existing population; but from this period a very material change for the better began to take place. In 1790 the births, for the first time, exceeded the burials; and during the ten years ended with 1800, there was an excess in the total number of births of 51,000 over the total number of deaths. This excess has since continued to increase, so that it is plain, supposing no unfavourable change to take place, that London might go on adding indefinitely to her population, without drawing a single recruit from the country.

The following table represents the mean annual mortality per cent. in the metropolis, and in England and Wales, from 13 classes of diseases. (2d Rep. App., p. 13.)

Classes of Disease.	Metropolis.	England and Wales.
1. Epidemic	741	652
2. Z endemic		
3. Contagious		
4. Nervous system	437	332
5. Respiratory Organs	420	395
6. Circulating do.	445	424
7. Digestive do.	180	129
8. Urinary do.	412	411
9. Generative do.	325	331
10. Locomotive do.	421	414
11. Integumentary system	404	403
12. Uncertain	285	285
13. Old age	219	237
14. Violent deaths	475	481
All causes of death	2,800	2,203
Population to 1 sq. mile	36,593	369

At present the average rate of mortality in London is estimated at about 9.8 per cent.; but the degree of mortality varies widely in different districts, increasing with the poverty and bad accommodations, and diminishing with the wealth and improved accommodations of the inhabitants. Thus, while the annual rate of mortality is 3.9 per cent. in Whitechapel, and 3.2 in Southwark and St. Giles's, it is less than 2.0 in St. George's, Hanover-square, and St. Pancras. "It is found, indeed, from a comparison of the several metropolitan districts, that, *ceteris paribus*, the mortality increases as the density of the population increases, and that where the density and the population are the same, the rate of mortality depends on the efficiency of the ventilation, and of the means employed for the removal of impurities." (App. to *Regist. Gen. 1st Rep.*) Epidemic diseases in crowded parts of London are attended with nearly

double the mortality that belongs to them in more airy districts; and diseases of the respiratory system are increased a half in close neighbourhoods. Mr. Farr's statements in the Report of the Registrar-general, as to the importance of ventilation and drainage, are fully corroborated by Dr. Southwood Smith, Dr. Arnot, and other authorities.

Summer is the healthiest, winter the most fatal season; and this rule has prevailed since the beginning of the last century. The deaths out of 100 living (1838) averaged in Jan., Feb., March, '85; in Apr., May, June, '70; in July Aug., Sep., '60; in Oct., Nov., Dec., '66.

Increase of Population.—It is much to be regretted that there are no accurate accounts of the population of London previously to the census of 1801. The population of the city was, however, estimated by Graunt, the well-informed author of the famous *Treatise on Bills of Mortality*, at 384,000 in 1661, and adding 1-3th to this for the population of Westminster, Lambeth, Stepney, and other outlying parishes, he estimated the entire population at about 460,000. (*Observations, &c.*, 5th ed., p. 82, and p. 105.) In all large towns, except (as in Petersburg) there be a great excess of military, the number of females is, in modern times, found invariably to exceed that of males; but if we may depend on Graunt's estimate, the reverse was the case in the city of London at the epoch referred to, for he makes the number of males 199,112, and of females only 184,886 (p. 83). In 1696 the population of the city and the out parishes was carefully estimated, by the celebrated Gregory King, at 527,560; and considering the great additions that had been made to the metropolis between the Restoration and the Revolution, this increase does not seem to be greater than we should have been led to infer from Graunt's estimate. The population advanced slowly during the first half of last century, and, indeed, as already stated, it fell off between 1740 and 1750. In his tract on the population of England, published in 1782, Dr. Price estimated the population of London, in 1777, at only 543,430 (p. 5). But there can be no doubt that this estimate, like that which he gave of the population of the kingdom, was very decidedly under the mark; and the probability seems to be that, in 1777, London had from 640,000 to 650,000 inhabitants.* Its population amounted, including Chelsea, as has been already seen, to 888,198 in 1801, and to 1,508,460 in 1831; and in 1841 it exceeded the prodigious sum of 2,000,000 (see the commencement of this article)—the greatest number of human beings ever, we believe, congregated within the same space in any age or country.

"Opulent, enlarged, and still
Increasing London! Babylon of old,
Not more the glory of the earth than she,
A more accomplished world's chief glory now."

London is, no doubt, principally indebted for her extraordinary rise and unexampled magnitude, to her admirable situation, on a great navigable river within a short distance of the sea, and in the centre of a rich and fertile country, of which she is naturally the emporium. Her river enables her to obtain abundant supplies of all the bulkier descriptions of products, not only from all parts of the United Kingdom, but also of the world, at the lowest possible cost. The advantages thence resulting have been great and obvious. A city in an inland situation never could have attained to anything like the colossal magnitude of London. Indeed, almost all great cities, in all ages of the world, have been built either on the seashore or on the banks of some great navigable river. Paris is probably the largest city that ever existed without any very great command of water carriage. But her advance has been slow compared with that of London; and notwithstanding the advantage she has long enjoyed, from being the capital of a powerful monarchy, and the residence of a polished and luxurious court, her population is not, at this moment, half that of London.

The extraordinary growth of the latter during the present century seems to be mainly attributable to the same causes that have increased wealth and population in other parts of the empire, that is, to the progress of arts, manufactures, and commerce. Though not in the manufacturing districts, London is now, by means of canals, railways, and other improved means of communication, intimately connected with them; and the many advantages she enjoys as a trading and commercial port, will always secure for her a large share of the shipments of manufactured products. London has also derived a vast accession of influence from her being the place where the dividends on the public debt are paid, where all transfers of stock are effected, and where all the important pecuniary transactions of the empire are ultimately adjusted. And how paradoxical a secret it may at first sight appear, it is certainly true that the very magnitude of London is an efficient cause of her continued increase. The greater a city becomes, the greater is the

* Erasmus, who visited England in the reign of Henry VIII., and was well acquainted with the country, ascribes the prevalence of the swelling sickness (a species of plague) and the plague to the inconmodious form and bad ventilation of the houses, the filthiness of the streets, and the dirtiness within doors. In a letter to Cardinal Wolsey's physician, he says, speaking of London, "*Concordia sola frons ista non exilis, sed et scriptis contribribus, et quibuslibet et reventantur, ut fundamentum manens alioquin daretur et glubit sub se frons ista, vomitus, et mictum tantum canum de hominibus, profectione carcerum, et pluvium rotuleque, alioquin daretur non nostrum, sed."*

* See the Tracts of the Rev. Mr. Horwatt and of Mr. Wales, in answer to Dr. Price.

LONDON.

scope she affords for the exercise of every talent and acquirement, and for the gratification of every taste and desire; and the more powerful, consequently, are the motives by which she attracts all sorts of individuals, whether aspiring or careless, industrious or idle, grave or gay, virtuous or profligate.*

Yet as London is the chances are, should the country continue to prosper, that she will continue to increase in magnitude for centuries to come; and the progress she has already made, unprecedented as it has been, may, not improbably, be surpassed by that which she is yet destined to make.

Habits.—The peculiarities of character belonging to the inhabitants of London must be learned from studying the manners of the middle and lower classes, as the higher classes, who reside here only during four or five months in the spring and summer, and leave whole districts almost uninhabited during the rest of the year, can scarcely be entitled Londoners. Great activity and unwearied diligence in business, a shrewd perception of character, and an ever-watchful regard of self-interest, not unmingled, however, with generosity, are the chief characteristics of the native population. Owing to the extreme subdivision of employments, and the undivided attention which most individuals give to their own pursuit, the citizens are, for the most part, singularly expert in it, and proportionally ignorant of everything else. This, however, is less so now than formerly; the extensive circulation of cheap publications having diffused information as to many topics of which the bulk of the population had formerly the most imperfect ideas. The leading merchants and tradesmen have generally houses in the outskirts of the town, and in the country, to which they retire after business hours during summer; and many, indeed, occupy those houses during the whole year. But to the inferior shopkeepers and tradesmen, summer and winter make little difference. Some, indeed, *rusticate* at a hot and dusty watering-place for a week or fortnight, trying, often in vain, to rid themselves of the turmoil and anxiety of business; but of a far larger number it may be said, as of John Gilpin, that

"For twice ten tedious years still they
No holiday had seen."

The London tradesman, unlike the Parisian, is essentially domestic in his habits, and his visits to his friends or club are only the exception to his ordinary regularity. Most classes of skilled workmen receive high wages, which have been little, if at all reduced since 1815, they are at present much better off than during the war. Their circumstances vary, of course, according to their prudence: few save money, but all live well, using butchers' meat to an extent unknown anywhere else, and dressing, on holidays at least, in a style equal to that of the classes above them. Many, not contented with one holiday in the week, keep a second, known as "St. Monday," sometimes spent in drunken revelry, but more frequently in country excursions with their families: others, however, work unremittingly from one year's end to the other, content with an annual Easter or Whit Monday's trip to Sheerness in a steamer, or with a picnic excursion to Hampstead or Blackheath. In the bright mornings of summer large social parties may be seen leaving town in vans, provided with good fare, and not unfrequently with a minstrel ready to furnish music for a dance on the green. The lowest class of all, whose means of existence are precarious, disreputable, or dishonest, have pleasures peculiar to themselves; but cleanliness and respectability of appearance are little studied by them, and they are almost unknown to the rest of the people, except when their wants or delinquencies intrude them on the public notice.

Environ.—The metropolis is surrounded by a country of varied surface and great productiveness. The ground on the E., W., and S. extends in a flat along the river, which is prevented from inundating it at high water by extensive embankments, probably constructed by the Romans. But on the N. the ground rises gradually to an elevation of 300 or 400 ft., and the flat on the S. is also bounded by grounds which attain to a like elevation. The picturesque hills of Surrey, near Dulwich and Norwood, are studded with the villas of wealthy merchants and others, who retire here from the bustle of town; and Blackheath, more to the E., and nearer the river, though not so fashionable as in the days when Greenwich had a palace and a court, is still a

* The clear and comprehensive account given by Seneca of the motives which drew so great a concourse of people to imperial Rome, applies with- out the alteration of a syllable to London: "aspice apud nos hanc frequen- tiam, cui vix urbis incommensurata sufficiat. Ex muni clipeo et coloreis suis, nec tunc denique orbe terrarum confunduntur. Alio aditit ambitio, alius ne- cessitas officii publici, alius impedit legatio, alius usuria, opulentum et op- portunitas istius loci quærens; alius liberalium studiorum cupiditas, alius spectacula: quondam traxit amicitia, quondam industria, istam ostendentes virtutis multa materiam: quidam venationem ferarum attulerunt, quidam ven- tibus eloquuntur. Nullum nos hominum genus concurrere in urbem, et vir- tutibus et vitis magna premita possidet."—*Consolat. ad Helvium*, cap. 6.

favourite resort in summer, and the buildings have in- creased since the railway has furnished fresh facilities for communication with London. N. of the metropolis lie Hampstead and Highgate, both of which, owing to their height, command extensive views of Hertfordshire, Surrey, and other counties: these villages, as well as Hornsey, Stamford Hill, and Walthamstow, are filled with respecta- ble residences, chiefly occupied by persons who daily visit London in pursuit of business. This prevalent fashion among the wealthy Londoners of fixing their abode in the suburbs has been greatly encouraged by the easy com- munication afforded by the numerous omnibuses and coaches which run to and fro at all hours of the day, and till late at night. Owing to this circumstance, the population of the city proper has decreased considerably since the com- mencement of the present century; indeed, it may now be called a collection of shops and warehouses rather than of residences for families. The suburban villas vary in size and grandeur, according to the means of their proprietors, but comfort and neatness are their universal characteristics.

Corporation.—The city of London is under the govern- ment of the lord mayor, two sheriffs, 25 aldermen, 206 com- mon councilmen, a recorder, and other officers, and is divid- ed, for municipal purposes, into 36 wards, each of which is under the government of an alderman. The Saxon de- nomination for the governor of London was *portraf* or *portreeve*, which, about a century after the Conquest, was changed to mayor. This officer was appointed by the crown till 1215, when the citizens obtained the right of electing their own mayor. The mode of election now fol- lowed was fixed in 1476 by an act of the common council.

The lord mayor is annually chosen from the body of al- dermen, at a court held at Guildhall on Michaelmas day, and is sworn in to the duties of his office on the 9th of No- vember following. A grand pageant takes place on the occasion, followed by a sumptuous dinner and ball held at the Mansion-house. In most instances, the alderman next in seniority to the lord mayor is elected his successor. He is always free of one of the great city companies, and must have served the office of sheriff. The lord mayor is second only to the sovereign within the city, and at the sovereign's death he takes his seat at the privy council, and signs be- fore every other subject. His powers are similar to those of a lord-lieutenant of a county, and his authority extends over the whole city and a portion of the suburbs.

The division of the city into wards appears to have been made very early in the 13th century; there were 24 wards, which became 25 in the year 1363, by a division of the ward of Farringdon. In 1550 a great part of the borough of Southwark was formed into a ward, and called Bridge Ward Without; but it is now merely a nominal ward, giv- ing a name to the senior alderman, who, on the occasion of a vacancy, is removed to it from his own ward, and is then called "the father of the city."

The following is an alphabetical list of the names of the wards, with an indication of their situation, the number of common councilmen, and the number of houses in each:—

1. Aldersgate, on both sides of Aldersgate-street, includ- ing the Postoffice. Com. coun. 8; houses, 726.
2. Aldgate, at the E. end of the city, includes the E. ends of Leadenhall-street, and Fenchurch-street, and Crutched- friars, called Alegate in the old list of 1285, given by Mal- land. Com. coun. 8 (6); houses, 770.
3. Bassishaw (corrupted from Basinge's-haugh) includes little more than Basinghall-street. Com. coun. 4; houses 130.
4. Billingsgate, from Billingsgate market to near Fen- church-street. Com. coun. 10 (8); houses 343.
5. Bishopsgate, both sides of Bishopsgate-street. Com. coun. 14; houses 1460.
6. Bread-street, E. of St. Paul's, and S.W. of Cheapside. Com. coun. 12 (8); houses 280.
7. Bridge Within, London bridge and Fish-street hill, in- cludes the Monument. Com. coun. 15 (8); houses, 198.
8. Bridge Without, part of the borough of Southwark.
9. Broad-street, between Bishopsgate ward and Coleman- street, includes the Bank; this is, apparently, the Lodging-ber of the ancient list. Com. coun. 10 (8); houses 300.
10. Candlewick, between Lombard-street and London bridge, named from Cannon-street, which was formerly called Candlewick-street. Com. coun. 8 (6); houses 210.
11. Castle Baynard, from St. Paul's to the Thames. Com. coun. 10 (6); houses 342.
12. Cheap, both sides of the E. end of Cheapside and the Poultry, including Guildhall. This is probably Ward Fort in the ancient list. Com. coun. 12 (8); houses 360.
13. Coleman-street, includes Lothbury, part of London wall, and Finsbury circus. Com. coun. 6 (8); houses 761.

* At first each ward sent two councillors, but the number has been gradu- ally increased, till it reached 840 in the whole, but a regulation very re- cently made will reduce the number to 206; the alteration will take place at the next election (1840), and the changes are indicated by being placed be- tween brackets.

LONDON.

14. Cordwainers, S.E. of Cheapside; includes Bow church. Com. coun. 8 (6); houses 315.

15. Cornhill, a small ward on both sides of Cornhill, includes the Exchange. Com. coun. 6; houses, 167.

16. Cripplegate, reaches from Wood-street, Cheapside, to the boundary of the city on the N.; it includes Fore-street and the Barbican. Com. coun. 16; houses 2079.

17. Dowgate, between Southwark bridge and London bridge, includes Merchant Tailor's school. Com. coun. 8 (6); houses, 203.

18. Farringdon Within, includes St. Paul's cathedral, part of Cheapside, Newgate-street, and Ludgate-street, and reaches the river near Blackfriar's bridge; this and the following are the "Lodgate and Newgate" of the old list. Com. coun. 17 (14); houses 1008.

19. Farringdon Without, includes Smithfield, the Old Bailey, the Fleet, part of Holborn, and the whole of Fleet-street. Com. coun. 16; houses 2030.

20. Langbourne, includes Fenchurch-street, a part of Lombard-street. Com. coun. 10 (8); houses 500.

21. Lime-street, includes the East India House, and a small space around it. Com. coun. 4; houses 190.

22. Portoken, eastward of Houndsditch and the Minories. Com. coun. 5 (8); houses 1216.

23. Queenhithe on the river, W. of Southwark bridge. Com. coun. 6; houses 350.

24. Tower, from Tower hill to Billingsgate, includes the Custom house. Com. coun. 12 (8); houses 530.

25. Vintry, on the Thames, and both sides of Southwark bridge. Com. coun. 9 (6); houses 900.

26. Walbrook, S. of the Mansion house, includes the Mansion house and the church of St. Stephen's, Walbrook. Com. coun. 8 (6); houses 966.

Houses in the whole, 16,466.

The aldermen are chosen by such householders as are freemen, and pay an annual rent of £19. Each alderman is elected for life, and has the direction of the business of his ward, under the superintendence of the lord mayor. They are all justices of the peace within the city. The sheriffs are elected every year, on Midsummer day, by the corporation and freemen, and are sheriffs of the county of Middlesex, as well as of the city of London: they enter on their duties, and are sworn in at Westminster on Michaelmas day. The common councilmen are chosen by the householders in all the several wards, except Bridge Without. The common councilmen are the representatives of the inhabitants in the "Court of Common Council," which is composed of the lord mayor, aldermen, and common councilmen. This court disposes of the corporation funds, makes laws for the regulation of the city, and nominates certain of the city officers. Its sittings are usually public, and its title is "honourable."

The Livery consists of freemen of the city, who are also free of one or other of the city companies. Each of these companies was, at its formation, intended to comprise the different individuals within the city, properly so called, engaged in the peculiar department of industry called by its name; and had powers to enact bye-laws, and to lay down regulations for the government of the trade. Thus, for example, no one could commence business within the city of London as grocer, mercer, or goldsmith, without being free of the grocers', mercers', or goldsmiths' companies. And this freedom could only be acquired by inheritance, serving an apprenticeship to a freeman, or paying a fine, or otherwise, as the company might choose to order; and, after admission, all individuals had to conform in the conduct of their business to the rules and regulations laid down by the company. But the inconvenience of this system gradually became obvious; and it has, in consequence, been so much modified that the privileges of the different incorporated companies no longer oppose any obstacle to individuals from distant parts of the country establishing themselves in business within the city, nor interfere in any degree with the management of their concerns. In fact, any one who pleases may now purchase at Guildhall a license entitling him to trade within the city for £5, without being free of, or having anything to do with any company. The city companies have, in truth, become charitable rather than political, or even municipal institutions. Some of them have a great deal of property. The principal companies obtained very large grants of land in Ulster during the reign of James I.; and most of them are trustees for sums of money and other property bequeathed by benevolent individuals. They expend their revenues partly in festivities, but principally in pensions to widows and decayed brethren, the support of schools, &c. There are in all 81 companies, of which 40 have halls, where they transact business, keep their records, and hold festivals. Some of these halls are very fine fabrics; that of the goldsmiths, in Foster-lane, rebuilt since 1831, is a magnificent structure; and, were it in a situation where it could be seen, would be one of the principal ornaments of the city.

The following 12 are called the *Great Companies*, and from one or other of them the lord mayor must be elected:

Mercers.
Grocers.
Drapers.
Fishmongers.
Goldsmiths.
Skinners.

Merchant Tailors.
Haberdashers.
Salters.
Ironmongers.
Vintners.
Clothworkers.

There are about 12,000 liverymen, in whom, previously to the passing of the Reform Act in 1832, the right of returning the four members of the House of Commons for the city was exclusively vested. A Common Hall is an assembly of the liverymen, called together at the requisition of a considerable number of their body: the lord mayor is the president by right of office.

The Guildhall, where the corporation meetings, festivals, and common halls are held, stands at the N. end of King-street, Cheapside. Having been much damaged in the great fire of 1666, it was replaced by the present edifice, constructed of the materials of the old building. The front, added in 1789, is in a heterogeneous style. The great hall, 153 ft. in length by 48 in breadth, and 53 in height, built and paved of stone, is capable of accommodating 6000 persons; at least that number were present at the grand entertainment given by the corporation to the allied sovereigns in 1814. At each end of the hall is a magnificent painted glass window, in the pointed style; but the roof is flat, panelled, and inappropriate; and the whole requires to be renovated and made consistent with the original character of the building. In the hall are statues erected by the corporation in honour of Lord Chatham and his son, the Right Honourable William Pitt, Nelson, and Alderman Beckford. On the pedestal of the latter is inscribed the famous rhymer made, in 1770, by Beckford, who was then lord mayor, and one of the members for the city, to the answer of his majesty (George III.) to an address and remonstrance of the common council. At the W. end of the hall are the two wooden giants called Gog and Magog, the subject of so many popular tales. In the council-chamber, where the lord mayor, aldermen, and common council hold their courts, is a statue of George III. by Chantrey; it has also a library containing books of reference, relative chiefly to the history of London, and the affairs of the city, and various other rooms for the use of the corporation.

The city has its peculiar courts of law, most of which are held in the Guildhall. The lord mayor's court, for actions of debts and trespass, and for appeals, is composed of the lord mayor, recorder of the city, and aldermen. The sheriff holds courts of record four days every week. The Chamberlain's court, held daily, decides disputes between masters and apprentices, and admits qualified persons to the freedom of the city. Courts of Petty Session for small offences are held daily at the Mansion house, by the lord mayor and an alderman, and at the Guildhall by two aldermen. There are also several minor courts.

The revenues of the corporation of London amounted, according to the commissioners' report, to £152,025 in 1831, and to £160,194 in 1832. These large funds are derived from rents of houses and land, market-tolls, bequests, interests on government securities, and a few other sources. The expenditure in the year 1831 was £149,411, and in 1832 £169,256: the chief items consist of salaries to municipal officers, maintenance of police and prisons, corporation entertainments, purchase of securities, and payment of debts. The lord mayor has £8000 a year allowed him to support the dignity of his office, and a splendid official residence. This, which is called the Mansion-house, stands at the E. of the Poultry, nearly opposite the Bank. It is a large structure, begun in 1730, and finished in 1753, in the Palladian style, with a fine Corinthian portico, on a lofty rustic basement. The grand or Egyptian hall (in which, however, there is nothing Egyptian!), the ball-room, and the saloon, are magnificent apartments; but some of the private apartments, occupied by the lord mayor, are but indifferently lighted. The plate used at civic entertainments belongs to the corporation, and is very valuable.

The city of Westminster was anciently governed by the abbot; but since the Reformation it has been under the authority of civil officers nominated by the dean. The chief magistrate is the high steward, generally a nobleman, who holds the office for life; the next is the high bailiff, chosen by the high steward, who also holds the office for life. There are 16 burgesses, whose offices are similar to those of aldermen, each having jurisdiction in a separate ward; out of these are elected two head burgesses, one for the city and the other for the liberties, who take rank after the high bailiff; each burgess has an assistant: there is also a high constable, who has authority over the other constables. The court of Quarter Sessions is held at the Westminster town-hall four times a year. The court of St. Martin's-le-Grand is held for the trial of personal actions relating to

LONDON.

that part of the liberties. The court-leet is held under the authority of the dean, for choosing officers, removing nuisances, and similar matters.

Southwark was anciently governed by its own officers, but since the year 1337, it has been for many purposes subject to the lord mayor, who governs by a steward and bailiff, the former of whom holds a court of record every Monday at the Town-hall in the Borough High-street. Another court is held at Bankside for the Clink liberty, a mean, densely peopled district, to the westward of London bridge.

Parliamentary Representation.—Down to the passing of the Reform Act, in 1832, the metropolis sent eight members to the House of Commons, viz., four for the city, elected by the liverymen; two for the city of Westminster, elected by scot and lot voters; and two for the borough of Southwark, also elected by scot and lot voters. In addition to the above, the Reform Act created four new boroughs, out of parts of the metropolis not included in the former boroughs, viz., those of Marylebone, Finsbury, the Tower Hamlets, and Lambeth, giving to each two members. Hence the metropolis now returns 16 members to the House of Commons, elected by the £10 householders, and those previously in possession of the franchise. Subjoined is an

Account of the Parliamentary Boroughs in the Metropolis, with the Number of their Representatives, and the Electors registered in each in the Year 1839-40:

Historical Notice.—Nothing is known of London previously to the invasion of the Romans; and it may be doubted, from the silence of Julius Cæsar, whether it then existed, or, at all events, whether it had attained to any considerable magnitude. But, however this may be, it is clear, from the statement of Tacitus (*Annal.*, lib. xxiii., cap. 14), already referred to, that so early as the reign of Nero it was an important emporium, though not distinguished by the title of a colony; and it is doubtful whether it ever attained to this honour.

After the Romans had left Britain, and the Saxons had divided the country among themselves, London is supposed to have become the capital of the E. Saxon kingdom. On the introduction of Christianity into England, it was one of the first places to embrace the new faith, and early became a bishop's see. St. Paul's, and St. Peter's, in Westminster, were first founded about this time. In the paucity of intelligence concerning the period of the heptarchy, all we hear of London is, that it suffered severely from fire in 764, 798, and 891, on each of which occasions it is said to have been nearly destroyed. As soon as England had been united under one monarch, it appears to have become the metropolis of the empire; and, in 833, a wittenagemot, or parliament was held in it to consult on the best means of repelling the Danes, who were ravaging the eastern counties. It was, however, sacked by the Danes in 839: in 992 it was nearly destroyed by fire; and in 994, the inhabitants purchased a temporary remission from the attacks of the Danes, by paying them a high ransom.

At the Conquest, London submitted to William, and soon after received a charter in the English language, the original of which is still preserved. Within the 60 years following the Norman conquest it suffered severely by fire on five different occasions; but being then built principally of wood, it was easily repaired from the timber furnished by the extensive forests of Islington and Hornsey, which still existed when Fitzstephen wrote in the succeeding century. London was then unpaved, and, if we may believe the statement of contemporary historians, the rafters of the roof of Bow church, which were blown off by a hurricane in 1091, struck into the ground to a depth of 20 feet. The same hurricane caused so high a tide in the Thames, that the wooden bridge, which had stood 200 years, was carried away by the stream. On the accession of Henry I. in 1100 a new charter was granted to the city, which restored its ancient privileges, as they existed before the Norman conquest, relieved the inhabitants from many oppressive services, such as compulsory entertainment of the king's household, and abolished several barbarous customs of the Saxon period. The citizens acquired by this charter the privilege of choosing their own magistrates. The Norman monarchs, it is true, seldom respected corporate privileges, even when conceded by themselves; but still this charter was valuable as furnishing a standard to which to refer in future disputes with the prerogative, and it is said to have served as the model

from which Magna Charta was taken. About the middle of the 12th century, it was determined to build a stone bridge over the Thames. The first wooden bridge having, as already stated, been carried away in 1091, was replaced by another, which was burned down in 1136. The bridge erected instead of the latter became so ruinous in less than 30 years, that it was thought a stone bridge would be less costly in the end than the continual repairs required to keep up these unsubstantial, though cheaper structures. The new bridge, begun in 1176, and finished in 1200, was a noble work for the time, and may be said to have been the very bridge taken down in 1832, though frequent alterations, additions, and repairs, had considerably impaired its identity. Three years after its erection a dreadful loss of human life was occasioned by a fire on the bridge, described in Stowe's Chronicle: "The tenth of July at night the city of London upon the S. side of the river of Thames, with the Church of our Lady of the Canons in Southwark, being on fire, and an exceeding great multitude of people passing the bridge, suddenly the N. parts, by blowing of the S. winds, was also set on fire, and the people which were even now passing the bridge, perceiving the same, would have returned, but were stopped with fire, and it came to pass, that as they protracted time, the S. end was fired, so that people thronging themselves betwixt the two fires, there came to aide them many ships and vessels, into the which the multitude so undiscernedly pressed, that the ships being drowned, it was said, there were destroyed about three thousand persons." About this time an order was made by the court of aldermen that no house should in future be built without party walls 3 feet in thickness, and 16 feet in height. This order, dated in 1191, was intended to obviate the frequent fires by which London had so often been partially destroyed; but it appears to have been little, if at all, attended to, and is interesting principally from its being the first document in which the chief magistrate of London is designated lord mayor. He had hitherto been called the chief bailiff.

In the year 1311 the citizens began to form a deep ditch, 300 feet wide, without the city wall on all sides, as a means of defence against King John. In 1348 the forest of Middlesex was cleared, and the citizens of London were permitted to purchase land, and build there. Thus was begun that part of the metropolis which stands N. of the city, and is now so populous. In 1321, Henry III. laid the first stone of the present Westminster Abbey. In 1336, the first water pipes were laid down in the city, which had previously been supplied with water from wells and rivulets running through it into the Thames; but these had gradually been either obliterated or converted to common sewers. The principal was the River of Wells, which, though hidden, still runs under what was lately Battlebridge, in the New Road, passes down through Clerkenwell and Turnmill-street, and falls into the Thames close by Blackfriars bridge. This river may be yet seen, or at least heard, through the iron gratings by which it is covered, in some of the obscure streets in Clerkenwell. This stream at low tide pours into the Thames a mass of black mud on the N. side of Blackfriars bridge. Holbourne, now a common sewer running through Holborn Hill, fell into the river of Wells. Walbrook entered the city by Winchester-street, and fell into the Thames at Dowgate: its name still remains. Langbourn ran with a swift stream from Aldgate to a spot near the Mansion house, where it fell into Walbrook. Several of the wells remain to this day: Holywell, in Shoreditch; Clerksweil, in Clerkenwell; Agnes le Clear, Perilous Pond, &c. The city, however, had gradually so much increased, that the supply was inadequate to the demand; in many cases, too, the new houses had encroached upon the little streams, and made it inconvenient to approach them. The water pipes now laid down brought a copious stream from six springs at Tyburn, a village on the site of the present Oxford-street, near its W. end, and conveyed it to one main pipe, 6 inches diameter, to the city of London. Afterward various leaden cisterns, named conduits, were constructed for the reception of water: the first of these was built in Westcheap (now Cheapside) in 1293; these were taken down, not only because increasing traffic rendered ground valuable, but because they had become comparatively unnecessary, from the introduction of a mode of supplying water to every tenement.

In 1329 several buildings were added to the Tower, one of which was appropriated to three leopards, presented in 1335 by the Emperor Frederic to Henry III., who, a few years after, assessed the city at the rate of 6d. per day for the maintenance of these animals, and 14d. per day for that of their keeper. In 1393, during a great frost, such masses of ice were brought down the Thames, that five arches of London bridge were destroyed. In 1304 the first recorder was appointed. In 1338, in consequence of the facility with which felons made their escape from London across the bridge into the adjoining village of Southwark, which, until then, was beyond the mayor's jurisdiction, Edward III.

LONDON.

granted a charter assigning this village to the city forever, and empowering the city magistrates to act in Southwark as in London. This jurisdiction still continues.

As we advance in time records of events crowd so thick upon us, that we can only notice such as have produced permanent effects; and in so doing, we must proceed rather by centuries than years. Of fires, pestilences, famines, and riots, it may be enough to say that they were extremely numerous; but except the great fire of 1666 none had any lasting consequences.

In 1354 the office of alderman, which had hitherto been annual only, was rendered more important by a law which made the aldermen irremovable for life, unless on some especial cause. In 1381 the rebellion of Wat Tyler, and his death by the hands of the lord mayor, occasioned the addition of the drawn dagger to the coat of arms of the city, where it still appears. During this century many improvements were effected in cleaning and paving the streets, and clearing out the water-courses and great city ditch; but an effectual bar was raised to these measures in 1392, when, in consequence of the refusal of a loan of £10,000 to King Richard by the corporation, the mayor, sheriffs, aldermen, and principal citizens were imprisoned, heavy penalties exacted, the city franchises abrogated, and the courts removed to York. Heavy bribes effected a removal of several of these grievances; but the city did not recover its proper influence till the accession of Henry IV.

In the following century the progress of improvement was still more rapid. Lamps were lighted at night in the streets as early as 1416. Holborn, a part of the Strand, and other principal thoroughfares were paved; additional conduits and water-pipes were laid down; the old wooden houses began to disappear, and were replaced by respectable edifices of brick; and the city wall was repaired. The bricks used for these purposes were made in Moorfields. The slaughtering of cattle within the walls was forbidden in consequence of the bad effects produced by it in the absence of sewers. An indication of some attention to the police of the city appears in the erection of stocks in every ward, for the punishment of disorderly persons. Guildhall, Leadenhall, and Crosby-house, in Bishopgate-street (a portion of which has recently been restored), were built in this century.

In the 16th century the advance was much greater; an unusually long exemption from those civil wars which had so much injured London under the Plantagenets, gave leisure to introduce those improvements which distinguish a modern town from a city of the middle ages. The city watch was now improved, nuisances were removed, street paving became more general, and regulations were made for supplying the town with provisions, so as to prevent the frequent famines which had before arisen, more from defective arrangements than from real want. The removal of monasteries had also a great effect in improving London: 54 large and many smaller establishments made way for factories, schools, charitable asylums, and hospitals. St. James's palace was built, the park was laid out, and many fine buildings were erected in Westminster. The two cities were now first joined by a number of handsome mansions belonging to the nobility on the N. side of the river; one of which, Northumberland house, is yet in existence. The streets S. of the Strand still indicate by their names the site of others that have disappeared. The Royal Exchange was built, and commerce began to flourish. Towards the end of this century water was first conveyed by machinery into private houses, and the New river was projected.

In the 17th century London assumed its present form, with the exception of that part destroyed by the great fire of 1666. Spitalfields was covered with houses; and before 1666 the space N. of the Strand as far as Holborn, and from Temple-bar to St. Martin's-lane, had been extensively built upon. The parts of Westminster, also, from Charing Cross to St. James's palace, had assumed the appearance of a town. The New river had been completed, and each house was supplied with water. Sewers were dug, smooth pavements were laid down for foot passengers, and hackney-coaches became general.

On the 3d of Sept., 1666, the great fire broke out at Pudding-lane, near the spot where the monument was subsequently erected in commemoration of the occurrence. It raged till the 5th, when it ceased, rather by pulling down houses in the line of its course, than by the success of the exertions to extinguish the flames. The ruins, covering 336 acres, comprised 13,900 houses, 90 churches, and many public buildings; the property destroyed being estimated at £10,000,000. But, though productive of great loss, and of much temporary distress and inconvenience, this conflagration was, in its results at least, of signal advantage. It would have been all but impossible, except by some such destructive agency, ever to have got rid of the vast mass of old wooden houses, and narrow and filthy lanes and courts, that had for centuries been the permanent abode of the plague and other pestilential diseases. No doubt it must ever be regretted, that the

designs of Sir Christopher Wren for the renovation of the city were not adopted. But notwithstanding the numerous defects of the new plan, it was a vast improvement on that by which it had been preceded. Though still too narrow, the streets were materially widened; the new houses were constructed of brick instead of wood; party walls were introduced; the old practice of making each story project over that immediately below, was abandoned; obstructions and filth of all sorts were removed; and the sewerage and pavement of the streets were vastly improved. A fire which happened in Southwark ten years afterward, afforded an opportunity for carrying the improvements into that part of the metropolis. The population and trade of the city now increased more rapidly than before. The revocation of the Edict of Nantes occasioned the immigration of a great number of French, who settled in Spitalfields and St. Giles's. The parishes of St. Anne and St. James were formed, the district called the Seven Dials was built, Piccadilly began to extend W., and Soho-square and Golden-square were laid out. In the city the Bank of England was built. St. Paul's Cathedral was almost completed; the parish of Wapping was formed E. of the city; the Penny Postoffice was instituted; the number of hackney coaches trebled; and several misnamed asylums (as Alsatia and the Mint), where robbery and crime had been protected, were abolished.

From this period the improvement and increase of London have been constant. In the early part of the 18th century an act was passed for building 30 new churches in and about London, most of which were completed within a few years, and some of them are still among the ornaments of the metropolis. Houses sprung up on every side; and by the middle of this century the W. end of the town, as far as Hyde park, became a compact mass of building, reaching beyond Oxford-street on the N., and extending E. from Portman-square, across Tottenham-court-road, past Montague house and Gray's Inn gardens, through Clerkenwell, Finsbury-square, Spitalfields, and Whitechapel to Wapping. Before this time water-works had been formed at Chelsea, in aid of the supply furnished by the New river. Sewers had become more general, lamps had been fixed in all the principal streets, Westminster bridge was built, St. Paul's completed, and Fleet ditch arched over. In the last half of the century Blackfriars bridge was built, the houses encumbering London bridge were removed, the Mansion house was finished, and Somerset house erected. At the same time many unsightly and inconvenient buildings were removed; overhanging signposts, water-spouts, which occasionally drenched unwary passengers, dirty, stagnant gutters, ash-heaps, and other obstructions to walking the streets, were swept away; the lamps were much increased in number, and lighted during the whole night; raised footways became universal, and the shops, which before were mere stalls, assumed a size and splendour evincing the wealth of their occupiers, and greatly contributing to the ornament of the metropolis.

The citizens of London have, generally speaking, been distinguished by their orderly behaviour and respect for the laws. In 1780, however, the peace, and even, in some degree, the existence of the metropolis, were compromised by the excesses of the mob. Certain concessions made in the course of the previous year to the Roman Catholics, had provoked a good deal of religious excitement in all parts of the kingdom. The contagion spread to London; and the weakness of the government, and the folly, or rather madness, of Lord George Gordon, and other leaders of the ultra Protestant party, led to a dangerous riot. The mob were, in fact, for about two days masters of the city. They took possession of the prisons, and turned the inmates out of doors; destroyed the chapels of the ambassadors of the different Catholic powers; many private houses, including that of Lord Mansfield, were plundered and set on fire; a great distillery, belonging to a Catholic firm, shared the same fate; and an attack was made on the bank, which, however, was happily repelled. At length this formidable riot was effectually put down, though not till a considerable number of the rioters had been killed and wounded. Since this disgraceful epoch, the peace of the city has not been seriously endangered; and the troops in and about town, added to the effective police force that now exists, seem quite adequate, under ordinary circumstances, to ensure the public tranquillity and the safety of the peaceable part of the community.

During the last 30 years London has made greater advances than could reasonably have been expected in an entire century. Within that period four bridges have been built, extensive docks have been excavated, gas has been introduced into every street and alley, steam, both on the river and on railways, has given it an almost unlimited power of intercourse with every part of the kingdom, and of the world; new and handsome markets have been erected, arcades lined with elegant shops have been formed, and wide lines of communication have been opened through

LONDON BRITAIN.

close and densely crowded neighbourhoods. A new park, larger and handsomer than any of the other three, has been laid out, and surrounded with houses more resembling palaces than private residences; an improved police has given additional security both to person and property; abundant supplies of water have been furnished to every separate dwelling: the paving and sewerage have been greatly improved, especially in districts inhabited by the poor; and the formation of spacious cemeteries in the suburbs is gradually leading to the disuse of interments within the town. At the same time the establishment of colleges and proprietary schools has materially increased the facilities for procuring good education, while the institution of a national gallery and school of design are contributing to improve the national taste, and to add to the innocent pleasures of the people. The spirit of improvement, moreover, is still suggesting extensive and noble works. The act (3 and 3 Vict., c. 67) founded on the Reports of the Metropolis-Improvement Committee, furnishes ground for hope that the time is not far distant when several new and large streets shall be constructed "in districts at present secluded from the observation of the wealthy and educated, and exhibiting a state of moral and physical degradation much to be deplored." One of these streets is to form a straight line of connexion between Oxford-street and Holborn; another is intended to join Long Acre with Broad-street, St. Giles's; a third is to open a wide line through the alleys about Leicester-square to the W. end of Long-acre; a fourth is to run from the N. end of Farringdon-street to Clerkenwell-green; and a fifth will form a direct communication between the London docks and Spitalfields church. "The melioration of the moral condition of the labouring classes" will also be vastly promoted by the project for laying out, on the N.E. and E. sides of London, spacious pleasure grounds and public walks, the enjoyment of which will, there is reason to think, be, at no very distant period, deemed superior by the bulk of the lower classes to the debasing revelry of gin-palaces.

Antiquities.—London possesses few antiquities: its wall is destroyed, its gates have been demolished; the remains of its monasteries, colleges, and friaries were obliterated at the great fire; and modern improvements have swept away almost every vestige of olden times. The diligent inquirer, however, may still find a few remnants, though generally either modernized or renovated. The Tower, Westminster Abbey, the Temple church, and St. Saviour's have been already mentioned. The priory of St. Bartholomew, founded in 1308, remains in the parish church, in Smithfield; the hospital of St. John of Jerusalem has a gateway remaining in Clerkenwell; the church of the Augustine friars may be seen at Austin friars, near London wall; and portions of the churches E. of the limits of the great fire, may still be seen incorporated in the modern edifices. Several fragments of the wall exist in Cripplegate churchyard, in Allhallows churchyard, Wornwood-street, and near Tower hill. Some ancient houses remain in Bishopsgate-street, the handiwork of which, Crosby's hall, has recently been restored to its primitive state, and now exhibits an excellent specimen of its civil architecture of the 15th century. London stone, near St. Swinburn church, Cannon-street, is supposed to be the point whence the Romans measured the roads in Britain. Much of it has been chipped off by curious antiquaries, and what remains is enclosed within a niche to prevent farther dilapidation. There are also some ancient crypts, or arched vaults under several private houses in the city; some of them are handsome, and have been either subterranean chapels, or vaulted chambers belonging to religious houses.

LONDON, p. v., Union t., capital of Madison co., O., 97 m. W. by S. Columbus, 420 W. It contains a brick courthouse, a jail, county offices, several stores, about 80 dwellings, and 500 inhabitants.

LONDON, p. v., capital of Laurel co., Ky., 94 m. S.W. Frankfort, 544 W. Situated on a branch of Laurel river, a tributary of Cumberland river. It contains a courthouse, jail, and several stores and dwellings. Nett proceeds of the postoffice, \$30.

LONDON, p. t., Monroe co., Mich., 45 m. S.W. Detroit, 502 W. It contains one grist-mill, two saw-mills, one tannery; four schools, 78 scholars. Pop. 425.

LONDON BRITAIN, t., Chester co., Pa., 35 m. S.W. Philadelphia. Watered by White Clay creek. It has two stores, one grist-mill, three saw-mills, one tannery; two schools, 180 scholars. Pop. 641.

LONDONDERRY, a marit. co. in the N. of Ireland, prov. Ulster, having N. lough Foyle and the Atlantic ocean; E. Antrim, from which it is separated by the lower Bann and lough Neagh; S. Tyrone; and W. Donegal. Area, 518,270 acres, of which 136,038 are unimproved mountain and bog, and 9,565 water, being mostly included in the portion of lough Neagh, belonging to this county. Surface in some parts mountainous and uneven; but there is, notwithstanding, a great extent of low, fertile ground. With the exception of lands belonging to the church and to corporations,

LONDONDERRY.

the entire property of this county was granted by James I. to 12 of the principal London companies, from whom most part of the land is now held, partly under terminable and partly under interminable leases. Farms vary in size from 2 to 300 acres; but the average may be from 5 to 30 acres. "Where there has been a perpetuity or a long lease, it is split; that is, the children are settled upon divisions of the father's farm; by which means leases of 40 acres come to be parcelled, in two or three generations, into patches of four or five acres. It seems as if the newly let lands were disposed of under some similar system of parceling. I could give instances where whole districts are subdivided into patches of six or seven acres, and rarely can boast a farm of 12 or 14." (*Sampson's Survey of Londonderry*, p. 249.) Some landlords have exerted themselves to counteract this wretched system, but hitherto without much effect. It is almost superfluous, seeing the way in which the land is subdivided, to say that agriculture is in a very backward state. Latterly, however, some improvements have been effected. Oats, potatoes, and flax are the principal crops; but a good deal of wheat is now also raised. Condition of the small farmers and cottiers very unprosperous. Average rent of land, 12s. 3d. an acre. Various minerals have been discovered, but they are of no great importance. The linen manufacture was, a few years ago, widely diffused, but has latterly been a good deal contracted, the mill-spun yarn being cheaper and better than that spun by hand-wheels. Exclusive of the Bann, the principal rivers are the Foyle, Faughan, and Roe. Principal towns, Londonderry, Coleraine, and Newton-Limavady. The county is divided into six baronies and liberties, and 31 parishes; and sends four members to the H. of C., being two for the county, one for Londonderry, and one for Coleraine. Registered electors for the county, in 1836-40, 3676. In 1831 Londonderry had 39,077 inhabited houses, 41,359 families, and 322,012 inhabitants, of whom 106,657 were males and 115,355 females.

LONDONDERRY, or DERRY, a city, parl. bor., and river-port of Ireland, cap. co. of same name, and a county by itself, advantageously and beautifully situated on the W. bank of the Foyle, about 5 m. above where it falls into lough Foyle, 131 m. N. by W. Dublin; lat. 54° 5' N., long. 7° 19' W. Pop. of parl. bor. in 1831, 14,030. The city was originally confined to the hill on which the greater part of it still stands; and which, from its projecting into the river, is called the "Island of Derry." This portion is surrounded by the old city walls, but it is now rapidly extending beyond its former limits, particularly along the river toward the lough. There is also a suburb on the opposite bank of the river, called Waterside. The communication between the latter and the city is kept up by means of a wooden bridge, 1068 feet in length and 40 feet wide, erected in 1729 at an expense of about £16,000, and rebuilt in 1814-15 at a further cost of £16,801. Derry is well built; many of the houses in the main streets within the walls are old-fashioned, with high pyramidal gables; but many modern mansions have, of late years, been erected in this part of the town; and without the walls rows of mud cabins have been superseded by respectable houses. The principal city streets are broad and clean, well paved, and well lighted; some of them, however, are inconveniently steep, and there are many narrow lanes and closes. In the centre of the city is an open square space, called the Diamond, from each side of which a handsome street leads to one of the four city gates. The summit of the hill is crowned by the cathedral, courthouse, and bishop's palace.

The cathedral, which is also the parish church, was built in 1633: it is a large, handsome, Gothic structure, 940 feet long, and has a tower and spire 538 feet high, erected in 1778; but this having become dangerous, was taken down in 1809, and was soon after rebuilt, with the addition of Gothic pinnacles. The view from the top is very fine. In the interior is a handsome monument to the late Bishop Knox; and in it also are displayed the colours taken at the siege of Derry. The bishop's palace is a large, plain building, with extensive pleasure-grounds. There are two other Protestant episcopal places of worship, the chapel of ease and the free church. The latter, which is without the city, was built in 1830, by Bishop Knox, and was intended for the use of the poorer classes, but it is no longer confined to them. There is also a Roman Catholic chapel, and places of worship for Presbyterians, Primitive and Wesleyan Methodists, Seceders, Covenanters, and Independents. Among the public buildings, exclusive of churches and other ecclesiastical edifices, may be specified the Corporation hall, in the centre of Diamond-square; it was originally constructed in 1692, but received so thorough a repair in 1822, as to be tantamount to a re-erection. The courthouse, adjoining the cathedral, erected in 1813, at an expense of £30,480, is a spacious and a fine building, partly constructed on the model of the temple of Erectheus at Athens. The new jail is a very extensive structure, being 242 feet in front, by 400 feet in depth; it is

LONDONDERRY.

built on the radiating or panoptic principle, and cost above £30,000. Among the chief ornaments of the city is the fluted column, erected, in 1837, in honour of the Rev. George Walker, its heroic defender. It stands on the central W. bastion, and is a well-proportioned pillar, 81 feet in height, bearing a statue of Walker, 9 feet high. It cost £4200, raised by subscriptions.

The principal school, called Foyle college, stands on an eminence near the river; it is a plain, but handsome, building, erected in 1814, having accommodations for 80 resident pupils; it was built by subscriptions from the bishop of the diocese, the Irish society, and other sources, and is maintained by similar means: the head master's salary, from these sources, is about £200 per annum. There is a parish school connected with the church, for the education of 100 boys and 100 girls. The Presbyterian congregation also supports a free school: a school, called St. Colum's national school, was established by the Roman Catholic bishop and clergy, but it is now under the National Board of Education. In 1839 a Mr. John Gwynn left the munificent sum of above £40,000 for the education of as many boys as the funds will allow in the useful parts of a good English education; and, exclusive of the above, there is an infant school, and a number of Sunday and other schools. Among the charitable institutions is the district lunatic asylum for the counties of Londonderry, Donegal, and Tyrone; it was opened in 1829, and cost £35,678; it can accommodate about 190 patients; the number admitted in 1837 was 189, of whom 100 were males and 89 females; the expense of the establishment for that year was £2806, being £15 10s. for each patient. Here is also an infirmary and fever hospital, a dispensary, a charitable loan fund, a mendicity association, and a clergymen's widows' fund, with several minor institutions of a similar description. Among the literary institutions is the Literary Association, with a reading-room and a pretty good library; the Literary Society, in which lectures are given, and discussions take place; a news-room; a mechanics' institute, &c. In 1840 the town had three newspapers. Races take place on a course in its neighbourhood. The citizens of Derry would seem to have but little taste for theatrical entertainments; at all events, the theatre has been converted into a coach-building establishment.

The walls or ramparts by which the city proper is surrounded remain nearly in their original state, except that the ditch has been filled up: they afford a fine broad walk all round the city.

Londonderry was originally granted by Edward II. to Richard de Burgh, earl of Ulster, but the corporation now holds its privileges under a charter granted by James I. in 1613. The government of the city is vested in the mayor, sheriff, recorder, 12 aldermen, and 24 burgesses. The freedom is acquired by birth, by marriage with the daughters of freemen, apprenticeship, and by the gift of the corporation. The city sent two members to the Irish House of Commons; and since the union it has sent one member to the Imperial House of Commons. Previously to the Reform Act the right of voting was in the burgesses and freemen. Registered electors in 1839—40, 1638. The mayor, and aldermen who have filled the office of mayor, are justices of the peace within the liberties. The mayor and recorder hold a court of record every Monday, for pleas, to any amount. A court of general sessions is held quarterly, one of petty sessions weekly; there is also a court of conscience, at which the mayor presides weekly, for debts under £30, and for suits of wages. The assizes for the county and city, and the general sessions for the corporation, are held here twice a year.

The revenue of the corporation, arising from the tolls of the bridge, and dues on tonnage, quays, &c., amounted a short while ago to about £7000 a year; but, owing to the expense of improvements, mismanagement, or some other cause, the corporation was involved in the greatest difficulties, and their property has been sequestered, and mostly made over to other managers.

Manufactures are quite inconsiderable, if we except the conversion of grain into flour. There is a brewery and a distillery in the city, and two distilleries in the vicinity. There was here formerly a sugar-house and a glass-house, but these are now relinquished. A foundry and copper-works were established here in 1891, and have succeeded. Some table-linen is manufactured; and cotton is said to be woven in the parish for the Glasgow manufacturers.

The trade of Londonderry is very extensive, and is rapidly increasing. Its fine river makes it the emporium of a large extent of country; and it is to this that its extensive commerce is principally to be ascribed. Its exports, like those of most other Irish towns, consist principally of agricultural produce, but a good deal of linen is also exported.

Prices were uncommonly low in 1835; and, making allowance for this, and the increase that has since taken place in the trade of the port, we may, perhaps, estimate the present (1840) value of the exports at £1,350,000 or £1,400,000 a year. The vast number and great value of the eggs export-

ed is a peculiar feature in the above account. The imports consist principally of manufactured goods and haberdashery, iron, sugar and tea, timber, wine, coal, glass, earthenware, &c. A great portion of the increase in the trade of the port may be ascribed to the establishment of steam-packets, which now ply regularly between the city and Glasgow and Liverpool. We subjoin an

ACCOUNT of the Quantity and Value of the principal Articles exported from Londonderry in 1835.

Articles Exported.	Quantity.	Estimated Value.
Corn, meal, and flour . . . cwt.	416,043	£ 120,000 0
Provisions	85,880	273,500 0
Sugar	35	140 0
Flax and tow	81,120	215,000 0
Feathers	5	10 0
Spirits	63,690	10,500 0
Linen	5,035,328	24,710 0
Cotton manufactures	908	24 0
Ores and coals	855	5,120 0
Horses	73	1,400 0
Sheep	813	900 0
Swine	11,108	15,000 0
Eggs	89,064,000	55,000 0
Hides and calf skins unskinned	24,260	11,500 0
Other articles	—	21,100 0
Total value	—	£1,000,000 0

Derry is one of the principal ports for the shipment of emigrants; as many as 5000 to 6000 individuals having of late years frequently sailed for the United States and Canada in the course of a single season. The emigrants are very generally among the best behaved and most industrious, as well as most enterprising, portion of the community.

The gross customs' revenue collected at Londonderry in 1830 amounted to £73,912, and in 1839 to £36,686; the post-office revenue in 1830 was £2303, and in 1836, £2682. The Bank of Ireland, the Belfast, Provincial, Northern, and Agricultural banks, have offices here. A savings' bank, established in 1815, had, in 1835, £16,327 of deposits, contributed by 699 depositors.

Lough Foyle is properly the outer harbour of Londonderry. It is a triangular basin, about 18 m. long, and 10½ m. where widest; but a great part of it is occupied by mud-banks and mud-flats. The navigable channel stretches along the Donegal or Innishowen shore; and by following it, the largest men of war reach the anchorage at Movilla, while merchantmen of 500 tons, without difficulty, ascend to the city quays, 5 m. above the lough and 23 m. from the sea. The river is navigable by barges from the city to St. Johnstone, and the Marquis of Abercorn has excavated a canal from the latter to Strabane. A portion of the wooden bridge at the city is constructed so as to open and admit the ascent and descent of vessels. It may be worth mentioning, that both the water and gas for the use of the city are conveyed across this bridge; so that the supply of both is intercepted whenever the bridge is opened.

But notwithstanding its increasing commercial prosperity, there is, we regret to say, much poverty in Derry. The contributors to the savings' bank are mostly mechanics, servants; and the mechanics, tradesmen, and labourers are, in general, very badly off. "Among the labourers great poverty prevails, from the want of steady employment, and their consequent exposure to dissipation, with the total absence of employment for their children. The better class inhabit huts which let for about £3 a year; but the poorer frequently lodge in garrets or out-houses, chiefly in the Bogside, at a rent of about 1s. 3d. a week; and yet, even in these hovels, they contrive to let shares of their rooms at 6d. a week." (*Ordnance Memoir of Londonderry*, p. 184.)

Derry was colonized and fortified in the reign of James I. by the London companies, who had purchased large tracts of the confiscated estates of the Earl of Tyrone; at which period it took the name of Londonderry. It is famous in Irish history for the memorable siege it sustained in 1689 against the forces of James II. Though ill fortified, and without any disciplined troops, the heroism of the citizens, and the enthusiasm inspired by their brave leader, the Rev. George Walker, enabled them to repel all the attacks of the enemy; and to sustain the more dreadful sufferings occasioned by the pressure of famine. The besiegers lost 8000 men in the course of the siege, which was raised on the 10th day. Derry continued, for a lengthened period after this epoch in its history, to be, as it were, the headquarters of Protestantism, or rather of Orangism in the N. of Ireland; but even in Derry the Catholics now outnumber the Protestants. (The reader will find, in the *Ordnance Memoir* referred to above, the most ample details as to all matters connected with the history and present state of Derry; see also, the *Boundary and Municipal Reports; the Railway Report, &c.*; and *Ingilt's Ireland*, &c. 1863.)

LONDONDERRY, p. t., Rockingham co., N. H., 34 m. S.E. Concord, 454 W. Bounded N.W. by Merrimack river. First 324

LONDON GROVE.

settled in 1719 by a colony of Presbyterians from near Londonderry, in the N. of Ireland, who with their religious teachers, came to New-England in the summer of 1718. It is watered by Beaver river, issuing from Beaver pond, and flowing into Merrimack river, and contains two churches, a Presbyterian, and Baptist, Fulkerton academy, named from its founder, who gave to it a fund of \$14,000, three stores, six grist-mills, 10 saw-mills; 11 schools, 327 scholars. Pop. 1356.

LONDONDERRY, p. t. Windham co., Vt., 96 m. S. Montpelier, 444 W. Watered by West and Winhall rivers, and Uley brook, which afford water-power. Chartered in 1770, confiscated in 1778, the proprietor having become a Tory; re-granted in 1780. It contains three churches, a Congregational, Methodist, and Baptist, three stores, two grist-mills, six saw-mills, two tanneries; 13 schools, 409 scholars. Pop. 1216.

LONDONDERRY, L. Chester co., Pa., 35 m. S.W. Philadelphia. It contains two churches, one store, two grist-mills, two saw-mills; four schools, 93 scholars. Pop. 608.

LONDONDERRY, L. Bedford co., Pa. Drained by Will's creek, which flows into Potomac river. It has one store, one falling-mill, one saw-mill, one tannery, one distillery, one pottery, one printing-office, one weekly newspaper; one academy, 36 students; one school, 38 scholars. Pop. 892.

LONDONDERRY, T. Dauphin co., Pa., 14 m. S.E. Harrisburg. Drained by Spring and Conewago creeks, the former affording water-power. It contains a Lutheran church, two stores, one falling-mill, seven grist-mills, one saw-mill; one school, 14 scholars. Pop. 1990.

LONDONDERRY, L. Lebanon co., Pa., 8 m. S.W. Lebanon. Bounded N. by Swatara creek. Drained by Quasaphilla and Conewago creeks. It contains six stores, one furnace, one grist-mill, one saw-mill, three tanneries; five schools, 145 scholars. Pop. 1762.

LONDONDERRY, p. t. Guernsey co., O., 95 m. E. Columbus, 302 W. Named from Londonderry in Ireland, whence some of its inhabitants originally came. It has seven schools, 164 scholars. Pop. 1606.

LONDON GROVE, p. t. Chester co., Pa., 34 m. S.W. Philadelphia, 71 m. E. by S. Harrisburg, 105 W. Drained by White Clay creek and its branches. It contains four stores, one woollen factory, one cotton factory, with 336 spindles, four flouring-mills, four saw-mills, 16 oil-mills, three tanneries, one pottery; three schools, 73 scholars. Pop. 1348.

LONG BRANCH, p. v. Shrewsbury t., Monmouth co., N. J., 30 m. S. New-York, 50 m. E. Trenton, 216 W. A watering place, much frequented for sea air and bathing, and for fishing and gunning. Situated on a peninsular beach on the Atlantic, where the land rises perpendicularly from the beach to the height of 20 feet, and has fine board-walks, 30 rods from the water, in front of which are pleasant lawns. It is much frequented in the summer season.

LONG ISLAND, N. Y., is the largest island of the United States on the Atlantic coast; and from fort Hamilton at the Narrows, to Montauk point, is about 140 m. long, with a breadth as far east as Peconic bay of from 12 to 30 m., a distance of 90 m. It is bounded N. by Long Island sound, E. by the Atlantic, S. by the Atlantic, and W. by the harbour of New-York, and the strait which connects the harbour with the sound, called East river, from half a mile to two miles wide. The island contains 1500 sq. m., and is divided into three counties, King's co. in the W., Queen's in the middle, and Suffolk on the E. Of these, King's, though the most important and populous, has much the smallest territory, and Suffolk in the E., the largest, comprising two thirds of the whole island. The population of King's co. is 47,613; of Queen's, 30,394; of Suffolk, 32,489; making a total population in 1840, of 110,496. A ridge of chain of hills commences at New Utrecht in the W. part, and extends with some interruptions, to near Oyster Point point, in Suffolk county. The highest point of this chain, which runs N. of the middle of the island, is Harbour hill, in N. Hempstead, Queen's co., which is 319 feet above the level of the tides. The whole island is underlaid with granitic rock, which rises high in the spine, and breaks out in the form of gneiss along E. river at Hell-gate, and in other places. The surface of the island N. of this ridge is generally rough and broken, while S. of it, it is almost a perfect plain, with scarcely a stone exceeding a few ounces in weight. On the E. side of the island is Great South bay, from one mile to five miles wide, affording an uninterrupted inland navigation for vessels of 60 or 70 tons; and which extends from Hempstead bay, eastwardly for 50 miles. This bay is enclosed by a narrow island or beach, with several inlets, in no part over 3 m. broad. Toward the E. end, the island divides into two parts, the southern consists of a promontory over 30 m. long, and not generally over 1 wide, constituting the town-

LONS-LE-SAULNIER.

ship of Easthampton, on the eastern extremity of which is Montauk point, on which is a lighthouse. The N. part, which is less extensive, terminates at Oyster point, and constitutes the township of Southold. Between these two parts is Great Peconic bay and several islands, the largest of which are Gardiner's and Shelter islands. The soil on the N. side of the dividing ridge, generally consists of loam, while through the middle and S. part of the island it consists of sand or gravel. Much of the central part of the island consists of pine forest, in which wild deer are still found. South bay abounds with shell and scale fish, and water fowl of many kinds. A railroad from Brooklyn, 94 m. to Greenport is in progress, which will probably be completed in July 1844.

LONG ISLAND SOUND, extends along the whole length of the island, and separates it from Connecticut on the N. It is a fine body of water, which furnishes great facilities for the coasting trade, being about 110 m. long, and from 2 to 30 m. broad. It has several good harbours, and a number of lighthouses. It communicates with the Atlantic on the E. by a broad and rapid strait called the Race, and with New-York harbour on the E. by the East river, in which is the dangerous pass called Hell-gate or Hell-gate, which can be safely passed by sail vessels at high or low water, or with a fair wind; and by steamboats at all times.

LONGFORD, an inland co. of Ireland, prov. Leinster, having N. Cavan and Leitrim, E. Westmeath, and W. Roscommon, from which it is separated by the Shannon. Area, 263,645 acres, of which 55,247 are unimproved bog and mountain, and 15,892 lakes. The arable soil is, for the most part, level and fertile. Property mostly in large estates. Tillage farms small, the state of agriculture and the condition of the occupiers being much the same as in the adjoining counties. Grazing, however, is extensively carried on. Average rent of land, 12s. 3d. an acre. It is divided into six baronies and 23 parishes; and sends two members to the House of Commons, both for the county. Registered electors, in 1839-40, 1971. In 1831 it had 19,418 inhabited houses, 30,438 families, and 112,558 inhabitants, of whom 55,310 were males, and 57,248 females.

LONGFORD, an inland town of Ireland, cap. of the above co., prov. Leinster, on the Camlin, an affluent of the Shannon, 65 m. N.N.W. Dublin. Pop. in 1831, 4134. It is "a well-built town, and is increasing rapidly in population and wealth. There is here a very large market for grain; great quantities being exported by the royal canal, a branch of which comes to the town." (*Municipal Boundary Report*)

It has a parish church, a Roman Catholic chapel, meeting-houses for Presbyterians and Methodists, a market-house, the county courthouse, prison, infirmary, and dispensary, with large cavalry and artillery barracks. The corporation, which, under a charter of Charles II. in 1637, consisted of a sovereign, two bailiffs, 12 burgesses, and a commonalty, sent two members to the Irish House of Commons till the Union, when it was disfranchised. The county assizes and general sessions are held here; and courts for petty causes are held on Mondays and Saturdays. It is a constabulary station. Some linen is manufactured; and there is a tannery, a brewery, and a distillery; but the great business of the town consists in its trade in corn and other raw produce. Markets on Wednesdays and Saturdays: fairs on March 25, June 10, Aug. 19, and Oct. 29. Postoffice revenue, in 1830, £1087; in 1836, £1137. Branches of the Bank of Ireland, and of the Agricultural and National banks, were opened in 1834-35-36.

LONG MEADOW, p. t. Hampden co., Mass., 95 m. W.S.W. Boston, 359 W. Bounded W. by Connecticut river. The principal village is built on a single broad street, one mile E. of Connecticut river, and parallel to it. The township contains three churches, two Congregational, and a Baptist, three stores, one grist-mill, three saw-mills, three tanneries; seven schools, 391 scholars. Pop. 1370.

LONG SWAMP, p. t. Berks co., Pa., 79 m. E. by N. Harrisburg, 165 W. Watered by Little Lehigh river. It contains a church common to Lutherans and Presbyterians, two stores, one furnace, one forge, two grist-mills, two saw-mills, two powder-mills, two tanneries, three distilleries. Pop. 1836.

LONGOBUCCO, a town of the Neapolitan dom., prov. Calabria Citra, 19 m. E.N.E. Cosenza. Pop. about 5000, chiefly employed in working metals and burning charcoal. The horses for hunting in Naples are bred in the neighbourhood.

LONS-LE-SAULNIER, a town of France, dep. Jura, of which it is the cap., in a deep valley, 50 m. S.E. Dijon. Pop. in 1836, 7684. It has no remarkable public buildings; but is generally well built, clean, and furnished with numerous public fountains, one of which, in the *Place d'Armes*, is ornamented with a statue of Pichegru, in white marble. At the N. extremity of the town is the salt spring from which it derived its ancient name of *Lada Salinaris*: this spring continues to yield great quantities of table salt; four

LOO-CHOO.

pumps are kept constantly at work, and the evaporating houses (*bâtiments de graduation*) are very extensive. Lons has a theatre, a public library with 3000 volumes, a gallery of paintings and antiquities, tribunals of primary jurisdiction and commerce, a communal college, &c. It is the entrepôt of the agricultural produce, iron goods, timber, wines, &c., of the dep., and has a fair on the 15th of every month. (*Hugo, art. Jura; Guide du Voyageur, &c.*)

LOO-CHOO, or LIEOU-KIEOU ISLANDS, a group tributary to the Chinese, in the N. Pacific ocean, nearly midway between Japan and Formosa, and comprised within lat. 26° and 28° N., and long. 127° and 130° E. There are in all about 36 islands; but, excepting the Great Loo-Choo Island, towards the centre of the group, 70 m. in length, by from 12 to 15 m. broad, they are mostly of very inferior dimensions. These islands, which are but little known to Europeans, are reported to have a delightful climate, and a soil of great richness, producing the fruits and vegetables of countries the most remote from each other. Rice is cultivated with great care. Cattle, goats, and pigs, are said to be diminutive; but poultry are large and excellent. The islands yield sulphur and salt, and have, it is alleged, rich mines of copper and tin. Conflicting statements have been made by different travellers respecting the civilization, political condition, jurisprudence, &c., of the natives. They appear, however, to be of the same race as the Japanese; and have not merely adopted the costume, but speak the language, of that people. Their religion is a species of Buddhism; and their government, like that of other Asiatic countries, of a despotical character. They are friendly and hospitable; but it is now sufficiently ascertained that Captain Hall was totally mistaken in the estimate he formed of these islanders; who, had his statements been well founded, almost resembled the poetical fictions of the golden age. The Loo-Choo islands were for some time subject to Japan, but were conquered by China about 1372. Kintching, the capital, is about 5 m. from its port Napkiang, near the S.W. extremity of Great Loo-Choo, lat. about 26° 14' N., long. 127° 32' E. (*See Hall, Macleod, and Bechoey's Travels, &c.*)

LOOE (EAST and WEST), two contiguous anc. bors. and market towns of England, co. Cornwall, hund. West, on both banks and close to the mouth of the Looe, 12 m. S.E. Bodmin, and 210 m. W. by S. Looedon. United pop. in 1831, 1458. They are mean, wretched places, connected by a narrow, old bridge of 13 arches; and would be unworthy notice, were it not that each of them enjoyed the privilege of sending two members to the House of Commons from the reigns of Edward VI. and Elizabeth down to the passing of the Reform Act, when they were both disfranchised.

LORAIN, county, O. Situated in the N. part of the state, and contains 540 sq. m. Watered by Rocky river and its branches, and by the E. branch of Black river. Organized in 1824. It contained in 1840, 20,931 neat cattle, 19,377 sheep, 16,841 swine; and produced 134,474 bushels of wheat, 3793 of rye, 243,034 of Indian corn, 3699 of buckwheat, 80,381 of oats, 106,577 of potatoes, 326,644 pounds of sugar. It had one commission house in foreign trade, 28 stores, four lumber-yards, one furnace, one fulling-mill, one woolen factory, one flouring-mill, 14 grist-mills, 34 saw-mills, eight tanneries, one distillery, three printing-offices, one bindery, three weekly and one semi-weekly newspapers; one college, 498 students; two academies, 135 students; 97 schools, 3123 scholars. Pop. 18,467. Capital, Elyria.

LORAIN, t. Shelby co., O. It has two stores, two saw-mills; two schools, 53 scholars. Pop. 904.

LORRAINE, p. t. Jefferson co., N. Y. 15 m. S. Water-town, 157 m. N.W. Albany, 408 W. Drained by Sandy creek and its tributaries. It has two stores, two flouring-mills, 10 saw-mills; eight schools, 265 scholars. Pop. 1669.

LORCA (an. *Ciociroca*), a considerable town of Spain, prov. Murcia, cap. of a partido of its own name on the Guadalequivir, a tributary of the Segura, 42 m. W.S.W. Murcia, and 116 m. E.N.E. Granada. Pop., according to Millaon, 40,306. The vale of Lorca is remarkable for picturesque beauty and great fertility; and the town, close under the Sierra del Cano that bounds it on the left, and the fine old castle on a rock hanging over it, adds greatly to the beauty of the picture. This has evidently been a considerable place; but, the lower part of the town being concealed by trees, nothing is seen on approaching it but a number of low houses crowded on the side of the mountain, and from the similarity of colour seeming almost to belong to it. This is the old or Moorish town, and is very irregular and mean in appearance; but the new town, on the plain, is much more regularly laid out, and better built. A collegiate (once episcopal) and seven parish churches, two hospitals, an episcopal palace, and a royal college, are the chief buildings and establishments. Saltpetre is manufactured on a large scale, and soap, thread, and linens, are pro-

LORETTO.

duced in small quantities; but the chief resources of the town consist in its great September fair, its markets, and the produce of its neighbourhood, both in stocks and agricultural produce. Mr. Inglis gives a lively picture of the market and its attendants: "All the women here wear a square white woollen shawl, worn like a mantilla; the men are dressed in short white drawers loose at the knees, and instead of stockings use sandals made of rope; and their heads are covered with close-fitting tapering black caps, others from the higher countries being enveloped in blankets of gaudy colours. Among the numerous things exposed for sale, were dried and shell fruits, Catalanian cloths and calicoes, shoes and rope sandals, quantities of Esparto rush and rush-baskets, beads, rosaries, trinkets, &c., in short, everything that one either eats or wears in Murcia. The show of pigs was extremely fine, and nowhere in the world are these animals found in greater perfection than in Spain, fed, as they are, on the flex nut. The price of a hog weighing 32 stone was 240 reals (£3 8s.), and that of a sucking pig 14 reals. Mutton sells at 12 quemas, a fowl costs 90s., a hare 10s., and bread is 1½d. per lb. The price of labour in the vale of Lorca is 5 reals or 1s. a day." (*Inglis's Spain*, ii., 306.)

Lorca, supposed to be the *Ciociroca* mentioned in Antioch's Itinerary, was exposed to frequent attacks during the contests between the Moors and the crown of Castile, and has at various times sustained sieges. It was nearly destroyed at the commencement of this century. In 1792, a speculator, with the permission of government, collected at a great expense all the waters of the district into a common reservoir (*pentase*) resembling that of Alicant. The basin was said to be "superb," and capable of containing water sufficient to irrigate for years the entire vale of Lorca. Ten years afterward (30th April, 1802) the waters, which had for some time been undermining the reservoir, rushed out with an impetuosity that swept everything before it, men and cattle, public buildings, and even trees and rocks. About 600 houses, a church, two convents, two hospitals, several mills and fountains, were at once swallowed up and disappeared, about 6000 human beings, 24,000 cattle, &c., being at the same time destroyed. The agricultural districts were covered over with sand, rubbish, &c., and the total loss occasioned by the catastrophe is supposed to have exceeded a million sterling. A like disastrous event is said to have destroyed the ancient city of Mared in Arabia Felix, an account of which will be found in the *Middle Traveller, Arabia*, p. 28. (*Inglis; Laborda*, vol. ii.; *Millaon*.)

LORETTO, a town of the Papal States, cap. of a commissariat of the same name, on a bold and commanding eminence, about 3 m. from the Adriatic, and 12 m. S.E. Ancona. Pop., with its suburbs, about 3600. It is surrounded with walls, constructed by Sixtus V., in 1587. This celebrated but poor town is wholly indebted for its fame, and even existence, to its having the good fortune to possess the *Santissima Casa*, or house occupied by the Virgin Mary, in Nazareth, conveyed by angels, first to Turas in Dalmatia, and thence, by the same agency, in 1384, to its present site! This miraculous edifice is a mean-looking hovel, about 30 feet in length, by 13 or 14 feet in width, and 16 feet in height; apparently built of Apennine limestone, with a modern vault of timber-work. It is incased in a shell of marble, sculptured with bas-reliefs, representing the history of the Virgin; the whole being under the dome of a splendid church, built to protect the sacred edifice. In a niche within the latter, once sealed in with gratings of solid gold, but now with pieces of gilt wood, is the image of the Virgin, assumed to be the work of St. Luke, to whose talents as an artist it does little credit, being "a little old woman about 4 feet in height, with the features and complexion of a negro." (*Millaon*.) Her dress is tawdry, and in the worst possible taste; she literally glitters in jewels and brocade, and reigns "amid the continual glare and smoke of lamps and candles, held by figures of angels." The church, which encloses the *santissima casa* is said to have been designed by Bramante. According to Eustace, it is a "very noble structure;" but it is less favourably spoken of by Woods and others. Its gates, which are of bronze, are embellished with *bas-reliefs* of the most admirable workmanship; in the one before it, is a handsome marble fountain, and a large statue of Pius VI. The riches formerly accumulated within this sanctuary, were a subject of astonishment to all travellers; and were, most probably, much exaggerated. The popes are believed to have occasionally abstracted some of the gold offerings, and to have substituted false for real gems. But when the French acquired possession of Loretto, they acted with less reserve; and, undismayed by the sanctity of the place, rifled its repositories, and carried off every article of value, applying them to secular and really useful purposes. It has since, however, received several considerable benefactions.

A lucrative trade was formerly carried on at Loretto in

L'ORIENT.

romanes, crucifixes, *agnus Dei*, and such like articles, partly taken off by pilgrims to the shrine, and partly exported. But this trade has now much fallen off. The number of pilgrims, though still very considerable, has also greatly declined; and they are now mostly of the lowest and poorest classes. On their arrival in town, they are received into a hospital, where they are boarded and lodged for three days; and this privilege has probably as much to do as expiation in attracting them to Loretto. (See *Addison's Travels*, p. 94, ed. 1786; *Morri's Italy*, l. 291; *Essex's Classical Tour*, l. 200; *Forry's*, 331, &c.)

L'ORIENT, a strongly fortified seaport town of France, dep. Morbihan, cap. arrond., at the confluence of the Scorff with the Blavet, at the head of the bay of Port Louis, about 3 m. from the Atlantic, and 20 m. W. by N. Vannes. Lat. 47° 45' 11" N.; long. 9° 21' 2" W. Pop., in 1836 (ex. suburbs), 15,136; but, according to recent statements, the population of the town and suburbs may now (1841) amount to 19,880 or 20,000, nearly 5600 of whom are employed in the dock-yard and its appendages. L'Orient is clean, and regularly built: the streets are wide, straight, and well paved, and the houses well constructed and handsome. One of its public squares, the *Place Royale*, is planted with lime-trees, and it has other good promenades. The principal church* is very large, and has a lofty spire, which is a conspicuous landmark. The prefecture, session-hall, town-hall, and theatre, are handsome edifices. The public slaughter-houses (*abattoirs*) are remarkably clean, and the meat, fish, and bread-markets are, next to those of Rennes, the best constructed, and most extensive in Brittany. In the centre of the market-place is a granite column erected to the memory of the commander, Bissou. Some years ago, a bridge, also of granite, was commenced over the Scorff, but the design was abandoned, lest the clearance of the port should be thereby impeded.

The port of L'Orient, about $\frac{1}{2}$ of a mile in length by nearly $\frac{1}{2}$ m. in breadth, is secure, commodious, and of easy entrance. It is bordered by fine quays, on which are some extensive buildings and establishments connected with the government dock-yard; an observatory 120 feet in height, which serves also for a telegraph and a lighthouse, and a very handsome public fountain. The naval establishment is on a smaller scale at L'Orient than at Brest; it has no docks, but it has a place of confinement for soldiers guilty of insubordination. More ships of war are now built in the dock-yard of L'Orient than at any other in France, 16, of the estimated cost of 8,652,300 francs, having been constructed here in 1840. L'Orient has slips enough for the construction of 20 vessels of all sizes; frigates are, however, the class of ships chiefly built. Towards the end of 1840, nine ships were occupied each with a frigate in course of active preparation; and, according to the report of an English traveller, 3000 workmen were exclusively engaged on these nine frigates. Many of the subordinate artificers get only 25 sous a day, and few of the better workmen receive more than 20 to 40 sous a day; but taking into account the cheapness of living in Brittany, they are, perhaps, fully as well off as the workmen in the English dock-yards. The seamen (*chefs d'attelage*) are not paid by the day, but receive from 1500 to 2000 francs a year, according to circumstances. L'Orient has excellent stores for masting vessels, &c., and good block sheds, the machinery in which, as well as a portion of that for cable-making, is wrought by steam. At the end of 1840, establishments were in course of being erected for the construction of steam engines for ships of war, and new forges, &c., were about to be commenced. The buildings formerly belonging to the French E. I. Company, are now converted into barracks. The arsenal and naval stores are very extensive, and the artillery barracks are capable of accommodating 1800 men. The lazaret is on a small island to the S. between L'Orient and Port Louis. L'Orient has a school of naval artillery and a spacious artillery ground near the town, a school of hydrography, established 1771, a large and well-arranged commercial college, a preparatory school for training for the government schools, a communal college, gratuitous schools of drawing, geometry, arithmetic, &c., a public and a pretty good naval library, museums of chemistry and mineralogy, an agricultural society, and various educational societies. It is the seat of tribunals of primary jurisdiction and commerce, a chamber of commerce, &c.

The manufactures of L'Orient, chiefly consisting of hats, finery, gold lace, earthenware, &c., are not very important. Its trade, though not so flourishing as in 1789, has latterly begun to increase. In 1830, only six merchantmen belonged to the port; it has now (1840) more than four times that number, some of them trading to the French colonies. The chief exports are wax, honey, butter, corn, cattle, and

LOT.

pilchards, the latter being taken in great quantities on the adjacent coast, are sent to Nantes to be prepared for exportation.

Though at present so little eminent for trade, L'Orient owes its origin and former importance almost wholly to commerce. It was but an insignificant village when, in 1726, the French E. I. Company made it their principal naval depot; and such was the influence of the change, that in 1736 its population is said to have amounted to 14,000! On the dissolution of the company in 1770, L'Orient was made one of the stations for the French navy, and a free commercial port. (*Hugo*, art. *Morbihan*; *Letter in the Times*, 7th Oct. 1840.)

LOBBRAINE (Gonn. *Lothringen*), one of the largest of the an. provs. of France, in the N.E. part of the kingdom, now distributed among the depts. of Meurthe, Meuse, Moselle, Vosges, and Bas-Rhin.

LOSTWITHIEL, or LESTWITHIEL, an an. bor. market-town, and par. of England, co. Cornwall, hund. Powder, on the W. bank of the Powey, 5 m. S.S.E. Bod min, and 211 m. W. by S. London. Area of bor., 130 acres. Population, in 1831, 1548. The houses are chiefly of stone, roofed with slate, but the streets narrow and ill-paved. The church, a curious old building, has a large E. window, and a fine tower and spire at the opposite end; the living is a vicarage, in the gift of Earl Mount-Edgcumbe. It has also places of worship for Independents, Wesleyans and Primitive Methodists, with attached Sunday schools. The corporation support a grammar and writing school; another school, for poor children, is liberally endowed by the trustees of the late Rev. St. John Eliot; and there are a few money boutiques. Near the church, an ancient building, supposed to have been either a palace of the Duke of Cornwall, or a court-house for the stannaries, was, till very recently used as a prison during the winter and summer county sessions, now removed to Bodmin. There is a town hall, where petty sessions are held, and under it is a small jail. Tanning and wool-stapling are the principal trades, and the town derives some importance from its situation on the Powey, by which iron and copper ore, &c., are exported. Lostwithiel was made a free borough by Richard Earl of Cornwall, and incorporated by James I.: it sent two members to the House of Commons, from the 19th Edward II. down to the Reform Act, by which it was disfranchised. It is not included in the Municipal Reform Act; but is now, as formerly, governed by a mayor, six capital, and 17 inferior burgesses. Markets on Friday; cattle fairs, July 10, Sept. 6, and Nov. 13.

About 1 m. N. of Lostwithiel, on the summit of a hill, is Restormel castle, the ancient seat of the baronial family of Cardinan, and subsequently of the earls of Cornwall; it was ruinous even so early as the time of Henry VIII. but was repaired and occupied during the civil war. (*Man. Corp. and Chas. Rep.* &c.)

LOT, a dep. of France, reg. S., chiefly between lat. 44° 15' N. and long. 10° 30' E., having N. Corrèze, E. and S.E. Cantal and Aveyron, S. Tarn-et-Garonne, and W. Lot-et-Garonne and Dordogne. Area, 525,280 hectares. Population in 1836, 287,003. The dep. is mountainous, with a general slope towards the S.W. Its mountains are ramifications of those of Cantal, and rise in the E. about 2500 feet above the sea. Its chief rivers are the Lot, and the Dordogne; from the first of which it derives its name. The Lot, which rises in Lozère, about lat. 44° 30' N. long. 3° 45' E., runs with a very tortuous course generally W. through Aveyron, the S. part of Lot, and the centre of Lot-et-Garonne and Gironde; uniting with the Garonne at Aiguillon, about lat. 44° 18' and long. 0° 19' E. It is navigable, during four months of the year, for nearly 100 m., Mende, Cahors, and Villeneuve d'Agen are on its banks. There are an immense number of narrow valleys, watered by small rivulets: these have frequently an alluvial soil of great fertility, but the soil in most parts is either calcareous, or stony and gravelly. In 1834, it was estimated that 252,533 hectares were arable, 25,895 in pasture, 58,627 in vineyards, 87,935 in woods, and 71,284 occupied by heaths, wastes, &c. Lot produces more corn than is required for its own consumption; but chestnut-flour forms an important article of food among the rural population. The corn grown is principally wheat, maize, and rye; and the total annual produce of all kinds is estimated at between 1,200,000 and 1,600,000 hectol. Agriculture is extremely backward, and there is a great want of capital, a consequence mainly of the splitting up of the land into an immense number of small properties. In 1835, of 111,948 properties subject to the contribution *foncière*, 50,471 were assessed at less than 5 fr., 18,731 at from five to 10 fr., and 17,632 at from 10 to 20 fr.; while the number of properties assessed at 1000 fr. and upwards amounted to only 18. The plough employed is a fac simile of that described by Virgil, and is drawn by oxen: the spade or hoe is, however, used in the culture of thin soils. The produce of wine amounts to about 600,000

* Hugo says that this church was originally planned and begun on so immense a scale, that after 20 years labour had been spent in its erection, the builders, despairing of being able to finish the work as commenced, found it necessary to demolish a portion of it to complete the rest.

hectol. a year, a third part of which is consumed by the inhabitants, and the rest sold or converted into brandy. The wines known in the market as *vins de Cahors* are strong and very dark-coloured, and are principally employed to give body and colour to other wines, for which purposes they are principally sent to Bordeaux. Tobacco is grown in this dep., and in 1833 about 1850 hectares were appropriated to its culture, and 933,330 kilog. produced. The climate is favourable for the mulberry, but the silkworm does not thrive. A few proprietors have flocks of merino sheep, but the pastures are badly irrigated and attended to, and most kinds of live stock are indifferent. The goats' hair of the dep. is, however, highly esteemed. The produce of sheep's wool is estimated at 500,000 kilog. a year. A great many hogs are fattened for sale in the neighbouring depts.; and about 60,000 turkeys and geese are annually exported, preserved in their fat. A considerable proportion of the truffes used in *Pâtis de Périgord* come from this dep. There are some iron and coal mines; but both mining and manufacturing industry are little attended to. A few copper and iron forges, woollen, cotton, and linen cloth factories, paper-mills, and tanneries, are the chief manufacturing establishments: these, however, are so few, that the inhabitants are usually supplied with cloths and leather in exchange for their wool and skins from the adjacent depts. There are nearly 1000 flour-mills in the dep. Lot is divided into three arronds.; chief towns, Cahors, the cap., Gourdon, and Figeac. It sends five members to the Ch. of Dep. Number of electors (1838-39), 1306. Total public revenue, in 1831, 4,765,687 fr.; but the expenditure in the same year amounted to 5,060,508 fr. (*Hugo, art. Lot; Official Tables, &c.*)

LOT-ET-GARONNE, a dep. of France, reg. S.W., formerly included in Guenne; chiefly between lat. 44° and 44° 40' N., and long. 0° and 1° E., having N. Dordogne, W. and S.W. Gironde and Landes, S. Gers, and E. Tarn-et-Garonne and Lot. Length and breadth about 50 m. each; area, 530,711 hectares. Population (1836) 346,400. The surface is mostly level, with a slope to the W. The Garonne intersects the dep. from S.E. to N.W., and receives about its centre the Lot from the E. The banks of these rivers may be classed among the most productive portions of France; but 365,496 hectares consist of a chalky soil, and about one eighth part of the surface in the W. of the dep. is composed of *landes*, or sandy plains, sprinkled with marshes, analogous to those in the adjoining depts. of Gironde and Landes. According to the official returns, it comprised, in 1834, 266,100 hectares of arable land, 42,322 do. meadow, 69,349 do. vineyards, and 68,613 do. woods. This dep. is principally agricultural. The corn grown exceeds what is required for home consumption: it is chiefly wheat and maize on the richer lands, and rye on the poorer. The produce of wine is estimated at about 650,000 hectolitres a year, of which nearly a half is exported. The N. part of the dep. produces about 40,000 hectols. a year of chestnuts, from 7000 to 8000 hectols of which are sent to Bordeaux and the neighbouring depts.: 2030 hectares are occupied with tobacco, which produced, in 1833, 746,596 kilogs., valued at about 560,000 fr. Excellent hemp is grown. The prunes of Agen are highly esteemed, and are exported to the value of 600,000 fr. a year: the dried figs of Clairac are also celebrated. On the *landes* are many fir plantations, which furnish about 800,000 kilogs. of resin, and 300,000 kilogs. of turpentine a year, besides pitch, deals, &c. The cork tree grows in a few communes, and its produce is valuable. Artificial pasture lands are rare. According to the official tables, there were in 1830 in this dep. 188,000 head of sheep, and 107,000 head of black cattle. Large flocks of geese are reared, especially near Agen; they are fattened on maize, and preserved in their fat. In 1833, of 122,538 properties subject to the *contribution foncière*, 51,946 were assessed under 5 fr., and 19,780 at from five to 10 fr. Mining industry is insignificant; but some iron ore is smelted by means of charcoal, there being no coal mine in the dep.: there are numerous distilleries. At Tonneins is a royal tobacco manufactory, employing 400 workmen, who produce 400,000 kilogs. of tobacco a year, for the supply of the neighbouring depts. At Nerc, Mezin, Barbaste, &c., are cork factories, which together may employ about 700 hands, and produce 130,000 metrical quint of corks a year. At Agen is a large sail-cloth factory, with 300 looms, for the service of the French navy; and there are also extensive rope-walks. Lot-et-Garonne has also manufactures of woollen thread, serge, linen and cotton cloths, gloves, paper, starch, glass, and earthenware, besides tanneries, iron works, &c. The dep. is divided into four arrond.; chief towns, Agen, the cap., Marmande, Nerc, and Villeneuve d'Agen. It sends five members to the Chamber of Deputies. Number of electors in 1838 39, 9771. Total public revenue (1831), 7,941,527 fr.; expenditure in the same year, 6,094,709 fr. (*Hugo, art. Lot-et-Garonne; Official Tables.*)

LOTHIAN, an extensive, fertile, well cultivated, and rich district of Scotland, lying along the S. shore of the frith of Forth. It is divided into the counties of East Lothian, or Haddington; Mid Lothian, or Edinburgh; and West Lothian, or Linlithgow. We shall make a few observations on each of these, beginning with

1st. *East Lothian*.—This, which, as its name implies, is the most easterly division of the Lothians, has the frith of Forth on the N., the German Ocean on the E., Berwickshire on the S., and Mid Lothian on the W. It is of an elliptical shape, and contains 174,080 acres, of which about four fifths are capable of cultivation. The S. portion of the county is occupied by the Lammermuir hills, which divide the county from Berwick; but with this exception, it is mostly level, or merely undulating; and when viewed from the adjacent heights, appears like an extensive, rich, and beautiful plain, gradually sloping to the sea. The district along its E. coast, comprising about 30,000 acres, has a reddish, loamy, and very fertile soil: the soil gradually becomes more clayey as it recedes from the sea; and, except in the district now referred to, its general character is that of a clay bottom. The climate is comparatively dry and early; but the E. winds, in April and May, are often very severe. This is one of the best cultivated districts of the empire, and is remarkable for the intelligence and skill of its farmers, and their superior husbandry. The best farming is seen in the district along the E. coast, the soil being there adapted alike to the growth of turnips and of wheat. The turnip culture, indeed, is carried on here to a greater extent, on more correct principles, and with better success than in any other part of the empire. In the clayey lands, or those that have a wet, retentive subsoil, summer fallow is extensively practised, and is found to be the best foundation of a profitable system of cultivation. During the late war, when the prices of corn were so enormously high, the raising of corn in this county was carried to an improper extent; and in many parts the land was unduly forced. But this error has since been obviated. The fattening of cattle of all kinds for the butcher is now an important part of the economy of every well conducted farm; and a greater extent of land is kept in grass, and for a longer period. Exclusive of the Lammermuir district, which is principally devoted to the breeding of sheep, the farms in the other parts of the county extend from 60 acres up to 500 acres, or more, the average being about 230 acres. Every farm has a threshing machine; and of these about 80 are driven by steam, seven by wind, 30 by water, and the rest by horses. Rents are commonly fixed in corn, convertible into money at the fair prices of the county. Six bushels of wheat may, perhaps, be taken as the average rent of the wheat lands of the district, which, taking the wheat at 7s. a bushel, will be equivalent to a money rent of 42s. an acre. In 1810, the average rental of the county was 30s. 10d. an acre. Notwithstanding its present highly advanced and improved condition, agriculture was in an extremely backward and depressed state in this county even so late as 1770. The land was then not half tilled; a rotation of crops was comparatively unknown; the stock and implements of husbandry were alike defective; much of the land was injured by the want of drainage; the *hinds*, or farm labourers, were badly fed and badly clothed; and the *ague* regularly made its appearance in spring in every hamlet and village, and almost, indeed, in every house. The change in the interval has been most striking and beneficial. Even within the last dozen years many important improvements have been made, principally by the introduction of furrow draining and bone manure, a better rotation of crops, and a more efficient and skilful management. The farm-houses and offices are excellent; but we are sorry to have to add, that while every thing else has been vastly improved, the cottages have not, in the majority of cases, been sensibly ameliorated, and their condition is discreditable alike to the farmers and the landlords. Except, however, as respects their lodging, the labourers are well off; and the *hinds*, or farm labourers, now receive each 34 bushels of oats a year more than they did previously to the commencement of the improvements. Estates of various sizes; some very valuable. There are about 7,500 acres of wood. The W. division of the county has valuable beds of coal; and limestone is very generally diffused. If we except some considerable distilleries, manufactures are all but unknown. The Tyne, which flows through the centre of the county, is the only considerable stream. The county sends one member to the House of Commons; and the boroughs of Haddington, N. Berwick, and Dunbar, join with Lunder and Jedburgh in returning one member. Registered electors, in 1839-40, 740. In 1831, E. Lothian had 6561 inhabited houses, 2080 families, and 36,145 inhabitants, of whom 17,397 were males, and 18,748 females. Valued rent, £168,674 Scotch. Annual value of real property in 1815, £250,191. (*Robertson's Rural Recollections*, passim; *New Statistical Account of Scotland*.)

LONDON.

2. *Mid Lothian*, or Edinburghshire, has the frith of Forth on the N.E., Lothian on the E., Roxburgh, Selkirk, Peebles, and Lanark on the S., and W. Lothian on the W. Area, 235,560 acres, of which about two thirds are supposed to be arable. In some parts, especially along its S. border it is rugged and even mountainous; the ridge of the Pentland hills, which approaches within a short distance of Edinburgh, divides its low grounds into two portions, that unite towards the sea. Soil for the most part clayey, and not in general very fertile. Agriculture similar to that of E. Lothian, but inferior; its details being also a good deal modified by the demand of the capital for milk, butter, potatoes, &c. Improvements of all sorts have been prosecuted with great zeal and industry. In 1727, a small field of wheat, within a short distance from Edinburgh, was reckoned so extraordinary a phenomenon that persons came from a great distance to see it! (*Robertson's Recollections*, p. 267.) But, at present (1840), wheat is the principal object of the farmer's attention; and there may be from 18,000 to 20,000 acres under that crop. There are a considerable number of rather large estates; but property is, on the whole, pretty well divided. Average rent of land, in 1810, 24s. 6d. an acre. There are large beds of coal in this county. For details as to its trade, manufactures, literary establishments, &c., the reader is referred to the articles Edinburgh and Leith. This county has, exclusive of Edinburgh, 27 parishes: it returns four members to the House of Commons, viz. one for the county, two for the city of Edinburgh, and one for Leith and Musselburgh. Registered electors for the county, in 1839-40, 3315. In 1831 Mid Lothian had 19,744 inhabited houses, 47,415 families, and 219,345 inhabitants, of whom 99,393 were males, and 119,952 females. Valued rent of county, £219,054, Scotch. Annual value of real property, in 1815, £770,875.

3. *West Lothian*, or Linlithgowshire, the smallest of the divisions of Lothian, has the frith of Forth on the N., Mid Lothian on the E. and S., and Lanark and Stirling on the W. It is of a triangular shape, and contains 78,500 acres, of which about three fourths are arable. Surface varied, with knolls; there are, however, but few hills, and no mountains. In the S. part of the county the ground is moorish, and there are some morasses; but elsewhere it is comparatively fertile. Agriculture similar to that of Mid Lothian, with this difference, that more turnips are raised and fewer potatoes. Estates large; farms of a middle size. Average rent of land, in 1810, 21s. 7d. an acre. Coal is found in most parts of the county. Manufactures of no importance. W. Lothian is divided into 13 parishes: it sends one member to the House of Commons for the county; and the burgoes of Linlithgow and Queensferry join with others in returning representatives. Reg. electors for the county in 1839-40, 716. In 1831 W. Lothian had 2400 inhabited houses, 5014 families, and 33,291 inhabitants, of whom 16,295 were males, and 12,996 females. Valued rent, £75,019 Scotch; annual value of real property, in 1815, £227,527.

LOUDON, county, Va. Situated in the N.E. part of the state, and contains 480 sq. m. Bounded N.E. by Potomac river. Watered by Goose creek, and its branches and Shenandoe river. It contained in 1840, 95,680 neat cattle, 31,503 sheep, 28,841 swine; and produced 573,485 bushels of wheat, 81,517 of rye, 891,085 of Indian corn, 6845 of buckwheat, 1479 of barley, 934,706 of oats, 53,947 of potatoes, 1255 pounds of tobacco. It had 79 stores, four fulling-mills, two woollen factories, 55 flouring-mills, 69 grist-mills, 31 saw-mills, 11 tanneries, five distilleries; six academies, 265 teachers, 23 schools, 1008 scholars. Pop. whites, 13,840; slaves, 2273, free coloured, 1318; total, 30,431. Capital, Loudounburg.

LONDON, p. t., Merrimac co. N. H. 8 m. N.E. Concord, 485 W. Chartered in 1773. Concord river affords water power. It contains three churches, two Congregational and Methodist, three stores, one woollen factory, three grist-mills, eight saw-mills, one oil-mill, three tanneries, one pottery; 10 schools, 495 scholars. Pop. 1640.

LONDON, p. t., Seneca co. O. 88 m. N. Columbus, 433 W. Drained by a branch of Sandusky river. It has two stores, one grist-mill; three schools, 94 scholars. Pop. 783.

LOUVEUN, a town of France, dep. Vienne, cap. arrond., on a hill 31 m. N.W. Poitiers. Population, in 1836, ex. com., 4423. It was formerly of considerable importance, and has still many large houses and wide streets; but its inhabitants being principally Protestants, it suffered much from the revocation of the edict of Nantes, from the effect of which it has never recovered. It has a hospital, a theatre, the remains of an ancient castle, a tribunal of original jurisdiction, and manufactures of woollen cloth, lace, &c. (*Hugo, art. Vienne.*)

This town is famous, or rather infamous, in the history of fanaticism for a judicial murder committed in it, in 1634, when a curate, of the name of Grandier, accused and convicted of sorcery and magic, was burnt alive! The unfur-

LOUISA.

tunage curate appears to have had but little respect for that rule of the Roman Catholic religion which enjoins the celibacy of the clergy; and he is said, and we presume truly, to have practised his arts with most success on the nuns belonging to an Ursuline convent in the town. (*See Biographie Universelle, art. Grandier; Histoire des Diabliques de Loudon, poëmie, &c.*)

LOUGHBOROUGH, a market town and par. of England, co. Leicester, hund. W. Goscoat, near the left bank of the Soar, 10 m. N. Leicester, and 98 m. N. by W. London. Population of township in 1831, 10,800. It is a clean and respectable looking town, with several streets lined with modern brick houses, meeting the principal avenue on the great London road. The market-place, in which is the town-hall, was formerly narrow and confined, but has been recently laid open by the pulling down of the old market-house. The church, a large and handsome structure in the perpendicular style, has a lofty and well proportioned tower: the living is a rectory (value £1484), in the gift of Emanuel college, Cambridge. There are places of worship, likewise, for Presbyterians, Independents, Baptists, Unitarians, Wesleyan and Primitive Methodists, and the Society of Friends, connected with which are seven Sunday-schools furnishing religious instruction to between 3000 and 3000 children of both sexes. Besides a well-endowed grammar-school, Loughborough has a charity-school for clothing and instructing 80 boys; a subscription-school, attended by 250 boys, and a school of industry with 108 girls. A dispensary and several charitable societies confer essential benefits on the poor, and there is also a large public library and news-room. Fleecy-hosiery and bobbin-net lace are the chief branches of industry, the former occupying nearly 1000 hands in the town and neighbourhood: several persons are employed in making cotton hose and gloves; there are many makers of machinery, and a considerable number of shoemakers, working for the London market. In 1839 there were two worsted-mills, giving employment to 312 persons. The prosperity of the town has been increased by the facility of transit afforded by the Leicester Navigation and Loughborough canal; but much greater benefits are likely to result from the recent opening of the Midland Counties' railway, which brings this town within four hours' distance of the metropolis. Petty sessions every market-day. Loughborough is the election town and principal polling place for the N. division of the county. Markets on Thursday: large fairs for horses, cattle, and sheep, February 14, March 28, April 23, Holy Thursday, August 12, and November 13: cheese fairs, March 24, and September 30.

LOUGHREEA, an island town of Ireland, co. Galway, prov. Connaught, on Loughree lake, 21 m. E. by S. Galway. Pop., 1831, 4007, mostly Roman Catholic. The town, which was formerly fortified, consists of several irregular streets and lanes. The public buildings are—the parish church, the spire of which was thrown down by lightning in 1833, three Roman Catholic chapels, several large schools, and a barracks. General sessions are held twice a year; petty sessions on Thursdays. It is a constabulary and revenue guard station. Markets on Thursday: fairs on Feb. 14, May 26, Aug. 20, and Dec. 5. Postoffice revenue, in 1830, £2668. Postage in 1836, £294. A branch of the National Bank was opened in 1836.

LOUIS (ST.), a town of Western Africa, and the capital of the French possessions in Senegambia, on an island of its own name in the Senegal, about 7 m. from its mouth: lat. 16° 9' N., long. 16° 13' 45" W. Pop., in 1836, ex. garrison, 11,608, of whom 6006 were slaves. It is laid out on a regular plan, nearly a mile in length, by about 308 yards broad. Fort St. Louis, with its esplanade, occupies the centre of the town; and from two of its opposite faces, a street is prolonged, and crossed at right angles by several others. The town has about 250 brick houses, half of which have only a ground floor, and the other half rarely more than an additional story; the other dwellings are mere huts of mud and straw. The chief public buildings are the governor's residence, the barracks, and the new hospital. The last is a superior edifice of its kind for a colony of such inferior rank, and has 122 beds, a number sufficient to accommodate the greatest average number of sick. There is good anchorage in the river on both sides the island, but especially in the E. channel, where ships may lie quite close to the quay. There are neither brooks nor public fountains in St. Louis; and the water for daily use, which has to be brought from the river, is brackish. St. Louis is the seat of a tribunal of primary jurisdiction and of commerce, and a council of appeal. It is also the residence of the apostolic prefect of the colony, and the chief officers of the colonial government. Boat-building and a little weaving are its principal branches of industry. (*Hugo, art. Senegal; Dict. Géog.*)

LOUISA, county, Va. Situated centrally in the E. part of the state, and contains 570 sq. m. Bounded N. by North

LOUISIBOURG.

LOUISIANA.

Anna river. Watered by South Anna river. It contained in 1840, 10,736 neat cattle, 12,711 sheep, 20,133 swine; and produced 220,748 bushels of wheat, 890 of rye, 432,661 of Indian corn, 158,131 of oats, 15,335 of potatoes, 2,430,764 pounds of tobacco, 19,190 of cotton. Value of gold produced, \$3000. It had 30 stores, three flouring-mills, 25 grist-mills, 16 saw-mills, 11 tanneries; 39 schools, 591 scholars. Pop.: whites, 6047; slaves, 9010; free coloured, 376; total, 15,433. Capital, Louisiana C. H.

LOUISIA, county, Iowa. Situated towards the S.E. part of the territory, and contains 443 sq. m. Bounded E. by Mississippi river. Watered by Iowa river and its tributaries, which afford water-power. It contained in 1840, 9080 neat cattle, 690 sheep, 6613 swine; and produced 10,535 bushels of wheat, 82,695 of Indian corn, 15,795 of oats; 6135 of potatoes. It had three saw-mills. Pop. 1997.

LOUISIA, p. v., capital of Lawrence co., Ky., 158 m. E. Frankfort, 436 W. Situated on the W. side of Big Sandy river, and contains a courthouse, jail, and several stores and dwellings. Net proceeds of the postoffice, \$63.

LOUISIA, C. H., p. v., capital of Louisa co., Va., 60 m. N.W. Richmond, 102 W. It contains a courthouse, jail, and several stores and dwellings. Net proceeds of the postoffice, \$368.

LOUISBOURG. See CARL BASTON.

LOUISBURG, p. v., capital of Franklin co., N. C., 36 m. N.E. Raleigh, 262 W. Situated on the N. side of Tar river. It contains a courthouse, jail, two churches, 10 stores, and about 500 inhabitants. Net proceeds of the postoffice, \$488.

LOUISIANA, the southernmost of the southern United States, is bounded N. by Arkansas and Mississippi; E. by Mississippi from which it is separated by Mississippi r. to the 31° of N. lat., thence E. on that parallel to Pearl r., and down that river to its entrance into the gulf of Mexico; S. E. and S. by the gulf of Mexico; and W. by Texas, from which it is separated by Sabine r. to 33° N. lat., and thence due N. to 33° N. lat., where it meets the S. boundary of Arkansas. It is between 90° and 33° N. lat., and between 89° 40' and 94° 25' W. long. It is 350 m. long, from N. to S. On the gulf of Mexico it is about 300 m. broad, and contains this width for 190 or 130 m. inland, when it suddenly contracts to the width of about 100 m., and on the N. boundary it is 180 m. wide. It contains 48,390 sq. m., or 30,924,800 acres. The population in 1810, was 76,556; in 1820, 153,407; in 1830, 215,575; in 1840, 352,411, of whom 168,452 were slaves. Of the free population 89,747 were white males; 63,710 do. females; 11,396 coloured males; 13,976 do. females. Employed in agriculture, 79,389; in commerce, 8549; in manufactures and trades, 7565; in navigating the ocean, 1322; do. canals, lakes, and rivers, 662; in the learned professions, 1818.

The state is divided into 36 parishes, answering to counties in other states, which with their population in 1840, were as follows:—

Eastern District.		Western District.	
Parishes.	Pop.	Parishes.	Pop.
Assumption	6,961	Averyville	6,616
Beaumont	7,141	Caddo	5,826
Baton Rouge, W.	4,632	Caldwell	5,017

Washington	2,619		
Total	319,641	Total of State	352,111

New-Orleans, on the N. bank of Mississippi river, which here runs eastwardly, 105 m. from its entrance in the gulf of Mexico, is the seat of government.

The whole southern border of the state, from Pearl river to the Sabine, consists either of sea marsh or vast prairies, which occupy about one fifth of the surface of the state; and on the borders of the streams are timbered lands. The tract about the mouths of the Mississippi, for 30 m., is one continued swamp, destitute of trees, and covered with a species of coarse reed, 4 or 5 ft. high. The prospect of the country, from the mast of a ship, is an extended and dreary waste. Along the whole border of the gulf of Mexico, a sea marsh extends inland for 30 or 30 m. Back of this the land

gradually rises a little, and constitutes the prairies. A large extent of country is annually overflowed by the Mississippi and its various outlets. From lat. 32° to 31° the average width of overflowed land is 90 m.; from lat. 31° to the estuary of La Fourche, the width is about 40 m. All the country below the La Fourche, with little exception, is overflowed. By a survey made by order of the government of the United States, in 1823, it was found that the river overflowed an extent of 5,000,000 of acres, a great proportion of which is at present unfit for cultivation. A part of this is covered by a heavy growth of timber and an almost impenetrable growth of cane, and other shrubbery. This becomes dry on the retiring of the river to its natural channels, and has a soil of great fertility, and which might, by labour, be rendered fit for cultivation. There are in some parts basins or depressions, in which the water remains until it is evaporated or absorbed by the earth. These by draining might constitute rice fields. The sea marsh is partially overflowed by the tides, and especially when driven in by the equinoctial gales. In the alluvial territory are small bodies of prairie lands, slightly elevated, without timber, and of great fertility. More extended prairies constitute a large portion of the state. The pine woods, which are extensive, have generally a rolling surface, and a poor soil. The greater part of the prairies has a second rate soil, but some parts of those of Opelousas, and particularly of Attakapas have great fertility and feed extensive herds of cattle. More earth is deposited by the Mississippi in its overflow on its immediate margin than further back; and therefore the land is higher adjoining the river than in the rear of its banks. This alluvial margin, of a breadth from 400 yards to 1½ m., is a rich soil; and to prevent the river from inundating the valuable tract in the rear, and which could not be drained, an artificial embankment is raised on the margin of the river, called the *Levee*. On the E. side of the river, this embankment commences 60 m. above New-Orleans and extends down the river more than 130 m. On the W. shore it commences at Point Coupee, 173 m. above New-Orleans. Along this portion of the river, its sides present many beautiful and finely cultivated plantations, and a continued succession of pleasant residences. The country between the Mississippi, Iberville, and Pearl rivers, in its southern parts, is generally level, and highly productive in cotton, sugar, rice, Indian corn, and indigo. The northern part has an undulating surface, and has a heavy natural growth of white, red, and yellow oak, hickory, black-walnut, sassafras, magnolia, and poplar. In the N.W. part, Red river, after entering the state by a single channel and flowing about 30 m., spreads out into a great number of channels, forming many lakes, islands, and swamps, over a space of 50 m. long and 6 broad. Here the fallen timber, floated down by the stream, has collected and formed the celebrated raft, which formerly extended 180 m., obstructing the navigation of the river. Most of it has been removed by order of the general government, and the remainder will ere long be cleared away, opening this fine river to an extensive steamboat navigation. The bottoms on this river are from one to ten miles wide, and are of great fertility, with a natural growth of willow, cottonwood, honey-locust, papaw and bushy; on the rich uplands grow elm, ash, hickory, mulberry, black-walnut, with a profusion of grape vines. On the low fertile and sandy uplands of the state are white pine and yellow pines, and various kinds of oak. The lower courses of Red river have been denominated the *paradise of cotton planters*.

The staple productions of this state are cotton, sugar and rice. Sugar-cane grows chiefly on the shores of the gulf, and the bayous Teche, La Fourche, and Plaquemine, and in some parts of Attakapas S. of 31° N. lat. No cultivation yields a richer harvest, though the labour of the hands is severe. There is a vast amount of sugar lands not brought into cultivation. The quantity of land adapted to sugar has been computed at 250,000 acres; of rice, at 250,000 acres, and of cotton, at 2,400,000. Rice is principally confined to the banks of the Mississippi, where irrigation is easy.

There were in this state in 1840, 96,886 horses and mules, 381,348 neat cattle, 98,072 sheep, 321,530 swine; poultry was raised to the value of \$263,550. There were produced 60 bushels of wheat, 1812 of rye, 5,932,912 of Indian corn, 107,353 of oats, 824,341 of potatoes, 118,894 pounds of tobacco, 3,604,534 of rice, 152,555,368 of cotton, 119,947,799 of sugar, 94,651 tons of hay, 49,283 pounds of wool, 1043 of wax; the products of the dairy were valued at \$152,069, of the orchard, at \$11,769, of lumber, at \$66,106. There were made 2,884 gallons of wine, and 2823 barrels of tar, pitch, or turpentine.

The climate is mild, though the winters are more severe than in the same latitude on the Atlantic coast. The summers in the wet and marshy parts are unhealthy, and New-Orleans has been frequently visited by the yellow fever. But a considerable portion of the state is healthy.

The Mississippi river divides the state from Mississippi

LOUISIANA.

for a course of 450 m., and enters the state wholly, 350 m. from its mouth, by the course of the channel of the river, and divides into several branches or outlets which, diverging from the main river, wind their way slowly to the gulf of Mexico, carrying off its surplus waters in times of flood, and dividing the southern part of the state into a number of large islands. The Atchafalaya, called here the Chaffalo, leaves the Mississippi on the W. side a little below the mouth of Red river, and is supposed to carry off as much water as Red river brings in; and inclining to the E. of S. it enters Atchafalaya bay in the gulf of Mexico. The outlet Plaquemine leaves the Mississippi 150 miles below the outlet of Atchafalaya, with which the main stream at length unites. Thirty-one miles below the Plaquemine, and 81 above New-Orleans, is the outlet of La Fourche, which communicates with the gulf of Mexico. Below the La Fourche, numerous other smaller streams leave the Mississippi at various points. On the E. side of the Mississippi, the principal outlet from that river is the Iberville, which passes to the gulf of Mexico through lakes Maroupa, Pontchartrain, and Borgne. This outlet on the E. side of Atchafalaya on the W., bounds what is denominated the Delta of the Mississippi. The Mississippi is navigable for vessels of any size, though the bar at its mouth has on it but 16 or 17 ft. of water. Red river crosses the state in a S. E. direction, and enters the Mississippi 240 m. above New-Orleans. Washita river runs in a S. direction, and enters Red river a little above its entrance into the Mississippi. The other rivers are Black, Tensas, Sabine, Calcasieu, Mermentau, Vermillion, Teche, Pearl, Atchoula, and Iberville. The largest lakes are Pontchartrain, Maroupa, Borgne, Chetumeh, Mermentau, Calcasieu, and Sabine.

The vast trade of the valley of the Mississippi centres at New-Orleans, a valley which, for its extent and fertility, has not its like in the world. The exports of this state amounted in 1860, to \$34,326,936, but these exports extensively belong to the great and fertile states of the great valley. Its imports were \$10,673,190. There were 24 commercial, and 261 commission houses engaged in foreign trade, with a capital of \$16,770,000; 9465 retail stores, with a capital of \$4,301,694; 597 persons were engaged in the lumber trade, with a capital of \$280,045; three persons employed in internal transportation, with 291 butchers, packers, &c., employed a capital of \$144,583.

In manufactures are less considerable. Home made or family manufactures amounted to \$65,190; two cotton factories with 706 spindles, employed 23 persons, producing articles to the amount of \$18,000, with a capital of \$22,000; six furnaces produced 1400 tons of cast iron, and two forges produced 1265 tons of bar iron, employing 45 persons, and a capital of \$357,000; 25 tanneries employed 186 persons, and a capital of \$139,025; seven other manufactories of leather, saddlery, &c., produced articles to the amount of \$108,500, with a capital of \$69,550; one pottery employed 18 persons, producing articles to the amount of \$1050, with a capital of \$2000; five sugar refineries produced to the amount of \$270,000; 101 persons produced confectionary to the amount of \$80,000; machinery was produced to the amount of \$2000; and hardware and cutlery to the amount of \$30,000; 24 persons produced carriages and wagons to the amount of \$24,336, employing a capital of \$15,780; mills of various kinds produced articles to the amount of \$706,785, employing 972 persons, and a capital of \$1,870,795; vessels were built to the amount of \$20,500; 190 persons manufactured furniture to the amount of \$23,000, with a capital of \$576,050; five distilleries produced 985,590 gallons, and one brewery 2400 gallons, employing 57 persons, and a capital of \$110,000; 70 persons manufactured 3,002,200 pounds of soap, 3,500,030 pounds of tallow candles, and 4000 pounds of wax or sperm candles, with a capital of \$115,500; 948 brick or stone houses, and 619 wooden houses were built by 1484 persons, and cost \$2,736,944; 35 printing-offices, five binderies, 11 daily, 11 weekly, and two semi-weekly newspapers, and eleven periodicals, employed 392 persons, and a capital of \$233,750. The total amount of capital employed in manufactures was \$6,430,669.

Louisiana college, at Jackson, was founded in 1825; Jefferson college, at Brinkley, was founded in 1831; St. Charles college, at Grand Coteau, is under the direction of the Roman Catholics; Baton Rouge college, at Baton Rouge was founded in 1838; Franklin college, at Opelousa, was founded in 1839. In these institutions there were, in 1840, 307 students. There were in the state 53 academies, with 1885 students; 179 common and primary schools, with 3373 scholars. There were 4361 white persons, over 30 years of age, who could neither read nor write. In 1835, the legislature granted to three colleges \$363,775, to be paid out of the state treasury; viz., \$68,775 to Jefferson college, to defray the expense of its buildings, and \$15,000 annually for the period of 10 years; to Louisiana college, \$15,000 annually for the same period to pay the salaries of their profes-

sors, and to lower the rates of tuition and other expenses; and \$15,000 also to Franklin college.

The state was originally settled by Roman Catholics, and they are still the most numerous religious denomination. In 1835 they had 27 ministers. Methodists, Baptists, Presbyterians, and Episcopalians exist in considerable numbers, and are increasing.

About the commencement of 1840, the state had 16 banks, with 31 branches, with an aggregate capital of \$41,736,768; and a circulation of \$4,345,533. At the commencement of 1843, the state debt amounted to \$30,550,569. The public debt consists almost entirely of state bonds, issued to the different banks, which bonds have been sold in Europe, and the proceeds constitute the capitals of the banks, which are loaned to the stockholders, on mortgages of their landed property. These mortgages are estimated to be worth \$25,400,000.

The constitution of this state was formed in 1819. The governor is elected for four years. The people give their votes for governor at the same time that they vote for senators and representatives, and on the second day of the succeeding session of the general assembly, the two houses, by a joint ballot, elect for governor one of the two candidates who have the greatest number of votes. The governor's term of office commences on the fourth Monday succeeding his election, and continues for four years, but he is ineligible for the next four years. The senators are elected for four years, one half being chosen every two years. The present number is 17, chosen by senatorial districts. The representatives are elected for two years, apportioned according to the number of electors, as ascertained by enumeration every four years. The present number is 69.

The pay of the members of both houses is four dollars per day. The legislature meets biennially at New-Orleans, on the first Monday of January. The judges of the supreme and inferior courts are appointed by the governor, with the advice and consent of the senate, and hold their office during good behaviour. The right of suffrage is possessed by every white male citizen of the United States, of 21 years of age or upwards, who has resided in the country where he offers his vote one year next preceding the election, and who in the last preceding six months has paid a state tax.

Several works of internal improvement have been undertaken. Pontchartrain railroad extends from New-Orleans 4½ m. to lake Pontchartrain, and cost originally \$200,000, and with its improvements \$500,000. West Feliciana railroad extends from St. Francisville on Mississippi river, 20 m., to Woodville, Miss. Orleans-street railroad, through Orleans-street, is 1½ m. long, and connects New-Orleans with the bayou St. Johna, and cost \$12,000. New-Orleans and Carrollton railroad extends from New-Orleans 6½ m., to Carrollton, passing through Lafayette. It has city branches, making its whole length 11½ m. Various other railroads and canals have been projected, and some work has been done upon them, but they are at present suspended.

The river Mississippi was discovered in 1683, by Marquette and Jollette, two French missionaries. In 1683 the country was explored by La Salle, and named Louisiana, in honour of Louis XIV. In 1699 a French settlement was begun at Iberville, by M. Iberville, who in the attempt to plant the country lost his life. His efforts were followed up by M. Crozat, a man of wealth, who held the exclusive trade of the country for a number of years. About the year 1717 he transferred his interest to a chartered company, at the head of which was the celebrated John Law, whose national bank and Mississippi speculation involved the ruin of half the French nobility. In 1731 the company resigned the concern to the crown, who, in 1762, ceded the whole of Louisiana to Spain. In 1800, Spain re-conveyed the province to the French, of whom it was purchased by the United States, in 1803, for about \$15,000,000. This purchase included all the present territory of the United States, W. of the Mississippi. Soon after the purchase, the present state of Louisiana was separated from the rest of the territory, under the name of the territory of Orleans. In 1812 Louisiana was admitted to the Union as a state, and the part of W. Florida W. of Pearl river was annexed to it. In December, 1814, and for several days afterwards, the British made an attack upon New-Orleans, but were repulsed, January 8th, 1815, by the Americans, under Gen. Jackson, with the loss of about 3000 men, killed, wounded and taken prisoners. The American loss is stated to have been only seven men killed, and six wounded. Gen. Packenham, the British commander, was killed.

LOUISVILLE, p. t. St. Lawrence co., N. Y., 233 m. N. N. W. Albany, 223 W. Bounded N. W. by St. Lawrence river. Watered by Grass river. Several islands in St. Lawrence river belong to it. It has two stores, one grist-mill, two saw-mills; 11 schools, 321 scholars. Pop. 1663.

LOUISVILLE, p. v., capital of Jefferson co., Ga., 53 m. E. Milledgeville, 634 W. Situated on Rocky Comfort creek,

LOUISVILLE.

Just above its entrance into Ogeechee river. It contains a courthouse, jail, a church, an academy, nine stores, and about 30 dwellings. The legislature met here from 1795 to 1807. The old state house has been converted into the courthouse. Here the famous *Yazoo acts*, conveying several thousand acres of land in western Georgia, now Mississippi, said to have been obtained by fraud, were burned, by order of the legislature, Feb. 13th, 1796, by fire from heaven, kindled by a sun glass. The sum of \$500,000 had been paid, which its owners were allowed to withdraw within eight months. Accordingly, \$300,000 were withdrawn from the treasury by claimants, and the balance was transferred to the United States government, who engaged to compromise with these claimants. It has been erroneously stated that the money was never refunded.

LOUISVILLE, p. v., capital of Winston co., Miss., 92 m. N.E. Jackson, 918 W. It contains a courthouse, jail, two churches, two academies, and about 180 inhabitants.

LOUISVILLE, city, port of entry, and capital of Jefferson co., Ky., is in 39° 3' N. lat., and 85° 30' W. lon. from Greenwich, and 8° 45' W. lon. from Washington, 53 m. W. by N. Frankfort, 1400 m. by water from New-Orleans, 800 m. by water and 350 m. by land from St. Louis, 650 m. by the river below Pittsburg, and 506 W. Situated on the S. side of Ohio river, at the head of the rapids. The Ohio river opposite to the city is over a mile wide, and for seven miles above is a most beautiful sheet of water, presenting, with its rapids, islands, cliffs, villages, and towns, a delightful landscape. The population in 1778, was estimated at 30 persons; by the census of 1800, 800; in 1810, 1357; in 1820, 4019; in 1830, 10,336; in 1840, 21,210; in 1843, by a census taken by order of the mayor and council, 28,643. The city is built on a gentle acclivity, about 75 ft. above low water mark, and is regularly laid out on a slightly undulating plain, with ten broad and straight streets, from 60 to 120 ft. wide, running parallel with the river, nearly E. and W.; intersected at right angles by 30 cross streets, all 60 ft. wide. The squares are 430 ft. on each street, and most of them are divided by alleys of from 10 to 30 ft. wide. Bear Grass creek, over which bridges have been constructed at convenient distances, divides the upper part of the city; and the point of land projecting between it and the river renders it an excellent and secure harbour for boats in times of high water, and of descending ice. The public buildings are a city-hall and courthouse, now in a course of completion, on a scale of vastness and magnificence equal to the wants of Philadelphia or New-York; a city and county jail on the most approved model, combining health, convenience, and security, containing 48 single cells, 6 ft. by 10 ft., and double cells, 10 ft. by 13 ft., all of solid stone, perfectly dry, and thoroughly warmed and ventilated, all opening on interior galleries to the third floor; a marine hospital, erected in 1830, by a grant of \$40,000 from the state; the lot on which it stands, containing about 7½ acres, was the noble donation of the late Thomas Frater and Cuthbert Bullitt; the building presents a fine appearance, is well endowed, admirably kept, and is amply sufficient for all the purposes of its establishment; a medical institute, adapted to its object, well supplied with books and apparatus, selected by an eminent surgeon, sent specially for the purpose to Europe. The institute has been for four years in operation, and for the last two years has been exceeded in the number of its students only by the medical schools at Philadelphia and Lexington; 25 churches, four Baptist, one Campbellite Baptist, six Methodist, one of which is a Dutch Methodist; and a Seamen's Bethel, three Presbyterian, two of which are Old School, and one New School; two Episcopal, one Friends, one Unitarian, one Universalist, two Roman Catholic, one of which is Dutch; three coloured churches, two of which are Methodist, and one Baptist; and a free-church, besides a Jews' synagogue. Some of the churches exhibit fine specimens of architecture. There are five banking-houses, four markets, a city workhouse, hospital, and prison, two orphan asylums, a Magdalen Asylum, under the care of the sisters of the Good Shepherd; a School for the Blind, endowed by the state; and four large city schoolhouses. Its spacious hotels are among the best in the Union. Many private dwellings, recently erected, exhibit a decided improvement in architectural taste, and add much to the beauty of the city.

The banking facilities are adequate to the wants of the extensive commerce centering at this point. The Bank of Kentucky has a capital of \$5,000,000; the Bank of Louisville of \$1,350,000; a branch of the Northern Bank of about \$1,000,000; and two savings' banks, with about \$100,000 each. There are four insurance offices, with capitals of \$100,000 each, which, with agencies from offices in other states, are sufficient for all the purposes of marine, fire, and life insurance. The principal business of Louisville is foreign and domestic commerce; it is the chief wholesale market of the west for dry goods and groceries, and is resorted to by merchants from the river towns above

and below; and from the interior of the adjacent states, as the place at which they can purchase a more complete assortment, and at cheaper rates than at any other place. This commerce is carried on by upward of 300 steamboats, constantly arriving at, and departing from every place accessible to them; besides numerous flat and keel-boats. Good turnpike roads lead from Louisville to all parts of Kentucky and Indiana, and the hourly arrival and departure of stagecoaches, wagons, and the 100 hacks, and 250 drays and carts employed in the city, present a scene of unusual bustle. It is estimated that, during the year 1843, of the groceries landed at this place, there were 15,000 hog-heads of sugar, and 40,000 bags of coffee, with other articles in proportion; that the importation of foreign and domestic goods exceeded \$10,000,000; and that the import and export trade amounted to more than \$40,000,000. The exports consist of about 8000 hog-heads of tobacco, 250,000 pieces and coils of bagging and bale-rope, large quantities of pork, lard, bacon, flour, whiskey, feathers, flaxseed, beeswax, ginseng, live-stock, and the usual agricultural products for the southern market. To these should be added steam engines, sugar-mills, and machinery of various kinds.

Manufactures to a considerable extent are already established, and are rapidly increasing. There are six large foundries with machine shops, in which engines and machinery are produced equal to any in the world. During the year 1843, 38 steamboats, many of them of the largest class, were built in Louisville and the adjoining towns, all of which were furnished with engines, &c., from the city foundries. Two extensive steam bagging factories are in full operation, and convert a number of tons of raw hemp into bagging daily; five ropewalks produce large quantities of cordage and bale-rope. There are three breweries and two distilleries; an extensive cotton factory; a woolen factory for the manufacture of jenns and negro-cloth; four flouring-mills, producing 300 barrels of flour daily; a mill for the manufacture of hydraulic cement; starch, white lead, linseed, and lard oil are made in large quantities; tobacco, snuff, cigars, mustard, cabinet wares, &c., with almost every article produced elsewhere, are now manufactured here. The book trade, printing, bookbinding, and paper-making are carried on with an energy, success, and extent of business unsurpassed by any western city.

The subject of education was one of the first objects to which the attention of the city government was called; and in 1839 the first free schools west of the mountains were established in the city. There are now 18 schools of which six are grammar schools, three male and three female, and 12 are primary schools, for both sexes. A college is also connected with the system, in which boys may be fitted, in the most thorough manner, for any occupation or profession. There are also between 40 and 50 private schools, many of which possess high merit. The number of children annually instructed in the public schools is 3000, and in the private schools is 1500. The Mercantile Library Association has a library of 3500 volumes of admirably selected books. The Kentucky Historical Society has a large and valuable collection of books and manuscripts connected with the settlement and history of the state. There are five daily and an equal number of weekly newspapers, besides several literary, religious, and scientific magazines. An Agricultural and a Horticultural Society have been organized, whose exhibitions would do credit to older places.

The city is abundantly supplied with excellent water from pumps at the intersection of the streets, and by numerous large cisterns, kept constantly full for extinguishing fires. Measures are also in progress for the construction of water-works sufficient to furnish an ample supply of pure water for all domestic and manufacturing purposes. These water-works are expected to be in operation in the course of the year 1844. No city is better lighted. The gas-works, equal to any in the country, furnish an abundant supply of the very best gas, to illuminate brilliantly the streets, shops, and dwellings. The fire-department is well organized, and supplied with all the requisite apparatus; and, whenever the occasion has called for it in emergency, it has been found admirably prompt and efficient.

The falls of the Ohio at this place are caused by a bed of limestone, extending across the river, over which the waters pour with an irregular current, and a crooked channel, for two miles, producing a descent in that distance of 24 ft. Previously to the construction of the canal, this was an entire obstruction to the passage of loaded boats for nine months in the year, and for ascending boats for 10 or 11 months. This was a great obstruction to the navigation of the beautiful and important Ohio, above this point. The canal is about 2½ m. long, and has four locks, sufficiently capacious to admit steamboats of the largest class. The canal is 50 ft. wide at the surface, and the entire lockage is 33 ft. With a trifling exception, the entire line is excavated out of compact limestone, to the mean depth of 16 ft.; everything connected with the canal is of the most substantial kind.

LOUTH.

and the mechanical execution is excellent. After encountering and overcoming many and great difficulties, this canal was successfully completed in 1833, at an expense of \$1,000,000 to the persevering and public-spirited individuals by whom this magnificent work was projected and undertaken; and the company are now reaping the reward their zeal and enterprise so richly deserve. The United States are stockholders to the amount of \$290,000; the remainder of the stock is owned by private individuals. The number of steamboat passages through the canal, since it was first opened in 1830, has been 13,550; of keel and flat boats, 3013; and the tolls received have been \$1,225,350. The shares were originally \$100; they are now selling at \$150. When the time shall arrive (and it is probably not remote) for the construction of a permanent dam across the Ohio at the falls, a slack-water navigation can be made for 75 m., to the mouth of Kentucky river, and an incalculable amount of water-power will be obtained; and Louisville may become one of the greatest manufacturing cities in the Union. Recent surveys have made the great water-power which she already possesses apparent, and the contemplated water-works will show how easily and how cheaply this hitherto neglected element may be made subservient to the wealth and prosperity of the city and surrounding country.

Shippingport and Portland are two villages separated by the canal, about 2 m. below the city. Formerly they were the port of the city below the falls, and goods and passengers from the Mississippi and the lower Ohio were landed at these villages, and brought up to the city by land. But now all steamboats which can run on the Ohio may pass through the canal, and discharge and receive cargoes at the wharves of Louisville.

According to the census of 1840, Louisville had one commercial and 11 common houses in foreign trade, with a capital of \$191,509; 270 retail stores, with a capital of \$2,138,400; three lumber-yards, capital \$52,000; two flour-mills, one paper-mill, two tanneries, one brewery, one glass cutting works, one pottery, two rope-walks, seven printing-offices, two binderies, five daily, seven weekly, and three semi-weekly newspapers, and one periodical; total capital employed in manufactures, \$713,675; one college, 80 students; 10 academies, 299 students; 14 schools, 398 scholars.

As early as 1778 a fort was built here, and corn was raised on the island opposite to the city, since called Corn Island. Gen. George Rogers Clark made it his headquarters, whence he fitted out his celebrated expedition against the British posts of Kaskaskia, Vincennes, &c. For several years after the first settlement, Louisville was harassed by Indian hostilities. In 1789 the legislature of Virginia authorized the laying out of a town at the falls of the Ohio, and named it Louisville, in honour of Louis XVI., the first ally of the American republic. In 1791, formal possession was taken, a fort was built, and a check was given to the depredations of the Indians. From the peculiar position of the town, in the midst of several swamps and ponds, it was justly considered, until 1823, as excessively unhealthy; but during that and the previous year, all these local causes of disease were removed, and since the fatal autumn of 1822 it is believed that no town or city of the Union has been more uniformly healthy. The average mortality from 1830 to 1842 inclusive, as derived from official sources, has been only two per cent. of the resident population.

LOUISVILLE, or LEWISVILLE, p. v. capital of Clay co. Ill., 112 m. S.E. Springfield, 741 W. Situated on the S.W. side of Little Wabash river. It contains a courthouse, and several stores and dwellings.

LOUTH, a marit. co. of Ireland, on its E. coast, being the most northerly in the province of Leinster, having E. the Irish sea; N. Carlingford bay, which separates it from Down and Armagh; and W. and S. Monaghan and Meath. Area, 265,261 acres, of which 14,916 are unimproved mountain and bog. Surface rugged in the N., but in other parts generally flat or undulating. Soil generally fertile. Estates of a medium size. Farms of all sizes, but the great majority are small. Its crops, agriculture, &c., are similar to those of Meath, which see. Average rent of land, 16s. an acre. Minerals unimportant. The linen manufacture is carried on to a considerable extent, especially at Drogheda, but the business has materially declined. Principal rivers Boyne and Dee. Principal towns Drogheda, Dundalk, and Ardee. Louth is divided into four baronies, and 61 parishes; and sends four members to the House of Commons, viz. two for the county, and one each for Drogheda and Dundalk. Registered electors for county, in 1830-40, 1192. In 1831, it had 22,040 inhabited houses, 23,285 families, and 124,846 inhabitants, of whom 60,617 were males, and 64,229 females.

LOUTH, a man. bur., market town, and par. of England, co. Lincoln, in the Wold div. of Louth-Eske hmd., par. of Lindsey, 29 m. E.N.E. Lincoln, and 197 m. N. London. Population of borough, in 1831, 6937. The town, agreeably situated in a fertile valley S.E. of the wolds of N. Lincoln,

LOUVAIN.

has of late been much improved, and is well paved and lighted with gas: it has several handsome, and a few elegant buildings, the houses generally being of brick, roofed with slate. The principal public buildings are the mansion-house, town-hall, sessions-house, and a small theatre. The church is a large Gothic structure, with a beautiful E. window, and one of the finest towers in the country, above which rises a light octagonal spire, to a height of 290 feet from the ground. The living is a vicarage attached to a prebend in Lincoln cathedral. A second par. church, once existing, is now destroyed; but its site is marked by the cemetery still used as a place of interment. A new district church has also been erected within the last few years. There is a Roman Catholic chapel; and the Wesleyan and Primitive Methodists, Baptists, and Independents have each places of worship; to which, as well as the church, are attached well attended Sunday schools. The free grammar-school, founded in 1552 by Edward VI., is endowed with landed property producing £700 a year; the half going as salary to the master, the fourth to the usher, and the residue to the support of 19 poor women. A school, established in 1677, provides instruction in English and mathematics to 20 free boys, and 30 pay scholars. There is also a well attended national school; and among the charitable institutions are almshouses, a dispensary, Benevolent society, and Bible society.

"Louth contains little or no manufacture, there being only one establishment of any importance, a carpet and blanket manufactory. The river Ludd flows round a considerable portion of the town: it is not navigable, but feeds a canal beginning at the N.E. extremity of Louth, and communicating with the Humber. It is in a very prosperous state: the principal traffic outwards is that of corn for London, and the W. riding of Yorkshire, the inland freight being chiefly coal, most of which comes down the Humber from York. There is a paper-mill and flour-mill on the river, in addition to wind-mills; and two other mills, one worked by steam, are employed in grinding bones." (*Man. Bound. Rep.*) The town has also a soap-boiling establishment, and is famed for its excellent ale. Louth was incorporated in the 5th of Edward VI., whose charter was confirmed by other subsequent monarchs, and lastly, by George IV. Under the Municipal Reform Act, the borough is divided into two wards, and is governed by a mayor, and three other aldermen, with 19 councillors: it has a commission of the peace under a recorder. Corporation revenues, in 1838, £1340 (exclusive of £133 accruing from the sale of property). Louth is also one of the polling-places for the N. or Lindsey division of the county, and the quarter-sessions for the county are held here in January, July, and October, the April sessions being at Spilsby. Markets on Wednesday and Saturday: considerable horse fairs, April 30, 3d Monday after Easter, August 5, and a large cattle fair, November 23. (*Man. Corp. and Bound. Reports.*)

LOUVAIN (Dutch *Leuven*), a town of Belgium, and formerly one of the most populous and industrious in that country, prov. S. Brabant, cap. arrond. and cant., on the Dyle, a tributary of the Scheldt, and on the railway between Brussels and Liege, 14 m. E.N.E. the former; lat. 50° 53' 26" N., long. 4° 41' 46" E. Population, in 1836, 24,342. It is partly surrounded by walls, and partly by an earth rampart from 80 to 100 feet high, with a deep fosse outside, the total circuit of both being about 7 m.; a great part of the inclosed area consists, however, of fields and gardens. But its fortifications are now cut through by different roads, and are mostly converted into boulevards. The castle, now in ruins, on a hill near the Dyle, is of considerable, but uncertain, antiquity: it was long the residence of the counts of Louvain. The town, which, though regularly laid out, is not generally well built, has several interesting public edifices. The town-hall, begun in 1440, and completed about ten years afterwards, one of the finest specimens of the florid Gothic in Europe, has been recently repaired, or rather restored, with great skill, at the joint expense of the town and government. It is lofty, has six light and elegant minarets, and is most elaborately ornamented. The collegiate church of St. Peter, a curious old edifice probably of the 14th century, with some good paintings, has a finely carved pulpit, and had, formerly, a steeple, blown down in 1604, which is said to have been of the extraordinary height of 533 feet, with two magnificent lateral towers. The university of Louvain was founded by John IV. duke of Brabant in 1436; but it was not till 1631 that it obtained the privilege of teaching theology, for which it was afterwards so celebrated. It had, in the days of its prosperity, more than 40 colleges, some of which were established in halls that had previously belonged to the cloisters. This famous seminary, after being suppressed by the French in 1707, was re-established in 1817. It has at present 90 colleges, some of which are handsome buildings. Its library, originally the drapers' hall, is richly decorated with antique wooden carvings. Edward III. of

LOUVIERS.

England resided for a year, and the emperor Charles V. was brought up, in the castle of Louvain. The town has five churches, five nunneries, eight hospitals and charitable asylums, a royal college, and a college for ecclesiastics; and is the seat of tribunals of primary jurisdiction and commerce, a chamber of commerce and manufactures, a board of forest inspection, &c.

In the 14th century Louvain was one of the great seats of the woollen and linen manufacture, which supported, it is said, no fewer than 150,000 individuals within the city (*Buckingham*); though this, most probably, is a gross exaggeration. But the manufacturers having revolted, in 1369, against the Duke of Brabant, many of them emigrated, on the revolt being suppressed, to foreign countries, and among others to England; where, being hospitably received by Edward III., they assisted in laying the foundations of the woollen manufacture. Louvain seems never to have recovered from this disaster. It has still some inconsiderable woollen fabrics; but it is now principally celebrated for its beer, said to be the best in Belgium. The different breweries produce about 900,000 barrels a year, a large proportion of which is sent to Antwerp and into Flanders. Louvain has also manufactures of lace and cotton yarn, and several dyeing and cotton-printing establishments, with tanneries, distilleries, and glass works, and numerous oil and flour-mills. It is connected with the Demer near Mechlin by the canal of Louvain, navigable for vessels of 150 tons; and has a considerable trade in corn, clover seed, flax, hemp, &c., the produce of the surrounding country. Under the French it was included in the dep. of the Dyle. (See the *Dictionnaire de Martinière*, for an elaborate article on this city; see also *Buckingham*; *De Cleet*; *Murray's Handbook*, &c.)

LOUVIERS, a manufacturing town of France, dep. Eure, cap. arrond., on the Eure, and on the road from Rouen to Evreux, 124 m. N. the latter, and 16 m. S.E. the former city. Population in 1836, ex. com. 8713. It consists of an old and new town; the former, consisting of three or four principal, united by many smaller streets, is built chiefly of wood; the latter, which is the residence of the principal manufacturers, has a broad and elegant main street, and many well-built brick and stone houses. The Eure, which is navigable from the Seine as far as Louviers, is here crossed by several good bridges. A large church, supposed to have been constructed during the early crusades, a hall built by the Templars towards the end of the 12th century, a theatre, and a public library are the chief public buildings. Louviers was formerly a fortress of some strength; and portions of its wall still exist. It is now, however, distinguished wholly by its industry; and ranks as one of the first seats of the woollen manufacture of France. Fine broadcloths and woollen yarn are its chief products; but of late years, other fine woollen goods have been introduced. Cotton yarn, linen, thread, soap, &c., are made; and there are many dyeing establishments, and bleaching grounds, tanneries, sugar refineries, and factories for looms and other machinery. The woollen manufacture in 1834 employed 6000 hands; and, according to Berghaus, produced, in 1840, goods of the value of between 3,000,000 and 4,000,000 francs. The work-people, according to Villermé, are in pretty much the same condition as at Elbeuf; perhaps their wages are a little lower, but at any rate they are in a tolerably prosperous state, and of pretty correct general habits. In 1835, spinners earned from 1 fr. 69 c. to 3 fr. 58 c. a day; women, as winders, from 1 fr. to 55 c. to 1 fr. 94 c.; and children *rattacheurs* (*drouseuses*), from 50 c. to 80 c. A family of three persons, one of each of the above classes, may gain together 1800 francs a year, or £64, certainly sufficiently to maintain them in a state of comfort.

The peace between Philip Augustus and Richard I. in 1196, was concluded at Louviers. The town was taken and sacked by Edward III. and Henry V. (*Hugo*, art. *Eure*; *Villermé*; *Tableau des Ouvriers*, &c.)

LOWELL, p. l. Oxford co., Me., 63 m. W.S.W. Augusta, 578 W. It contains a large pond which has its outlet into Saco river. A stream issuing from several connected ponds has falls of 40 feet. It has one fulling-mill, two grist-mills, six saw-mills; 10 schools, 410 scholars. Pop. 941.

LOWINGSTON, p. v., capital of Nelson co., Va., 105 m. W. by N. Richmond, 157 W. It contains a courthouse, jail, two churches, several stores, and about 150 dwellings. Nett proceeds of the postoffice, \$345.

LOWELL, p. l., Orleans co., Vt., 45 m. N. Montpelier, 568 W. Formerly called Kellyville. Chartered in 1791. Mis-sisque r. rises in a pond in this t., and with its branches, affords water-power. It contains two stores, one grist-mill, two saw-mills; six schools, 149 scholars. Pop. 431.

LOWELL city, and semi-capital of Middlesex co., Mass., is in 42°38' 48" N. lat., and 71°18' 37" W. long., 25 m. N.N.W. Boston, 37 m. N.N.E. Concord, 37 m. N.E. Worcester, 38 m. S.E. Concord, N. H., 444 W. In the rapidity of its growth, and the extent of its manufactures, it stands unri-

LOWELL.

valled in the United States, and well deserves the appellation of the "Manchester of America." The town of Lowell was incorporated by the legislature of Massachusetts in March, 1836, with a territory of four miles square, from the E. part of Chelmsford. In 1834, Belvidere Village, the W. corner of Tewksbury, was added to it, making a territory of nearly 5 sq. m. The population in the territory in 1830, was less than 300, and the valuation of property not exceeding \$100,000; in 1830, the population was 5471; in 1836, 21,706, and the assessors' valuation of property was \$32,400,000; the population in 1844, was 35,000. In 1838, Lowell was chartered as a city. It lies on the S. side of Merrimac river, below Pawtucket falls, at the junction of Concord river with the Merrimac; and it possesses a great amount of water-power, easily available. This is produced by a canal, 60 ft. wide, 8 ft. deep, and 14 m. long, commencing at the head of Pawtucket falls, and extending to Concord river. By locks at its outlet into Concord river, it forms a boatable passage round the falls of the Merrimac. From the main canal, the water is carried by lateral canals to mills and manufactories where it is needed, and is discharged either into Merrimac or Concord river. The entire fall is 31 ft. What 11 years ago was a wild pasture has become a large and flourishing city; a proof of what water-power, seconded by capital and enterprise can do for a place. There are in Lowell 98 cotton factories, with 905,000 spindles; two calico-printing works; two woollen factories; a machine shop, for the manufacture of cotton machinery, loco-motive engines, &c.; two carpet factories, one of which is filled with power-looms; said to be the first and only one of the kind in the world. The capital invested in these works is \$10,550,000. In them are employed 3345 males, and 6375 females, making a total of 9720. Less than 250 of these are children under 15 years of age; and these are never employed without certificates of attendance at school for three months of the year, in accordance with the provision of the laws of Massachusetts. The annual amount for the sales of manufactured goods is between 6 and 7,000,000 of dollars. Besides these there are the Lowell bleachery, extensive powder-mills, flannel and blanket-mills, carpet-mill, card and whip factory, iron foundry, grist-mills, saw-mills, &c., employing 600 hands, and a capital of about \$900,000. A new cotton factory, much larger than any now in the city, has already been commenced, and extensive additions to others are soon to be made. The number of yards of cloth made annually are 70,375,400. The annual amount of cotton consumed is 32,568,000 pounds, or 56,940 bales of 361 pounds each. The amount of mineral coal consumed per annum, is 12,300 tons; besides 3000 cords of wood; and 62,180 gallons of oil are used. Flour for starch consumed in the mills, print works, &c., is 4000 barrels per annum; and 600,000 bushels of charcoal are used. The average wages, exclusive of board, are, for females, \$1 75 per week; and for males, 70 cents per day. The "lock and canal" machine shop can furnish machinery complete for a mill of 5000 spindles in four months. When building mills they employ directly or indirectly, from 1000 to 1500 hands. Most of the factories, boarding houses, &c., are built according to a contract with this company, and the proprietors of the mill have little to do before it is put in operation, except to see that everything is done according to contract. This arrangement gives ample employment to the resources of the "Proprietors of locks and canals," and secures to the new company the most approved machinery, at the cheapest rates. They also contract with the same company for the necessary water-power and building ground, for which an annual rent is paid.

The public buildings of Lowell are a courthouse, city-hall, market-house, mechanics' hall, hospital, belonging to the factories, and the edifices for the public schools. The mechanics' hall was erected by the Mechanics' Association, incorporated by the legislature as early as 1825. Eight or ten years after, the proprietors of locks and canals gave them a lot of land in the heart of the city, where a spacious and expensive hall has been erected, and where one or more courses of lectures are annually delivered. This building is furnished with a fine library and reading-room, a chemical and philosophical apparatus, and a mineralogical cabinet of several thousands of specimens. The public schools consist of a high school, and six grammar schools, which have spacious and substantial buildings. Besides these there are 30 primary schools. Twenty-four thousand dollars per annum are appropriated to these schools; a very large amount in proportion to its population. There are two newspapers in the place, each published tri-weekly, and two weekly papers from the same office, and three other papers devoted to literature and religion. A periodical is issued called the "Lowell Offering," which has gained deserved celebrity, consisting of original communications by the young women of the factories. This is a new thing in the history of manufacturing cities. There are 23 religious societies of the following denominations: two Episcopal,

LOWER.

three orthodox Congregational, one Unitarian, two Episcopal Methodist, two Wesleyan Methodist, three Baptist, three Free-will Baptist, two Christian, and two Roman Catholic. There are two banks, with an aggregate capital of \$1,050,000, and an institution for savings, having a deposit of \$300,000, one third of which belongs to 978 factory young women. Visitors will be agreeably impressed with the neat and respectable appearance of the operatives of this industrious city; and equally so with their moral condition. One third of the entire population of the city is connected with the Sunday schools, established by the various religious societies; and there is less intemperance and crime than in any other place of its size.

A railroad extends from Lowell 96 m. to Boston, and was completed in 1835, in a very substantial manner. Another branch railroad extends from it, 10 m. from the city, and goes to Dover, N. H. The Lowell and Nashua railroad extends 9 m. to New-Hampshire line. The Merrimack canal leaves the Merrimack river, 2 m. above Lowell, and proceeds to Boston harbour.

Lowell is a splendid example of an American manufacturing city, and excites the attention, and in some measure, the jealousy, of Manchester and Glasgow. That a place which, 91 years since, had not a "local habitation and a name," should have become the second place in population in the state, and the fourteenth in the United States, is proof of what manufactures can accomplish. Every true friend of his country must rejoice to see it becoming independent of other countries for the articles of consumption. The manufactures of Lowell are generally of the coarser descriptions; but the same enterprise which has carried them thus far, will extend them farther. Cottons, which a little over 90 years since, would have cost over 30 cents a yard, can now be bought for six cents. And another 90 years may exhibit goods which, for fineness as well as cheapness, will rival those which are now imported. According to statistics of the census of 1840, there were in Lowell 191 retail stores, capital \$373,300; five lumber-yards, capital \$19,000; one furnace, four fulling-mills, eight woolen-factories, with a capital of \$551,200; 96 cotton factories, with 166,000 spindles, and three dyeing and printing works, with a capital of \$6,000,000; three powder-mills, capital \$150,000; one paper-mill, capital \$6000; one flouring mill, three grist-mills, one saw-mill, capital \$50,000; two printing-offices, two blancheries, three weekly, and two semi-weekly newspapers, and one periodical, capital \$10,000; total capital in manufactures, \$6,837,460; seven academies, 1311 students; 93 schools, 4026 scholars.

LOWER, t. Cape May co., N. J. More than half of it is covered with sea beach and salt marsh. Cape May island and lighthouses are in the t. It has six stores, three saw-mills; six schools, 240 scholars. Pop. 1133.

LOWER ALLOWAYS CREEK, t. Salem co., N. J., 9 m. S. Salem. It has extensive marshes, secured from overflow by embankment. It has a Methodist and a Friends' church, four stores, one grist-mill. Pop. 1952.

LOWER CHANCEFORD, p. t. York co., Pa., 51 m. S.E. Harrisburg, 91 W. Bounded E. by Susquehanna river, across which is McCall's ferry. It contains four stores, one woolen factory, one furnace, one forge, three saw-mills, one paper-mill; five schools, 135 scholars. Pop. 1991.

LOWER DUBLIN, t. Philadelphia co., Pa., 10 m. N.E. Philadelphia. Pennypack creek affords water-power. It contains five churches, three Baptist, a Methodist, and an Episcopal, 12 stores, one lumber-yard, five grist-mills, one saw-mill; five academies, 335 students, three schools, 73 scholars. Pop. 3398.

LOWER MACUNGY, t. Lehigh co., Pa. It has five stores, one woolen factory, six grist-mills, three saw-mills, one oil-mill. Pop. 2156.

LOWER MAHANOY, t. Northumberland co., Pa. It has three stores, two saw-mills, two tanneries, four distilleries, two potteries; four schools, 107 scholars. Pop. 1189.

LOWER MAHANTANGO, p. t. Schuylkill co., Pa., 55 m. N.E. Harrisburg, 165 W. Crossed by Broad and Sharp's mountains. Watered by Deep and Swatara creeks. It contains anthracite coal, and has four stores, five grist-mills, 13 saw-mills, two tanneries; one school, 30 scholars. Pop. 1465.

LOWER MAKEFIELD, t. Bucks co., Pa., 24 m. N.E. Philadelphia. Delaware canal runs along its E. boundary. It has two stores, two grist-mills, two saw-mills; four schools, 328 scholars. Pop. 1550.

LOWER MERION, p. t. Montgomery co., Pa., 90 m. E. Harrisburg, 150 W. Schuylkill river and Mill and Cobb's creeks afford water-power. It has three churches, nine stores, two woolen factories, three cotton factories, with 1200 spindles, three grist-mills, three saw-mills, seven paper-mills; six schools, 734 scholars. Pop. 3997.

LOWER MT. BETHEL, t. Northampton co., Pa. Watered by Richmond, Martin's, and Muddy creeks. It contains

LOWESTOFF.

a Lutheran church, seven stores, one flouring-mill, eight grist-mills, eight saw-mills, one powder-mill, five tanneries; five schools, 183 scholars. Pop. 2957.

LOWER NAZARETH, t. Northampton co., Pa. Drained by Manookick creek. It has two stores; two schools, 116 scholars. Pop. 1901.

LOWER OXFORD, t. Chester co., Pa., 41 m. S.W. Philadelphia. Watered by Octarara and Elk creeks. It contains a Presbyterian church, four stores, one fulling-mill, two woolen factories, three cotton factories, with 3500 spindles, four grist-mills, six saw-mills, one oil-mill, two paper-mills; three schools, 75 scholars. Pop. 1939.

LOWER PAXTON, t. Dauphin co., Pa., 6 m. N.E. Harrisburg. Watered by Beaver and Paxton's creeks. It has two stores, one woolen factory, one grist-mill, one tannery, one distillery; one school, 45 scholars. Pop. 1337.

LOWER PROVIDENCE, t. Montgomery co., Pa. Drained by Perkiomen and Shippack creeks. Lead ore is found on the former. It contains five stores, one flouring-mill, seven grist-mills, one saw-mill; four schools, 268 scholars. Pop. 1413.

LOWER SALFORD, t. Montgomery co., Pa., 35 m. N.W. Philadelphia. Drained by branches of Perkiomen and Shippack creeks. It contains four stores, four grist-mills, one saw-mill; five schools, 300 scholars. Pop. 1141.

LOWER SANDUSKY, p. v. capital of Sandusky co., O., 105 m. N. Columbus, 423 W. Situated on the W. bank of Sandusky river, which is navigable to this place for small steamboats. It contains a courthouse, jail, two churches, 10 stores, two warehouses, one grist-mill, one saw-mill. In this t. was fort Stephenson, where Col. Croghan made a gallant defence against the British and Indians during the last war, the remains of which are still visible. Pop. of the t., 1117.

LOWER SAUCON, p. t. Northampton co., Pa., 90 m. E.N.E. Harrisburg, 199 W. Watered by Lehigh river and Saucon creek. Two bridges here cross the Lehigh. It contains the v. of Hellertown, and has five stores, two fulling-mills, two flouring-mills, seven grist-mills, four saw-mills, one oil-mill, one paper-mill, one tannery, one distillery; seven schools, 350 scholars. Pop. 3710.

LOWER ST. CLAIR, t. Alleghany co., Pa., 6 m. S.W. Pittsburgh. Bounded N. by Monongahela and Ohio rivers. Drained by Chartier's creek. Coal abounds. It contains Birmingham v., a mile below Pittsburgh. It has five stores, three furnaces, two flouring-mills, two grist-mills, three saw-mills, one oil-mill, two glass factories; one academy, 19 students; 12 schools, 600 scholars. Pop. 4773.

LOWER SWATARA, t. Dauphin co., Pa., 5 m. S.E. Harrisburg. Bounded S.W. by Susquehanna river. Harrisburg lies partly in this t. Watered by Spring and other creeks. It contains three stores, four lumber-yards, capital \$31,000, two flouring-mills, one grist-mill, one saw-mill; two schools, 95 scholars. Pop. 1958.

LOWER SMITHFIELD, t. Monroe co., Pa. It has six stores, one grist-mill, five saw-mills, four tanneries. Pop. 1192.

LOWER WINDSOR, t. York co., Pa., 8 m. E. York b. It contains five stores, one furnace, one forge, one flouring-mill, four grist-mills, three saw-mills, one tannery, two distilleries; seven schools, 150 scholars. Pop. 1687.

LOWESTOFF, or LOWESTOFT, a market town, seaport, and par. of England. E. coast co. Suffolk, hund. Mustford and Lotheringham, 22 m. S.E. Norwich, and 104 m. N.N.E. London; lat. 52° 29' 10" N., long. 1° 45' 11" E., being the most easterly land in England. Area of par., 1950 acres. Pop. in 1831, 4236. The town consists of one principal street, which has a gradual descent from N. to S.; and from this main avenue proceed several other streets towards the W.; but, though well paved and lighted, they are narrow and irregular. In the market-place is a building open below, the upper part of which is used for assembly-rooms and other purposes; and there is a small theatre. The church is a handsome Gothic building, with a tower and steeple 183 ft. high, the living being a vicarage, is the gift of the bishop of Norwich. There is also a chapel of ease; and the Independents, Baptists, and Wesleyan Methodists have each their places of worship, with attached Sunday schools. A free school furnishes instruction for 40 boys, and there is a good national school. A friendly and benevolent society, a lying-in charity, and dispensary, are the principal charities. Several handsome lodging-houses have been built for visitors coming here for bathing in the summer months; and there are warm baths, reading-rooms, libraries, &c. At the S. end of Lowestoff is a battery, with 13 pieces of cannon, and two others are placed at the N. end, near which latter, on a high point of land, stands a round tower, the upper lighthouse (first built in 1676, and rebuilt in 1778). On the beach, below the cliff, is another lighthouse; and, by keeping both in a line, vessels are directed safely through the sand banks, which render this coast especially dangerous. The harbour, or rather road,

LOWNDES.

is defended on the E. by the Corton sand; the channel between the latter being marked by a light vessel, and well buoyed. This, which till lately was little better than a little fishing town, engaged in preparing red herrings for the London market, will probably rise to considerable commercial importance. Since 1827, an artificial harbour has been formed on a grand scale at Lowestoff, which communicates with the lake Lothering to the W. of the town; and then, by a short canal, with the Waveney, which is navigable to Beccles. Another canal joins the Waveney with the Yare, which has been rendered navigable for vessels drawing 10 ft. water as far as Norwich. Owing to the flatness of the ground, no locks, except the sea lock at Lowestoff, are required on either line of navigation. This improved communication must be of great service to the country which it intersects, and especially to Beccles and the city of Norwich, on which, indeed, it has conferred most of the advantages of a seaport. (*Priestly on Canals, &c.*, 513.)

Still, however, the chief consequence of Lowestoff, as a port, is owing to its herring fisheries: the quantity of fish annually taken and cured is very large; while, at the same time, their quality is considered superior, and they fetch higher prices in the London market than those sent from Yarmouth. Sail-making, boat-building, and the manufacture of rope and twine are extensively carried on; and several hands are employed in making barrels in which to pack the cured fish previous to their being sent to market or exported. Markets on Wednesday; fairs, May 12, Michaelmas day, and Oct. 10.

The only historical celebrity of Lowestoff is derived from the fact that on the 3d of June, 1665, a sanguinary naval engagement was fought off the coast between the English and Dutch, the fleet of the former being commanded by the Duke of York, afterward James II., and that of the latter by Admiral Opdam, who was killed in the battle.

LOWNDES, co., Ga. Situated in the S. part of the state, and contains 3080 sq. m. Watered by Withlacoochee and Allapaha rivers and their branches. It contained in 1840, 41,003 neat cattle, 2458 sheep, 30,349 swine; and produced 2383 bushels of wheat, 130,198 of Indian corn, 54,385 of buckwheat, 1173 of oats, 25,513 of potatoes, 275,095 pounds of cotton. It had five stores, nine grist-mills, five saw-mills, one distillery; one school, 12 scholars. Pop.: whites, 4394; slaves, 1177; free coloured, 3; total, 5574. Capital, Troupeville.

LOWNDES, co., Ala. Situated a little S. of the centre of the state, and contains 1600 sq. m. Bounded N. by Alabama river, by branches of which it is watered. It contained in 1840, 3750 neat cattle, 801 sheep, 97,365 swine; and produced 1431 bushels of wheat, 1736 of rye, 162,540 of Indian corn, 11,113 of oats, 18,353 of potatoes, 4743 pounds of rice, 803,933 of cotton. It had 30 stores, three tanneries; four academies, 247 students; three schools, 100 scholars. Pop.: whites, 6656; slaves, 12,569; free coloured, 14; total, 19,530. Capital, Haynesville.

LOWNDES, co., Miss. Situated in the E. part of the state, and contains 294 sq. m. Watered by Tombigbee river and its branches. It contained in 1840, 11,960 neat cattle, 3669 sheep, 20,463 swine; and produced 13,668 bushels of wheat, 575,140 of Indian corn, 39,915 of oats, 3100 of potatoes, 7,153,056 pounds of cotton. It had 30 stores, nine grist-mills, eight saw-mills, 17 oil-mills, 10 tanneries, two printing-offices, two weekly newspapers; one college, 54 students; two academies, 75 students; eight schools, 221 scholars. Pop.: whites, 5730; slaves, 8771; free coloured, 12; total, 14,513. Capital, Columbus.

LOWVILLE, p. t., Lewis co., N. Y., 137 m. N.W. Albany, 463 W. Bounded E. by Black river, and watered by its tributaries. It contains five churches, a Methodist, two Presbyterian, a Baptist, and Friends'; an academy, a bank, six stores, one fulling-mill, one flouring-mill, three grist-mills, eight saw-mills, three tanneries, one distillery, one printing-office, one weekly newspaper; 16 schools, 601 scholars. Pop. 9047.

LOYALSOCK, t., Lycoming co., Pa. Bounded S. by the W. branch of Susquehanna river, W. by Lycoming creek, E. by Loyalsock creek. It contains Williamsport borough, the capital of the county, exclusive of which it has one store, one furnace, one forge, one grist-mill, four saw-mills, one distillery; five schools, 145 scholars. Pop. 1107.

LOXA, or LOJA, a town of Spain, in Andalusia, prov. Granada, on the Xenil, 96 m. W. Granada, and 92 m. E. by S. Seville. Pop., according to Mifano, 13,966. It stands on the S. side of a rocky gorge, by which the Xenil escapes from the fertile *Pega* of Granada; and "its situation is peculiarly picturesque, the town being built on a steep acclivity, embosomed in groves of fruit trees, and overlooked by a towering mountain, forming one of the offsets of the Sierra Nevada." It contains three small and shabby parish churches, with two hospitals; and on an eminence at its S. extremity is a ruined Moorish castle, once of great strength and celebrity, but now the residence of a few her-

LUBECK.

mits. "Loja is proverbially noted for the fertility of its gardens, olive-grounds, and orchards, the abundance and purity of its springs, and the loose and hard features of its rural inhabitants. (*Scott's Renda and Granada*, II., 328, 339; *Mifano*.)

LOZERE, a dep. of France, reg. S., between lat. 44° and 45° N., and long. 3° and 4° E., having N., Haute-Loire and Cantal, W. the latter dep. and Aveyron, S. Gard, and E. Gard and Ardèche. Length, N.W. to S.E., 65 m.; greatest breadth nearly 50 m. Area, 514,795 hectares. Pop. (1836) 141,733. This department lies chiefly on the N.W. slope of the Cevennes, with the ramifications of which it is mostly covered. The surface varies from 2500 to 3000 ft. above the level of the sea; but its average elevation may be estimated at 3800 ft. The department derives its name from the mountain Lozere in the S.E., one of the principal summits of the Cevennes, 4888 ft. in height. The rivers Lot, Tarn, Ailler, and Gard have their sources within this department, which is not, however, watered by any stream of magnitude. There are several small lakes, one of which appears to occupy the crater of an extinct volcano. The climate is cold; snow remains on the mountains during the greater part of the year, and fogs are frequent. The soil is mostly stony in the N. and S., and calcareous in the centre. In 1834, the surface is said to have been distributed as follows, viz., arable land 308,600 hectares, meadows 35,166 hect., forests 44,589 hect., and heaths, wastes, &c., 179,000 hect. Agriculture is very backward, and little likely to improve, from the sterility of the soil, the remoteness of most parts of the department from great roads, the great subdivision of property, and smallness of the farms. Rye and wheat are raised, but not in sufficient quantities to supply the consumption. In the Cevennes potatoes are pretty extensively cultivated, and form, with chestnuts, the chief food of the inhabitants. About 50,000 hockettes a year of inferior wine, and some oil and silk are produced; the sharp winds experienced in the department are, however, unfavourable to the silk-worm. Hemp and flax succeed well, but the culture of madder and saffron has been abandoned. The mountain pastures are excellent, and feed many sheep: coarse woollens and serges are made in almost every peasant's family. In 1835, of 43,847 properties subject to the *contribution foncière*, very nearly a half were assessed at less than 5 fr., and 6635 at from 5 to 10 fr.; only seven properties being assessed at more than 1000 fr., and 53 at from 500 to 1000 fr. The department is said to be rich in mineral products, but the mines are but little attended to. Lozere is divided into three arrondissements; chief towns, Mende, the capital, Florac, and Marvejols. It sends three members to the chamber of deputies. Number of electors in 1838-39, 712. Total public revenue in 1831, 2,256,376 fr.; expenditure in the same year, 1,771,870 fr. (*Hugo, art. Lozere; Official Tables, &c.*)

LUBECK, p. t., and port of entry, Washington co., Me., 180 m. E.N.E. Augusta, 706 W. Situated at the W. entrance of Passamaquoddy bay, and has West Quoddy Head lighthouse on a point of land at the entrance of that bay. It has a good harbour, protected by Grand Manan island, which has a depth of water for vessels of the largest class, and is never obstructed by ice. It has other bays and entrances, and some islands. It contains 13 stores, three grist-mills, nine saw-mills; 12 schools, 867 scholars. Pop. 2307.

LUBECK, a city and republic of N. Germany; the city, which is the capital of the Hanseatic towns, and the seat of their high court of appeal, is situated on the Trave, about 10 m. (direct distance) from Travemünde, at its mouth in the gulf of Lubeck, in the Baltic, 36 m. N.E. Hamburg, and 38 m. S.E. Kiel; lat. 53° 58' N., long. 10° 41' E. Population estimated at rather more than 35,000. The town was built on a gently elevated ridge, on one side of which runs the Trave, and on the other the Wesenack. The environs are well wooded, and enlivened with cheerful villas, more particularly those along the banks of the Trave. The streets, which are steep, are wider than those of Hamburg. The houses generally appear to be old, and mostly built of stone; like those of Hamburg and Antwerp, their gable ends face the street. They are in general very lofty, six or seven stories not being uncommon. Round the ramparts of the city, in which there are two handsome gateways, is a promenade shaded with fine trees. The principal buildings are the cathedral, four churches, and the town-hall. The cathedral is a curious old building, the spires of which being much out of the perpendicular, momentarily threaten to fall, which also is the case with the towers of St. Mary's and St. Peter's. The church of St. Mary is handsome in the interior, and well worth a visit, were it only for the sake of the paintings, many of which are curious and of ancient date. Among them is the celebrated picture of the Dance of Death (usually attributed to Holbein, but which belonged to the town for at least 15 years before Holbein's birth). In the same edifice may be seen

LUBECK.

some fine specimens of sculpture, particularly a representation of the Lord's Supper, carved in white marble, finely designed and beautifully executed." (*Barrow's Excursions in the N. of Europe*, p. 29-34.) Behind the high altar is an old astronomical clock, constructed in 1405, which is the grand curiosity of the place. According to one of the guide-books, it exhibits at a certain hour figures representing the emperor and the seven German electors; but, according to Mr. Barrow, the figures are meant for the Twelve Apostles, who "at mid-day sally forth and march in regular succession, passing a figure of our Saviour, to whom they each face round, and having made a quick and familiar nod of the head, they then march onwards to a door on the opposite side, which closes upon them the moment the twelfth apostle has entered." (P. 34.)

The cathedral, begun in 1170, and finished in 1341, has many monuments of the senatorial families of Lubeck, some of which are well executed, and, among others, a remarkably curious oil picture, by Hans Hemling, dated in 1471, the subject of which is the Passion of Christ, treated in 23 distinct groups. The town-hall, a turret Gothic building, faces the market-place. It was the place of assembly for the deputies from the cities formerly comprised in the Hanseatic League; but the hall in which they held their meetings was unfortunately destroyed in 1817. Lubeck has a Calvinist and a Roman Catholic church, an exchange, arsenal, and mint, several hospitals and benevolent institutions, a gymnasium, a city-school, which in 1832 had 963 pupils, ecclesiastical and teachers' seminaries, schools of surgery, midwifery, navigation, drawing, swimming, and numerous other schools, a public library of 35,000 volumes, a society of useful sciences and arts, a Bible society, a house of correction and prison, a theatre for operas, &c.

Lubeck, though by no means so prosperous and important as formerly, is still a thriving commercial town. Many of its modern-built houses are on a grand scale. Their basement-stories are used as magazines or warehouses, and they have commonly large court-yards into which the carriages of the proprietors are driven. (*Barrow*, p. 25.) In Lubeck and its territory are numerous breweries, distilleries, iron forges, and linen yarn factories; besides manufactures of hats, vinegar, starch, tobacco and snuff, wax lights, paper and cards, musical instruments, with numerous oil and other mills, several printing establishments, and a few woollen, cotton, and golden and silver lace factories. Its trade is principally confined to the N. and W. of Europe. *Berghaus* states that upwards of 1600 vessels a year enter and leave its port; they are principally Danish, the rest being Russian, Swedish, Lubeck, Dutch, English, and Prussian. Lubeck communicates by means of the Trave and a canal with Hamburg (which see), with which it has an extensive intercourse. The principal articles of export are corn: the principal articles of import are wines and silks, from France; cottons, hardware, and other manufactured goods, from England; colonial products, dye stuffs, &c. It has an extensive commission and transit trade, and considerable markets for wool, cattle, horses, &c. Vessels of considerable burden load and unload by means of lighters at Travemünde, at the mouth of the river, which is properly the port of Lubeck. Two steamboats, of small draught of water, ply on the river between the city and its port. Steam-packets sail at fixed periods from the latter for Petersburg, Stockholm, and Copenhagen.

Lubeck has several fire and life insurance companies. Accounts are kept in marks of the value of 1s. 9-12d. each, divided into 16 schellings of 12 pfennigs. The Lubeck rix-dollar, equivalent to three marks, is worth 4s. 6-12d. The lb. = about 18 oz. avoird.; 112 lbs. = 1 centner.

The territory subject to Lubeck consists of a district of about 80 sq. m. immediately adjacent to the city, surrounded by the territories of Mecklenburg, Holstein, and Oldenburg, and the Baltic; of numerous small detached portions of surface enclosed by Holstein; and of the *Vier-Länder*, and town of Bergedorf, the sovereignty over which it shares with Hamburg. United area, about 137 square miles. Population, in 1839, 47,900, all Lutherans, except about 300 Calvinists, 400 Roman Catholics, and as many Jews. The land is very productive, yielding good crops of corn, fruits, and kitchen vegetables; but the rearing of live stock is the chief occupation of the rural population. The government is vested in the senate and house of burghesses (*bürgerchaft*); the former consists of four burgo-masters, holding office for life, two syndics, and 16 councillors; and the latter of 19 colleges or companies, only seven of which have, however, the privilege of voting. The house of burghesses has the initiative in all deliberations relative to the public expenditure, foreign treaties, &c.; the senate is entrusted chiefly with the executive duties, but its sanction is necessary to the passing of new laws. Public revenue, in 1838, 748,904 marks; expenditure, 700,863 marks. In 1836, the public debt amounted to

LUCCA.

five and a half millions marks; but it has since been in process of reduction. Lubeck has one vote in the full council of the German confederation, and along with the other Hanse towns, a vote in the committee. It furnishes a contingent of 407 men to the army of the confederation. It is uncertain when or by whom this city was founded; but no doubt it existed as early as 1140. Early in the 13th century, the Emperor Frederick II. made it one of the free towns of the empire; and from 1380 to 1659, Lubeck was the repository of the archives of the powerful association of cities included in the Hanseatic League, and the station of the confederated fleet. The dissolution of the League marked the epoch of the decline of Lubeck. After the battle of Jena, Blücher threw himself into Lubeck, which, after a severe engagement, was taken by the French, and sacked. In 1820, it was made the capital of an arrondissement in the department Bouches de l'Elbe; but was restored to its rank, as a free city, by the congress of Vienna in 1815.

Sir Godfrey Kneller, the painter, Mosheim, the historian of the Christian religion, Meibomius, and H. Müller, were natives of Lubeck. (*Martinique, Dictionnaire Géographique; Berghaus Allg. Länder, &c.*, W., 486-488; *Barrow's Excursions in the N. of Europe*.)

LUBLIN, a city of Russian Poland, cap. of the palatinate of Lublin, in a marshy situation, on the Biebrza, a tributary of the Wieprz, 97 m. S.E. Warsaw. Population estimated at 19,500, half of whom are Jews. It is subdivided into the old and new town, the former situated on an eminence, and the latter on the bank of the river. Lublin was fortified by a wall and ditch, till these works were destroyed in the civil wars towards the end of the 18th century. It has still, however, a citadel standing on a high rock, and according to Stein, the ruins of a castle built by Casimir the Great. Its streets are irregular and filthy, and its houses mostly of wood. The principal edifices are a handsome town-hall, the Sobieski palace, the cathedral, the churches of the Dominicans and Carmelites, and that formerly belonging to the Jesuits. There are in all 18 churches and 19 convents, six nunneries, a spacious synagogue, an Episcopal seminary, a Piarist college, several civil and military hospitals, an orphan asylum, and a theatre. Lublin is a bishop's see, and the seat of the second court of appeal in Poland. It has manufactures of coarse woollens; considerable trade in woollen cloth, corn, and Hungarian wines; and three large yearly fairs, each lasting a month, and attended by German, Greek, Armenian, Arabian, Russian, Turkish, and other traders. (*Dict. Geog.*; Stein, &c.)

LUCAS, county, O. Situated in the N.W. part of the state, and contains 600 sq. m. Bounded S.E. by Maumee river, and watered by its tributaries. It contained in 1840, 11,597 neat cattle, 3103 sheep, 18,381 swine; and produced 103,836 bushels of wheat, 5245 of rye, 154,017 of Indian corn, 13,968 of buckwheat, 59,222 of barley, 62,444 of oats, 122,904 of potatoes, 14,061 of sugar. It had six commission houses in foreign trade, 41 retail stores, five grist-mills, 19 saw-mills, one brewery, three printing-offices; 43 schools, 1151 scholars. Pop. 9382. Capital, Maumee.

LUCCA (DUCHY OF), a state of Central Italy, being, excepting San Marino, the smallest of the Italian states; between lat. 43° 46' and 44° 14' N., and long. 10° 9' and 10° 43' E.; having (except a few small detached portions) N.W. and N. the territories of Modena and the Tuscan Lunigiana, E. and S. Tuscany, and W. the Mediterranean. Length (N. to S.) 26 m.; greatest breadth, 21 m. Area (incl. Montignoso, &c.), 490 sq. m. Pop. (1839), 168,198. The Apennines skirt the N. part of the duchy, two thirds of which they cover with their ramifications; but none of these rise to the height of 4000 feet. The rest of the surface is a low but fertile plain, which becomes marshy towards the coast. The general slope of the country is from N. to S., in which direction it is traversed by the Serchio near its centre. This river is not navigable, but is of great use for irrigation: most of the other streams in the duchy are its tributaries. Near the shore are some small lakes. The mean annual temperature is about 52° F.; in the summer it rises to 80°; in winter it rarely freezes in the plain of Lucca. The soil, which is calcareous and stony in the N., is sandy in the S., and rich in the intermediate region. The population is chiefly agricultural, but the corn produced is not sufficient for home consumption; the deficiency being principally supplied by beans, which are largely cultivated, and partly, also, in the mountainous districts, by chestnut flour. The latter is sometimes exported to the neighbouring states, the price varying from 6s. 8d. to 10s. a sack. The culture is extending of all the articles for the production of which the soil and climate afford facilities. The number of mulberry trees has rapidly increased since the peace, and the manufacture of olive oil has been materially improved. The latter is esteemed the best in Italy, and fetches the highest price, especially that grown on high grounds. It is exported to the value of about £22,000

LUGCA.

a year: the market price being from 4d. to 5½d. the Lucca pound of 12 oz. Wine is said to give a fair return to the cultivator; hemp and flax are raised, and the produce of silk is very considerable. Lucca, in fact, was early distinguished by her proficiency in the silk manufacture; and in 1319 the culture of the mulberry became an object of public attention. Rice is grown near the coast, in which neighbourhood also most of the cattle in the duchy are reared. There are nearly 25,000 landed proprietors, of whom a large part have necessarily very small properties, and belonging to the class of agricultural or manufacturing labourers. The principal causes which have led to this subdivision of the land, as well as to the rapid increase and great density of the population, appear to be the habit of dividing leasehold property equally among the males of a family, the suppression of monasteries, and the abolition of entails.

The *metayer* system of agriculture is not so prevalent here as in Tuscany and elsewhere; but *Sismondi* represents the peasantry of Lucca as being, notwithstanding, in a very depressed condition. "Every day the husbandman is reduced to buy the day's provision. Very rarely has he a reserve of corn; still more rarely, of oil or wine. The former has been sold in the press, and the latter in the tub. He has rarely any provision of salt meat, butter, cheese, or vegetables. All the kitchen utensils are of earthenware; and the whole furniture consists of a table and some wooden chairs, one or two chests, and an indifferent bedstead, on which the father and mother sleep, with their feet in one direction, and the children with their feet against the head-board. When the division under General Vetrain ravaged the districts of the Val di Nievola, in 1799, the peasantry derived this advantage from their indigence, that when they had concealed their clothes, and the gold trinkets of their women, they had scarcely anything left to lose." (*Sismondi, Tableau de l'Agric. Toscane, &c.*, p. 213, 214.) But, according to Dr. Bowring, this statement must be either too highly coloured, or the condition of the peasantry must have improved in the interval; for he affirms that the labourers, in addition to articles of prime necessity, consume salt provisions, and sometimes fresh meat and colonial products. The ordinary wages of country labourers vary from 5d. to 6½d. a day, with food: farm labourers, who dwell with their masters, get from 45 to 55 francs a year. The mountaineers, who depend almost entirely upon the culture of the chestnut, are said to be in a better condition than the peasantry of the hills and plains. The inhabitants of the districts of Pontio and Scilapies are in particular distinguished by their robust and healthy appearance, and by the beautiful complexion and regular features of the women. This last circumstance is the more remarkable, as, during a great part of the year, these women, have to bear the whole burden of domestic labour; while their husbands, fathers, and brothers emigrate to the Tuscan maremma, and the states of the church, in search of harvest and other work. During winter, about 3600 labourers set out for these territories, Corsica, &c.; and return in summer, bringing with them their small savings, the aggregate of which may amount to £10,000. Most of the Italian image and plaster cast-makers, in other countries of Europe, are emigrants from Lucca. Mining is little or not at all pursued, though copper, iron, and lead ores are met with. Statuary marble, and other fine marbles, are found in great abundance. From 5000 to 6000 hands are employed in the manufacture of silk, wool, and cotton; and there are in the duchy about 30 paper factories, and others of linen cloth, straw and beaver hats, leather, glass, and iron goods. The capital is the chief seat of manufacturing industry.

The value of the exports amounts to about four millions francs a year, more than one fourth part of which is derived from oil and silk. These articles go chiefly to other parts of Italy, and to France, England, and the Levant. Grain, seeds, wine, liqueurs, live stock, lamb-skins, and fresh fish, are sent to Tuscany; and woollen goods to the rest of Italy and the Levant. The imports, which mostly come from Tuscany through Leghorn, consist principally of grain, seeds, rice, fine wines, hemp, flax, cotton, colonial products, salted provisions, pig-iron, &c. British cotton woollen and linen fabrics pay an import duty of 10 per cent. *de valeur*; cotton twist pays 3 lire, pig and bar iron, 5 lire 15 soldi, and glass wares, 6 lire per 100 lbs. The importation of tobacco and salt is prohibited, except on account of government which has a monopoly of those articles. The lb. (libra) of Lucca is somewhat less than the lb. Troy; the peso grosso = 11 lb.; the copo of oil = 94½ pail gross; the stajo of corn = about 5½ gallons. Accounts are kept in lire of 90 soldi and 940 danari. The lire = 7½d.; the scudo = 4s. 5½d.; the gold doubloon or pistole = 14s. 5½d. English. Lucca has only one seaport, Viareggio.

The government is a limited monarchy, under a duke, who exercises the executive power, nominates the mini-

sters, and all other public officers, &c. But an estimate of the amount of the public expenditure is annually laid before the senate, and must be sanctioned by it. This body consists of 35 members, elected from among the four classes of merchants, artisans, scholars, and landed proprietors, called together by the duke for at least a month every year; and without its consent no tax or other public burden can be imposed. The council of state consists of the two state ministers and six additional councillors. Justice is administered by a local commissioner in each commune; and a tribunal of original jurisdiction, a civil and criminal court of appeal, and a court of cassation in the cap. A permanent council of war, and a court of revision, sit to decide in military causes. The military force comprises about 750 men, costing about £10,800 a year. The naval force consists of only a goelette of 13 guns, and three gunboats. The regular and secular clergy amount together to about 1900 persons, under the archbishop of Lucca. There are about 1300 communal and other public and private schools, educating 3000 pupils, or one in 53 of the population. The principal establishments of this kind are the college of Charles Louis, with 140 students, the archbishop's seminary, the ducal lyceum with 300 students, and the conservatory of Louis Charlothe with 40 female scholars. There are some extensive charitable institutions, costing the state annually about £12,500. The public revenue and expenditure are about £83,000 a year each. The civil list costs about £25,300. Lucca has no public debt, except that due for pensions, &c.

Lucca, like the rest of Italy, experienced many changes in the middle ages. The capital attained its liberty after the decease of the Countess Matilda, in 1115, when it became an independent republic. In the next century it again fell under feudal authority, and afterwards belonged successively to Louis the Bavarian, and to noble Genoese, Parmesan, Veronese, and Florentine families. In 1370, it again obtained its liberty, by purchase, from the emperor Charles IV., for 100,000 crowns; and from that date to 1805, it was governed by its own *gonfalonieri*. Napoleon united Lucca with Piombino in a principality; the congress of Vienna, in 1814, erected it into a duchy, the greater part of which is hereafter to be united to Tuscany, and the rest to the Modenese territories. (*Bowring's Report on Lucca; Serriotti, Statistica d'Italia*, part iii.; *Hoffman; Rampoaldi, &c.*)

LUCCA (anc. *Lucca*), a city of Italy, cap. of the above duchy, in a plain near the left bank of the Serchio, 11 m. N.E. Pisa, and 38 m. W. Florence; lat. 43° 50' 49" N., long. 10° 30' 40" E. Pop. in 1830, 34,092. The city is surrounded with walls; which would form, however, but a very feeble defence against an enemy. The towers of the churches, rising above the ramparts, have a fine effect in the rich and beautiful landscape, the view being bounded by vine-clad hills spotted with villas, over which tower the craggy Apennines. On a nearer inspection, the public buildings are less pleasing in their architecture than in their distant effect; yet many of them are very curious structures. According to Mr. Woods, "The churches are all, more or less, imitations of the cathedral at Pisa; smaller, indeed, in size, but some of them are decidedly superior in the proportions and disposition of the parts." (*Lectures of an Architect*, II., 410.) Most of the churches are built of Carrara marble. The cathedral, mostly constructed in the 11th century, has much carved, inlaid, and mosaic work; a rich display of stained glass; a Madonna, by Fra Bartolommeo; and some pictures of the Venetian school. The churches of San Michele, and San Frediano are both ancient. The latter belonged to a monastery restored and enriched towards the close of the seventh century. Frequent notices, both of the monastery and the church, occur in the succeeding centuries, but nothing, it is said, indicates that the latter has been ever rebuilt, or materially altered. Its curious architecture is described by Woods, II., 411. The ducal palace is a large structure, the exterior of which presents nothing remarkable; but its interior is superbly furnished with articles of Lucca manufacture, the ceilings and walls being also adorned with frescoes by Lucchese artists. The *Palazzo Pubblico*, the residence of the *gonfalonieri*, in the days of the republic, is described by Forsyth as an immense and august edifice, which makes the city round it look little. There is a small, but handsome theatre. Lucca is generally well built: many of the private houses are very good, though their pointed roofs, gable ends, &c., give it the aspect rather of a Flemish than an Italian city. The streets, though crooked, are broad and well-paved; and the ramparts, planted with trees, form pleasing promenades. It has several colleges, a seminary, founded by Eliza, Princess Baciocchi, sister of Napoleon, for 100 young ladies, a botanic garden, a ducal library with 21,000 volumes, a university library with 16,000 volumes, a *dépot de mendicants*, a *monté di pietà*, and a savings' bank. Forsyth, who visited this city in 1803,

LUCENA

speaks of it as silent, dull, and gloomy; it enjoys, however, the title of *Industria*, and is one of the principal inland commercial towns in Italy. Its manufactures mostly consist of silk and woollen fabrics. The usual wages paid to men vary from one to two francs a day; women and boys earn about half a franc a day. The city has also a considerable trade in olive oil, &c. About 18 or 13 m. up the valley of the Serchio are the baths of Lucca, picturesquely situated, and frequented by numerous visitors. The temperature of the hottest spring is about 138° Fah.

Lucca was colonized by the Romans A.U.C. 575. It was a municipal town, and frequently the head quarters of Omsur, during his command in Gaul. Traces of a Roman amphitheatre are still discoverable. This city was taken by the French in 1799; and, in 1805, Napoleon made it the capital of a principality he erected for his sister's husband, Bacciochi. (*Rampoldi; Woods; Forsyth; Cramer's Anc. Italy*, 1, 173.)

LUCENA (an. *Elisene*), a town of Spain, in Andalusia, prov. Cordova, 31 m. S.S.E. Cordova, and 89 m. E. Seville. Population, according to Mifano, 19,716. It stands on the slope and at the foot of a hill, comprising some respectable streets, lined with good houses; two squares, and agreeable suburbs. The neighbourhood is distinguished for the abundance of its produce in fruit and grain, which chiefly contributes to the support of the population; but the processes of tillage are of the rudest description, and the resources of the soil are little tried.

LUCERA (an. *Luceria*), a city of S. Italy, Neapol. dom., prov. Capitanata, cap. canton, on a height abrupt towards its N. side, 13 m. W.N.W. Foggia. "The city contains 12,000 inhabitants, apparently in easy circumstances. The houses, which are all tiled, are generally good; but the streets are narrow, ill-paved, and dirty. Some ancient walls, in very bad condition, inclose it; and five gateways open from them to an outward road, which winds entirely round the town. A few gardens and convents are scattered about, and these, with some olive plantations and vineyards, in which the natives have small country houses, contribute greatly to enliven and diversify the prospect. The vines are trained low; and supply the proprietors with a good strong white wine, and a still stronger, but less pleasing red one." (*Ossen*, 44, 45.) About ½ m. from the city, on the edge of the same eminence, is the Castle of Lucera, a ruined Gothic fortress, erected by the emperor, Frederic II. The extent of its walls would almost lead to the belief that they surround a second city; but they at present encircle only an empty area, overgrown with grass. Craven believes that there can be no doubt, from the Roman inscriptions, and pieces of sculpture found within the area of this building, that its situation is identical with that of the citadel of the ancient *Luceria*, taken by the Samnites after the defeat of the Romans at the Caudine Forks, and afterward retaken by L. Papirius. (*Tour in the S. Prov. of Naples*, 48.) This castle is a very conspicuous object; it has a deep moat, a drawbridge, two large round towers, one supporting the telegraph which communicates with Foggia, and the other a piece of masonry, built with consummate skill; in the interior of its area are traces of extensive cisterns. The cathedral of Lucera was formerly a Saracenic mosque, and preserves, on the exterior, some marks of its origin. It has a pulpit adorned with that kind of Byzantine mosaic, of which the cathedral of Salerno offers so fine a specimen; but its principal ornaments are 13 beautiful pillars of verd antique, originally found under the cathedral itself, and supposed to have belonged to a temple of Apollo: the capitals are modern. Facing this church is the bishop's palace, considered the finest piece of architecture in Apulia. The tribunal and other public edifices, render the appearance of this part of the city somewhat imposing. The *Tribunale* includes the criminal and civil courts for the province, the register office, the notarial chamber, the residences of the president and judges, and the public prisons. Lucera has a royal college, and an extensive private collection of coins, medals, and antiquities. Great numbers of cattle are kept in its neighbourhood; and its cheese is held in great repute.

Lucera is said to have been founded by Diomed, and was the capital of Daunia under the Greeks; it afterward became a Roman colony. Having fallen into decay, it was renovated in 1330, by Frederic II., who transported thither a colony of Saracens from Sicily, to whom he gave great privileges. In 1360, however, Charles of Anjou expelled from the Neapolitan dominions such Moors as refused to embrace Christianity, and converted the mosque of Lucera into a church. Numerous antiquities of various ages have been discovered in and about Lucera. (*Ossen's Tour*, &c., p. 43-51; *Switzerland*, 1, 157-160; *Cramer's Ancient Italy*, 1, 296, &c.)

LUCERNE (CANTON OF), a canton of Switzerland, ranking third in the Confederation, between lat. 46° 47' and 47° 17' N., and long. 7° 56' and 8° 30' E.; having N. Solothurn and Aargau, E. Zug, Schwytz, and Unterwalden,

LUCERNE.

and S. and W. Bern: length N.E. and S.W. 36 m., breadth varying from 8 to 30 m.; area 557 sq. m. Pop., in 1833, 124,531, all Roman Catholics, except about 50 Calvinists. The surface in the N. is generally plain, undulating in the centre, and rising gradually towards the S., where are several mountain-ranges of considerable height. The principal of these is M. Pilate, between Lucerne and Unterwalden, its highest summit, the Tomlishorn being estimated at 7195 feet above the level of the sea. The S. and E. parts of the canton are watered by the Reuss and Little Emmen; the other rivers are the Wigger, Sur, Vinco, &c., all having a N. course, and joining the Aar in Aargau. The lake of Lucerne (which see) forms a part of its E. boundary, and the canton comprises several small lakes, as that of Sempach, 4 m. in length, and memorable for the battle fought on its banks 9th July, 1386 (see *SEMPACH*), those of Baldeg, 3 m. in length, Mosen, &c. The climate is mild, and the soil more favourable to agriculture than that of most of the neighbouring cantons. According to Ebel, more corn is grown than is required for home consumption. Ingli, however, affirms that the surplus is very trifling, and that the greater part of the grain brought to the corn-market in the town of Lucerne comes from the canton of Aargau. "I have never seen," says he, "anywhere more abundant crops than are produced in Lucerne, where time and industry are bestowed upon the lands. In no part of Switzerland might the inhabitants be more at their ease than in this canton; and yet there is not a commune in which paupers are not to be found." Industry is not nearly so active as in the neighbouring cantons of Bern and Zurich. The vine flourishes in some parts, fruit is plentiful, and wine and cider are produced; but the chief occupations of the people are cattle breeding, and dairy-husbandry. The Enlisbuch, or valley of the Little Emmen, about 95 m. in length, affords pasture for about 7000 head of cattle, and 11,000 sheep and goats: the inhabitants make large quantities of cheese, which, though not so good as that of the Emmenthal in Bern, is exported as the produce of the latter district. The inhabitants of this valley are remarkable for their vigour, intelligence, and independent spirit, and are usually richer than those of the rest of the canton; but they are neither so well clothed, nor have such neat cottages as the peasantry of the Emmenthal. (*Cott's Letters on Switzerland*, let. 23.) Traces of various metals, coal, &c., are met with in this canton, but no mines are wrought. Manufacturing industry is unimportant, and is mostly confined to domestic linen weaving and spinning. The inhabitants are more occupied in the transit trade from N. Switzerland across the St. Gothard, than in any commercial dealings of their own.

The government is vested in the council of one hundred, 50 of whose members are chosen from among the citizens of the capital, and 50 from the inhabitants of other parts of the canton. The 18 arrondissements into which the canton is subdivided, and the three municipalities of Sursee, Sempach, and Villenau, send one member each to the council, and the remaining 39 members from the rural districts, are chosen by the council itself. The council also nominates 40 of the deputies from the town of Lucerne, the remaining 10 being sent by that municipality. The right of election belongs to every native (bourgeois) of the canton 30 years of age, having property to the amount of 400 fr., and who has not been penally condemned, or is bankrupt. Members of the council must be 25 years of age, and pay taxes on property to the amount of 4000 fr., or have rendered important services to the state. A body of 36 members, 30 years of age, chosen from among the council, and holding office for life, form the senate, to which is confided all the executive power. The council meets regularly three times a year, but may be convoked oftener, at the pleasure of the senate. Two *syndics*, or presidents, are chosen annually from among the senate, by the council, one to preside at the council and the other in the court of appeal. The latter tribunal is composed of 12 members, chosen from the senate, and has authority in all legal causes, except in cases of capital punishment, when the senate is assembled to pronounce judgment. The council of state for the Swiss Confederation is chosen from among the senate, when Lucerne has the directorial power, which occurs once every three years. In ecclesiastical matters, Lucerne is subordinate to the bishop of Basle; but being at the head of the Roman Catholic cantons of Switzerland, it was the permanent residence of the papal nuncio till 1835, when, in consequence of a dispute with the government, the nuncio removed into the canton of Schwytz. Public instruction is under the direction of a commission of senators: it has been till lately indifferently conducted, but is improving. The public revenue amounted in 1832 to 366,139 Swiss fr., the public expenditure to 359,283 fr. A contingent of 1734 troops is furnished to the army of the confederacy, and 36,000 Swiss fr. money.

LUCERNE, a town of Switzerland, capital of the above canton, and one of the three seats of the Swiss diet, on both sides the Reuss, where it issues from the W. extremity of

LUCERNE.

The lake of Lucerne, 25 m. S.S.W. Zurich, and 43 m. E.N.E. Berne. Lat. $47^{\circ} 3' 27''$, long. $8^{\circ} 18' 35''$ E. Pop. 7000. Its situation is highly picturesque, and its environs abound with pleasant promenades. The town is surrounded by a circle of watchtowers, and the land side is inclosed by a continuous wall. It is pretty well built, and has several fine public edifices. The cathedral, founded in 685 (*Ebc.*), has a painting of Christ on the Mount of Olives, by Lanfranc, and an organ with nearly 3000 pipes. The church of St. Peter and the Jesuits are handsome buildings; and there are several convents; that of the Jesuits has, however, been happily converted into a lyceum. The most remarkable objects in Lucerne are the four bridges over the Reuss, connecting the great and little towns. Some of these are of considerable length; all of them are covered and ornamented with pictures illustrative of Swiss and Scripture history, or copied from the "Dance of Death." The town-hall, where the diet and cantonal council meet, erected in 1608, is, though small, a handsome building. In the arsenal are several suits of ancient armour, including the coat of mail worn by Leopold of Austria, killed at the battle of Bempach. Lucerne has two hospitals, an orphan asylum, a mint, a jail, a theatre, public libraries belonging to the town, the Jesuits, Cordeliers, Capuchins, &c., and a lyceum, with 14 professors of theology, law, natural and moral philosophy, history, mathematics, and the fine arts. Attached to the lyceum is a large public school. "Into this school every child until the age of 19 is admitted, upon payment of six francs a year, and is taught reading, writing, arithmetic, and the first principles of Latin; and this privilege of acquiring, in early years, the rudiments of learning, is not confined to the city of Lucerne, nor even to the canton; persons may claim admittance from any other of the Swiss cantons; and even from foreign countries. The college and the school are one establishment; and every one who has received his education in the school is immediately received as a pupil of the college, and pays nothing for his instruction there. The original fund for this establishment amounted to 400,000 fr., but has subsequently been greatly increased by donations." (*Anglia*, 116, 117.) The institutions for the intellectual and moral improvement of the inhabitants are on a scale of great liberality, though education be far from being widely diffused either in the city or the canton generally. In the town is the celebrated model in relief of Switzerland, made by General Pflyger; and in the Pfiffer Garden, outside the walls, is a monument, from a design by Thorwaldsen, to commemorate the Swiss guards who fell at Paris in the memorable attack on the Tuilleries, on the 10th of August, 1793. "It represents a lion of colossal size, wounded to death, with a spear sticking in his side, yet endeavouring with his last grasp to protect from injury a shield bearing the fleur-de-lis of the Bourbons, which he holds in his paws. The figure, hewn out of the sandstone rock, is 28 feet long, and 18 feet high, and its execution (which is by Aborn of Constance) merits great praise." (*Murray's Handbook*.)

The weekly corn market held here is one of the most extensive in Switzerland. Lucerne has a casino and a theatre open in winter. Dancing is prohibited by the authorities, except during the last three days of the carnival and on a few other special occasions. This prohibition is strictly enforced in Zurich; but it appears less absurd there than in a Catholic canton.

The city of Lucerne was given by Popin in 708 to the abbots of Murbach in Alsace; to whom it belonged till towards the end of the 13th century, when it was sold to the house of Hapsburg. But, in 1332, the citizens, impatient of the Austrian yoke, rebelled and joined the three primitive cantons of the Swiss Confederacy. In less than 30 years they conquered the territory which now forms the canton. The town was taken by the French, May 1, 1798, and was for eight months the capital of the Helvetic government.

LUCERNE (LAKE OF) (Germ. *Walstattler See*, or the lake of the four forest cantons), a lake of Switzerland, in nearly the centre of that country, between the cantons of Lucerne on the W., Schwyz N., Uri E., and Unterwalden S. It is the largest and decidedly the finest lake in the interior of Switzerland, and one of the most picturesque in Europe. It is of a singular cruciform shape, with an addition to its E. end, termed the Lake of Uri. Its greatest length is about 25 m.; but the breadth of any of its arms is seldom more than 2 or 3 m. Area estimated at 43 sq. m.; height of its surface above the level of the sea, 1380 feet; depth varying from 300 feet near Lucerne to 900 feet near its E. end. The Reuss traverses this lake in its entire length, emerging from it near its W. extremity. Its banks exhibit every gradation of scenery, from a gently rising and fertile country at its W. end, to rugged and savage sublimity on the lake of Uri. Its E. and S. parts are surrounded by mountains rising to many thousand feet above the sea, the chief of which are mounts Pilate and Right. Its shores abound in localities memorable in early Swiss history. At the N. extremity of what is called

LUCIA.

the lake of Uri is the little town of Brunnen, where, in 1315, a treaty was entered into by Uri, Schwyz, and Unterwalden, which gave birth to the Helvetic Confederacy. Like all mountain lakes, it is subject to violent tempests; and in consequence of the different positions of its different arms, and the influence of the surrounding mountains, different winds seem to prevail in different parts of its extent at the same time. A steamboat plies eight times a week in summer, and five times at other seasons, between Lucerne at its W. and Fluelen at its E. extremity, calling at the intermediate ports. (*Ehli, Voyageur en Suisse*, 368, 361; *Picot's Statist. de la Suisse*, 212, 233; *Coxe's Switzerland*; *Anglia's Switzerland*, &c.)

LUCIA (ST.), one of the British W. India islands, belonging to the Windward group, in lat. 14° N., and long. 61° W., about 90 m. N.N.E. St. Vincent, and 25 m. S. Martinique. It is of an oblong shape, being nearly 23 m. in length by about 19 m. in its greatest breadth. Its area has been differently estimated, but may amount to about 300 sq. m. Pop. by the last census, 16,017, of whom 13,348 were black. The central and E. parts of the island are occupied by the table-land, called Capisterre; the W. part, which has a much less elevation, is called Baseterre. These two districts differ widely in physical aspect; but each, in an eminent degree, is subject to the operation of those agencies which are supposed to exert a baneful influence on the health of Europeans in tropical climates. St. Lucia has, in fact, always been noted for its unhealthiness. At an average of the 30 years, ending with 1836, the annual deaths amounted to upwards of 192 per thousand of the white, and 42 per thousand of the black troops.

"Baseterre, the best cultivated portion of the island, abounds in swamps and marshes. Capisterre consists of a succession of abrupt mountains of the most picturesque and fantastic shapes, covered to the summit with forest trees and dense underwood, and intersected by numerous ravines, which, being too narrow to admit of free ventilation, are at all times replete with moisture, and choked up with decaying vegetation in every stage of decomposition. The climate is principally characterized by extreme moisture and variability. During several months, but particularly in October and November, rain is incessant, and showers are frequent for at least nine months of the year. Cool dry weather generally sets in about Christmas, and continues three or four months, at which time the climate is exceedingly pleasant, though not more healthy, since it is at that period of the year that the greatest mortality prevails. During the rest of the year the weather is sometimes dry and sultry, at others cold and damp, exhibiting a difference of 10 or 15 degrees of temperature in a few hours." (*Trillock's Report on Mortality*, &c., in the *W. Indies*.) The range of the thermometer is much the same as at Dominica. Nearly 9500 acres are under crops, and 4700 in pasture. The mountains are feathered to the top with tall forest trees, and the valleys at their feet abound with excellent timber.

St. Lucia has several good harbours, the chief being the Carriacou on the W. coast, within which 30 ships of the line may lie in perfect security, without even, as is stated, being moored. The wish to command this admirable harbour was, in truth, the motive which made the island be formerly so much coveted by the European powers.

The quantities of the principal articles imported into the United Kingdom from St. Lucia in 1836 and 1839, were:

Years.	Sugar.	Rum.	Molasses.	Coffee.	Cocoa.
	Cuts.	Galls.	Cuts.	Lbs.	Lbs.
1836	66,691	7,493	4,796	143,385	16,285
1839	50,215	14,061	11,029	81,000	25

The total value of the exports from St. Lucia, in 1836, amounted to £260,040, and that of the imports in the same year to £260,344. During that year, 371 ships, of the aggregate burden of 13,044 tons entered, and 379, of the aggregate burden of 13,106 tons, left the ports of the colony.

The island is divided into nine parishes. Castries, the capital, lies in a low and marshy situation, at the extremity of a long and winding bay of the same name. The fort, where most of the troops in the island are stationed, is built on the summit of a steep hill, called Morne Fortin, about $\frac{1}{2}$ m. from Castries, and 550 ft. above the level of the sea. Near it is the principal hospital. Another hospital, and some barracks, are erected on Pigeon Island, a small, conical, and extremely unhealthy islet, near the N. extremity of the island. St. Lucia is governed by a governor and council, acting under orders from England. The mutual jealousies of England and France prevented, for a lengthened period, a permanent settlement being made on the island, which was then regarded as a sort of neutral territory. At length it was ceded to the French in 1763; but, being taken by the English in 1803, it was definitely assigned to us by the treaty of Paris. (*Parliamentary Reports*, &c.)

LUCIA (STA.), a town of Sicily, intend. and distr. of

LUCKIPOOR.

Momina, cap. canton, in a healthy situation on the declivity of mount Dianamare, 7 m. S. by E. Milazzo. Pop. in 1831, 6270.

LUCKIPOOR, a town of Hindostan, prov. Bengal, distr. Tipperah, a few miles from the mouth of the Brahmaputra, with which it communicates by a small river, 156 m. E.N.E. Calcutta; lat. $25^{\circ} 55' N.$, long. $90^{\circ} 43' E.$ Coarse cotton cloths of a substantial kind are made here; and the neighbourhood is so fertile and productive that Luckipoor is one of the cheapest towns in British India.

LUCKNOW (Hind. *Lakshmanote*), a large city of Hindostan, prov. and kingdom of Oude, of which it is the cap., on the Goomty, a tributary of the Ganges, about 150 m. N. W. Benares, and 265 m. S.E. by E. Delhi; lat. $26^{\circ} 51' N.$, long. $80^{\circ} 50' E.$ Pop. formerly estimated at 300,000, but now probably under 200,000. This city is interesting from its being the capital of one of the most powerful native states in Hindostan, with which the British power in its rise and progress in India has been more intimately connected than any other; and it is also one into which European habits have been very extensively introduced by the late reforming sovereign of Oude, Saadet Ali. "When viewed from the summit of a lofty edifice, Lucknow presents a confusion of gilded cupolas and pinnacles, turrets, minarets, and arches, bounded by the winding Goomty, and so thickly interspersed with the richest tropical foliage as apparently to realize the most fantastic visions of oriental splendour. A nearer inspection, however, does not fulfil the anticipations which a bird's-eye survey is calculated to excite. This capital may be divided into three quarters. The first is the city, properly so called, containing the shops and private dwellings of the inhabitants connected with the court and residency. The streets here are sunk 10 or 12 ft. below the surface, and are so narrow that two carts cannot pass, besides being filthy in the extreme. The chowk, and one or two bazars in its vicinity, are good streets; but, on the whole, this extensive quarter is more meanly built than, perhaps, any city of the same rank in Hindostan.

"The second quarter of Lucknow was built mostly by the late nabob, Saadet Ali. It stands near the Goomty, towards the S.E., and consists of one very handsome street, after the European fashion, above a mile in length, with bazars striking out at right angles, and a well-built new *chowk* or market-place in the centre, with a lofty gateway at each extremity, which presents a Grecian front on one side, and a Moorish one on the other. The houses that compose the remainder of this street belong to the king, and are occupied by members of his family, or officers of his household. These are, for the most part, in the English style, but with a strange occasional mixture of Eastern architecture. The same remark applies to the palaces, &c., that occupy the space between this street and the river. All these palaces are filled with European furniture and pictures, and may rank with comfortable English houses, but none are on a scale of royal magnificence. The king's peculiar residence only excels the others in being approached through six spacious courts, with reservoirs, fountains, and innumerable pieces of cast statuary, China figures, and other toys that decorate its area. The adjacent buildings of the British residency terminate the great street to the N. At its opposite extremity is the entrance of the Delkusha park, an artificial wilderness of high grass, with which Saadet Ali clothed the arid tract between Lucknow and Constantia, and well stocked with deer, antelopes, and peacocks.

"The third quarter of the city adjoins the Goomty to the N.W. being only separated by a wretched bazaar from the second. It consists chiefly of palaces and religious buildings; and, being in a style more purely oriental than the modern portion of the city, is by far the most interesting quarter to a stranger. The magnificent pile of *Imaum-darak*, with its noble gateway, called the *Roumi-derwasseh*; the new palace built, but never finished, by Saadet Ali, the *Dowlet-khanah*, &c., are the chief ornaments of this division of Lucknow." (*Hamilton's E. I. Gaz.*, ii., 130, 131.)

There are many stately *khanas*, and some handsome mosques and pagodas scattered in different parts of the wretched alleys, of which this city chiefly consists; but the most striking buildings, as in other Mohammedan capitals, are the royal tombs and mosques. Of these, the *Imaum-darak*, or tomb and mosque of Asophud Dowlah, is the chief. It is said by Lord Valentia to be the most beautiful building he had seen in India. "The approach to the building is through a very large quadrangle to a garden, elevated a small height; on one side of which is a very beautiful mosque, and on the other the *Bales* palace. The *Imaum-darak* itself is built on an elevated terrace, and consists of three long and finely-proportioned apartments, running parallel to each other: in the middle one is the tomb, level with the ground." (*Valentia's Trav.*, i., 157.) The central room is, according to Hamilton, 167 ft. in length, by 32 ft. in breadth, with an octagon room at each end; and

LUDLOW.

in the rear of the centre, a raised set of rooms, or open arches, with fountains and basins of water under each arch. Lord Valentia says that a range of silver temples or cenotaphs also extends from one end to the other of the room, raised on platforms about 3 ft. from the ground, and each valued at from 50,000 to 100,000 rupees. The *Roumi-Derwasseh*, so called from being supposed a copy of one of the gates at Constantinople, is in a light and elegant, though fantastic style, and a mixture of Gothic and Moorish architecture. A good engraving of it and a part of the city is given in Lord Valentia's Travels (i., 173). Near it is the Fivefold palace, a large fortified building, appropriated to the wives, &c., of deceased sovereigns.

Two bridges have been erected over the Goomty at Lucknow; one a heavy bridge of masonry, the other a bridge of boats. The erection of an iron bridge was projected by Saadet Ali, but the materials arrived from England too late for the accomplishment of the work during his lifetime; and his heir, conformably to a prejudice universal among the Mohammedans of Hindostan, declined the unlucky task of completing the unfinished undertaking of a deceased predecessor. About 3 m. from Lucknow is Baroun, a country seat of the last-named chief, built by himself. It is in a Grecian style of architecture, and has, as might be expected, many faults; but it is ornamented by a very fine portico, rising the whole height of the house in front. Near the city is also Constantia, the former residence of a general in the East India Company's service, and erected at an expense of seven lacs of rupees; but this building is in wretched taste, and only imposing at a distance. It has, however, or had, some fine gardens attached to it.

Lucknow is traditionally said to have been founded by *Lakshman*, the brother of *Rama*; who had his residence here, to extinguish the recollection of which Aurungzebe erected a mosque with two minarets on its site. After the battle of Buxar, Shuja ud Dowlah removed his court from Lucknow to Fyzabad; but on his death, in 1775, his successor made this again the capital of Oude. (*Lord Valentia's Travels*, i., 135-175; *Mod. Trav.*; *Hamilton's Hindostan* and *E. I. Gaz.*, &c.)

LUCKPUT-BUNDER, a town of Hindostan, province of Cutch, of which it is the chief port after Mandavee, on the Khoree, or most easterly branch of the Indus, on the high road from Mandavee to Hyderabad and Tatta, 93 m. S.E. by S. the last-named city, and 67 m. W.N.W. Bhooj. It is defended by a good fort. Early in the present century, it had but 2000 inhabitants, and, owing to the shallowness of the river, could only be approached by very small craft; but, by an earthquake in 1819, the Indus was deepened at Luckput to more than 18 ft. at low water, and there is now 20 ft. water in its channel from the ocean to Busta, 8 m. below this town. (*Geog. Journal*, iii., 119.) This must, no doubt, have contributed to the commercial prosperity of Luckput-Bunder, though we have not learned the particulars.

LUDLOW, a mun. and parl. bor., market town, and par. of England, co. Salop, hund. Munslow, on the Teme, 34 m. S. Shrewsbury, 32 m. W. by B. Birmingham, and 196 m. W.S.W. London. Pop. of parl. bor. in 1831, 5332. The town is neat and well built, and the streets are generally wide, well paved, and lighted. On a bold rock, overhanging the river, at the N.W. angle of the town, stands the castle, supposed to have been built in 1130. The walls and towers which still remain present a mass of extensive and magnificent ruins; and round the castle are public walks, shaded with trees, from which there is a fine prospect of the surrounding country. Near the centre of the town is "the Cross," a handsome stone building, with rooms over it used as a school; and in Castle-street is the market-house, the lower part of which is open, and serves as a corn-market, the upper part comprising several large rooms, used for corporation meetings, assemblies, public balls, &c. The guildhall, where the quarter sessions and court of record are held, is a neat and commodious modern structure; and there is a prison called Gaolford's tower. Performances are given in a small theatre during the races, which are held in the neighbourhood. The church, which stands at the upper end of the town, is a large cruciform building of perpendicular architecture, surmounted by a square embattled tower, rising from the intersection. The interior is very beautiful: lofty pointed arches divide the nave from the aisles; and at the E. end of a very spacious choir is a noble window, entirely filled with painted glass: the whole church is ceiled with fine oak, and embellished with carving. The S. entrance is peculiar, consisting of a hexagonal porch richly ornamented. The living (valued at £160 a year) is a rectory, in the gift of the lord chancellor. There are three places of worship for dissenters, and to both the churches and chapels Sunday schools are attached, furnishing religious instruction to upwards of 500 children. The grammar school, founded in the reign of Edward VI., is intended to give free instruction, in English

LUDWIGSBURG.

and classical learning, to the sons of all residents within the borough. The pupils comprise about 30 free boys, and nearly the same number of pay scholars boarding with the master, who receives a yearly salary of £100, and is assisted by an usher. The master holds, also, the office of preacher, with a salary of £48 a year. A national school, under the superintendence of the rector and a committee, is attended by 150 boys and 100 girls; and is liberally supported, partly by contributions and partly, also, by the funds of a blue-coat charity recently merged into it.

Ludlow, as a place of trade, is of little importance. The glove trade formerly employed several hundred hands; but of late years it has greatly diminished. A small flannel-mill employs about 30 hands, and there is a considerable paper-mill. Malting and tanning are also carried on to some extent; but the chief business is confined to the retailing of goods consumed in the town and neighbourhood. The corporation charter was granted by Edward IV., and has been subsequently confirmed by nine different monarchs. Under the Municipal Reform Act, the government is vested in a recorder, four aldermen, and 12 councillors. Corporation revenue in 1836, £264. The borough has returned two members to the House of Commons since 19 Edward IV.; the right of election, previously to the Reform Act, being nominally vested in the resident burgesses (made so by birth, marriage, or gift), but substantially in the lord of the manor, Earl Powis. The electoral limits were enlarged by the Boundary Act, so as to include, with the old borough, the township of Ludford, and part of the parish of Stanton Lacey. Registered electors in 1835-40, 422. Market (well attended) on Monday; fairs, chiefly for horses, cattle, and pigs, Monday before Feb. 13, Tuesday before Easter, Wednesday in Whitweek, Aug. 21, Sept. 23, and Dec. 6, on the two last of which large quantities of hops are exposed for sale.

The history of Ludlow is closely connected with that of its castle, which, being erected by the barons of Montgomery in the 12th century, continued in a habitable state till the suppression of the council of the marches of Wales by William III. To all lovers of English poetry this castle is interesting, as having been the scene where Milton's "Comus" was performed in 1631, by the family of the earl of Bridgewater.

Lunlow, p. t., Windsor co., Vt., 60 m. S. Montpelier, 672 W. Chartered in 1761, first settled in 1784-5. Watered by Black river. It contains four churches, a Congregational, Baptist, Universalist, and a Union church; a flourishing academy, three stores, three fulling-mills, one woollen factory, one grist-mill, five saw-mills, two tanneries; one academy, 130 students; 16 schools, 498 scholars. Pop. 1363. The township contains beautiful *verd antique* marble and excellent iron ore, some of which is magnetic.

Lunlow, p. t., Hampden co., Mass., 82 m. W. by S. Boston, 373 W. Incorporated in 1774. Chickapee river bounds it on the S., by a branch of which it is watered, and which affords water-power. It contains two churches, a Congregational and Methodist; one store, one grist-mill, three saw-mills; 10 schools, 250 scholars. Pop. 1268.

LUDWIGSBURG, a town of Wirtemberg, circ. Neckar, of which it is the cap., on rising ground, about 1 m. W. of the Neckar, and 8 m. N. Stuttgart. Pop. in 1837, 6900. It is one of the best laid out and handsomest towns of the kingdom, but is dull. Charles-street, by which it is traversed from end to end, is 1 m. in length, and like most of the other streets is lined with rows of trees. From 1737 to 1753, Ludwigsburg was the chief residence of the court; its palace, though now deserted, is one of the largest and finest in Germany; and it has a gallery of old German, Dutch, and Flemish pictures; and a theatre. The palace gardens, formerly celebrated for their beauty, are now falling into disorder from neglect. Ludwigsburg has a Lutheran parish church, three other churches, an arsenal, a military school for 80 officers' sons, a lyceum, an orphan asylum, and workhouse, house of correction for females, school for poor children (*kinderrrettungsschule*), a cannon foundry, and manufactures of woollen cloth, earthenware, and buttons. In the neighbourhood are the royal summer palaces of Favourite and Monrepos, and the fine statue of Count Zeppelin, erected by King Frederick of Wirtemberg. About 6 m. distant is Marbach, the birthplace of Schiller, and the mathematician Mayer. (*Memmingen*; *Beschreibung von Wirtemberg*, 583-94; *Berghaus*; *Stein*.)

LUGANO (TOWN AND LAKE OF). The town of Lugano, being with Bettinzoro and Locarno, a cap. of the Swiss canton of Tessin, stands on a bay on the W. bank of the lake of same name, 15 m. N.N.W. Como. Pop. 3800. It is a well built, handsome town, finely situated round the curve of a beautiful bay, surrounded by an amphitheatre of hills, having their slopes studded with villas, vineyards, gardens, and forests; while in the distance are seen the snowy pinnacles and craggy masses of the Alps. Among the principal public buildings are the church or cathedral

LUMBERLAND.

of San Lorenzo, on an eminence above the town, commanding a fine view, with a finely-sculptured portal and a façade, said to be by Bramante: the church of the Franciscan friars, remarkable for two paintings of first-rate excellence by Bernardo Luini. It has also some pretty extensive silk manufactures, a large theatre, and a hospital; several establishments for the printing and sale of books newly published or prohibited in Italy; and no fewer than three newspapers, which occasionally advocate doctrines that are but little to the taste of the Austrian and Sardinian governments. Perhaps, however, the town may derive its principal support from its being on the route, and one of the entrepôts, of a considerable portion of the trade carried on between Italy and Switzerland, and Germany by the pass of St. Gothard. Though nominally and politically Swiss, the Luganese are Italians in dress, language, manners, and appearance; in everything, in short, but their greater activity and enterprise; and for this distinction they are mainly indebted to their comparatively free institutions and free press. Monte Caprino, near Lugano, has a great number of natural caverns or grottoes, which, on account of their coolness, are used by the inhabitants in summer as cellars in which to keep their wine, meat, and other provisions.

The lake of Lugano (formerly the *Lacus Ceresiae*), is principally within the canton of Tessin, in Switzerland, but partly also in Lombardy, between the lago Maggiore and the lago di Como. It is of an extremely singular figure: its greatest length, from Porlezza at its N.E. to Porto at its S. extremity, is about 16 m.; but, in addition to its main body, it has two great arms, one stretching S.E. to Lago, and the other N. to Agno. It is nowhere above 2 m. in width, and is mostly surrounded by high mountains, overhanging woods, and bold, abrupt precipices. One of the mountains, San Salvador, on a promontory, washed on two of its sides by the lake, rising to the height of nearly 2000 ft. above its level, is a sublime object from the lake, and commands from its summit a most magnificent and varied prospect. In some parts, however, the banks of the lake slope gently down to the water's edge, and are covered with villages, vineyards, gardens, &c. The bay of Lugano on its W. side, with its surrounding amphitheatre of hills, is particularly fine. Its waters are quite transparent, and so very deep, that in some places no soundings are said to have been attained. It is about 190 ft. above the level of the lakes of Como and Maggiore, into the latter of which the Tresa conveys its surplus waters. (*Condor's Italy*, I., 314; *Enstace*, IV., 60; *Coe's Switzerland*, III., 365; *Murray's Handbook*, &c.)

LUGGERSHALL, or LUDGERSHALL, a decayed borough, market town, and par. of England, co. Wilt., hnd. Amesbury, 25 m. N.E. Salisbury, and 68 m. W. by S. London. Area of par. and bor., 1600 acres. Pop. in 1851, 533. The town, now in a wretched and decaying state, contains nothing worth mention, except an old, ruinous church, and a place of worship for Baptists; the inhabitants are chiefly supported by agricultural labour. Formerly, however, it must have been a place of more importance, for a large castle existed here soon after the conquest: it was also one of the most ancient parliamentary boroughs, and, notwithstanding its insignificance in modern times, sent two members to the House of Commons down to the passing of the Reform Act, by which it was disfranchised.

LUGO, a town of Spain, prov. Galicia, and a bishop's see, on the Minho, 47 m. E.S.E. Coruña, and 142 m. N.N.E. Oporto. Pop., according to Miñano, 7309. It occupies an eminence on the E. bank of the river, and is surrounded by an ancient wall of great thickness, with circular projecting towers. The streets are mean and irregularly built: the chief buildings are a Gothic cathedral, four convents, two hospitals, a singular-looking prison, a founding asylum, and public seminary. The climate is alleged to be colder than that in other parts of Galicia: snow is frequent, and N. winds are common during the winter months. The place appears to be in a languishing condition; the only fabrics are those of three stockings and Morocco leather. In the neighbourhood are bred great numbers of cattle, horses, mules, sheep, and hogs, which meet with ready sale at the monthly fairs, and the great fair in October.

Lugo is a place of great antiquity, having been the capital of the *Amorcani*, or district, under the Romans, who called it *Lucus Augusti*. Many monuments of Roman art were existing in the time of Pons, but they have nearly all been since destroyed. The Roman medicinal baths are still, however, used, and the works formed to protect them from the floods of the Minho may yet be traced. Among the Catholic wrested Lugo from the Moors, and re-established its bishopric. (*Miñano*, *Man. Trav.*)

LUMBERLAND, p. t., Sullivan co., N. Y., 120 m. S.W. Albany, 12 m. S.W. Monticello, 287 W. Bounded S.W. by Delaware river, E. by Monguip river. Drained by tributaries of Delaware river. The Hudson and Delaware canal passes through the t. It contains nine stores, three grist-

LUMBERTON.

mills, 39 saw-mills; four schools, 373 scholars. Population, 1265.

LUMBERTON, p. v., capital of Robeson co., N. C., 91 m. S. by W. Raleigh, 379 W. Situated on the E. bank of Lumber river. It contains a courthouse, jail, and several stores and dwellings. Net proceeds of the postoffice, \$68.

LUMPKIN, county, Ga. Situated in the N. part of the state, and contains 760 sq. m. Drained by head waters of Stowah and Chestnut rivers and their branches. It contains the richest gold mines in the country. It had, in 1840, 2899 neat cattle, 3116 sheep, 14,363 swine; and produced 10661 bushels of wheat, 777 of rye, 214,734 of Indian corn, 266 of oats, 7813 of potatoes, 4217 pounds of tobacco, 17,812 of cotton. It had 36 stores, 91 smelting-houses, which produced gold to the amount of \$74,460, 39 grist-mills, 10 saw-mills, one tannery, 37 distilleries, one pottery; 14 schools, 22 scholars. Pop.: whites, 5143; slaves, 516; free coloured, 12; total, 5671. Capital, Dahlonega.

LUNEVILLE, p. v., capital of Stewart co., Ga., 137 m. S.W. Milledgeville, 793 W. Situated on the S. side of Hannabush creek, 16 m. E. of its entrance into Chattahoochee river. It contains a courthouse, jail, a Baptist and Methodist church, 24 stores, and about 40 dwellings. Net proceeds of the postoffice, \$640.

LUND, a city of Sweden, near its southern extremity, prov. Malmö, 30 m. N.E. Malmö. Pop. 4198. It is open, and irregularly built, but clean. It is an archbishopric, and has a cathedral, an ancient, irregular building, raised at different periods. But it is chiefly remarkable for its university, founded in 1608. This institution has 22 regular and seven assistant professors, and is attended by about 600 pupils. In 1834 it had 926 pupils, whereof 103 were students of divinity, 130 of law, 50 of medicine, and 160 of philosophy, the sciences, &c. It has a library of 30,000 printed volumes and 1000 MSS., with museums of natural history and mineralogy, antiquities and medals, &c.; an observatory, a chemical laboratory, and a botanical garden. Puffendorf, who, next to Grotius, is the grand authority in matters of public law, was appointed Professor of the Law of Nature and Nations in this university in 1670; and here, in 1673, he published his great work *De Jure Nature et Gentium*. "Without," to use the words of a distinguished authority, "the genius of Grotius, and with very inferior learning, he has yet treated this subject with sound sense, with clear method, with extensive and accurate knowledge, and with a copiousness of detail sometimes indeed tedious, but always instructive and satisfactory." (*Macintosh on the Law of Nature and Nations*, p. 21.) LINNÆUS was for some time a pupil in the university of Lund. The town has manufactures of woollen cloths and tallow, tanneries and sugar refineries, a discount bank, and some foreign trade. The ancient kings of Scandinavia were chosen on the hill of Lybren, near the town. (*Stein; Oz's Travels*, iv., 298; *Dict. Geog.*, &c.)

LUNEBURG, a town of the kingdom of Hanover, cap. of the distr. and principality of Lüneburg, on the Ilmenau, 67 m. N.E. Hanover, and 37 m. S.E. Hamburg. Population, in 1838, estimated at 11,800. It is surrounded by walls of so great strength, and entered by six gates. It has dark and narrow streets, and old-fashioned houses. The castle, or palace of the prince, the town-hall, council-house, military academy for young nobles, gymnasium, exchange, and cavalry barracks, are the principal public buildings. The military academy has a library of 14,000 volumes, and in the town-hall is another library. Lüneburg has four churches, in one of which are the tombs and monuments of many of the ancient dukes of Lüneburg, several superior schools, an orphan asylum, and a *mont-de-piété*.

Lüneburg was formerly a Hanse town, was governed by magistrates of its own selection, and had an extensive trade. It took part in the Baltic herring-fishery, and had numerous breweries and manufactures of woollen stuffs, &c., now much fallen off. Lime-burning and the making of salt are at present the chief branches of industry. A large and singular rock of gypsum, rising nearly 170 feet above the Ilmenau in the immediate vicinity of the town, furnishes abundant materials for the former business. About 90,000 tons of lime a year are sent to Hamburg, Altona, and Holland. About 100,000 centners a year of salt are procured from some adjacent salt-springs: the evaporation is effected by means of turf, and is conducted under a special commission, the government having a monopoly of the article. The price of the undried salt is 40 dollars, and of the dried, 46 dollars the last of 400 lbs. (*Bergkass.*) Lüneburg has some fabrics of woollen and cotton and linen goods, tobacco, paper, cards, and soap; with distilleries, breweries, &c. It also trades in horses; and is the seat of a transit trade between Hamburg and the Elbe, and the interior provinces of Hanover. About 200,000 centners of merchandise are said to have passed in transitu through Lüneburg in 1838. (*Von Rahn's Hanover*, ii., 87, &c.; *Bergkass.*; *Stein; Hedeekin's N. Germany*).

LUNEL, a town of France, dep. Hérault cap. cant. on

LURGAN.

the canal of Lunel, 14 m. N.E. Montpellier. Pop. in 1836, ex. com., 6021. It has a fine promenade, infantry and cavalry barracks, numerous liqueur and brandy distilleries, and a brisk trade in corn, wines, and raisins. The muscadine wine, produced from vineyards situated on gently rising grounds to the N. of the town, and bearing its name, is reckoned by some connoisseurs as the best of its class, and is rivalled only by the Frontignan. "It is a very delicate wine, of a bright yellow colour, with a less distinct flavour of the grape, and less cloying, than the Frontignan. The vineyard called the Clos-Mazet, which has been long known to afford the first-rate growth, makes about 100 hds. a year, being one third of the total quantity supplied from the territory of Lunel. Several of the more ordinary muscadine wines, however, come into the market as Frontignan and Lunel; but they may be easily detected by their deeper colour, and the want of the characteristic flavour and perfume." (*Henderson on Wines*, p. 177.) According to Julien, the wines of Lunel, "*Sont plus précoces et plus fins que ceux de Frontignan; mais ils ont moins de corps, un goût de fruit moins prononcé, et ne conservent pas aussi longtemps.*" (*Topographie de Nîmes*, p. 250.)

LUNENBURG, county, Va. Situated in the S. part of the state, and contains 400 sq. m. Bounded N.E. by Notaway river. Drained by Meherrin river and its branches. It contained, in 1840, 7470 neat cattle, 9004 sheep, 15,805 swine; and produced 36,894 bushels of wheat, 274,547 of Indian corn, 128,945 of oats, 10,136 of potatoes, 2,640,000 pounds of tobacco, 8560 of cotton. It had 30 stores, 92 grist-mills, six saw-mills, three tanneries; 12 schools, 320 scholars. Pop.: whites, 4132; slaves, 6707; free coloured, 316; total, 11,055. Capital, Lewistown.

LUNENBURG, p. t., Essex co., Vt., 58 m. N.E. Montpelier, 567 W. Bounded S.E. by Connecticut river. Fifteen Mile falls on that river commence in the S. part of the t. Chartered in 1763. It contains three churches, a Congregational, Methodist, and Baptist, two stores, one fulling-mill, four saw-mills; 11 schools, 377 scholars. Pop. 1130.

LUNENBURG, p. t., Worcester co., Mass., 46 m. N.W. Boston, 428 W. Incorporated in 1793. Watered by branches of Nashua river. It manufactures extensively books and palm-leaf hats. It contains two Congregational churches, one store, one grist-mill, five saw-mills, two tanneries, two printing-offices, one bladery; 10 schools, 434 scholars. Pop. 1372.

LUNENBURG, C. H., called also Lewistown, p. v., capital of Lunenburg co., Va., 78 m. S.W. Richmond, 197 W. It contains a handsome brick courthouse, with a portico of four columns in front, a jail, county clerk's office, two stores, 30 dwellings, and about 100 inhabitants.

LUNEVILLE, a town of France, dep. Meurthe, cap. arrond., on the Vezouze, and on the road from Paris to Strasbourg, 16 m. S.E. Nancy. Pop. in 1836, ex. com., 12,661. It is generally well built, and has a good square, a *château* erected by Leopold, duke of Lorraine, early in the last century, and long the residence of Stanislaus, king of Poland, a handsome parish church, very extensive cavalry barracks, a parade-ground of 200 hectares, a large covered riding arena, two hospitals, a synagogue, theatre, and manufactures of woollen cloth, woollen and cotton yarn, gloves, &c. Luneville is one of the principal cavalry stations in France. The origin of the town is uncertain, but its name seems to indicate that Diana was anciently worshipped here; and several Roman medals, with the impress of that divinity, have been found near a fountain in the neighbourhood. The peace between France and the German Confederation, in 1801, by which the former acquired the territory on the left bank of the Rhine, was concluded in this town. (*Hugo, art. Meurthe; Bergkass.; Guide du Voyageur*, &c.)

LURAY, p. v., capital of Page co., Va., 130 m. N.W. Richmond, 98 W. Situated on Hawkhill creek. Founded in 1814, when the first house was built. It contains a courthouse, jail, two churches, a Methodist and Baptist, four stores, 50 dwellings, and about 400 inhabitants.

LURGAN, an inland town of Ireland, co. Armagh, prov. Ulster, about 3 m. from the S. border of Lough Neagh, and 18 m. W.S.W. Belfast. Pop., in 1831, 9343. It is a neat, clean, and well-built town, consisting principally of one wide street. It has a parish church, a Roman Catholic chapel, meeting-houses for Presbyterians and Quakers, a courthouse, and a bridewell. A manor-court is held every three weeks, and general sessions and petty sessions every Friday. It is a constabulary station; and has two schools on the foundation of Erasmus Smith, and a subscription school. The linen manufacture, particularly that of diapers and damasks, is extensively carried on, as is that of tobacco: there are two breweries and an extensive distillery. Markets on Fridays; fairs, August 5th and November 24th. The nearness of the town to the point where the Lurgan and Newry navigation joins Lough Neagh, affords great facilities for inland traffic. Postoffice revenue, in 1830, £409; in 1836, £293. Branches of the Belfast, Northern, and Pro-

LUTON.

vincial banks were opened in 1834; of the Agricultural bank in 1836; and of the Ulster bank in 1837.

The town is on the estate and in the immediate vicinity of the residence of the Browlaw family, to the head of which it gives the title of baron.

LURBAN, L., Franklin co., Pa., 13 m. N. Chambersburg. Watered by the N. and S. branch of Conodogwinit creek. Bituminous coal is found. It has three stores, five grist-mills, six saw-mills, two oil-mills, two tanneries; seven schools, 250 scholars. Pop. 1143.

LUTON, a market town and par. of England, co. Bedford, hund. Flitt, 16 m. W.N.W. Hertford, and 28 m. N.W. London. Area of par., 15,500 acres. Pop., in 1831, 5693; do. of township, 3961. The town, pleasantly situated between two hills in the Chiltern chalk range, is irregularly built, with three long streets, running from a market-place (in which is an old town-hall), in the form of the letter Y. The church is an interesting specimen of Gothic architecture, with a square embattled tower surmounted at the angles by hexagonal pinnacles, and a handsomely decorated W. door: the interior contains, besides some painted windows, a curiously carved font, and some fine old monuments. There are also places of worship for Wesleyan Methodists, Baptists, and the Society of Friends. Three well-attended Sunday schools, a national and Lancastrian school, furnish instruction to the children of the poor; and there is a well-endowed hospital for lodging and clothing 24 aged widows. The inhabitants are principally engaged in the manufacture of straw hats, and especially of the variety called the Tuscan grass-pall. Lace-making used also to be carried on to a considerable extent; but this business has been all but extinguished by the rise of the Nottingham frame-lace trade. Two miles E. of the town is Luton Ho park, a seat belonging to the Bute family, erected by Lord Bute, the favourite of George III. Markets on Monday; large cattle fairs, April 18th and October 18th.

LUTTERWORTH, a market town and par. of England, co. Leicester, hund. Guthlaxton, 19 m. S. Leicester, and 79 m. N.N.W. London. Area of par., 1860 acres. Pop., in 1831, 3962. The town, situated on the Swift, a tributary of the Avon, comprises one main and well-built street, with others of inferior size: there are some good houses, but a large proportion of the tenements are mere mud-walled thatched cottages. The church is a large and very handsome structure, in the pointed style, with a high square tower having turrets at the angles: the interior is elegantly fitted up. But it is principally remarkable from having been the scene of the pastoral labours of John Wycliffe, and from its containing his pulpit and portrait. This early and illustrious reformer and eminent divine was appointed rector of Lutterworth in 1374, where he expired 10 years afterward, on the 31st of December, 1384. Luckily, however, his doctrines did not die with him. In 1415 the council of Constance vainly endeavoured to gratify their impotent rage against his memory, by ordering his remains to be disinterred and cast upon a dunghill. This disgraceful sentence was carried into effect: for the bones of Wycliffe, being taken up, were burned, and the ashes thrown into the Swift. "Thus," as Fuller has ingeniously expressed it, "this brook (the Swift) has conveyed his ashes into Avon, Avon into Severn, Severn into the narrow seas, they into the main ocean: and thus the ashes of Wycliffe are the emblem of his doctrine, which now is dispersed all the world over."

Lutterworth has three places of worship for dissenters, four Sunday schools, an endowed free-school, attended by 100 boys, and three smaller subscription schools. Its chief manufacture is that of coarse woollen, but it is not extensive. It has a considerable trade in farm and dairy produce, chiefly carried on at its seven annual fairs. Markets on Thursday: fairs, Thursday after February 19th, March 10th, April 15th, July 23d, and October 10th; also on Holy Thursday.

LUTZEN, a town of the Prussian states, prov. Saxony, circ. Merseburg, 19 m. S.W. Leipzig. This town, the population of which is under 1500, would be unworthy notice, were it not that its environs have been the scene of two of the most memorable conflicts of modern times. The first, which occurred on the 16th of November, 1632, took place between the Imperialists, under Wallenstein, and the Swedes, under their heroic monarch, Gustavus Adolphus. The latter were victorious; but the Swedes were dearly purchased by the death of their king, who fell (it has been alleged by treachery) in the action. Besides their king, the Swedes lost about 3000 men; but the loss of the Imperialists amounted to double that number, and their artillery fell into the hands of the conquerors.

The other great conflict took place nearly on the same ground, on the 2d of May, 1813, between the French, under Napoleon, and the allied army, encouraged by the presence of the emperor Alexander and the king of Prussia. The struggle was most bloody and bloody; but in the end victory declared in favour of the French. The allies lost 30,000

LUXEMBURG.

men, killed and wounded, and that of the French was also very severe.

LUXEMBURG (GRAND DUCHY and PROVINCE OF), a territory of W. Europe, between lat. 49° 25' and 50° 28' N., and long. 5° and 6° 30' E.; having N. the Belgian prov. of Liege, W. that of Namur, E. Rhenish Prussia, and S. France. Greatest length and breadth about 65 m. each. Area, 2700 sq. m. Pop., in 1836, 327,683. By the treaty of the 19th of April, 1839, this territory was definitively partitioned between Holland and Belgium; the E. portion, with an area of about 1000 sq. m., and a population of 160,000, being assigned to the former, and the W. portion, with an area of 1700 sq. m., and a population of about 160,000, to the latter. The title of grand duke of Luxembourg, with the suffrage in the councils of the German confederation, are enjoyed by the king of the Netherlands.

A chain of hills, branching from the Ardennes, traverses the country from S.W. to N.E. It nowhere rises to more than 2000 feet above the sea; but it forms the dividing line between the basins of the Meuse and the Moselle. The last-named river and the Sur form the E. boundary of the grand duchy; the other principal streams are the Our, Our, Alzette, Semois, &c., tributaries of either the Meuse or the Moselle. The valleys are fertile, but the rest of the country has mostly a stony and barren soil; and in some parts, especially about the centre of Belgium Luxembourg, a good deal of the surface is occupied with marshes, heaths, and poor waste land. The entire surface is estimated at 690,000 *hectares* (a measure nearly answering to *hectares*), of which about 240,000 are supposed to be in till, 311,000 in woods, 137,000 in heaths, wastes, &c., and 112,000 altogether unproductive, or occupied by roads, rivers, &c. It is mostly divided into small properties. Rye, barley, oats, and wheat are the principal corn crops; and potatoes, with flax, hemp, and beet-root, are raised. The agricultural course almost invariably occupies three years: the first year wheat, maiz, or rye is sown; in the second, oats, barley, or potatoes; and in the third the land is left fallow. The vine is grown on the banks of the Moselle; and the annual produce of wine was estimated, in 1837, at 75,303 *hectol.* The chief branch of rural industry is, however, the rearing of cattle for exportation. The sheep yield indifferent wool, but their flesh is excellent. Horses are good. A great many hogs are reared, and, in the first half of 1836, 36,793 were exported to France. The meadow-lands, especially in the valleys of the Alzette, Chiers, and Semois, are carefully irrigated and manured. The woods are an important source of wealth, the annual produce of timber and firewood being estimated, according to Vandermieden, at nearly 1,100,000 *steres*. Nearly 93,000 *hectares* of woods belong to communes, there being scarcely a commune without a certain portion of forest-land. There are few countries in which iron is more abundant; and about 9,900,000 *kilog.* of metal are produced annually: from the want of coal, it has to be smelted with timber.

Since 1837, however, coal has been admitted into Belgium Luxembourg (where this branch of industry is principally conducted), from Rhenish Prussia, at the reduced duty of one franc per 1000 *kilog.* and the production of iron is probably on the increase. The slate of Luxembourg is of a superior quality. Viel-Salm, in the N. of Belgium Luxembourg, furnishes about 4,000,000 of slates a year, and in the S. the quarries of Herbenmont and Geripont produce about 10,000,000 a year, mostly exported to the neighbouring countries. Slate-pencils, marble, and a little lead, zinc, copper, and manganese are the other chief mineral products. Glass to fuses and potteries, woollen cloth, lace, leather, and meat factories, distilleries, and breweries, are the most numerous manufacturing establishments. The commerce of Luxembourg, however, except in iron, slate, and cattle, is insignificant. The inhabitants, partly of Saxon extraction, and partly Walloons, are all Roman Catholics. The whole territory is subdivided into three districts: those of Luxembourg, Diekirch, and Grevenmacher: each has in it a tribunal of original jurisdiction; and the first, which is identical with the Dutch province, is placed under a Prussian military governor, and a Dutch civil commissary. Belgium Luxembourg is governed in the same way as the other Belgian provinces. Dutch Luxembourg has the 11th place in the German Confederation, with three votes in the full council and one in the committee. It has, since 1839, furnished a contingent of 1850 men to the army of the confederation; the contingent previously to the division of the duchy having been 2556 men.

LUXEMBURG (Germ. *Lutzelburg*), a town belonging to the kingdom of the Netherlands, the cap. and only place of any importance in the above grand duchy, and one of the strongest fortresses of Europe; on the Alzette, a tributary of the Sur, 32 m. S.W. Treves, and 77 m. S.S.E. Liege; lat. 49° 37' N., long. 6° 7' 5" E. Pop., in 1830, 11,943. It is built partly on a steep rocky height, and partly in the valley beneath; being, consequently, divided int. the upper and lower

LUXEUIL.

towns, which communicate by flights of steps, and streets running zigzag, so as to be passable for carriages. Both towns are fortified; and the works, which are partly excavated in the solid rock, have been greatly strengthened by the successive possessors of the town—Spaniards, Austrians, French, and Dutch. Great improvements have recently been made in them; and, since 1837, a new fort has been constructed outside the Treves gate. The casemates of that part of the fortifications called *Le Bas*, resemble those of Gibraltar, and are capable of accommodating 4000 men. Luxembourg is tolerably well built, but has no remarkable public buildings. It has some iron forges, and manufactures of linen fabrics, leather, and tobacco. It is at present garrisoned by 9000 Prussian troops.

The territory of Luxembourg was governed by its own counts from the time of the Carolingian Frankish kings to 1354, when the emperor, Charles IV., erected it into a duchy. It was taken by the French in 1794, and subdivided among the *depts.* of Forêts, Ardennes, Sambre-et-Meuse, and Ourthe; but, in 1814, it was erected into a grand duchy, and given to the king of Holland, in exchange for the renunciation of his claims upon Nassau. (*Vandermaelen's Luxembourg; Bergheux, &c.*)

LUXEUIL (an. *Luxovium*), a town of France, *dep.* Haute-Saône, cap. cant., on the Breuchin, 15 m. N.E. Vesoul. Pop. in 1836, ex. com., 3023. It is well built and clean, and has a good town-hall, a large hospital, a communal college, and manufactures of hats, leather, tin and iron goods, &c.; but it is chiefly remarkable for its hot or thermal springs, which are usually frequented by from 500 to 600 visitors. The hot baths of *Luxovium* were known to the Romans, who are said to have decorated them with fine buildings. (*D'Auvill, Notice de la Gaule*, p. 430.) The traces of several Roman roads, aqueducts, and edifices, with various statues, medals, &c., have been discovered in and around the town. (*Hugo, art. Haute-Saône; Dict. Géog.*)

LUZERNE, county, Pa. Situated toward the N.E. part of the state, and contains 1350 sq. m. Watered by Susquehanna river. Anthracite coal is extensively found. It contained, in 1840, 30,941 neat cattle, 32,415 sheep, 37,007 swine; and produced 944,369 bushels of wheat, 97,504 of rye, 222,325 of Indian corn, 131,923 of buckwheat, 304,004 of oats, 384,317 of potatoes, 907,578 tons of anthracite coal, of 38 bushels each. It had 132 stores, six furnaces, one forge, 12 fulling-mills, one woollen factory, 30 flouring-mills, 45 grist-mills, 313 saw-mills, one paper-mill, four powder-mills, 24 tanneries, five distilleries, two breweries, one pottery, one rope-walk, two printing-offices, two weekly newspapers; five academies, 140 students; 182 schools, 7418 scholars. Pop. 44,006. Capital, Wilkesbarre.

LUZERN, t., Fayette co., Pa., 12 m. N.W. Uniontown. Bounded N. and W. by Monongahela river. Drained by Dumlup's creek, across which is a bridge connecting it with Brownsville. It has three stores, four flouring-mills, three saw-mills, two tanneries; four schools, 95 scholars. Pop. 1715.

LUXERNE, p. t., Warren co., N. Y., 55 m. N. Albany, 10 m. S.W. Caldwell. Bounded W. by Hudson river. Hadley falls are in the S. part of the t. It contains one church, four stores, one fulling-mill, two grist-mills, 21 saw-mills; 11 schools, 435 scholars. Pop. 1284.

LUZON, the largest and most N. of the Philippine islands, which see.

LYCOMING, county, Pa. Situated a little N. of the centre of the state, and contains 1600 sq. m. Watered by the W. branch of Susquehanna river and its tributaries. The west branch of Pennsylvania canal passes along the N. branch of the river through the county. It contained, in 1840, 16,713 neat cattle, 24,584 sheep, 36,080 swine; and produced 231,757 bushels of wheat, 116,393 of rye, 177,082 of Indian corn, 63,909 of buckwheat, 308,715 of oats, 194,113 of potatoes, 36,343 pounds of sugar. It had 67 stores, nine lumber-yards, one fulling-mill, nine woollen factories, one flouring-mill, 43 grist-mills, 55 saw-mills, two oil-mills, 20 tanneries, 11 distilleries, one pottery, three printing-offices, two weekly newspapers; three academies, 54 students; 118 schools, 4094 scholars. Pop. 22,642. Capital, Williamsport.

LYCOMING, t., Lycoming co., Pa., 7 m. N.W. Williamsport. Bounded S. by the W. branch of Susquehanna river. Drained by Lycoming creek. It contains four stores, three grist-mills, eight saw-mills, three tanneries; one academy, eight students; six schools, 183 scholars. Pop. 1917.

LYKENS, t., Dauphin co., Pa., 36 m. N. Harrisburg. Watered by Wiconisco, Little, and Mahanago creeks. Superior anthracite coal is abundant, and has an easy access to Susquehanna river. It has three stores, one fulling-mill, five flouring-mills, one grist-mill, seven saw-mills, two tanneries, two distilleries; eight schools, 295 scholars. Pop. 1499.

LYMAN, p. t., York co., Me., 72 m. S.W. Augusta, 523 W. Watered by Saco river, and a head branch of Kenne-

LYMINGTON.

bank river. It has three stores, one grist-mill, five saw-mills; 13 schools, 545 scholars. Pop. 1478.

LYMAN, p. t., Grafton co., N. H., 53 m. N.W. Concord, 408 W. Bounded N.W. by Connecticut river, in which are Fifteen Mile falls, opposite to this t. Watered by Burnham's river, issuing from a pond on Lyman's mountain, 100 rods long and 80 wide. It falls into Ammonoosuc river. It has three stores, one grist-mill, 11 saw-mills; one academy, 100 students; 16 schools, 531 scholars. Pop. 1785.

LYME, p. t., New-London co., Ct., 45 m. S. by E. Hartford, 338 W. Incorporated in 1667. Bounded W. by Connecticut river, over which, at its mouth, is a ferry to Baybrook. It contains six churches, four Congregational and two Baptist, eight stores, one lumber-yard, three fulling-mills, two woollen factories, six grist-mills, six saw-mills, three tanneries; 18 schools, 847 scholars. Pop. 2856.

LYME, t., Jefferson co., N. Y., 12 m. W. Watertown, 172 m. N.W. Albany. Bounded W. by Lake Ontario, N.W. by St. Lawrence river. Watered by Chaumont river. It has nine stores, one grist-mill, 13 saw-mills; 14 schools, 466 scholars. Pop. 5472.

LYME, p. t., Huron co., O., 99 m. N. by E. Columbus, 408 W. It has one store, two saw-mills; seven schools, 313 scholars. Pop. 1330.

LYME-REGIS, a pari. and mun. bor., market town, seaport, and par. of England, co. Dorset, in Bridport div. of lib. Loders and Bothenhampton, 204 m. S.S.E. Taunton, and 132 m. W.S.W. London. Area of pari. bor., which comprises the two parishes of Lyme and Charmouth, 1980 acres. Pop., in 1831, 3345. "Lyme is a small and irregularly built town, situated among hills, which, by rendering it difficult of access, effectually preclude it from becoming a place of importance. This place, as well as Charmouth, is frequented in the summer as a watering-place, and many respectable families are settled in the neighbourhood; but the streets are very irregular, and not lighted, so that, on the whole, it has the appearance of a poor and inconsiderable place." The pier or cobb (originally erected in the reign of Edward III., and greatly lengthened in 1836, at the expense of government) is 680 feet long and 12 feet broad, furnishing good shelter for shipping between Start point and the Isle of Portland; and close to the pier is the custom-house. "The regular trade of the place, however, appears to be altogether inconsiderable; and it is chiefly valuable as a port of refuge for small vessels in bad weather." (*Parl. Boundary Rep.*) In 1836 there belonged to the port 19 vessels, of the burden of 1177 tons: the customs' revenue in 1839 amounted to £3580, indicating a great diminution since the close of the last century, when they amounted to about £16,000 a year. This change is ascribed partly to the decay of its once considerable Newfoundland fishery and Mediterranean trade, and partly also to the separation of Bridport, united with Lyme till 1833. An old church, three places of worship for dissenters, a house used for assemblies, and an old town-hall, are the chief public buildings. Two schools for poor children are supported by subscription, and there are almshouses and other charities for the sick and aged.

The borough of Lyme is undoubtedly very ancient, and claims to be one by prescription. Its first charter is dated 12 Edward I.; and its early consequence as a port is shown by the fact, that in the war with France under Edward III. it furnished four ships to serve at the siege of Calais. The municipal borough is now governed by a mayor, three other aldermen, and 12 councillors, but has no commission of the peace. Corporation revenue, in 1839, £374. The borough sent two members to the House of Commons from the reign of Edward I. down to the passing of the Reform Act, which deprived it of one member: previously to that act the right of election was vested in the capital burgesses and freemen. The Boundary Act enlarged its limits, so as to include the entire parishes of Lyme and Charmouth. Registered electors in 1839-40, 277. Markets on Fridays; large cattle fairs, Feb. 13, and Oct. 2.

LYMINGTON, a pari. and mun. bor., seaport, and market town of England, co. Hants, in the E. division of the New Forest, close to the mouth of a river of its own name, which falls into the Solent, 23 m. S.S.W. Winchester, and 61 m. W.S.W. London. Pop. of pari. bor. (comprising the par. of Lymington and a part of the par. of Boldre), in 1831, 3361. The town, situated on the W. bank of the river, is well paved and lighted with gas, and consists of one well-built and wide street, crossed by two others of an inferior description. On the E. bank is the village of Underslow, comprising several villas and houses of a superior kind, inhabited by persons of independent fortune; it is connected with the town by a bridge, and clearly forms a suburb of Lymington. Among the public buildings are a town-hall, a neat theatre, and a custom-house; the port, though sufficient for vessels of 300 tons, and provided with wharfs and storehouses, is subordinate to that of Southampton. The church is an irregular building of brick and stone, the living being a curacy dependent on the vicarage of Boldre.

LYNCHBURG.

There are likewise three places of worship for Wesleyan Methodists and other dissenters. A free school for both sexes, a girls' national school, and an infant school, provide instruction for the children of the poor, and there are several minor charities.

"The town is considered to be in an improving state, and several large outlays of capital have taken place in the last few years. A company has been formed for the purpose of supplying steam navigation to and from Portsmouth and the Isle of Wight; £3000 have been subscribed for the formation of gas works, and the same sum for the erection of baths; dwelling-houses, also, have been and are now being built on an improved scale, the principal object of these improvements being to induce visitors to resort to the town during the summer. Little or no commerce is carried on here; and the only manufacture of the neighbourhood is that of salt, which some years ago was carried on to a very large extent, but latterly has decreased. A large yearly fair is held for the sale of cheese, exported to various places along the Sussex coast." (*Mun. Corp. Rep.*)

Lymington is a borough by prescription, its corporate officers since the Municipal Reform Act being a mayor, three other aldermen, and 19 councillors; but it has no commission of the peace. Corporation revenues in 1839 (chiefly from quay and river dues), £100.

Lymington has sent two members to the House of Commons since the 27th of Elizabeth, the right of election being vested, till the Reform Act, in the resident burgesses, of whom there were only 36 in 1831. The Boundary Act enlarged the limits of the borough, so as to include the entire parish of Lymington with a part of the parish of Boldre. Registered electors in 1839—40, 305. Lymington is also a polling place for the S. division of Hampshire. Markets on Saturday; large fairs for cheese, bacon, and cattle, May 12 and Oct. 5.

LYNCHBURG, p. v., Campbell co., Va., 116 m. W. by S. Richmond, 191 W. It is in 37° 36' N. lat., and 79° 32' W. long. Pop. in 1836, 4626; in 1840, 6365. Situated on the S. side of James river, 30 m. below its passage through the Blue ridge. In 1793 it had but five houses. Incorporated in 1805. It contains seven churches, two Presbyterian, two Methodist, a Baptist, an Episcopal, and a Roman Catholic. It has a Friends' church in the vicinity. There are 124 dry goods and grocery stores, four apothecary stores, six public warehouses, in which from 15,000,000 to 20,000,000 pounds of tobacco are annually inspected, 22 tobacco factories, in which from 35,000 to 40,000 boxes of tobacco are manufactured annually, one large cotton factory, one iron foundry, three large flouring-mills, 15 classical schools, besides many common and primary schools, six large hotels, as well as many others, and over 1000 dwellings. The James river and Kanawha canal is in operation from this place to Richmond. Five handsome packet boats, affording fine accommodations for passengers, some of which leave for, and arrive from Richmond every day in the week, except Sundays; and 40 freight boats of from 60 to 100 tons burthen, are employed on the canal. Lynchburg has an extensive trade with the N., the N.W., and the S. parts of the state, together with the adjacent states of Ohio, Kentucky, Tennessee, and North Carolina. It is the fifth place in population in the state.

LYNDEBOROUGH, p. t., Hillsborough co., N. H., 33 m. S.S.W. Concord, 461 W. Incorporated in 1764, first settled in 1750. Watered by branches of Souhegan river. It contains a Baptist church, one store, one fulling-mill, one woollen factory, one grist-mill, six saw-mills, two tanneries; 12 schools, 334 scholars. Pop. 1032.

LYNDON, p. t., Caledonia co., Vt., 44 m. N.E. Montpelier, 354 W. Chartered in 1789, organized in 1791. Watered by Passumpsic river, which by two falls affords extensive water-power. It contains two churches, a Methodist and Congregational, and some Baptists, four stores, one fulling-mill, two grist-mills, eight saw-mills, one oil-mill, two tanneries; one academy, 131 students; 16 schools, 607 scholars. Pop. 1753.

LYNN, p. t., Essex co., Mass., 9 m. N.E. Boston, 449 W. Bounded S. by the Atlantic. On the side next the ocean, and on Saugus river, by which it is watered, there is excellent salt marsh. It contains eight churches, three Methodist, two Congregational, a Friends', a Baptist, and a Universalist, two banks with a capital of \$150,000 each, besides a savings bank, three insurance companies, 36 stores, three grist-mills, one saw-mill, one rope-walk, two printing-offices, four weekly newspapers; six academies, 133 students; 19 schools, 1035 scholars. Pop. 9367. Lynn is distinguished for the manufacture of ladies' shoes. The various manufactures of leather, consisting chiefly of these articles, amounted, in 1840, to \$1,367,500. On the S. of Lynn is the peninsula of Nahant, which has become a fashionable watering place, and is beautifully situated to enjoy the ocean-breeze. The peninsula consists of two parts. The inner portion contains 43 acres. The outer

LYNN-REGIS.

portion, called Great Nahant, is about 9 m. in length, and in some parts half a mile broad, containing 463 acres, and is finely diversified, rising to elevations of from 40 to 100 feet above the level of the sea. A large and splendid hotel occupies a commanding situation, containing nearly 100 rooms, and surrounded by a double piazza. In the vicinity are several other hotels and boarding houses, and about 50 beautiful cottages erected as country seats by gentlemen of fortune. Great Nahant is connected with Little Nahant by a beach half a mile long. The beach which connects Little Nahant with the mainland is narrow and about a mile and a half long, and barely rises so high as to prevent the water from ordinarily flowing over it. The sand has become so compact from the water dashing on it, that the print of a horse's hoof or a wheel of a carriage is scarcely left in passing over it. Two steamboats are constantly running between this place and Boston in the summer season.

LYNN, t., Lehigh co., Pa. It contains seven stores, one woollen factory, 10 grist-mills, five saw-mills, one powder-mill, four tanneries, 30 distilleries; seven schools, 312 scholars. Pop. 1895.

LYNNFIELD, p. t., Essex co., Mass., 20 m. N. Boston, 460 W. Incorporated as a separate town in 1814. It had previously belonged to Lynn. Bounded N. by Ipswich river. It contains two churches, a Congregational, and a Methodist; three schools, 180 scholars. Pop. 767.

LYNN-REGIS or KING'S LYNN, a part and mun. bor., seaport and market town of England, co. Norfolk, locally situated in hund. Freebridge-Lynn, at the mouth and on the E. bank of the Ouse, 36 m. W. by N. Norwich, and 90 m. N. by E. London. Lat. 53° 48' N., long. 2° E. Area of par. bor., 2690 acres. Pop. in 1831, 11,503. The town, about 1 m. in length, by $\frac{1}{2}$ m. in breadth, comprising two principal, with other smaller streets, "is generally speaking, well built, and contains many excellent houses, and extensive premises calculated for trade. It is well paved, lighted with gas, supplied with good water, and very clean. The public walks, also, in the E. part of the town deserve notice, for their extent, and the neatness with which they are kept." (*Mun. Bound. Rep.*) Lynn was formerly encompassed on the land-side by a wall and deep wet ditch, defended by nine bastions: these fortifications yet remain, but the wall and bastions are much dilapidated; it is also divided into several parts by four small streams here called *fleets* (from the Dutch *vliet*) over which are 11 bridges. The market place, called by way of distinction the Tuesday's market place, is an area of three acres, situated at the N. end of the town, having a sculptured stone cross in its centre, and surrounded by good houses. A smaller market is held on Saturday in an open space near St. Margaret's church, and outside the town is a cattle-market. The custom-house, built in 1683, and intended for a merchant's exchange, is a handsome building of freestone, with an ornamental front, and a statue of Charles II.: the guildhall is an old-fashioned building of stone and flint, with suitable apartments for the transacting of municipal business, &c.; and near it is the borough jail, a respectable stone structure, which "seems to be on the whole well regulated, and admits, to a certain extent, of the classification of prisoners." (*Mun. Corp. Rep.*) A new theatre has recently supplied the place of an older one, now converted into warehouses. The parliamentary borough comprises two parishes, that of the St. Margaret's (the living of which is a perpetual curacy in the gift of the dean and chapter of Norwich), and that of All-Saints (a vicarage in the patronage of the bishop of Ely). St. Margaret's church in the N. Lynn, built in the 13th century, is alleged to be one of the largest parish churches in England, and had formerly a lofty steeple blown down by a tempest in 1741: its W. end is still distinguished by two square towers of dissimilar architecture, the upper parts of which are of modern construction. St. Nicholas, a Gothic structure, with a bell-tower and light octangular spire 170 feet high, is a chapel of ease to the above parish church. All-Saints' church, in S. Lynn, is a well-built cruciform edifice, occupying the site of an old convent of White friars. On the opposite side of the Ouse in W. Lynn, but not within the borough, is another parish church, that of St. Peter's. There is also a Roman Catholic chapel; and the Wesleyan Methodists, Independents, Baptists, Unitarians, and the Society of Friends, have their respective places of worship, with large attached Sunday-schools. The grammar school is in the patronage of the corporation, from which its master receives a salary of £63 a year: it has two or three small exhibitions in the University of Cambridge. Various charity-schools have likewise been established, which, with a well-conducted Lancasterian school, furnish instruction to numerous children of both sexes. Gaywood's hospital provides lodging, and a weekly stipend of 5s. to 53 poor widows: there are also three other well endowed sets of almshouses, and many minor bequests, &c., for the relief of the aged poor.

LYONS.

"Lyons contains an iron-foundry and four building-yards for ships from 400 tons downward; but there are no other manufactures. A considerable and increasing trade is carried on, coast-wise, in exporting corn, with other natural products of the fens; and importing principally coal: there is also a direct trade with Canada and the Baltic in timber; as well as with Portugal in wine, fruit, &c.; but this is of much less extent and importance than the coasting-trade." There belonged to the port, in 1836, 130 ships, of the aggregate burden of 15,363 tons; besides which, upward of 3000 coasters, chiefly colliers, come thither, each year, from other ports. Gross customs' revenue, in 1839, £87,253. The harbour is capacious; but the approach to it is rendered both difficult and hazardous by numerous and perpetually shifting sand-banks, occasioned by the action of the tide on the light silt and sand forming the bed of the river. The estuary of the Ouse is nearly 1000 feet broad, and there is accommodation in the port for about 300 merchant-ships. Spring-tides rise about 18 feet, and during the prevalence of N. and N.E. winds, are thrown in with such violence and rapidity as sometimes to damage the shipping. "The harbour has also been injured since the completion of the Eau-brink cut, which has caused a great accumulation of alluvial soil along the King's stailth and other quays lining the E. bank of the river; but this evil is now somewhat lessened by the erection of jetties on the opposite shore, which direct the course of the river more to the E. bank, by means whereof these deposits are scoured away." (*Misc. Board. Rep.*)

King's Lynn, (called Bishop's Lynn before Henry VIII. conferred on it its present name,) received its first charter from King John, in return for valuable services done him by its inhabitants during the baronial wars. Its corporate privileges were confirmed and enlarged by several monarchs, and lastly by Charles II. The borough is now divided into three wards, the municipal officers being a mayor and five other aldermen, with 18 councillors. Quarter and petty sessions are held under a recorder, and a court sits monthly for the recovery of debts under 40s. Corporation revenues, in 1839, £2615. Lynn has sent two members to the House of Commons since the 6th of Edward II., the right of election down to the Reform Act being vested in freemen by birth, servitude, gift, or purchase. Registered electors, in 1839-40, 930. Lynn is also a polling-place for the W. division of Norfolk. Markets, principally on Tuesday, but also on Saturday. Large fairs for London goods, Feb. 14, and five succeeding days, also for cheese a week after old Michaelmas, lasting two days.

LYONS (Fr. *Lyon*; an. *Lugdunum*), a large city of France, being the principal manufacturing town of that kingdom, in the dep. of the Rhone, of which it is the cap., 275 m. E.N.E. Bordeaux, 172 m. N.N.W. Marseilles, 245 m. S.E. Paris, and 70 m. W.S.W. Geneva: lat. 45° 45' 58" N., long. 4° 48' 34" E. Pop. of the city proper, in 1836, 147,323; but, including its suburbs, the pop. is about 200,000. It is situated at the junction of the Rhone and the Saône, chiefly on a tongue of land or peninsula between those two rivers, the length of which is nearly 3 m., and its average breadth about 3 furlongs, though in the N. part of the city increasing to upward of 1 m. Some extensive and important quarters, as St. Just, St. George, St. Irénée, Vaise, &c., are, however, situated on the W. or right bank of the Saône, and on round the hill of Fourvières; and in the E., on the left bank of the Rhone, are the *Passeburg Guillotière* and the *Quartier des Brotteaux*. S. of the city, the handsome and regular suburb of *Perache* is rapidly extending towards the extremity of the peninsula; while on the N., beyond the fortifications, on the declivity of a hill extending from one river to the other, is the municipal commune of La Croix Rousse, comprising the suburbs of Gerin and St. Clair. A tower on the hill of Fourvières, 680 feet above the Saône, commands a landscape which combines the rich and the grand in the highest degree. At the spectator's feet is Lyons, with its two noble rivers; its bridges, squares, quays, and public edifices, the vessels that crowd the Saône, and the busy activity that pervades its streets, announcing a highly civilized, prosperous, and opulent community. "Unlike Paris and many other French towns, which stand isolated, as it were, in the country, with ploughed land and meadows coming close up to the barriers, Lyons appears as the nucleus of a vast population, melting gradually by its suburbs into clusters of villages, which break up into smaller villages, hamlets, villas, and manufactories. Even at the distance of 10 m., the country is pretty thickly dotted with buildings, some of which are seen sweetly perched on the S. and W. declivities of the hills which enclose the plain. The high and mountainous land on the W. side of the city is scarcely an exception; for sterile as it seems, it is enlivened by country-houses, villages, and manufactories. Beyond the hills which bound the plain on the N.E., is seen Mount Jura; on the E. we have part of the Alps; above which, at the distance of 100 m. from the town,

Mont Blanc is distinctly seen like a white cloud or a mass of snow." (*Maclear's Notes*, p. 35.)

The interior of Lyons exhibits little regularity, and chiefly consists of narrow, winding, and dirty streets, rendered dark by the extreme loftiness of the houses. These, though of stone, and solidly built, are old and *triste*, and several of the streets leading up steep declivities are inconvenient for carriages. The *quartier St. George* is disgustingly filthy, and greatly inferior in appearance to the suburbs of Croix Rousse and des Brotteaux, which, like it, are chiefly inhabited by the working classes. But the wretched aspect of some parts of the city is in some degree counterbalanced by the magnificence of others. Three ranges of quays, two on the Saône, and one on the Rhone, interspersed with 17 bridges, nearly all of modern construction, with the glacis and hill of Fourvières, encompass all that is situated between the two rivers, and form a noble and imposing outline. The Saône, which is far more useful to Lyons in a commercial point of view than the Rhone, is lined with numerous wharfs and landing-places; and along the Rhone from the Faubourg St. Clair to Port Perche, a distance of a league, is a line of elegant public and private edifices, and a public walk, planted with a double row of trees, commanding a fine prospect over the fertile plain to the E. The waters of the Rhone are rapid, cold, and clear, and it forms in every respect a remarkable contrast to the Saône, which has a sluggish current, and a muddy stream. The Rhone is very liable to sudden inundations, to prevent the devastating effects of which some extensive embankments have been raised on its left bank. Still the river, when swollen, frequently does much damage, as was fully evinced in the autumn of 1840, when the inundations carried away some of the bridges, laid a considerable portion of Lyons, and of the surrounding country, under water, and occasioned great damage. There were previously 10 bridges within the city, three of which crossed the Rhone. These were the *Pont de la Guillotière*, originally built in 1190, 330 yards in length by 24 feet wide, with 17 stone arches, but of these only eight are over the water; the *Pont Moreau*, constructed of wood in 1774, 228½ yards long by 14 wide; and between the two the *Pont Lafayette* (formerly *Charles X.*), a handsome bridge, 235 yards in length, the piers of stone, and the upper part of wood. The bridges over the Saône vary in length from 120 to 140 yards; the principal is the *Pont de Tilsit*, leading from the centre of the city, a stone bridge of five arches, 130 yards long by 15 wide, erected at a cost of 3,000,000 francs, or £130,000 sterling. (*Hugo*.) Lyons has 55 places or squares, some large and regular, but, as may readily be inferred from their number, the great majority are very much the reverse. The *Place Bellecour* (formerly *Louis-le-Grand*), one of the largest and handsomest in France, and perhaps in Europe, in the very heart of the city, has two of its sides nearly 340 yards in length, the two others measuring 240 and 218 yards. One of the principal streets forms part of its N. face; its two shorter sides consist of symmetrical ranges of handsome buildings; and on its S. side is a fine plantation of linden trees. This square is ornamented with an equestrian bronze statue of Louis XIV., and forms, with the quays, the favourite promenade of all classes. The *Place Louis XVIII.* leads into the *Cours de Médi*, a broad and fine thoroughfare, planted with trees, which separates the city from the new town of *Perache*. The other principal squares are the *Place des Terreaux*, containing the town-hall, and *Palais des Arts*; *des Cordeliers*, with a fluted column upward of 60 feet in height, supporting a colossal statue of Urania; *de Comédie*, in which is the entrance to the *Grand Théâtre*; *Sathonay*; in the *Rue Louis XVI.*, in the *quartier des Brotteaux*, &c. In the N. part of the city a covered arcade has been formed, called the *Galerie de l'Argue*, nearly 500 feet in length, and containing many good shops. Lyons is supplied with water from the Rhone, and has numerous public fountains, but none worth notice.

The town-hall holds the first rank among the public buildings. This edifice, the finest of its kind in France, was erected between 1646 and 1655. It has a front nearly 100 feet in width, flanked with a square tower and dome at either end. Its balustrade is ornamented with two large statues of Hercules and Minerva, and in the centre is a clock tower, surmounted by a cupola, which rises to the height of 157 feet above ground. The depth of the building is 363 yards at the end of which another handsome front faces the *Place de Comédie*. Its interior contains a vestibule, in which are two colossal bronze groups emblematical of the Rhone and Saône; a fine staircase, and a saloon, 87 feet long by 40 wide, which formerly contained many fine paintings, destroyed during the Revolution. Of the 18 churches, none is very remarkable either for size or elegance. The cathedral of St. John, on the right bank of the Saône, was begun in the 7th century, but not completed till the reign of Louis XI. It is a Gothic edifice, having at its four corners, four heavy square towers, in one of which

LYONS.

is a bell, weighing 35,000 French lbs. The W. entrance is very much ornamented; the interior is characterized chiefly by simplicity. In this church is a remarkable clock, constructed at the end of the 16th century by a native of Basle, which formerly indicated besides the year, month, day, hour, minute, and second, the sun's place, the phase of the moon, and the saints' day, as they occurred. This curious piece of mechanism has been suffered to fall into decay. The church of Ainay, erected on the site of an ancient temple dedicated to the emperor Augustus, has four granite columns and a base-relief, originally forming parts of that edifice. Several of the churches date from the time of Charlemagne. Here is also a Protestant church and a synagogue.

The hospitals are the largest public buildings in Lyons. The *Hôtel-Dieu*, the most ancient and finest establishment of its kind in France, was founded by Childbert and his queen at the beginning of the 6th century: the present edifice consists of a continuous range of building, extending along the Rhone. It has a noble front, a fine entrance, and two domes, which, as well as the distribution and arrangements of its interior, are generally admired. This establishment receives annually 15,000 in-patients, besides affording medical aid to many persons without its walls. The *Hospice de la Charité*, also on the banks of the Rhone, apparently occupies little less space than the former, and is an asylum for 400 infirm persons of both sexes, besides many orphans, foundlings, and women *en cenceinte*. The *Hospice de l'Antiquaille*, for syphilitic and insane patients, stands on the hill of Fourvières, on the site of the Roman palace in which the emperors Claudius and Caracalla were born. The *Hospice de la Providence* has established numerous schools of instruction with the view of checking mendicity, &c.

The prefecture occupies a spacious building, formerly a Dominican convent; its interior is well adapted to its present purpose, and attached to it are some fine gardens. The hall of justice, and the archbishop's palace, present little deserving of notice. The *Palais des Arts*, formerly the Benedictine convent of St. Pierre, consists of four large piles of building, enclosing a square court: different portions of this edifice are devoted to the exchange, and chambers of commerce, the museums of painting, antiquities, and natural history, a cabinet of medals, gallery of casts from the antique, *dépot* of machinery for the silk manufacture, the academy, schools of drawing and natural history, society of agriculture, &c. The collection of paintings comprises some works of great excellence; and that of antiquities is rich in Roman and middle age specimens of art found in and about Lyons, mosaics, and Egyptian antiquities. The public library, and library of Adamaly (so called from having been presented by a citizen of that name), are deposited in the royal college, and together comprise 100,000 volumes (*Hugo*), among which are some valuable oriental works, and old MSS. The prefecture, mint, grand theatre (an elegant structure), theatre *des Célestins*, court of justice, archbishop's palace, new prison, *condition**, salt-magazine, &c., are among the other chief edifices. The botanic garden is situated within the city, and is a favourite place of public resort. About one and a half miles above Lyons is the beautiful *le Barbe* in the Saône, connected with its left bank by a handsome new suspension bridge.

Manufactures and Commerce.—Lyons is in France what Manchester is in England. And notwithstanding the active competition of Zurich, Basle, Crefeld, and other places on the continent, and of Coventry, &c., in England, she still maintains her rank as the first silk manufacturing city of Europe. Her position is peculiarly favourable: she is situated at the point of junction of two large navigable rivers, and has a ready communication with the Mediterranean, on the one hand, at the same time that she is the *entrepôt* of a vast extent of inland country. The districts of France which produce the largest quantities of silk, are immediately adjacent, while Lyons is the natural *dépot* and place of transit for the silk of Italy, in its way to the great manufacturing countries. Added to which, the manufacture has here had, for centuries, its principal seat: the population have been thoroughly trained and habituated to it; so that, though frequently disturbed by political events, and once or twice nearly annihilated, it has never failed, on tranquillity being restored, to return to its former locality. The silks manufactured here, are distinguished by the equality and perfection of the fabric; the brilliancy, though perhaps not the durability, of their dyes; and by the unrivalled superiority of their patterns, and the taste displayed in the designs. This superiority has been ascribed, with what justice we shall not stop to inquire, to the

School of Arts (*Institution de la Martinière*), and the liberal encouragement of this branch of science by the city authorities, and the government. About 180 students are gratuitously instructed in the various branches of drawing and modelling, and there is a professor, who teaches the "*mise en carte*," that is, the adaptation of designs to the loom. The trade of Lyons, like that of all manufacturing towns, is subject to frequent crises, and periods of distress: a very serious one occurred in 1836-37, which led to formidable riots. But though many workmen implicated in the insurrections have settled in the rival towns of Switzerland, &c., there never, perhaps, were so many looms at work as at present, nor was the manufacture ever more flourishing. The gross produce of the Lyonnese looms, in 1838, was estimated at 135 millions of francs, being considerable more than half the estimated value of all the silk goods manufactured in France. (See FRANCE, vol. I., p. 931.)

According to M. Villermé, there were, in 1833, in Lyons and its neighbourhood, 40,000 silk looms; 17,000 in the city proper, 9000 in the suburbs of la Croix Rousse, la Guillotière, and Vaise, 5060 in the neighbouring parts of the department Rhone, and 8990 in the adjacent parts of Loire, Saône-et-Loire, Ain, Isère, and Drôme. Dr. Bowring was furnished with an estimate in 1834, which made the number of looms in the city 16,000, of which 4990 were for figured stuffs; in the suburbs 9000, half for figured silks; and in the country, for 12 or 15 leagues round, 7900, almost wholly for plain silks: making in all 32,000 looms. According to an official estimate in 1835, the master weavers (*chefs d'atelier* or *maître-ouvriers*) in Lyons and its suburbs amounted to about 8000; and the journeymen, or *compagnons*, to 30,000; in all, 38,000 weavers: but the *compagnons* include the wives and children of many of the master weavers. The number of individuals employed in accessory occupations, that is, in the culture of silk, the manufacture of looms, &c., cannot be ascertained; but it has been estimated by M. Villermé and M. Giroud de l'Ain at 27,000 to 30,000. Hugo says that, altogether, 88,000 persons in or about Lyons are supported, directly or indirectly, by the silk manufacture.

Silk weaving at Lyons is not conducted in large buildings or factories belonging to the silk merchants (*fabricans*); but on the domestic system, in the dwellings of the master weavers, each of whom has usually from two to six or eight looms, which, with the greater portion of their fittings, are his own property. Himself and his family keep as many of these looms at work as they can, and employ *compagnons* for the remainder. The latter are not settled in Lyons; but visit it, and stay a longer or shorter time according to the demand for their labour. Apprentices and *lanceurs* make up the remainder of the working classes. The former are usually apprenticed from the ages of 15 to 18: the latter are children from 9 to 14, who prepare bobbins and weave fabrics demanding less nicety than others. About three sevenths of the looms are wrought by master weavers, nearly an equal number by *compagnons*, and the remaining seventh by apprentices and children. The *fabricans*, or silk merchants, of whom there are between 500 and 600 in Lyons, supply the patterns and silk to the owners of looms, to whom is entrusted the task of producing the web in a finished state. Half the wages paid by the silk merchants go to the owner of the loom, and half to the labouring weaver. A master weaver may gain by his own labour from two to three and a half francs a day; and he who has three looms is supposed to receive from the two at which he does not himself work, about 900 francs, or £36 a year. His rental may be about 150 francs; the cost of lodging his two journeymen 80 francs; and there remains besides his own labour a surplus of 670 francs. Those weavers are, of course, the most prosperous, who having three or four looms, employ their children to weave on them, and thus receive the whole wages paid by the manufacturer. Three looms will clear to a family from 1500 to 1600 francs (60 to £64) a year.

Wages have risen considerably of late years. In 1838, the price per ell paid for common plain *velins* was five and a half francs, for *gras de Naples* 80 to 90 cents, and for common figured silks from one to one and a half francs. A master weaver who made two francs a day in 1834, could make at least two and a half francs in 1838; and the journeymen need never earn less than one franc 75 c., and may frequently get two francs. The hours of work usually vary from 12 to 16 hours; but when the demand is brisk, they reach to 16, 18, and even 20. The weaving population is ill lodged, the master weavers generally having but two rooms at most, and these kept in a disgraceful

* This is an establishment where, by the agency of heat, the unwrought silk is reduced to an equal weight and dryness. In 1831, the weight of silk, submitted to the condition, amounted to 685,222 kilogrammes.

† There is one exception: on the bank of the Saône, opposite the *St. Germain*, is a factory called *le Désordre*, employing from 400 to 500 hands, who may sleep in the building on payment of 50 c. a month, and board there also at a low rate.

LYONS.

by filthy state. But they live very well; that is, they have abundance of nourishing food, much more than the population of other manufacturing towns in France. Most of the journeymen are boarded by their employers at from 45 to 50 c. a day; and have about one and a half pounds of good bread, quarter litre of wine, a dinner of soup, butchers' meat, &c., with cheese or salad at supper. They rarely save money, and few of the *compagnons* raise themselves to become *chefs d'atelier*. The weavers, speaking generally, are very ignorant; some years since not one fourth part of the children in Lyons could read or write. But after all, according to M. Villermé, there is less profligacy in Lyons than in many other of the French manufacturing towns. (See *Villermé*, l., 365-69.) The proportion of illegitimate to the total number of births in 1835 was indeed as high as one in three; but, in point of fact, a good many of the connections out of which these births arise are really but little different from matrimonial connections. The weavers, to escape the *actes*, frequently visit the *cabarets* beyond the barriers, to drink their wine, play billiards, &c., on Sundays and Mondays; but they are not addicted to intoxication or rioting, and it is affirmed, and we believe truly, that they are at present improving in morals, manners, and cleanliness; and certainly they have much room for amendment. Notwithstanding their good wages and liberal supplies of food, the best French authorities admit that the Lyonsese weavers are physically an inferior and degraded race, remarkably subject to scrofulous and scrobutic complaints, spinal diseases, and rheumatism; and according to M. Charles Dupin, half the young men in Lyons liable to military service are exempted on account of weakness, deformity, or deficiency of height, though the standard for recruits or conscripts in the French is considerably below what it is in the English army. (See vol. i., 936.)

Happily, however, the upper and middle classes of Lyons, the latter comprising most part of the shopkeepers, and many of the master weavers, are eminently comfortable, rich and thriving. Mr. Maclear states that there are three times more villas round Lyons than round Paris; and the number of private and public works erected in and near the city during the last 20 years sufficiently evince the rapid increase of wealth and enterprise. The want of coal is the greatest obstacle to the improvement of the manufactures of the city, and to the extension of its industry. But despite this disadvantage, Mr. Maclear states that the district of which Lyons is the centre is "advancing with great strides." (P. 36.)

Lyons has numerous dyeing establishments and printing offices, and manufactories of jewellery, liqueurs, &c.; but all these are insignificant compared with its chief branch of industry. It is the seat of a royal court, of tribunals of primary jurisdiction and commerce, a chamber of commerce, one of the five royal libraries of the kingdom, a university, academy, royal college, and academy of sciences, &c.; and has schools of theology, medicine, veterinary medicine, and rural economy; a royal society of agriculture, &c.; societies of medicine, jurisprudence and literature, a Protestant Bible society, deaf and dumb asylum, a *mont-de-piété*, savings' bank, maternity, and many other charitable institutions.

The early history of Lyons is involved in much obscurity. But it appears certain, from the statement of Dion Cassius, that Munatius Plancus, about anno 40 B.C., settled in it fugitives from some adjoining towns. (lib. xiv.) Augustus made Lugdunum the capital of a province, and being embellished and enlarged by succeeding Roman emperors, it became one of the principal cities of the Roman world. The old city was principally built on the hill of Fourvières, which, in fact, is merely a corruption of its ancient name of *Forum Vetus*. (*D'Ancelle, Notice de la Gaule*, p. 493.) Among the Roman antiquities which still exist at Lyons, are the remains of four aqueducts, several churches, a theatre, traces of a palace, and a naumachia, recently discovered within the limits of the botanic garden.

From the 5th to the 12th century, Lyons belonged successively to the Burgundians, Saracens, Franks, its feudal archbishops, and its municipal council. In 1319 it was seized to the crown of France; and in the same century, owing to the immigration of many merchants from Italy, it began to be distinguished by its manufactures. It suffered much during the religious wars of the 16th century; but far more from the revolutionary frenzy of 1793. Its ancient fortifications were then destroyed; but it has been since enclosed on the N. by a line of earth ramparts. Among the distinguished individuals, natives of Lyons, were, in antiquity, the emperors Claudius and Caracalla, and Sidonius Apollinaris; and, in modern times, Jusseau, the botanist; J. B. Say, the economist; Jacquard, the inventor of the loom which bears his name; Degrando, the author of the able and elaborate work *Sur la Bienfaisance Publique*, &c., (Hugo, *arts. Rhone; Lyons; French Official Tables*;

MACAO.

Bearing and Synond's Reports; Villermé; Tableau Physique et Moral des Ouvriers; Inglis; Maclear, &c.)

LYONS, p. v., capital of Wayne co., N. Y., 180 m. W. by N. Albany, 373 W. Organized in 1811. Drained by Ciyde river, formed by a junction of Mead creek with Canandaigua outlet. The Erie canal passes through it. It contains a court-house, jail, county clerk's office, six churches, a Presbyterian, two Methodist, an Episcopal, Baptist, and Lutheran, 20 stores, one lumber-yard, one fulling-mill, five flouring-mills, three grist-mills, six saw-mills, three tanneries, two distilleries, one pottery, two printing-offices, two weekly newspapers; eight schools, 979 scholars. Pop. 4302. The village, on the Erie canal, contains about 250 dwellings and 1500 inhabitants.

LYBANDER, p. v. Onondago co., N. Y., 144 m. W. by N. Albany, 364 W. Bounded S. by Seneca river. It has seven stores, two fulling-mills, one woollen factory, one grist-mill, 16 saw-mills, four tanneries; 18 schools, 930 scholars. Pop. 4306.

M.

MAAD (Hung. *Mada*), a town of Hungary, co. Zemplin, in the Heggysalla mountains, about 6 m. N.W. Tokay. Pop. 5640, partly Lutheran and partly Roman Catholics. It is one of the places at which the Tokay wine is grown in the greatest perfection, and near it is the imperial vineyard of Theresienberg.

MAASLUIS, or MAASLANDLUISE, a town of S. Holland, on a branch of the Maas, 9 m. W. by N. Rotterdam. Pop. 4500. It has manufactures of sailcloth, cordage, leather, &c., and some building docks; and its inhabitants take an active share in the herring and cod fisheries.

MACAO, a seaport town and settlement of the Portuguese in China, province Quang-tong, on a peninsula, projecting from the S.W. corner of the island Macao, on the W. side of the estuary formed at the mouth of the Tigre or Canton river, 84 m. S. by W. Canton; lat. 22° 11' 30" N., long. 113° 32' 30" E. The population is stated in the "Chinese Repository" to amount to upwards of 30,000; but we incline to think that 20,000 is nearer the mark, of whom about 15,000 are Chinese, and the rest chiefly Portuguese and slaves imported from Timor, &c.

The peninsula on which Macao stands is less than 2½ m. in its greatest length from N.E. to S.W., and not 1 m. in its greatest breadth. It is connected with the rest of the island by a long, low, and sandy neck, in one part 400 yards broad, but generally less. Across this isthmus a wall is erected, having in its middle a gate and a guardhouse, called *Casa brace*, for the Chinese soldiers; by means of which barrier, all communication between the peninsula and the rest of the island is cut off at the pleasure of the Chinese authorities. The Portuguese inhabitants of Macao are rarely permitted to pass beyond this wall. This town has a very imposing appearance from the sea. It is built chiefly on the declivities of two hills, meeting each other at right angle, in front of a small semicircular bay forming the harbour. A handsome row of houses faces the bay, with a parade in front embanked with stone to resist the encroachments of the sea, and interrupted once or twice by granite quays with steps leading down to the water. Behind this terrace the houses are arranged in a confused manner, and the gable ends of European residences and the steeples of the churches appear curiously intermixed with Chinese houses and temples. Macao has 13 churches, one of which, that of St. Joseph, is collegiate. There are few other edifices of any note. A spacious senate-house, in the heart of the town, forms a termination to the principal street. The Portuguese governor's residence, near the landing-place, is nowise remarkable, and the contiguous English factory is a plain, commodious building.

The Chinese live chiefly together in the central and back parts of the town, and along the inner harbour; some of them have well furnished shops, and they principally supply Europeans with provisions. Besides the college of St. Joseph, there are in Macao, royal grammar-school and several other Portuguese schools, a female orphan asylum, and other charitable institutions. It is defended by six forts, two of which are placed on a lofty height at either end of the harbour, and it is usually garrisoned by about 400 Portuguese soldiers. At one extremity of the town is a mansion called the *Casa*; in the grounds belonging to which is the celebrated cave of Camoens, sheltered on one side by a lofty rock, and on the other by a grove of bamboos, above which a tower commanding a fine view has been erected. In this sequestered retreat Camoens is said to have composed great part of the *Lusiad*, while holding the office of Portuguese judge at Macao. The land immediately without the town is fertile and is appropriated to vegetable gardens and rice-grounds.

MACASSAR.

The harbour is on the W. side of the town, between it and Priests' island, a small circular island, which formerly belonged to the Jesuits; but it has not depth enough to admit large ships, which accordingly anchor in the roads on the other side of the peninsula, from 5 to 10 m. E. of the town. All foreign vessels coming into the roads send their boats to the custom-house and pay a duty for all goods landed, however trifling. When a ship arrives among the islands, she is generally boarded by a pilot, who reports to the Chinese custom-house officer the nature of her cargo, and obtains a *chop* or permit allowing her to enter the Bogue or Bocca Tigis, with the understanding that she has nothing on board that is contraband. All females must, however, be landed at Macao, as the ship will not be allowed to proceed to Whampoa with them on board. The Chinese regulations do not allow any vessels, except such as belong to Portuguese or Spaniards, to trade at Macao. But the Portuguese inhabitants lend their names for a trifling consideration to such foreigners as wish to be associated with them for the purpose of trading from the port; and vessels of other nations seldom experience any difficulty in obtaining the connivance of the Chinese officers to the landing or receiving of goods in the roads by means of Portuguese boats. Vessels of other nations, if in distress, and not engaged in the contraband trade, are admitted into the harbour for repair, on application to the senate. The latter is composed of the bishop, the chief justice, the military commandant, and several of the chief Portuguese inhabitants; but a Chinese mandarin has substantially the supreme authority in the town. Except during the period of the year when the merchants of Canton are obliged to leave that city and repair to Macao, the latter is said to be dull and uninteresting. At that season, however, the carnival is celebrated with more than its usual sumptuousness in Catholic countries; and balls, masquerades, and concerts follow each other in rapid succession. Macao was given to the Portuguese by the Chinese emperor in 1586, in return for assistance afforded by them against pirates that had infested the coast. (*Hamilton's E. I. Gaz.; Commerc. Dict.; and Private Information.*)

MACASSAR. See CHELSEA.

MACCLESFIELD, a large manufacturing town, parl. and mun. bor. of England, co. Chester, locally situated in Prestbury div., of the hund. of its own name, on the Bollin, 16 m. S. by E. Manchester, and 143 m. N.N.W. London. Pop. of parl. bor., which includes, with the old bor., parts of the townships of Hursfield and Sutton, nearly 30,000 in 1831; and at present the pop. is estimated at 40,000. The town, which is pleasantly situated on a slope near the borders of Macclesfield forest, has greatly increased in size during the last 30 years, and is now about 1½ m. long, by 1 m. in breadth, consisting of one principal thoroughfare on the London road, crossed by two others leading to numerous subordinate streets. The buildings, in the more conspicuous parts of the town, are of superior construction: the streets also are well lighted, and the inhabitants have plentiful supplies of good water, conveyed from springs in the adjacent hills. An open market-place, with excellent shambles, and a covered corn market, stand near the centre of the town; and the newly erected town hall is a commodious and handsome building, tastefully decorated, and containing, besides courts of justice, offices, &c., a large assembly and concert room. The old church is a large structure, partly Gothic, with a handsome tower, formerly surmounted by a lofty steeple: it was originally erected by Edward I., in 1278, but has, at different times, been almost rebuilt, so that few parts of it can lay claim to any great antiquity. It affords accommodation for about 1700 persons, and has an adjoining chapel containing several interesting monuments: the living is a perpetual curacy, till very lately in the gift of the corporation, but now in private patronage. Christ-church was erected, in 1775, at the private expense of Charles Roe, Esq., who endowed it with £100 a year: it is a regular building, with a neat tower, having, in the interior, an elegant marble monument of the founder, by Bacon. Trinity church, in Hursfield, a very recent erection, is beautifully situated on an eminence, and may accommodate about 900 persons. St. George's in Sutton (built in 1832) has accommodation for 1500, and in the S. suburbs of the town is a fifth church, remarkable for its neat construction, and light spire. There are also several places of worship for Wesleyan Methodists, and other dissenters. A free grammar school, originally founded in 1503, was endowed by Edward VI., with property then producing only £25, but now estimated at £1200 a year, and rapidly increasing in value. A head and under-master, who have salaries of £300 and £175 a year (the former having a house and school-field, free of rent and taxes), give instruction in classics, elementary mathematics, history, geography, &c., the average number of scholars being about 60. This school enjoys certain advantages at Brasenose College, Oxford, and it has been proposed to set aside a portion of its property to

MAC DONALD.

found four exhibitions of the annual value of £50 each, tenable for four years at any college either in Oxford or Cambridge. The wishes of the trading classes have likewise been consulted by the very recent establishment of a separate school, called the "Modern Free School," endowed with £350 a year, and furnishing good instruction in those branches of knowledge best calculated to enable the scholars to carry on the trades, and support the commerce of Macclesfield. A charity school, national school, and several Sunday schools, with others maintained by voluntary subscription, furnish instruction to the children of the poor; and there are almshouses, various money charities, a dispensary, lying-in charity, and provident society.

"The silk manufacture of Macclesfield affords employment to the largest part of the population; a few, however, are employed in the cotton factories that have been lately established. This place participated deeply in the general distress occasioned by over-trading in 1825, and for several years subsequent to that period the silk trade was in a most depressed state. The effects of that shock, however, seem at length to have subsided, and business has resumed a healthy aspect." (*Mess. Berard, Rep.*) The trade has greatly increased since the date of this report, but it is subject more than other branches, to sudden shocks, productive of great distress to the working classes. There was at work in the parish of Prestbury (and chiefly in Macclesfield and its immediate vicinity) in 1839, 16 cotton-mills and 46 silk-mills, employing 10,963 hands. The wages of the work-people employed in these mills vary, at present (1841), from 2s. 6d. to 15s. a week. About 4500 hand-loomers are engaged in weaving silk fabrics, chiefly silk handkerchiefs and scarfs of every description, sarcenets, Persians, silk-fur, and galloon, with a few gros-de-Naples, giving employment altogether to about 9000 persons, whose wages amount to from 6s. to 15s. a week; but there are a few industrious and expert weavers, who earn weekly as much as 35s. when in full work. The cotton manufacture, which was introduced only a few years ago, is in a thriving condition, employing a population of about 3000 in factories only; and halmaking is carried on to some extent. Numerous mechanics, makers of machinery, &c., depend indirectly on the staple trade of the town. The Bollin turns several mills, and the neighbourhood furnishes abundant supplies of excellent coal. Stone and slate also are quarried near the town, and form a considerable object of trade with the surrounding districts. The transit of heavy goods is facilitated by the Macclesfield canal, which connects it N. and S. with the great canal lines of England. There are two private banking establishments, with a savings bank. A newspaper is published weekly, and there is a good news-room.

Macclesfield, which was incorporated by a charter of Prince Edward, son of Henry III., and subsequently by various sovereigns of England, has been divided by the Mun. Reform Act into six wards, and is now governed by a mayor and 11 other aldermen, with 26 councillors. Corporation revenues in 1839, £2551. It enjoys also a commission of the peace, with petty sessions, under a recorder. This important manufacturing town had no voice in the legislature, till the Reform Act conferred on it the privilege of sending two members to the House of Commons. Registered electors in 1840-41, 894. Macclesfield is also one of the polling places for the N.E. division of Cheshire. Markets on Tuesday and Saturday: cattle, wool, and cloth fairs, May 6, June 22, July 11, October 6, and November 11. (*Parl. Reports, &c.*)

MAC CONNELLSVILLE, p. v., Morgan t., capital of Morgan co., O., 73 m. E. by S. Columbus, 230 W. Situated on the E. bank of Muskingum river, on the second bottom from 10 to 30 feet above high water. It contains a common house, jail, two churches, a Presbyterian and Baptist, 12 stores, two tanneries, 80 dwellings, and about 500 inhabitants.

MAC CRACKEN, county, Ky. Situated in the W. part of the state, and contains 900 sq. m. Bounded N. and N.W. by Ohio river. W. by Mississippi river, N.E. by Tennessee river, S. by Mayfield's river. Watered by Clark's river and its branches. It contained in 1840, 5921 neat cattle, 2947 sheep, 17,668 swine; and produced 13,455 bushels of wheat, 198,277 of Indian corn, 25,649 of oats, 11,917 of potatoes, 65,643 pounds of tobacco, 9038 of cotton. It had 39 stores, eight grist-mills, one saw-mill, three tanneries, four distilleries, one printing-office, one weekly newspaper, four academies, 115 students; six schools, 112 scholars. Pop. whites, 4064; slaves, 654; free coloured, 27; total, 4745. Capital, Paducah.

MAC DONALD, p. v., capital of Randolph co., Ala. 161 m. E. Tuscaloosa, 757 W. Situated 3 m. E. of Little Talla poosa river. It contains a courthouse, jail, a male and female academy, and several stores and dwellings.

MAC DONALD, p. v., capital of Barry co., Mo., 200 m. S.W. Jefferson city, 1115 W.

MAC DOUGUGH.

MAC DONOUGH, county, Ill. Situated in the W. part of the state, and contains 576 sq. m. Organized in 1829. Watered by Crooked creek, which flows into Illinois river. It contained in 1840, 5112 neat cattle, 5643 sheep, 15,368 swine; and produced 35,684 bushels of wheat, 322,553 of Indian corn, 41,030 of oats, 14,130 of potatoes. It had nine stores, six grist-mills, 13 saw-mills; 15 schools, 336 scholars. Pop. 3308. Capital, Macomb.

MAC DONOVAN, p. l., Chenango co., N. Y., 112 m. W. Albany, 326 W. Drained by Bowman's and Genesawette creeks. It contains a Methodist and Baptist church, two stores, one fulling-mill, two grist-mills, 14 saw-mills, three tanneries, one printing-office, one weekly newspaper; 13 schools, 520 scholars. Pop. 1390.

MAC DONOVAN, p. v., capital of Henry co., Ga., 65 m. W.N.W. Milledgeville, 690 W. Situated between Towellaga and S. Ocmulgee rivers. It contains a courthouse which cost \$6500, a jail, an academy which cost \$9900, two churches, a Baptist and Methodist; eight stores, 50 dwellings, and about 300 inhabitants.

MACE DON, p. l., Wayne co., N. Y., 30 m. E. Lyons, 199 m. W. by N. Albany, 356 W. Watered by Mud creek. It contains nine stores, one fulling-mill, five grist-mills, 10 saw-mills; 13 schools, 306 scholars. Pop. 2396.

MACERATA, a city of Central Italy, Papal States, cap. deleg. of same name, on a hill between Chieti and Potenza, 21 m. S. by W. Ancona, and 170 m. N.E. Rome. Pop., in 1838, 15,000. It is well built, surrounded with walls, and entered by six gates. In the centre of the town is an irregular open space ornamented with several good buildings, including the cathedral, the palace of the delegate, and the theatre. Including the cathedral, there are seven churches, in one of which are some good paintings, 13 convents, several literary associations, and a secondary university for theology, philosophy, and medicine, founded by pope Leo XII. in 1824. This city presents nothing antique, and its most interesting feature is the fine view it commands of the Adriatic, and occasionally of the mountains of Dalmatia.

"Macerata," says Forsyth, "contains a number of *palazzi*, and therefore a swarm of provincial nobility. The peasants observe an established uniform in dress, of which orange appears the prevailing colour. So constant are the women of this class to local costume, that the female head becomes a kind of geographical index. At Macerata they adhere to the ancient mode of plaiting and coiling the hair, which they transfer with long silver wire tips at both ends with large knobs, evidently the antique *ovos crinalis*."

"*Figat acuti torres castanisque comes.*"—*Mart.*

Macerata is a bishop's see, and the seat of a court of appeal for the delega. Macerata, Camerino, Ancona, Ascoli, Fermo, and Urbino. Its manufactures and commerce are insignificant. Under the French, Macerata was the capital of the dep. Musone. About 9 m. to the N., on the Potenza, are the remains of a theatre of considerable size, with vaults and foundations of other edifices, supposed to indicate the site of *Helvia Ricina*, colonized by Septimius Severus, and destroyed by the Goths. (*Forsyth's Italy*, p. 220; *Rampoldi*.)

MAC HENRY, county, Ill. Situated in the N.E. part of the state, and contains 980 sq. m. Drained by the N. branch of Chicago, by Des Plaines, and Fox rivers. Limestone is abundant. It contained in 1840, 2936 neat cattle, 370 sheep, 4968 swine; and produced 43,957 bushels of wheat, 45,607 of Indian corn, 36,974 of oats, 33,870 of potatoes. It had five stores, seven saw-mills, one distillery; 15 schools, 265 scholars. Pop. 2578. Capital, Mac Henry.

MAC HENRY, p. v., capital of Mac Henry co., Ill., 223 m. N.W.E. Springfield, 738 W. Situated on the W. side of Fox river, 12 m. S. of the line of the state. It contains a courthouse, jail, and several stores and dwellings. Nett proceeds of the postoffice, \$118.

MACHIAS, p. l., port of entry, and capital of Washington co., Me., 151 m. E. by N. Augusta, 330 N.E. Boston, by land, and 200 by water, 773 W. First settled in 1763, incorporated in 1784. Watered by the W. branch of Machias river, on the E. side of which the village is situated, at the falls. The river admits vessels of 250 tons within 30 rods of the falls. A great amount of lumber is here produced and exported. It has 10 stores, two grist-mills, 33 saw-mills, two tanneries; 11 schools, 322 scholars. Pop. 1331. Tonnage of the district, 11,847.

MACHIAS, p. l., Cattaugus co., N. Y., 296 m. W. by S. Albany, 333 W. Drained by Ischua creek, the outlet of Lake lake. It contains a church, three stores, one grist-mill, three saw-mills; nine schools, 310 scholars. Pop. 1085.

MACHIAS PORT, p. v., port of entry, Washington co., Me., 155 m. E. by N. Augusta, 777 W. Situated on Machias river, below the junction of the two branches. It has an excellent harbour, protected by Cross Island at the mouth of the bay, and considerable shipping, employed in the lumber trade and the fisheries. Incorporated in 1896. It has

MACKINAC.

one store, one grist-mill, three saw-mills; 12 schools, 364 scholars. Pop. 824.

MACHYNLETH, a market town and parl. bor. of N. Wales, co. Montgomery, near the Dyff, 30 m. W. Montgomery, and 175 m. W.N.W. London. Area of parliamentary borough, about 500 acres. Population of the town in 1831, 856. Machynlleth is an ancient, well-built town, superior to most in N. Wales for cleanliness and respectability, the streets being remarkably broad and regular. The town-hall, a plain building, was erected by the Wynn family, in whom the manor is vested: the county sessions are held alternately here and at Montgomery, and the magistrates sit here occasionally in petty sessions for the hundred. The church, a handsome structure, was rebuilt in 1837: the interior is conveniently fitted up, and the W. tower is embattled, and surmounted with crocketed pinnacles. There are places of worship for Independents, Calvinists, and Wesleyan Methodists, with attached Sunday schools, and a well-endowed national school furnishes instruction to poor children of both sexes. There is also a savings bank. "The flannel trade has long existed at Machynlleth, being chiefly carried on at farm-houses: the fabrics are sent for sale to Newtown. Weavers' wages (when on full work) vary from 7s. to 9s. a week, and with respect to their moral condition, it is remarked as being much higher than that of operatives in general, in other districts, but yet neither better nor worse than that of the labouring classes generally within the parish. The truck system is partially practised in this vicinity, being fostered by the improvidence of the weavers, few of whom make any provision for emergencies. The prices of provisions are as follows: flour 1s. for 5 lbs., potatoes 2s. for 40 quarts, mutton 5d. per lb., bacon 9d., butter 11d., and oatmeal 2d. per lb. This town formerly possessed an excellent shipping trade, and was, in fact, the port of Montgomery; but since the canal was brought to Newtown, and facilities were opened direct between Wales and the commercial districts of England, the carrying trade is in barges, and few ships now come to Machynlleth." (*Hand-loom Weavers' Report*, part 5.) This borough unites with Montgomery and others in sending one member to the House of Commons. Registered electors in 1839-40, 78: ditto in the entire district, 1021. Machynlleth is celebrated in the history of the principality as the place in which Owen Glendwr, in 1405, convoked a parliament, where he was inaugurated Prince of Wales.

MAC INTOSH, co., Ga. Situated in the S.E. part of the state, and contains 600 sq. m. Bounded S.E. by the Atlantic, S.W. by Altamaha river, N.E. by South Newport river. Drained by Sapelo river. It has Sapelo and Black Bend islands on the coast. It contained in 1840, 7884 neat cattle, 734 sheep, 4093 swine; and produced 30,406 bushels of Indian corn, 40,791 of potatoes, 2,896,903 pounds of rice, 549,877 of cotton, 7300 of sugar. It had one commercial and five commission houses in foreign trade, 17 stores, two grist-mills, four saw-mills, one printing-office: one academy, 65 students; one school, 13 scholars. Pop.: whites, 1348; slaves, 3910; free coloured, 102; total, 5360. Capital, Darien.

MAC KEAN, co., Pa. Situated in the N., towards the W. part of the state, and contains 1470 sq. m. Organized in 1804. Watered by Alleghany river and its tributaries, and by branches of Burnessmahoning creek. It abounds with coal, iron, and salt. It contained in 1840, 3977 neat cattle, 3713 sheep, 1781 swine; and produced 8169 bushels of wheat, 1870 of rye, 12,070 of Indian corn, 3136 of buckwheat, 19,278 of oats, 52,911 of potatoes. It had ten stores, nine grist-mills, 33 saw-mills, two tanneries, one academy, 30 students; 21 schools, 575 scholars. Pop. 3975. Capital, Smethport.

MAC KEAN, p. v., Erie co., Pa., 9 m. S. Erie, 265 m. N.W. by W. Harrisburg, 338 W. Drained by Walnut creek and its branches, and by Elk creek. It has one fulling-mill, four grist-mills, eight saw-mills; 19 schools, 449 scholars. Pop. 1714.

MACKINAC, or **MICHILIMACINACK**, co., Mich. Situated in the upper peninsula of Michigan, and contains 37,684 sq. m. The strait, generally pronounced Mackinaw, which connects Lake Michigan and Lake Huron, is 40 m. long, and in its narrowest part 4 m. wide, contains several islands, as Mackinac, Bois Blanc, Drummond's, and several smaller ones belonging to this county. The greatest height of Mackinac Island, above the level of the lake, is 300 feet. It produces wheat, oats, barley, peas, and beans. It was first settled in 1784, surrendered to the government of the United States in 1796, taken by the British in 1812, but restored by the treaty of Ghent, signed Dec. 24th, 1814. The county contained in 1840, 96 neat cattle, six sheep, 65 swine; and produced 20 bushels of Indian corn, 614 of oats, 2016 of potatoes. It had 11 stores, capital in the lake fisheries \$1000, value of skins and furs \$21,750. Pop. 923.

MACKINAC, p. v., cap. of Mackinac co., Mich., 300 m. N.N.W. Detroit, 821 W. Situated on the S.E. extremity of

MAC LEAN.

an island of the same name, and contains a courthouse, jail, two churches, a Presbyterian and Roman Catholic; a school of the American Board of Commissioners for Foreign Missions, a Roman Catholic missionary school, and a branch of the university of Michigan. Fort Mackinac stands on a rocky eminence, 150 feet above the village, which it commands. The harbour is spacious and safe, capable of accommodating 150 vessels. More than 3000 barrels of trout and white fish are annually exported. It is the seat of an extensive fur trade.

MAC LEAN, co. Ill. Situated a little N.E. of the centre of the state, and contains 1260 sq. m. Drained by Mackinaw river, and Kickapoo and Salt creeks. It contained in 1840, 8049 neat cattle, 6777 sheep, 35,740 swine; and produced 44,471 bushels of wheat, 350,830 of Indian corn, 81,028 of oats, 4598 of potatoes. It had 14 stores, one flouring-mill, 14 grist-mills, 19 saw-mills, three tanneries, 42 distilleries; three academies, 70 students; 14 schools, 452 scholars. Pop. 6365. Capital, Bloomington.

MAC LEANSBOROUGH, p. v., cap. of Hamilton co., Ill. 165 m. S.E.E. Springfield, 776 W. It contains a courthouse, jail, about 95 dwellings, and 150 inhabitants. Nett proceeds of the postoffice, \$98.

MAC MINN, co. Tenn. Situated in the S.E. part of the state, and contains 908 sq. m. Watered by Hiwassee river and its tributaries. It contained in 1840, 11,407 neat cattle, 9839 sheep, 37,679 swine; and produced 93,661 bushels of wheat, 3507 of rye, 638,578 of Indian corn, 163,634 of oats, 9833 of potatoes, 7360 pounds of tobacco, 1443 of cotton. It had 90 stores, two cotton factories with 679 spindles, 19 flouring-mills, 93 grist-mills, 39 saw-mills, two oil-mills, one paper-mill, nine tanneries, 51 distilleries, two printing-offices, two weekly newspapers; two academies, 99 students; seven schools, 393 scholars. Pop.: whites, 11,450; slaves, 1941; free coloured, 98; total, 12,719. Capital, Athens.

MAC MINVILLE, p. v., cap. of Warren co., Tenn. 75 m. S.E. Nashville, 624 W. Situated on Collin's river, a branch of Coney fork of Cumberland river. It contains a courthouse, jail, two academies, several stores, five tanneries, a printing-office, and about 800 inhabitants.

MAC NAIRY, co. Tenn. Situated towards the S.W. part of the state, and contains 960 sq. m. Watered by branches of Big Hatchee and Forked Deer rivers. It contained in 1840, 12,232 neat cattle, 6110 sheep, 42,371 swine; and produced 36,956 bushels of wheat, 235,715 of Indian corn, 56,591 of oats, 13,577 of potatoes, 943,190 pounds of tobacco, 42,446 of cotton, 1897 of sugar. It had 10 stores, one woollen-factory, 39 grist-mills, 10 saw-mills, three tanneries, 39 distilleries; one academy, 34 students; 11 schools, 373 scholars. Pop.: whites, 8589; slaves, 763; free coloured, 33; total, 9385. Capital, Purdy.

MACOMB, co. Mich. Situated in the E. part of the state, and contains 485 sq. m. Bounded S.E. by St. Clair lake. Watered by Clinton river and its branches. It contained in 1840, 7193 neat cattle, 8959 sheep, 9609 swine; and produced 81,064 bushels of wheat, 7367 of rye, 71,028 of Indian corn, 699 of buckwheat, 1344 of barley, 69,799 of oats, 80,881 of potatoes, 32,991 pounds of sugar. It had 19 stores, one fulling-mill, four flouring-mills, one grist-mill, 12 saw-mills, one glass factory, two distilleries, two printing-offices, two weekly newspapers; two academies, 29 students; 76 schools, 1973 scholars. Pop. 9716. Capital, Mount Clemens.

MACOMBS, p. v., cap. of Mac Donough co., Ill. 86 m. N.W. Springfield, 859 W. Situated on a fertile prairie, 2 m. S. of Drowning fork of Crooked creek. It contains a courthouse, four stores, and about 125 inhabitants.

MACON (an. *Meticeo*), a town of France, dep. Saône-et-Loire, of which it is the cap.; on the Saône, here crossed by a bridge of 13 arches, 38 m. N. Lyons; lat. 46° 18' 27" N., long. 4° 50' 8" E. Pop. (1836) 11,944. It is pleasantly situated, but is generally ill built; the streets are narrow, crooked, and paved with rounded pebbles, painful to walk upon; the squares, though clean, are mostly small, and destitute of ornament; and the houses, though mostly of stone, are *tristes et mauguines*. It was once partially fortified, but the works were never completed, and they are now laid out in public walks. A handsome quay borders the Saône, and is continuous with a planted promenade at either extremity. The ancient *hôtel de Montresol*, now occupied by the town hall, theatre, and public library, with 9000 volumes; the general hospital, two *hospices*, some of the churches, the prefecture, and the new prison, are the chief public buildings. Maçon is the seat of tribunals of primary jurisdiction and commerce, a communal college, schools of mutual instruction and linear design, and of a society of agriculture, arts, and *belles lettres*; and has manufactures of coverlets, clocks and watches, copper and earthenware, pump machinery, barrels, &c. But Maçon is principally dependent on its wine trade. The same chain of hills that overhang the rich vineyards of the Côte d'Or extends through the department of the Saône-et-Loire, and

MACON.

the part of the department of the Rhone called the Beaujolais. But whether it be from some difference of exposure of soil, or other unknown cause, the wines produced in the district now mentioned are, though in many respects excellent, inferior to those of the Côte d'Or. In commerce, the wines both of the Maconnais or district round Maçon, and of the Beaujolais, are known by the name of Maçon wines, from Maçon being the emporium where they are mostly sold. They are strong and durable, *coriis, spiritibus, qualche fois trop fumeux, et toujours acides (Julien)*; and in general may be regarded as ranking next to the Beaune wines. The best growths are those of Tournay, Romanèche, Chénas, and Pouilly. (*Henderson on Wines*, p. 165.) Many Roman antiquities have been found at Maçon, and the ruins of its cathedral, destroyed during the revolutionary frenzy in 1793, form a very picturesque object. On the opposite bank of the Saône is the flourishing suburb of St. Laurent, the seat of a large corn market. (*Sup. art. Saône-et-Loire; Dict. Geog., &c.*)

MACON, co. N. C. Situated in the W. part of the state, and contains 900 sq. m. Drained by head branches of Tennessee river. It contained in 1840, 6285 neat cattle, 5560 sheep, 11,863 swine; and produced 6311 bushels of wheat, 4375 of rye, 125,890 of Indian corn, 32,858 of oats, 9613 of potatoes, 3983 pounds of tobacco. It had five stores, one flouring-mill, 39 grist-mills, five saw-mills, four tanneries, 11 distilleries; three schools, 140 scholars. Pop.: whites, 4446; slaves, 368; free coloured, 55; total, 4869. Capital, Franklin.

MACON, co. Ga. Situated a little S.W. of the centre of the state, and contains 480 sq. m. Watered by Flint river and its tributaries. It contained in 1840, 9176 neat cattle, 9586 sheep, 19,050 swine; and produced 90,933 bushels of wheat, 1092 of rye, 942,039 of Indian corn, 5985 of oats, 19,863 of potatoes, 1,379,005 pounds of cotton. It had 11 stores, 14 grist-mills, nine saw-mills; three schools, 38 scholars. Pop.: whites, 3553; slaves, 1489; free coloured, 3; total, 5045. Capital, Lanier.

MACON, co. Ala. Situated towards the S.E. part of the state, and contains 970 sq. m. Watered by branches of Tallapoosa river. It contained in 1840, 15,958 neat cattle, 769 sheep, 21,731 swine; and produced 2316 bushels of wheat, 312,313 of Indian corn, 6941 of oats, 23,076 of potatoes, 863,125 pounds of cotton. It had 16 stores, three flouring-mills, 13 grist-mills, 71 saw-mills, two tanneries, one pottery; six academies, 943 students; 14 schools, 368 scholars. Pop.: whites, 5369; slaves, 6551; free coloured, 97; total, 11,247. Capital, Tuskegee.

MACON, co. Ill. Situated near the centre of the state, and contains 1400 sq. m. Watered by Sangamon river. It contained in 1840, 4264 neat cattle, 3546 sheep, 13,985 swine; and produced 21,344 bushels of wheat, 1741 of rye, 173,167 of Indian corn, 44,366 of oats, 5354 of potatoes. It had five stores, one woollen factory, six grist-mills, six saw-mills, one tannery, one distillery; eight schools, 234 scholars. Pop. 3039. Capital, Decatur.

MACON, co. Mo. Situated towards the N. part of the state, and contains 846 sq. m. Watered by Chariton and E. Chariton rivers, and branches of Salt river. It contained in 1840, 6539 neat cattle, 7050 sheep, 30,973 swine; and produced 9105 bushels of wheat, 558,906 of Indian corn, 15,517 of oats, 8581 of potatoes, 57,871 pounds of tobacco. It had 11 stores, six grist-mills, four saw-mills, three tanneries, two distilleries; seven schools, 183 scholars. Pop.: whites, 5809; slaves, 393; free coloured, 1; total, 6204. Capital, Bloomington.

MACON, city, cap. of Bibb co., Ga. 30 m. S.W. Milledgeville, 686 W. Situated at the head of steam navigation on Ocmulgee river, chiefly on the W. side, though it has extended to both sides; connected by a bridge 369 feet long, which was sold to the city for \$65,000. The streets run N.W. and S.E., following the course of the river. Wharf-street, on the river, is 880 feet wide; the next is 120, and the other streets are from 120 to 180 feet wide. There are crossed at right angles by other wide streets. The public buildings are a courthouse, 93 by 47 feet, and three stories high, with a cupola. In the basement are offices of various descriptions. In the second story are the court rooms; in the third are offices of the clerks; a jail, a market house, five churches, two Presbyterian, a Methodist, Episcopal, and Baptist; and two banks. A great amount of cotton is shipped from this place. Eight or ten steamboats are employed on the Ocmulgee, besides towboats and poleboats. In 1823 a single cabin occupied the site of the city. It is now the third place in population in the state, being exceeded only by Savannah and Augusta. It contained in 1840, nine commercial houses in foreign trade, capital \$75,000; 29 retail stores, capital \$385,000; nine lumber-yards, capital \$7500; one grist-mill, three printing-offices, three weekly newspapers, and one periodical; one college, 150 students; three academies, 200 students; two schools, 75 scholars. Pop. 3927.

MACOUPIN.

MACOUPIN, p. v., cap. of Noxubee co., Miss., 185 m. N.E. Jackson, 355 W. Situated on the Noxubee river, and contains a courthouse and several dwellings.

MACOUPIN, p. v., Lenawee co., Mich., 60 m. S.W. Detroit, 590 W. Watered by the S. branch of Raisin river. It contains three saw-mills, seven schools, 311 scholars. Pop. 1146.

MACOUPIN, co., Ill. Situated a little S.W. of the centre of the state, and contains 864 sq. m. Organized in 1830. Watered by Macoupin creek and its branches. It contained in 1840, 11,773 head cattle, 10,331 sheep, 37,917 swine; and produced 43,919 bushels of wheat, 54,530 of Indian corn, 57,685 of oats, 17,179 of potatoes, 11,196 pounds of tobacco. It had 19 stores, two flouring-mills, 16 grist-mills, seven saw-mills, one tannery, three distilleries; one academy, 45 students; 14 schools, 375 scholars. Pop. 7686.

MACQUARRIE RIVER. See AUSTRALIA, vol. I, p. 212, 213.

MACROOM, an inland town of Ireland, co. Cork, prov. Munster, on the Sullane, 30 m. W. Cork. Pop. in 1831, 2853. It is a poor, mean place, consisting of a single street, mostly of cabins. It has a parish church, a Roman Catholic chapel, a large school, a courthouse, market-house, and constabulary barracks. A manor-court for the recovery of debts to the extent of £3 is held every three weeks. General sessions are held in December, and petty sessions on alternate Tuesdays. Markets on Saturday. Post-office revenue, in 1830, £336; in 1836, £235. Near the town is a large cavern, the interior of which has not been thoroughly explored.

MADAGASCAR, a large island of the Indian ocean, off the E. coast of Africa (from which it is separated by the Mozambique channel), between lat. 19° 9' and 25° 40' N., and long. 44° 30' and 51° 30' E., length, 930 m.; average breadth, 300 m. Area estimated at about 234,400 sq. m., being somewhat greater than that of France. This country, of which only a few years ago we had scarcely any knowledge, has recently been visited and explored by missionaries and other travellers; so that we now possess very satisfactory information respecting the island and its inhabitants. The coast is generally flat and low; but the interior is considerably diversified, and, though it is not traversed by any continuous chain, many parts, especially the E. N., and S. districts, may be called mountainous, its highest point, Ankaratra, in lat. 19° 40' N., long. 47° 30' E., is about 11,000 ft. above the sea. These mountains consist of granite, syenite, and quartz, covered in the lower parts with clay-slate, primitive limestone, and old red sandstone; volcanic rocks occur in several places, and coal strata, abounding with iron, are widely distributed through the island. Rock-salt and nitre occur near the coast; and iron pyrites, oxide of manganese, and plumbago, have been found in some districts. The rivers of Madagascar are numerous, and many of considerable size, the greater number flowing into the sea on the W. side; but most of them are choked with sand, have frequent falls and rapids, and are almost entirely unnavigable. There are likewise numerous lakes, not only in the central parts of the island, but also in the low alluvial districts near the sea, some of which are remarkable for their size and beauty. The most fertile parts are the valleys, most of which produce rice or other vegetables, or else are clothed with a rich and luxuriant verdure. The climate of Madagascar is extremely diversified; that of the coast being oppressively hot, while in the interior the temperature seldom exceeds 85° Fahr. The heat at Antananarivo, the capital, fluctuates between 40° and 85°; the middle of the day in summer is often extremely sultry, but the mornings and evenings are always pleasant. From May to October (the winter months of this island) the ground is often covered with hoar-frost, and the heat seldom exceeds 40°. At other seasons, however, the fluctuations between heat and cold are extreme and sudden, the temperature in the morning being seldom more than 40°, whereas, in the same day, the afternoon heat often exceeds 80°. The climate of Madagascar is extremely prejudicial to Europeans, in consequence chiefly of the effluvia rising from stagnant lakes and swamps near the coast; but in the central parts, and especially in Ankova, the metropolitan province of the island, the malarial fever does not exist. The weather on the coast is usually hot and damp or rainy; but in the interior the rains are periodical, in a great measure regulating the divisions or seasons of the year. The trade winds from the E. and S.E. prevail during the greater part of the year; but the rains are often accompanied by violent gales from the N.W., W., and S.W. Earthquakes are occasionally felt, and the capital has more than once suffered considerable damage from such visitations.

Among the animals peculiar to Madagascar, may be mentioned five varieties of the monkey, foxes, wild dogs, and cats, hogs, goats, a peculiar kind of cattle and sheep similar to those of the Cape of Good Hope; crocodiles swarm in nearly all the rivers and lakes, and are objects of great

MADAGASCAR.

dread to the natives; serpents, also, some of large size, abound in the woods, and lizards, scorpions, and centipedes, are very numerous and troublesome. Birds also, of various kinds, are found in the forests, the principal of which are the parakeet, flamingo, falcon, kite, turtle-dove, pigeon, turkey, and different varieties of land and water fowls. The sea abounds with fish of various kinds, and oysters are numerous on the coast. The soil in many parts is prolific and highly susceptible of improvement, and the island produces numerous and highly valuable plants. The forests yield abundance of trees of varied durability and value; some used as dye-woods, others in building, with ebony, betel, mangrove, dragon-tree, bamboo, sugar-cane, locust-tree, *Urena* species, caoutchouc-tree, plantain, banana, zahana (*Bignonia articulata*), hibiscus, mimosa, castor-oil plant, longosa (*Coccoloba zelaeria*), cotton, indigo, and tobacco plants, allspice, pepper, ginger, turmeric, and rice. Various other vegetable productions have been introduced, such as the cocoa-nut, bread-fruit, yam, manioc, lemon, orange, peach, mulberry, quince, fig, and pomegranate. Several varieties of the Ceylon vine have been found to thrive well, the coffee-plant has been brought from the Mauritius, and the potato is largely cultivated, as well as highly esteemed; but the common European cereals have met with little encouragement. The flora of the country is abundant, but the brilliant aspect usual to the gardens of tropical countries is here missed, in consequence of the rapid alternations of heavy rains and extreme drought.

The husbandry of Madagascar, pursued by a distinct class, consists, in great measure, of the cultivation of rice, which is conducted with great care and success. Good time is in September; at which season the grain, after being steeped in water, and subsequently kept in a warm place till it begins to sprout, is very thickly sown in a fine mould, almost covered with water artificially introduced into the fields. The water is afterward drained off, manure is thrown over the seed, and as soon as the sprouts appear above the surface, moisture is again applied. The average produce in inferior grounds is said to be about 50 for 1; but the best cultivated grounds are alleged to produce seventy and even one hundred fold, the harvest being in January and February. Each rice field is separated from those adjoining by banks rising about six inches above the field, and affording great convenience to the labourers. Neither wagon, cart, sledge, nor beast of burden, is used in getting in the harvest, and the threshing is conducted either against a stone, or on the floor, by simply beating the ears with the hand. The secure storing of the grain, however, is an object of special attention; the Ovahs, the prevailing tribe of the island, have underground storehouses, made with extreme ingenuity; but other tribes have granaries above ground, bee-hive shaped, about 16 ft. high, made of thick, clay-built walls, and entered only from the top. Manioc is another great object of farming industry; it is raised from cuttings, and about 18 months elapse between the planting and harvest. The roots, usually about 10 inches in length by three in diameter, are prepared for use by scraping and boiling, and are sometimes made into cakes. Cotton is cultivated to a considerable extent; and the pigeon-pea (*Cytisus cajan*) is raised for the purpose of rearing silk-worms. The European cereals have been introduced by the missionaries; the plough and harrow have likewise been brought into use, and oxen broken in to cultivate the ground; but the natives prefer their old and imperfect methods of preparing the soil, to the adoption of readier plans, and superior implements. Next to the cultivation of the soil, the working of iron is the most important occupation of the people. In some parts the iron ore is found in large quantities on or near the surface, whence it is gathered in baskets and smelted for use; but when it is dug out of the ground, numerous small pits are made about 6 feet in depth, and no further attempt is made to explore the riches of the interior. The ore is first crushed, then broken into small pieces, and afterward submitted to the action of a charcoal fire in a rude furnace of stone-work, built up to the height of 2 or 3 feet without mortar, and thickly plastered with clay on the outside, the blast being obtained by means of wooden cylinders, in which a rude sort of piston is fitted to drive the air into a bamboo cane through the fire. The native forges are equally simple; the anvil, about the size of a sledge hammer, is fixed in the ground near the fire, the water-trough is close by, and the smith, when at work, squats on a piece of board while his attendants surround him, armed with large hammers, and ready to strike the metal according to his directions. The articles thus manufactured comprise spears and javelins, knives, hatchets and axes, chisels and hammers, a rude sort of plane iron, files, pots, spoons, lamps, and nails; besides which they have been taught by the English to make hinges, screws, and locks, as well as to draw copper and iron wire. The manufacture of swords and fire-arms was introduced by the French a few years ago, and the native goldsmiths and sil-

MADAGASCAR.

vernales evince considerable ingenuity in making rings, chains, and other gold ornaments, silver diadems, mugs, spoons, &c. The felling of timber (which appears to be a monopoly of the government) employs about 700 men; the pit saw has been brought into general use, and the native carpentry has been so much improved by the application of European tools, that their work may be justly styled "strong, neat, and well finished." (*Ellis*, vol. i. p. 317.) The art of turning wood is practised by the best workmen of the capital; earthenware is made with considerable skill and taste, and many hands are employed in making rope and twine, as well as in tanning leather. The chief occupation of the people, however, next to the cultivation of rice, is the spinning and weaving of silk, cotton, and linen fabrics; but all the processes are so extremely simple, imperfect, and tedious, that it is a matter for surprise that the threads of their cloth are even and well-twisted, the weaving regular, and the patterns regular, and exhibiting fancy and good taste. The art of dyeing is also practised, and several of the native dyes produce bright and durable colours.

The population of Madagascar consists of four chief political divisions, the numbers of which are estimated to be as follows:—

The Ovahs (in the central table-land) . . .	800,000
Bakalavats (W. side of the island) . . .	1,300,080
Betsileo (S. of the Ovahs) . . .	1,500,000
Betaninana and Betalamarka (on the E. coast)	1,900,000
	4,700,000

It is said, also, that this amount of population is considerably less than it was a few years back, owing chiefly to wars between the different tribes, the prevalence of the slave-trade, &c. It is, also, supposed that the practice of infanticide, which is alleged to have prevailed from time immemorial, has contributed to reduce the population. But most probably the influence of this practice is greatly overrated; and it is evident it cannot at all account for the recent decrease. The inhabitants differ materially in appearance and character, nor is there any doubt, though the people are nominally comprised in one political empire, and speak one language, that they include several distinct and peculiar nations. The distinction of colour separates the population into two great classes, the Ovahs, and a few other tribes, having olive complexions, handsome features, graceful persons, and lank dark hair, whereas the inhabitants of the shore, and indeed the majority of the people greatly resemble the Papuas, being short and stout, almost black, with low foreheads, broad flat faces, large eyes and mouth, and long crisp hair. There are differences also in the languages spoken by various sections of the population, and many of their customs vary so much, as to make it clear that, however amalgamated, they are not one nation, but a combination of several distinct races. With the exception, however, of the Ovahs, they are little better than barbarians, run almost naked, despise a fixed life, are extremely superstitious, and practice most of the vices so generally prevalent among the savages of the neighbouring continent. Circumcision is universal, marriages are formed in very early life, and divorces are very common, and easily effected, the law permits polygamy, restricting the husband to 19 wives; but few have more than two, or at most three. Fidelity to the marriage engagement, however, forms no part of the female character, and modesty is a virtue almost unknown. Their houses are usually of rude construction, except in the capital of the Ovah country, where European improvements have been partially introduced. The diet of the people consists, in great part, of rice and manioc, with smaller portions of beef, poultry, &c., and the cookery is extremely simple.

Pedlary and hawking are favourites, though not profitable occupations. The markets are favourite places of resort for all classes; and not only is there a daily general market at Tananarivo, but four or five large markets are held in different parts of the province, and well attended by a vast concourse of people from the adjoining districts. Animal and vegetable productions, native and foreign manufactures and cattle are exposed promiscuously; and in no nation are there more clever and persevering bargainers than in Madagascar. The slave-trade, also, which a few years ago was nearly extinct, is now said to be pursued on a large scale. Money has not been coined on the island; dollars are more or less known in all parts, through communication with Europeans; but the trade is more generally carried on by barter. Most goods are sold by measure; rice by the bushel, meat by the *eye*, snuff by the spoon, fuel by the bundle, &c. Rice, which may here be considered the standard of value, costs about 1s. a bushel; 20 ducks or fowls may be purchased for a dollar, geese cost about 9d. each, and a fine turkey may be got for 1s. A bullock costs from three to eight dollars, sheep average about 1s. 6d. each, and 30 good

pine apples may be had for 3d. Labour is also extremely low, many working for mere food, and others gaining only 2d., or at most 4d. a day. An intercourse has long been carried on with Madagascar by Arabs from Muscat, Indians from the presidency of Bombay, Europeans from the Cape of Good Hope, and Americans from Brazil and the United States. The taste of the people for foreign goods was also on the increase a few years ago; and horses, saddles and bridles, scarlet cloth, gold lace, red satin, purple, green, and yellow silk, silk handkerchiefs, sewing silk, calico and printed goods, hosiery, gloves, finger rings, watches and musical boxes, hardware, salt, and, above all, arrac and rum, fetched very high prices in the markets of Antankara; but since the death, in 1838, of Radama, the most enlightened monarch that ever held sway in Madagascar, the foreign trade has greatly declined, and the policy of the present government seems to threaten the entire cessation of all trade with Europeans.

Madagascar was divided into 38 provinces, all of which have their separate chiefs; but for some years past the Ovahs have been reckoned the prevailing tribe, the chief of which is, in effect, the king of the island, receiving tribute from, and exercising sovereignty over, all the rest. The government is despotic, and the succession to the throne is commonly hereditary, the monarch having the right not only to appoint his immediate successor, but also to settle the line through future generations. He is the father of his kingdom, appoints every subordinate officer, enacts laws and orders their execution, decides cases and raises armies; but he often convokes assemblies of the people, for the purpose of obtaining information or advice on matters requiring mature deliberation, or in cases where the wishes of the aristocracy have to be consulted. The royal family is highly honoured, and no people can be more tenacious of etiquette, and the respect due to rank. The judges, who rank next to the blood royal, hear causes, decide disputes, and are exclusively privileged to communicate between the sovereign and people. Subordinate to these are the *ferentse*, the police and tax-gatherers of the country; the *amban-jats*, or local magistrates; the *marosserena*, or military governors of provinces (a very powerful and important body); and the *sedintany*, or royal courtiers, who not only carry government dispatches, but constitute a general patrol for the country. The king receives tithes of all produce, enjoys the monopoly of timber, and is exceedingly rich both in slaves and cattle, receiving also a considerable *ad valorem* duty from the possessors of these valuable articles. The sovereign is also high-priest of the realm, and presides over the great national sacrifices. The religion of the country is a rude species of polytheistic idolatry, and the people almost without exception believe in witchcraft and the efficacy of charms. Christianity was introduced with temporary success by English missionaries, in 1818-1830; but it is believed that at present it is almost powerless, in consequence of the royal edict of 1835, which not only forbade its public profession, but legalised the persecution, and even enslavement, of all natives becoming its adherents.

Madagascar, the earliest accounts of which were given by Marco Polo, from the narrative of others, was discovered, in 1506, by the Portuguese, who established a settlement close to the S. end of the island, and soon after tried, though with little success, to introduce the Roman Catholic religion. It was at first resorted to merely as a place of refuge and provisioning station for ships; but in 1642 an attempt was made by the French to make it one of their colonies, which however proved futile, in consequence of its extreme unhealthiness; and in 1664 most of the colonists removed to the neighbouring island of Bourbon. The Jesuits meanwhile continued to exert themselves in the establishment of Christianity; but owing to the injudicious zeal of Father Stephen, the superior of the mission in Madagascar, the natives were exasperated at the innovations of the foreigners, some of the missionaries were massacred, and the rest were glad to escape from the island. Various attempts have subsequently been made by the French to establish a permanent settlement, and since the general peace of 1815 they have formed four small colonies on the E. coast, as well as on the contiguous island of Madame-St. Mary. The English missionaries were allowed to visit Madagascar in 1818-1823, with full permission to disseminate their moral and religious views, and the sovereign Radama was favourable to the establishment of schools and the introduction of improved methods both of agriculture and manufactures. Since his death, however, there has been a stagnation in the trade with England, the missionaries have been forbidden to approach the island, all possible means have been adopted to destroy the effects which the exertions of Europeans had accomplished in eight years, and Madagascar may now be ranked among the barbarous countries of E. Africa. (*Roche's Voyage to Madagascar*; *Ellis's Hist. of Madagascar*, vol. i. *passim*; and valuable private information.)

MADAWASKA.

MADAWASKA, L. Aroostook co. Me., 290 N.E. by N. Augusta. Bounded N. by St. Johns river. It contains five stores, four grist-mills, one saw-mill, three schools, 56 scholars. Pop. 1584. The settlement lies along the road, following the course of the river. The part N. of the river, by the late treaty, belongs to New-Brunswick, and contains 1676 inhabitants.

MADDALONI, a town of S. Italy, king. of Naples, prov. Terra-di-Lavoro, cap. canton, 14 m. N.N.E. Naples. Pop. 10,500. It has several churches and convents, a house of refuge, a royal college, and a noble aqueduct, which conveys water to the royal palace at Caserta.

MADERA, a great river of S. America, a tributary of the Amazon (which see).

MADEIRA, a famous island in the N. Atlantic ocean, belonging to Portugal, Funchal its cap. on its S.E. side, being in lat. 32° 35' N., long. 16° 54' 30" W.: length of Madeira, about 46 m.; breadth about 7 m. Area, estimated at above 300 sq. m.; it is a mass of basaltic rock, presenting to those approaching its N. coast, numerous disjointed crags, and tall isolated peaks, interspersed here and there with less elevated spots of verdure, the whole being based on enormous, dark-looking columns, rising perpendicularly several hundred feet from the sea; which is usually so deep, even close in shore, that soundings are not found in less than 50 fathoms and upwards, except in Funchal road where ships anchor in from 30 to 35 fathoms. The cliffs on all sides are very lofty: the *Ponta d'Agria* (eagle's rock) on its N. coast, a black cubic-shaped mass of rock, is upwards of 1000 ft. high; and C. Fago, at the N.W. extremity of the island, rises 4000 ft. above the sea; but the most curious feature on the coast is the *Punta S. Lorenzo*, at its E. extremity, a ledge of rock 8 m. in length by 1 m. in breadth, which, though less lofty than other parts, is remarkable for its bold projection into the sea, and its fantastically-broken cliffs and peaks. The rapid declivities of the island are furrowed by deep and narrow valleys, at the bottom of which flow rivers of pure spring water; and up their sides vineyards are formed by means of successive terraces, to the height of 2300 ft. above the sea. The mountain scenery of the interior is bold, and highly romantic; one part, a few miles N.W. of Funchal, being called, by way of distinction, "the Switzerland of Madeira." Here is a deep valley, or crater, inclosed on all sides, except seaward, by a range of magnificent precipices, rising upwards of 1000 ft. above the vale, the summits and sides of which are broken into every variety of dark beetling pinnacle, or flattened and tree-clad buttress; while far below smiles a fair region of cultivation and fruitfulness, rich in every species of vegetation, though itself rather more than 3000 ft. above the sea level. The culminating point of the island is *Pico Ruivo*, rising 5450 ft. above the sea, and covered with vegetation to its summit. Three rivers, or rather torrents, rise on its sides, and cross the island in several directions, contributing greatly to its fertility. The streams are carefully collected, and rendered more available for the purposes of agriculture, by means of artificial channels, or *levadas*, with sluices, constructed with vast labour. At present (1840) a great work of this kind is in the course of being completed, by which a copious stream, which is precipitated from the top of a cliff 1000 feet in height, will be made subservient to the purposes of irrigation.

The climate of Madeira fluctuates less than that of any country N. of the equator: its mean annual temperature having been found, in a period of 18 years, not to exceed 68° Fahr., that of the hottest months (Aug. and Sept.) being 74°, and that of the coldest, (Dec. and Jan.) 62°, the glass seldom falling below 52° even in the severest weather. The heat of summer, however, is considerably higher, being increased from 10° to 15° during the prevalence of the hot and parching E. winds (the *seirices*): that blow off the African continent. The temperature of Funchal, however, is considerably higher than that of the island in general: there dews are slight, and the rains few and far between; but in the higher parts of the island, a cool climate is rendered more delicious by frequent dews and rains enriching vegetation, and rendering the air fresh and salubrious. This remarkable equality of climate, not only through the year, but during the days and nights, constitutes the chief recommendation of Madeira to invalids. Persons subject to chronic pulmonary complaints, unattended by any material disorganization, have derived much benefit from a voyage to Madeira; as have others afflicted with diseases of the windpipe; and a still greater number who are the victims of dyspepsia, or other maladies of the stomach, the cure of which is hastened by the regular habits and exercise usually taken by invalid residents in the island. The efficacy of the climate, however, in cases of confirmed tubercular consumption has been absurdly exaggerated. It may then, indeed, lengthen life a little; but it cannot effect a cure. During the last half century, vast numbers of invalids, of whose recovery no rational hope could be enter-

MADEIRA.

tained, and who should have been left quietly to expire at home, have been hurried off to this island, at an expense which they could often but ill afford, for no purpose unless it were to amuse them with false hopes, or that they might occupy a place in Funchal churchyard. Invalids should not attempt the voyage before the middle of June, nor later than the end of September; spring is a trying season, owing to the prevalence of N.E. winds; and October is the first month of the rainy season of autumn.

Every part of Madeira, not encumbered with rocks, is extremely fertile; the hills are covered with luxuriant vegetation, and the most delicate flowers grow on their summits, which are constantly moistened with dew from the clouds overhanging the island. Trees and shrubs of the finest kinds are everywhere abundant, and tropical plants which have strayed from the gardens soon become naturalized to the soil.

"Here" says Mr. Wilde, "all is sunshine: the green bananas, and their beautiful feathery tops, tell the visitor that he has bid farewell to Europe: the orange trees hold out to him their branches, laden with golden fruit. Plantations of coffee trees fill the spaces between the houses, the splendid coral tree hangs over his head, and the snowy bells of the tulip tree mingle with the scarlet hyacinth. If he wish for exercise, he has the most inviting walks, and the most tempting shades to shelter him: wide-spreading plane trees, and willows of gigantic growth, bend their slender arms over the streams that murmur from the hills. As he begins to ascend from Funchal, the beauty increases, and the sea-view opens to his sight. The roads, though steep, are well paved, and the horses trained to an easy pace. He rides through a perfect vineyard, where in many places the vines are carried on trellises over the road, and large bunches of grapes hang within his reach. Hedges of geraniums, fuschias, and heliotropes, border those narrow paths, and shade him from the sun; the *Ficus indica* clothes the cottages, the *Salvia fulgens* and Guernsey lily are sprinkled over the vineyards, and the *Camelia japonica*, with its delicate white flower and waxy leaf, adorns every quince. Higher up grow the yam, prickly pear, dragon-tree, and cedar, the aloe, agave and hydrangea, the sweet potatoe, and the *Phormium tenax*; and heaths and pines crown the highest summits of the island." (*Narrative*, l. 69-91.)

Thus it appears, that below the elevation of 1900 ft., many of the most useful tropical plants, as the date, palm, guava, banana, coffee plant, &c., are found, with numerous others peculiar to the warmer part of the temperate zone. Up to 2500 ft., the fruits and grains of Europe, especially maize and corn, are raised; and nearly the whole of this district is covered with vineyards. The chestnut, which is extremely abundant, the beech, and other European trees, with the mahogany, attain an elevation of 3400 ft., above which rise pines, heath, ferns, and grasses. Pasture is scanty: few cows are kept, and the products of the dairy are here expensive luxuries. Horses are little used, their place as beasts of burden being supplied by mules and asses of the Spanish breed. Goats and hogs are very numerous, and are allowed to run wild on the mountains, where also are found large quantities of rabbits. Poultry is abundant, and cheap; and small birds of magnificent plumage occupy the groves. Myriads of finely variegated lizards crowd the gardens and vineyards, occasionally doing much damage to the grapes; but there are no venomous reptiles, and the inhabitants are free from that insect plague that is usually one of the drawbacks of warm countries. The honey bee is abundant, and produces fine honey. Many varieties of fish are caught on the coast, especially tunnies and eels, which are the favourite food of the inhabitants.

Agriculture is chiefly confined to the raising of vines. Land is usually let out in small holdings, varying from 10 to 40 or 50 acres, and the rent is estimated, on the *metayer* principle, at half the produce, according to a yearly valuation of the crops. Wheat, barley, and rye are produced; but the crops average little more than a third part of the annual consumption. The wheat grown in 1837 is said, though we attach little credit to such statements, to have amounted to 6787 qrs., the barley to 2664 qrs., and the rye to only 570 qrs. Wheat is sown in Oct., and reaped in June, this crop being followed by another of beans or sweet potatoes. Rice is cultivated more as an ornamental grass than for any useful purpose; and Indian corn, which is admirably adapted to the climate, and is much used as an article of food, has till very lately been little grown.

Considerable attention has lately been devoted to the cultivation of the coffee plant, which, should the demand for wine not increase, may, perhaps, become of considerable importance. Fruits and vegetables are raised with little trouble, and the show in the fruit market of Funchal, in a grove of noble palm-trees, would astonish any untravelled European, even from Italy or Spain. Here, besides all the ordinary fruits and garden vegetables of S. Europe, as oranges and lemons, green figs, grapes, pomegranates, water

MADEIRA.

and Valencia melons, pumpkins, &c., one may see bananas and guavas, finer even than those grown in the W. Indies, custard-apples, alligator pears, (the fruit of the *Lasurus Persae*), numerous tribes of cucurbit, the exquisitely flavoured fruit of the *Cactus triangulatus*, the Cape gooseberry sent as a preserve to Europe, and the *tscho-tscho*, said to be "delicious." But its wine is the great glory of Madeira. The grape is not indigenous to the island; and it is said to have received its first plants from Crete, carried thither by order of the famous Prince Henry of Portugal, under whose auspices it was settled by the Portuguese in 1431. Many other varieties of the grape have since been carried to the island, its mild climate and volcanic soil being especially suitable for their growth.

The steepness of the hill-sides, on which the vines chiefly grow, and the necessity of economizing valuable space, have led to the practice of raising the vine-beds on successive terraces, supported by retaining walls. The vines are trellised on bamboo and other supports for the purpose of exposing the grapes to the ripening influence of the sun, and the bunches are frequently of enormous size. The usual method of cultivation is to trench the ground from four to seven feet deep, according to the soil, and to lay a quantity of loose or stony earth at the bottom, to prevent the roots from reaching the clayey soil beneath, which would otherwise hinder their growth. The ground is watered three times, if the summer be very dry, and each time it is thoroughly saturated; but the less it is watered the better is the wine, though the quantity, of course, be diminished.

The N. side of the island, though sufficiently fertile, being the most exposed to cold winds and fogs, is not so favourable to the culture of the vine as the S., where all the finest growths are raised. The best Madeira-malmsey, or *Malveira*, is produced on rocky grounds exposed to the full influence of the sun's rays, the grapes being allowed to hang till they are dead ripe. The *Sercial* grape will, also, only succeed on particular spots. The wine made from it, is, when new, harsh and austere, and requires to be long kept. The best Madeira wine is produced on the S. side of the island; but it is alleged that not less than two-thirds of the wine grown even in this quarter is of secondary quality; so that in Madeira, as in all wine countries, the first growths (*premiers crus*) are both scarce and dear. The process of making the wine is very simple. The grapes are picked from the stalk, thrown into a vat, pressed, first with the feet, and afterwards with a weighted wooden lever. The proprietor of the land, and the collector of taxes for the crown, both attend at the press; the latter takes out of the tub his *tenth* of the whole mass, the remainder being equally divided between the landowner and the tenant. Each takes with him a sufficient number of porters to carry away their respective shares, sometimes in barrels, but more frequently in goat skins, *berrackas*, to the cellars in Funchal, where the English merchants have extensive yards and vats for storing the wine, and carrying it through the usual processes of fermentation, mixture, &c. They frequently advance money beforehand to the growers, to enable them to defray the expenses of cultivation. (*Barrow's Voyage to Cochin China*, p. 22.)

Though naturally strong, a quantity of brandy is added to Madeira wine when racked from the vessels in which it has been fermented, and another portion is added when it is about to be exported. The demand for Madeira wine in the E. and W. Indies, where it is highly esteemed, first led to a knowledge of the improvement it derives from being carried to a warm climate; and it has long been customary for ships outward bound for India and China to touch at Madeira, and take large quantities of wine on board, which they bring home to England. But it must not be supposed that all the Madeira wines that has gone to Calcutta and Canton is necessarily better than any brought direct from the island, as much must obviously depend on the quality of the wine sent to the east. But, if due care be taken in the selection of the wine sent to India and China, it is very much improved and matured by the voyage; and it not only fetches a higher price, but is in all respects superior to the direct importations. Most of the adventitious spirit is dissipated in the course of the Indian voyage, and the full flavour of the wine is evolved.

1. Madeira wines may be kept for a very long period.
2. "Like the ancient vineyards of the Surrentine hills, they are truly *aristocratic wines*, retaining their qualities unimpaired in both extremes of climate, suffering no decay, and constantly improving as they advance in age. Indeed, they cannot be pronounced in condition until they have been kept for ten years in the wood, and afterward allowed to mellow nearly twice that time in bottle; and even then they will hardly have reached the utmost perfection of which they are susceptible. When of good quality, and matured as above described, they lose all their original harshness, and acquire that agreeable pungency, that bitter

sweetness, which was so highly prized in the choicest wines of antiquity; uniting great strength and richness of flavour with an exceedingly fragrant and diffusible aroma. The nutty taste, which is often very marked, is not commended, as some have imagined, by means of bitter almonds, but is inherent in the wine." (*Henderson*, p. 253.)

The wines of Madeira have fallen of late years into disrepute in England. The growth of the island is very limited, not exceeding 15,000 or 18,000 pipes, of which a considerable quantity goes to the East and West Indies, and America. Hence, when Madeira was a fashionable wine in England, every sort of deception was practiced with respect to it, and large quantities of spurious trash were disposed of for the genuine vintage of the island. This naturally brought the wine into discredit; so that sherry has been for several years the fashionable white wine. It is difficult, however, to imagine that adulteration should ever have been practiced to a greater extent upon Madeira than it is now practiced upon sherry. It is not, therefore, improbable that a reaction may take place in favour of Madeira, which has sunk to a much lower place in the public estimation than it deserves to hold. In 1697, 308,295 gallons Madeira were entered for home consumption, whereas the quantity entered in 1839 amounted to only 118,715 gallons, being less than 5 per cent. of the sherry entered for consumption in the same year! Such is the power of fashion, for there cannot be a question that really good Madeira is one of the very best of wines.

The commerce of Madeira is very considerable; the exports consist principally of wine. Among the minor articles of export are fruits, both fresh and preserved, dragons' blood (the gum of the *Calamus draco*), honey and wax, orchil (a white lichen used in purple dyeing), tobacco, and provisions for ships. Its imports comprise manufactured goods, sheep, salted provisions, fish (especially herring and cod), oil, corn, and some tropical productions. We subjoin a statement of the vessels, and their tonnage, which arrived at and left Funchal in 1837; specifying the countries whence they came, and for which they cleared out, with the value of their cargoes:—

Countries.	Arrived.			Departed.		
	Ships.	Tons.	Value of Cargoes.	Ships.	Tons.	Value of Cargoes.
Gt. Britain	130	29,428	53,386	131	29,270	131,066
Portugal	75	5,339	34,672	75	5,859	6,355
U. States	35	5,284	27,301	35	5,205	71,295
Sardinia	28	4,336	30,431	32	4,598	91,515
Denmark	10	1,264	6,294	9	1,728	13,000
France	7	945	5,620	7	945	4,385
Holland	3	507	1,940	3	507	11,100
Other countries	14	1,264	9,090	14	1,264	1,200
Total	305	50,371	159,364	307	50,372	340,500

The imports from England in 1838, comprised cotton, woollen and linen fabrics, and haberdashery, to the value of £23,370, with coal, earthenware, butter and cheese, salt meat, rice, sugar, &c., making in all a total value of £35,000. The Americans send timber, whale-oil, salt fish and meat, spermaceti candles, with other articles, in small quantities, to the value, in 1839, of 41,057 dollars.

The government of Madeira has at its head a lieutenant-governor, whose power is so extensive that the comfort and happiness of the inhabitants, especially the British, are greatly dependent on his character and acquaintance with the island. Justice is administered by a tribunal in whose favour little can be said, from which there is an appeal to the courts at Lisbon. The crown revenues are derived partly from a duty of 90 per cent. on all imports, except provisions; but the most productive source is the tithe of wine, with an additional duty per pipe on the quantity exported. A revenue is also derived from the monopoly of salt, cards, and soap. The revenue is sufficient to defray the expenses of the civil, military, and ecclesiastical establishments; considerable sums are likewise expended in public works, roads, &c., and frequently there remains a surplus which is remitted to Portugal. The number of clergy, including monks and nuns, is stated to be somewhat under 300; they are partly supported by the crown revenues, the tithe on wine being originally intended for their maintenance; but the present government allowance, which they receive in lieu of it, is extremely small; so that the monks and clergy traffic in wine, or engage in other secular business, while the nuns gain a considerable income by making artificial flowers of wax and feathers, which are justly admired for their delicacy and beauty, and purchased by visitors and shippers at high prices. It would be well, however, were both nuns and monks suppressed. According to Sir John Barrow, who is by no means disposed to be over-zealous, "The clergy are not very rigid in exacting from others the duties of religion, nor in setting an example of pious conduct in their own persons. On the contrary, the loose

MADEIRA.

manners, the temperate mode of life, and the free conversation of many of the monks, are a disgrace to the sacred office which they hold." (P. 14.)

The population of Madeira, which, including Porto Santo (see post), was ascertained by a late census to amount to 112,500, is a mixed race, sprung principally from Portuguese and Moors; but in Funchal many of the labouring classes show, by their English faces and complexions, that there has been a considerable intermixture with British settlers. Negro slaves, also, are still numerous; but they seldom intermarry with those of European origin. On the whole, the natives are a finer and more comely race than the Portuguese; they are of the middle size, well formed, and strongly knit, with masculine features, hair, and complexion. The women are almost universally under the standard height, and, when young, display handsome features, which, however, soon become coarse and unattractive, owing to their laborious field occupations. The men are dressed, somewhat in the costume of English sailors, with large full leather boots, and a little funnel-shaped cap on their heads. This curious head-gear is worn also by the women over the white muslin handkerchief, which covers the head and hangs down over the shoulders; and their gay chitras gowns, and scarlet pelerines give them a light and picturesque appearance. "It is delightful," says Mr. Wilde, "to see groups of these peasantry in companies of eight or ten sitting in some places under the umbrageous palms, eating their morning's meal, or completing their toilet, before entering the town, while others are hastening along, loaded with the various produce of their gardens, consisting of bunches of yellow bananas, strings of crimson pomegranates, &c., or carrying fowl, firewood, and fish to the market of Funchal, each little party preceded by its mandolin-player, who at times accompanies the wire-strung instrument with his voice, and is joined at intervals by the hearty chorus of the whole group." But the condition of a people is not to be learned from such holiday descriptions as this; and the truth is, that the native inhabitants of Funchal are meagre, sallow, and short-lived. "This," as Sir John Barrow has stated, "is not to be attributed to the climate, but to the poverty of their food, which chiefly consists of pumpkins, sour wine, or pernicious spirits; to a life of drudgery and exposure to the great vicissitude of climate, by daily ascending the steep and lofty mountains in search of fuel; and, above all, to a total disregard of cleanliness." In fact, all the natives of the island are infected with a species of itch, which they regard as incurable, and which is accompanied with a great degree of inflammation. (Barrow, p. 11.) Among the richer inhabitants are many Portuguese *fidalgos*; but by far the larger part are merchants and private residents belonging to almost every commercial country, especially Great Britain. These hold little intercourse with the other inhabitants, but live either in their town-houses at Funchal, or at their villas or *quintas* higher up the island, where they exercise the most liberal hospitality. A small tax on wine sent to England is levied by our consul, to form a fund for charitable purposes, which is further increased by the benevolent contributions of the merchants, who also support an English episcopal church, the present minister of which (Mr. Lowe) is at once a zealous clergyman, and a scientific naturalist.

Funchal, the only town of Madeira requiring any special notice, is situated on the S.E. side of the island, and stretches nearly a mile along the margin of the bay. It is irregular, inconvenient, and meanly built, with narrow, crooked, steep, and dirty streets, some of which being paved with sharp-pointed pebbles, are extremely painful to walk upon. Streamlets of water run down some of the streets from the overhanging mountain; but when Sir John Barrow was here, the inhabitants washed their clothes, cleaned their fish, and threw their filth, &c. into these streamlets; so that, in fact, they were rendered rather a nuisance than anything else; but it is stated in late works on the island, that these inconveniences have been in part obviated, and the filth of the town materially abated. The houses are commonly low, not often exceeding one story in height, with white outside. Those belonging to the *fidalgos* or rich merchants are comparatively large and handsome, having at the top a *terrace* or turret, commanding a view of the harbour, used for reconnoitring vessels as they arrive in the offing. The governor's castle is a large clumsy looking Gothic structure, near the beach. The cathedral has a *paraiso*, or open space, before its W. door; and beyond it is the *Terreiro da Sé*, a pleasant promenade under several parallel rows of trees, enclosed by a low wall, and overlooked by pretty houses with balconies. In one of the wings of the Franciscan convent is a chamber, the walls and ceiling of which are formed or covered with human skulls and thigh-bones! The English church in the suburbs is an elegant and commodious building, literally embosomed in ever springing roses and white daturas. The convent of *Nossa Senhora do Monte*, amid groves of chestnut-trees half way

MADISON.

up the mountain, commands a very fine view. Funchal roads labour under several disadvantages: the anchorage is in 35 or 40 fathoms; land squalls are often extremely violent; a heavy surf on the beach, especially in spring, makes a landing at all times unpleasant, and sometimes unsafe, except in the shore-boats, in managing which the natives are very skilful. From the autumnal to the vernal equinox, when strong southerly gales throw in a heavy sea, the roads are peculiarly dangerous, and many accidents have then occurred.

A few inconsiderable islands in the vicinity of Madeira are included under its government. Of these Porto Santo, 35 m. N.W., is the only one that is inhabited. It has a parched barren aspect, and has but one fountain of good water. Its products comprise wine of an inferior quality, good barley, water-melons, and other fruits; but it is wholly destitute of wood. The town is insignificant, and is occasionally used as a place of exile from Madeira. The entire population of the island may be about 1400. The little islands called the Desertas, are occasionally visited by a few fishermen and smugglers, and the rest are mere rocks.

Madiera is said to have been discovered in 1344, by Macham, an Englishman, who was wrecked, and cast on its shores. But this story is very doubtful; and it seems most probable, that Juan Gonzalez, who had been despatched on a voyage of discovery by Prince Henry of Portugal, and who fell in with this island in 1419, was its real discoverer. When discovered, it was uninhabited, and covered with wood, and was on that account called *Madiera*, that being the Portuguese term for timber. It was settled by the Portuguese in 1421, and has since continued in their possession. (Robertson's *America*, book 1.) Its occupation by the English during the late war with France, being merely in order to prevent its falling into the hands of the French, it was restored to Portugal, at the peace of 1814.

MADELEY, a market town and par. of England, co. Salop, franchise Wenlock, on the banks of the Severn, 13 m. E.S.E. Shrewsbury, and 196 m. N.W. London. Area of par. 2750 acres. Pop., in 1841, 7368. The town, which is of considerable antiquity, and celebrated in history as having given refuge to Charles II. after the battle of Worcester, derives its present importance from its proximity to the great coal and iron district of Coalbrookdale. The church is a handsome modern structure, the living being a vicarage in private patronage. The Roman Catholics, Wesleyan, and Primitive Methodists have also their respective places of worship, and there is a meeting-house for the society of Friends. A national school is connected with the church, and there are four Sunday schools. The iron trade, carried on here to a considerable extent, is most facilitated by means of the Shropshire canal, which joins the Birmingham and Liverpool junction canal, and connects Madeley and the Kexley iron-works with the great manufacturing districts of Dudley, Wolverhampton, Birmingham, &c. About 2 m. W. of the town, and near the romantic village of Coalbrookdale, is a cast-iron bridge, erected in 1780, of one arch, 100 ft. in span, 40 ft. above the river, and containing 375 tons of metal, being the first structure of the kind raised in the kingdom. This beautiful rural district, embosomed between high and well-wooded hills, has within the last half century been converted into one of active mining and manufacturing industry, the furnaces now (1841) at work in this vicinity being estimated to produce 20,000 tons of iron a year. At Coalport, about 2 m. from the above mentioned bridge, is a considerable manufactory of china. Markets on Friday: fairs May 29, and last Tuesday in Oct.

The neighbourhood of Madeley is remarkable for an extraordinary convulsion of the earth, that took place in 1773, when about 30 acres of land were shifted from their site, and broken into irregular chasms, large oak trees were uprooted, and the Severn, blocked up for more than 900 yards by the displaced soil and fallen trees, was compelled to find a new channel, in which it now flows.

MADISON, county, N. Y. Situated a little E. of the centre of the state, and contains 563 sq. m. Watered by head branches of Chenango, Unadilla, Otsego, and Toughhonia rivers. Bounded N. by Oneida lake, into which some of its streams empty. Water-lime and gypsum abound, and marl and bog iron ore are found. The Erie and Chenango canals cross the county. It contained in 1840, 43,191 neat cattle, 204,616 sheep, 30,757 swine; and produced 200,143 bushels of wheat, 3225 of rye, 171,304 of Indian corn, 5998 of buckwheat, 135,635 of barley, 343,307 of oats, 676,649 of potatoes, 107,280 pounds of hops, 215,619 of sugar. It had 109 stores, three furnaces, 26 fulling-mills, 10 woolen factories, two cotton factories with 744 spindles, four flouring-mills, 39 grist-mills, 167 saw-mills, three oil-mills, one paper-mill, one rope-walk, 40 tanneries, seven distilleries, one brewery, nine printing-offices, three binderies, two weekly newspapers, and two periodicals; eight academies, 968 students; 253 schools, 12,297 scholars. Pop. 40,008. Capital, Morrisville.

MADISON, county, Va. Situated a little N.E. of the cen-

MADISON.

tre of the state, and contains 330 sq. m. Bounded S. by Rapid Ann r. Drained by Robertson's r. It contained in 1840, 7006 neat cattle, 6804 sheep, 12,851 swine; and produced 100,680 bushels of wheat, 23,697 of rye, 371,890 of Indian corn, 33,005 of oats, 12,796 of potatoes, 148,700 pounds of tobacco. It had 12 stores, 10 flouring-mills, 23 grist-mills, 17 saw-mills, seven tanneries, five distilleries; two academies, 41 students; 17 schools, 356 scholars. Pop.: whites, 3790; slaves, 4366; free coloured 70; total, 8107. Capital, Madison.

MADISON, county, Ga. Situated in the N.E. part of the state, and contains 950 sq. m. Bounded E. by broad river, and drained by its branches. It contained in 1840, 1956 neat cattle, 1571 sheep, 3997 swine; and produced 8939 bushels of wheat, 53,130 of Indian corn, 6657 of oats, 3350 of potatoes, 797,118 pounds of cotton. It had nine stores, three grist-mills, one saw-mill; one academy, 90 students; three schools, 79 scholars. Pop.: whites, 3125; slaves, 1363; free coloured, 3; total, 4510. Capital, Danielville.

MADISON, county, Flor. Situated in the central part of the territory, extending from Georgia on the N. to the gulf of Mexico on the S. Bounded E. by Suwannee river, W. by Oscilla river. It contained in 1840, 5000 neat cattle, 823 sheep, 3969 swine; and produced 37,965 bushels of Indian corn, 3205 of oats, 13,915 of potatoes, 1150 pounds of rice, 703,400 of cotton, 1900 of sugar. It had three stores, two grist-mills, one saw-mill, two oil-mills; four schools, 74 scholars. Pop.: whites, 1443; slaves, 1202; total, 2644. Capital, Madison.

MADISON, county, Ala. Situated in the N. part of the state, and contains 780 sq. m. Watered by Flint river and other branches of Tennessee river. It contained in 1840, 28,074 neat cattle, 12,308 sheep, 79,970 swine; and produced 65,099 bushels of wheat, 1,357,808 of Indian corn, 152,816 of oats, 46,371 of potatoes, 15,555 pounds of tobacco, 10,358,597 of cotton. It had 40 stores, 39 grist-mills, 17 saw-mills, 11 tanneries, 11 distilleries, two printing-offices, two weekly newspapers; two academies, 125 students; 39 schools, 1167 scholars. Pop.: whites, 12,927; slaves, 13,965, free coloured, 144; total, 25,706. Capital, Huntsville.

MADISON, county, Miss. Situated a little S.W. of the centre of the state, and contains 548 sq. m. Bounded N.W. by Big Black river, S.E. by Pearl river. It contained in 1840, 31,045 neat cattle, 4908 sheep, 64,038 swine; and produced 1198 bushels of wheat, 877,693 of Indian corn, 79,495 of oats, 152,981 of potatoes, 14,842,153 of cotton. It had 19 stores, one printing-office, one weekly newspaper; one college, 100 students; two academies, 170 students; two schools, 193 scholars. Pop.: whites, 3086; slaves, 11,532; free coloured, 11; total, 15,530. Capital, Canton.

MADISON, parish, La. Situated in the N.E. part of the state, and contains 800 sq. m. Bounded E. by Mississippi r. Watered by Bayou Macon, and Texas r. It contained in 1840, 6930 neat cattle, 767 sheep, 8641 swine; and produced 190,745 bushels of Indian corn, 13,188 of potatoes, 5,378,610 pounds of cotton. It had eight stores, three saw-mills. Pop.: whites, 1210; slaves, 3623; free coloured, 9; total, 5143. Capital, Richmond.

MADISON, county, Tenn. Situated in the W. part of the state, and contains 670 sq. m. Watered by the S. Fork of Forked Deer r. and its branches, and by the Middle Fork of the same river. It contained in 1840, 12,747 neat cattle, 17,563 sheep, 64,583 swine; and produced 65,178 bushels of wheat, 8530 of rye, 793,215 of Indian corn, 286,004 of oats, 65,926 of potatoes, 136,633 pounds of tobacco, 2,933,030 of cotton. It had 19 stores, one furnace, three woolen factories, two cotton factories, with 1200 spindles, 15 flouring-mills, 31 grist-mills, 13 saw-mills, seven tanneries, 10 distilleries, one printing-office, one weekly newspaper; four academies, 103 students; 23 schools, 512 scholars. Pop.: whites, 10,490; slaves, 6073; free coloured, 37; total, 16,530. Capital, Jackson.

MADISON, county, Ky. Situated centrally towards the E. part of the state, and contains 590 sq. m. Bounded N. by Kentucky r., and drained by its tributaries. It contained in 1840, 8361 neat cattle, 12,906 sheep, 49,104 swine; and produced 41,502 bushels of wheat, 90,903 of rye, 564,894 of Indian corn, 6430 of barley, 68,247 of oats, 16,953 of potatoes, 125,983 pounds of tobacco, 37,171 of sugar. It had 10 stores, two woolen factories, 23 grist-mills, three saw-mills, one tannery, 12 distilleries; eight schools, 234 scholars. Pop.: whites, 10,860; slaves, 5413; free coloured, 63; total, 16,355. Capital, Richmond.

MADISON, county, O. Situated a little S.W. of the centre of the state, and contains 400 sq. m. Watered by Little Darby and Deer creeks. It contained in 1840, 16,177 neat cattle, 15,636 sheep, 19,135 swine; and produced 47,646 bushels of wheat, 1918 of rye, 419,066 of Indian corn, 1287 of buckwheat, 71,173 of oats, 12,366 of potatoes, 1150 pounds of sugar. It had 23 stores, one fulling-mill, nine grist-mills, 15 saw-mills, two potteries; 94 schools, 9017 scholars. Pop. 9925. Capital, London.

MADISON, county, Ia. Situated a little N.E. of the centre of the state, and contains 390 sq. m. White river and its branches afford water-power. It contained in 1840, 3788 neat cattle, 6436 sheep, 31,579 swine; and produced 46,881 bushels of wheat, 1559 of rye, 373,715 of Indian corn, 68,587 of oats, 17,694 of potatoes, 47,867 pounds of sugar. It had two stores, one flouring-mill, seven grist-mills, 13 saw-mills, three tanneries, two distilleries, two potteries; 35 schools, 1190 scholars. Pop. 8874. Capital, Andersontown.

MADISON, county, Ill. Situated toward the S.W. part of the state, and contains 760 sq. m. Bounded W. by Mississippi r. Drained by Cahokia, Silver, and Wood creeks, and their branches. It contained in 1840, 92,036 neat cattle, 13,876 sheep, 53,484 swine; and produced 160,910 bushels of wheat, 18,735 of rye, 1,370,735 of Indian corn, 12,353 of buckwheat, 12,960 of barley, 200,800 of oats, 121,305 of potatoes, 11,280 pounds of tobacco. It had four commission houses in foreign trade, 67 retail stores, two lumber-yards, seven flouring-mills, eight grist-mills, 16 saw-mills, one oil-mill, two tanneries, two distilleries, one brewery, four printing-offices, three weekly newspapers, and one periodical; one college, 101 students; two academies, 144 students; 52 schools, 1445 scholars. Pop. 14,433. Capital, Edwardsville.

MADISON, county, Mo. Situated towards the S.E. part of the state, and contains 780 sq. m. Drained by St. Francis r. and its branches. It contained in 1840, 2453 neat cattle, 2905 sheep, 12,415 swine; and produced 9746 bushels of wheat, 155,510 of Indian corn, 36,331 of oats, 3921 of potatoes, 9850 pounds of tobacco. It had eight sawing houses, producing 1,963,455 pounds of lead, four grist-mills, four saw-mills, two tanneries, eight distilleries; 11 schools, 944 scholars. Pop.: whites, 3792; slaves, 611; free coloured, 28; total, 3395. Capital, Fredericktown.

MADISON, county, Ark. Situated in the N.W. part of the state, and contains 1050 sq. m. Drained by branches of White river. It contained in 1840, 3341 neat cattle, 9675 sheep, 11,634 swine; and produced 4139 bushels of wheat, 146,755 of Indian corn, 4518 of oats, 7949 of potatoes, 14,939 pounds of tobacco, 3690 of cotton, 1037 of sugar. It had five grist-mills, one saw-mill, two tanneries, two distilleries; two schools, 53 scholars. Pop.: whites, 2808; slaves, 63; total, 2775. Capital, Huntsville.

MADISON, p. v., Somerset co., Me., 40 m. N. Augusta, 635 W. Bounded W. by Kennebec r. Incorporated in 1804. It has four stores, two grist-mills, three saw-mills, two tanneries; 16 schools, 697 scholars. Pop. 1761.

MADISON, p. l., New-Haven co., Ct., 56 m. S. Hartford, 390 W. Incorporated in 1836 (formerly East Gafford). Bounded S. by Long Island sound. It contains a Congregational church, Lee's academy, named from its founder; 11 stores, one fulling-mill, one grist-mill; one academy, 60 students; 13 schools, 488 scholars. Pop. 1788.

MADISON, p. v., Madison co., N. Y., 95 m. W. by N. Albany, 365 W. Drained by head-waters of Chenango r. and Oriskany cr. It occupies the summit level of the Chenango canal, which passes through the town. It contains two churches, a Baptist and Universalist; four stores, one fulling-mill, two grist-mills, nine saw-mills, two tanneries, one distillery; 16 schools, 306 scholars. Pop. 2344.

MADISON, t., Columbia co., Pa., 10 m. N. Danville. Drained by Little Fishing and Mahoning creeks. It has one store, seven saw-mills, three tanneries; six schools, 212 scholars. Pop. 1700.

MADISON, t., Armstrong co., Pa. It has three stores, five grist-mills, four saw-mills; three schools, 64 scholars. Pop. 1365.

MADISON, t., Perry co., Pa. It has three stores, one fulling-mill, one woolen factory, six flouring-mills, 10 saw-mills, two distilleries; seven schools, 315 scholars. Pop. 1929.

MADISON, p. v., capital of Morgan co., Ga., 41 m. N.W. W. Milledgeville, 625 W. It contains a courthouse, jail, a Masonic hall; two academies, a male and female, with a library; a Presbyterian and a Methodist church; several stores, 70 dwellings, and about 450 inhabitants.

MADISON, p. t., Lake co., O., 190 m. N.E. by N. Columbus, 340 W. Watered by Grand r. Bounded N.W. by Lake Erie, on which is a harbour. Large quantities of iron are manufactured into hollow ware, mill iron, and other articles, and are exported. It contains nine stores, two grist-mills, nine saw-mills, three tanneries, one distillery; 29 schools, 1250 scholars. Pop. 2900.

MADISON, t., Clark co., O. It has 11 schools, 368 scholars. Pop. 1115.

MADISON, t., Columbiana co., O. It has three schools, 100 scholars. Pop. 1474.

MADISON, t., Butler co., O. It has four schools, 111 scholars. Pop. 1935.

MADISON, t., Franklin co., O. Watered by Alum and Big Walnut creeks. Pop. 1810.

MADISON, t., Fairfield co., O. It has one store, six grist-mills, eight saw-mills. Pop. 1102.

MADISON, t., Guernsey co., O. It contains Winchester

MADISONVILLE.

and Andrim villages, and has one college, 16 students: four schools, 171 scholars. Pop. 1222.

Madison, t. Licking co., O. Watered by Licking river. The Ohio canal passes through it. It has three schools, 74 scholars. Pop. 1119.

Madison, t. Highland co., O. It has nine schools, 707 scholars. Pop. 1916.

Madison, t. Perry co., O. It has one store, one woollen factory, two flouring-mills, four grist-mills, five saw-mills, two distilleries; six schools, 140 scholars. Pop. 1167.

Madison, p. v. and city, capital of Jefferson co., Ia., 88 m. S.S.E. Indianapolis, 500 W. Situated on a N. bend of the Ohio river, above the reach of the highest floods. It is regularly laid out with broad streets, several of which are paved. A wharf is constructed for the landing of steamboats. It is handsomely built, mostly with brick, and has a courthouse, jail, market-house, and six churches, a Methodist Episcopal, a Reformed Methodist, a Baptist, an Episcopal, and two Presbyterian; a branch of the state bank, with a neat edifice, a saving's bank, an insurance office, 30 stores, two iron foundries, a steam engine factory, a cotton factory, a steam flouring-mill, an oil-mill, a grist-mill, a saw-mill, and a boat-yard. Fifteen thousand hogs have been slaughtered here in a year. Many goods are sold at wholesale. It is the second place in population in the state, and in 1840 contained 3798 inhabitants. In the rear of the village are hills 250 feet high, which afford a delightful prospect.

Madison, t. Putnam co., Ia. It has two grist-mills, three saw-mills. Pop. 1071.

Madison, p. v., capital of Dane co. and of the territory of Wisconsin, 90 m. N.E. Galena, 90 m. W. of Milwaukee, 847 W. It is pleasantly situated between the third and fourth lakes, of the chain called "the Four Lakes," on a gently rising ground, from which there is a regular descent each way to the water, affording a beautiful water-prospect. It is regularly laid out, with a central square, 914 feet on a side, in the centre of which the statehouse has been erected by the general government. It is a spacious stone edifice, two stories high above the basement, with a handsome dome, and can be seen for the distance of ten miles in every direction. The square is surrounded by a fence with 16 gates, for which Congress has appropriated \$1000. There is a jail, and several places of worship, and two printing-offices, each of which issues a weekly newspaper, 10 or 12 stores, 60 dwellings, and it had in 1840, 376 inhabitants.

In 1837 the contractor with 40 men and 5 females cut their way, in 11 days, from Milwaukee, through the wilderness, and commenced building the capitol. The distance is now travelled in two days. Since the spring of 1841 the growth of the place has been rapid, and it has a substantial prosperity.

Madison, C. H., capital of Madison co., Va., 97 m. N.W. Richmond, 98 W. It contains a courthouse, jail, two churches, an Episcopal, and one free to all denominations; six stores, five flouring-mills, two tanneries, 40 dwellings, and about 300 inhabitants.

Madison, C. H., p. v., capital of Madison co., Flor. It contains a courthouse, and a few dwellings.

Madison, p. v., capital of Hopkins co., Ky., 197 m. W.S.W. Frankfort, 759 W. It contains a courthouse, jail, and 51 inhabitants.

MADISONVILLE, p. v., capital of Monroe co., Tenn., 173 m. E.S.E. Nashville, 540 W. Situated on Batser, which enters into Little Tennessee river. It contains a courthouse, jail, an academy, three churches, six stores, a printing-office, and about 500 inhabitants.

MADISONVILLE, p. v., and seaport, St. Tammany par., La., 35 m. N. New-Orleans, 1137 W. Situated on the W. side of Lake St. Pierre, 3 m. from its entrance into lake Pontchartrain. It has the best harbour on the lake. Packet schooners ply daily to New-Orleans.

MADRAS (PRESIDENCY OF), an extensive division of British India, being the second in rank and the most southerly of the three presidencies. It comprises, with its tributary states, the whole of Hindostan S. of the river Krishna, the N. Circars, and Canara. It extends from 69° to 80° N. lat., and from 74° to 85° E. long. It is of a triangular shape; the base of the triangle being formed by a line drawn from Ganjam, on the coast of Coromandel, to Sadasarapur, near the 15th degree of lat., on the coast of Malabar, the sides by their coasts, and the apex by Cape Comorin, at the southern extremity of India. It is consequently bounded on two of its sides, the E. and W., by the ocean, while on the third, or N., it has the dominion of the Nizam and the Rajah of Berar, parts of the presidencies of Bengal and Bombay, and the Portuguese territory of Goa.

Its greatest length, N. to S., is about 950 m. Its area, population, subdivisions, &c. are specified in the following Table:—

MADRAS.

Districts.	Area in sq. m.	Pop. 1836-7.	Pop. to sq. m.	Land Revenue, 1836-7.
Ganjam	3,700	538,079	118	663,967

Physical Geography. Mountains.—The surface consists of a central table-land, surrounded on all sides by an undulating or plain country gradually diminishing in elevation as it approaches the sea. The mountain-ranges bounding the table-land on either side are the E. and W. Ghauts, which diverge from each other at the knot of mountains termed the Nelgherries, in about 11° N. lat., and from 70° 30' to about 77° E. long. The W. Ghauts approach much nearer to the sea than the E., so that there is a much greater extent of plain country in the E. than in the W. portion of the presid. The Nelgherry hills, which may be considered the nucleus of the mountain system in S. Hindostan, extend 34 m. E. to W. by 15 m. N. to S., having numerous peaks rising to between 5000 and 6000 feet, and one, Doddabettas, estimated at 8760 feet above the level of the sea. The W. Ghauts are more continuous and generally more elevated than the E.; the latter, even in the district of Salem, where they are highest, seldom attaining to an elevation of 6000 feet, while the former frequently rise 3000 feet higher. The table-land above or between the Ghauts averages in Coorg nearly 5000 feet in elevation, and, in Canara, Balaghaut varies from 3000 to 5000 feet; but it decreases rapidly in height as we proceed E. and N., and even in Mysoor, Bangalore is only 2307 feet, and Hurryhur only 1831 feet, above the sea. S. of the Nelgherries, is the Paulghautcherry Pass, in Coimbatore, 16 m. in width, extending from sea to sea, and forming a complete break in the mountain-system of S. India. S. of this pass, a mountain-chain, little inferior in height to the Nelgherries, stretches nearly due S. to Cape Comorin. This chain separates Cochín and Travancore, on the W., from the district of Madura and Tinnevely, on the E. The Ghauts elsewhere form the chief line of separation between the British territories and those of the subsidiary states.

The principal rivers are the Godavary and Krishna, with their tributaries; and the Pennar, Palaur, Pannair, Cavery, Coleroon, and Vighy. These have all an E. course, and disembogue on the Coromandel coast. The three principal have been already described. (Vol. I., 568, 1000, li. 132.) The only other river worthy any particular notice, the Coleroon, is the N. branch of the Cavery, which, having separated from the latter, opposite Trichinopoly, bounds the district of Tanjore on the N., and falls into the sea about lat. 11° 30'. The streams running W. have short courses; the longest is the Poanay, which traverses the Paulghautcherry pass, but it is of little use for navigation, being very shallow in the dry season. There are no lakes of any importance: that of Colair, in Masulipatam, is the principal. There are numerous salt lagoons, or inlets of the sea, on the Coromandel coast, but they are of little use for navigation; and the whole of the Coromandel coast has a shelving shore, and is beat by so heavy a surf, as to be at all times difficult to reach, and during the monsoon it is quite unapproachable. The inlet of Cochín, on the Malabar coast, is not within the British territory. The Malabar coast within this presidency is also very destitute of good harbours.

The Climate.—differs widely in the different portions of this presidency. The W. coast is exposed to all the fury of the S.W. monsoon, during which the rains are excessive, and often accompanied by heavy squalls and thunder storms. On the opposite coast, the rains are, on the contrary, brought in by the N.E. monsoon, a circumstance explained by the fact, that the Ghauts are elevated enough to intercept the passage of the clouds. The N.E. monsoon lasts from October to March; but the monsoon winds are over in December; and much less rain falls on the Coromandel coast than on the Malabar coast.

MADRAS.

mandal than the Malabar coast, where, as in Canara, the annual fall of rain is sometimes 114 inches. The quantity falling in Coimbatore, in 1836-7, was only nine inches, and in 1837-8, 22-1 inches. The heat is much more oppressive on the E. than the W. side of S. India, owing to the greater prevalence of dry weather and parching winds. If we may depend on the statement of Berghaus, the average annual temperature of Pondicherry, lat. 11° 53', is no less than 84° 7' Fah. (59-6 centig.), that of Madras being 83° (Allg. Länder, &c., i. 230.) At the mouth of the Krishna, in the N. Circars, at about 16° lat., the thermometer has been known to stand at 106° Fah. at midnight! (*Hamilton's E. I. Gaz.* i. 418.) The plain country, in the E. part of the presidency, is frequently very unhealthy; but on the Malabar coast this is not the case. The country above the Ghauts, which has a mean temperature many degrees below that of the plains, is decidedly salubrious; it derives rain from both monsoons, having an equable climate, and an atmosphere usually clear, serene, and highly invigorating.

The Geology of S. India has been noticed with that of the rest of Hindostan. (I. 963.) Syenite, granite, quartz, greenstone, mica, and hornblende are among the chief primitive rocks, in the Ghauts, Nelgherries, &c. The upper soil on the coasts is usually sandy, and not very productive; but in the valleys of the interior, it frequently consists of a rich alluvium or loam. The soil of the Balahaghat district, N. of Mysore, consists principally of the red and black earth, so prevalent in the Deccan.

Natural products.—Many portions of the soil in the tableland are highly impregnated with carbonate of soda, nitre, and other salts; iron is generally plentiful, and the iron ore of the district of Salem is extremely rich. Copper is found in Nellore, and a few other districts, and diamonds near Cuddapah. The presidency yields no other mineral products of much value. A considerable extent of surface, especially in the upper part of the country, is covered with forests, comprising teak, mandal, ebony, and other valuable timber trees. Teak grows on the E. as well as the W. Ghauts; but that of the Malabar coast is the most available, and best known, in the market; a good deal being floated down to the coast by the small rivers, and sent to Bombay and elsewhere for ship-building. The toddy-palm (*Borassus flabelliformis*), cocoa-nut tree, the products of which form important articles of export from the W. districts; and other palms flourish on the sandy coast lands, which supply few other useful articles. The sugar cane, areca, yam, plantain, tamarind, jack, mango, melons, and various other fruits, ginger, turmeric, cotton, hemp, &c., some of which are indigenous, and pretty generally grown; pepper is an important article of culture on the Malabar coast, and Coimbatore is celebrated for the excellence of its tobacco. Rice, paddy, wheat, barley, maize, and all the other grains common in India, both wet and dry, are here cultivated: the first is grown chiefly on the plains of the coast; but it forms also the chief export of Coorg, though a high country, and is the great staple of Canara. The Balahaghat districts are almost wholly appropriated to dry grain cultivation.

Animals.—The elephant, tiger, cheetah, bear, bison, elk, spotted deer, antelope, jackal, wild hog, jungle sheep, &c., inhabit this as well as other parts of India; tigers, however, are not so numerous as in the countries watered by the Ganges, and other low and jungly portions of Hindostan. Ivory is a product of some consequence in Coimbatore; from 700 to 800 elephants being destroyed in that province between 1833 and 1836. Domestic animals are most numerous in the E. and S. districts; Guntoor is celebrated for its cattle; and Coimbatore for its sheep, which are not hairy and long-legged like those of the Carnatic, but small, yielding good mutton and coarse wool, made into common sorts of clothing, carpets, &c. Live stock, above the Ghauts, is scarce and inferior.

Land-tax, &c.—With the exception of the N. Circars, (see CIRCARS, NORTHERN,) the greater portion of the territories included in the Madras presidency, are assessed for the land-tax on what has been called the *ryotwar* system. It is unnecessary, however, after the copious details we have already given in the article on British India (see *ant.* p. 13), to enter, in this place, into any farther investigations with respect to the nature and operation of that settlement. It is sufficient to say that the land-tax in Madras is oppressive in amount; and that the system under which it is assessed, being subject to perpetual changes is, in fact, subversive of the security of property, and consequently of all industry, except what is indispensable to meet immediate wants. We do not mean to impeach the motives, or to depreciate the talents, of Sir Thomas Munro, and the other individuals most instrumental in the establishment of this system; but we do not well see, supposing they had set about devising a scheme for paralyzing enterprise, and creating an insuperable obstacle to all improvement, how

they could have hit upon one better fitted to accomplish such objects than the *ryotwar* assessment. It appears to have every quality that an assessment should not, and not one that it should, have; and it were idle to expect that either the revenue of the presidency, or the industry and condition of the inhabitants, should be materially improved, so long as it is permitted to shed on all sides its withering influence.

Agriculture, &c.—The imposition of an oppressive assessment is the more severely felt, as the land in the Madras presidency is generally much less fertile than in Bengal and many other parts of British India. Tanjore may be said to be the granary of the presidency, and produces the greatest land revenue. The widest breadth of cultivated land is met with in Rajahmundry, Tanjore, and Coimbatore. The modes of agriculture pursued in the different provinces will be found briefly noticed in the articles which have especial reference to them. Generally, however, it may be said that agriculture is at a very low ebb; that the occupiers, ground down by oppressive taxes, are for the most part miserably poor, and their implements and stock alike bad. Irrigation is extensively practised; and wherever a sufficient supply of water (whether from rivers, tanks, or wells) can be commanded, as in the delta of Tanjore, S. Arcot, &c., the crops of rice are very heavy. The land under dry grains is generally manured; and cow dung used as fuel in this presidency being subject to a tax, it is generally used as manure. Opium is rarely or not at all grown; and indigo only in small quantities, principally in the N. districts. Coimbatore exports annually upwards of 4000 candies of tobacco to Malabar, Cochlin, and Travancore; and large quantities to Trichinopoly and Mysore. The superiority of the tobacco grown in this province is attributed to the soil containing much saltpetre and peroxide of iron, as well as to the attention bestowed on its culture. The exhaustion of the land, from its cultivation, is, however, very great; the ground consequently requires frequent and regular manuring, and is cultivated every other year with dry grains. Tobacco costs on the spot where produced, about 25 rases per candy. Cotton is a staple product of Tinnevely; and it and sugar are raised in various other places.

Manufactures, &c.—The chief are those of cotton cloth; and formerly cotton fabrics and other piece goods were largely exported, especially from the N. Circars; latterly, however, the lower price and better quality of British piece goods have enabled them, to a great extent, to supersede those of India in most foreign markets; though the latter are still exported, especially from Tinnevely to the W. Indies and America. The natives have recently turned their attention to the imitation of English cottons, and, in some instances, it is said, with considerable success. The mullins of Chicacole, the woollen carpets of Ellore, and the silks of Berhampore (Ganjam), are of old celebrity; but in general manufacturing industry flourishes most in the S. districts, and the cloths of Madura are highly esteemed for their fine red dye. The state of manufactures appears to depend in a great degree on the state of the roads, and means of communication. In the S. provinces the government has completed several good carriage roads, and in the N. they are also pretty good. Canara, on the other hand, may be said to be wholly without roads, and vehicles are unknown. The Malabar coast has a singular paucity of manufactures: its chief wealth arises from its large exports of rice to Arabia and Bombay, and of pepper and other spices, areca, cocoa-nuts, &c. A good deal of iron is made in Tinnevely; and saltpetre and salt are made in various parts; but the latter are inferior to those of the Bengal presidency. Above the Ghauts the arts are in a very rude state.

Weights and Measures.—At Madras, the *mannd* of 40 seers or 8 ris = 25 lbs. avoird.; the *candy* of 30 *mannds* = 500 lbs.; the *garo* for grain = 13-8 mds. At Trichinopoly, the *seer* for metals = 9 oz. 84 dr. In Malabar, the *tolam* of 40 seers = 23 lbs. 3 oz.; the foot = 10-45 in. At Madras, the *manney* = 2400 sq. ft.; the *cassany* of 34 *manney* = 1-3923 acres. (*Madras Almanack*, 1835.)

The government is vested, as in Bombay, in a governor, subordinate to the governor-general of India. He is assisted by a council of three members, one being the commander in chief, and three secretaries, placed over the revenue and judicial, political, and military departments. In each of the 20 districts there is a European collector, who exerts also the chief magisterial power. Zillah courts are holden in the principal towns of most of the districts; and there are four provincial courts of appeal at Chittoor, Masulipatam, Trichinopoly, and Tellicherry. In Madras is a court of Sudder and Fodjary Adawlut, an admiralty court, and the high court of judicature for the presidency. The church of England ecclesiastical establishment consists of the bishop and archdeacon of Madras and 19 chaplains, in different parts of the presidency. There are numerous Protestant dissenting and Roman Catholic chapels, Madras

MADRAS.

being the see also of a Roman Catholic bishop. According to the government returns of 1835, about 183,600 children were receiving instruction at the schools within the presidency. The Madras military force, according to recent returns, consists of 50,357 men, of whom about 9900 are Europeans.

Account of the revenues of the presidency of Madras during the four years ending with 1836-39.

Heads of Revenue.	1835-36.	1836-37.	1837-38.	1838-39.
	<i>Rs.</i>	<i>Rs.</i>	<i>Rs.</i>	<i>Rs.</i>
First duties	15,397		23,667	22,351

History.—In the article INDIA, Britons will be found a table, showing the dates of the successive augmentations to the British possessions in the east. The city of Madras, with a territory 5 m. along shore by 1 m. inland, granted us in 1639, formed the first nucleus of our eastern empire. But we may here notice the chief successive acquisitions under the Madras presidency. The Jaghire, or Chingiepat, was obtained by the E. I. Company from the nabob of Arcot, in 1750 and 1763. In 1793, Malabar, Canara, Coimbatore, Dindigul, Salem, the Barramahli, &c., were acquired by conquest from the sultans of Mysore; in 1800 the Balaghat districts were ceded; and in 1801, the remainder of the nabob of Arcot's territories were added to the foregoing. (*Madras Almanack for 1839-39: Part. Reports and Papers; Hamilton's Hindostan and E. I. Gazetteer.*)

MADRAS, a marit. city of Southern India, cap. of the above presidency, in the district of the same name, on the Coromandel coast, 650 m. (direct distance) S.E. Bombay, and 870 m. S.W. Calcutta; lat. 32° 4' N., long. 80° 31' E. The area of the district or collectorate of Madras is only 39 sq. m.; but its pop. in 1836-37 amounted to 630,000; and the pop. of the city and its immediate environs, within a radius of perhaps 24 m. round fort St. George, is usually estimated at upward of 400,000.

Madras is in all respects badly situated: it is almost wholly unapproachable by sea. "There being no indentation on the coast, nor any island to break off the surge, a heavy swell rolls in throughout the year. Vessels anchor in the open roads; the large ones keeping a mile or two from shore. The swell keeps them pitching and rolling as

uncomfortably as when at sea. The danger is so great during the S.W. monsoon that vessels are not allowed to lie here for several months, and the anchorage seems deserted. Cargoes are loaded and unloaded by boats adapted for passing through the surf: these, called *catamarans*, consist of three flattened timbers, 8 or 10 feet long, tied together horizontally, and sharpened a little at the point. One or two men propel it with a paddle, flatted at both ends, and dip first on one side and then on the other. When no boat could live five minutes, these catamarans go about in perfect safety. The men are often washed off, but instantly leap on again without alarm. A waterproof cap, for the carriage of letters to and from newly arrived vessels, is almost their only article of dress. The boats used are large and deep, made without ribs or timbers, of thin wide planks, warped by fire to a proper shape, and fastened together by strong twine. Against the seams straw and mud are fastened strongly by the twine, which ties the planks together. No nails are used, for none would keep a boat together with such thumping. The boatmen display energy and skill scarcely to be surpassed. Keeping time to a rude tune, they now take long, and now short pulls, as the waves run past; they at length push the boat forward on a foaming surf, and she is thrown upon the beach." (*Malcolm's S. E. India*, i., 53.) There being no pier of any description, passengers and merchandise have all to be landed in the rough way now described.

Madras presents, from the sea, nothing to create great expectations. Only a few public buildings are visible, and not much of the town, as the site is quite level. It is, however, a noble city, and has many fine streets. Fort St. George may be considered the great nucleus and centre of Madras. It is neither so large nor so regular as fort William, at Calcutta; but it is strong, and has the advantages of requiring a smaller garrison, and of being easily relieved by sea. It occupies a semicircular area, rather more than 4 m. in length, by from 3 to 3 furlongs in width, in a commanding situation, immediately on the beach; and is surrounded by an esplanade traversed by roads, and shaded public walks. Within it were formerly, besides many public offices, some streets of private European dwellings, shops, and stores; but these have been mostly cleared away, and the fort now contains only the barracks, arsenal, a bazaar for the supply of the garrison, the council-house, the old church, the exchange, on which a lighthouse with a lantern 90 feet high is erected. The merchants and tradesmen have mostly removed their establishments to the new streets, opened in the N.E. quarter of the Black-town, and along the skirts of the esplanade. The Black, or native town, which is N. and N.E. the fort and esplanade, is well laid out, and is defended by a substantial brick wall. "The houses are far better, at an average, than those of the natives in Calcutta. Though there are not so many fine residences of rich *bahabs* as in that city, there are some scarcely surpassed in elegance by any in America." (*Malcolm*, i., 54.) It has probably been improved of late years. Hamilton, in his *E. I. Gazetteer* says, it is irregular and confused, being a mixture of brick and bamboo houses, and makes a better appearance at a distance, than when closely inspected. A fine range of public edifices, including the custom-house, office for the board of trade, courthouse, granary, and many store-houses, &c., forms its frontage towards the beach, protected from the fury of the surf by a breakwater of many stones. The front of this terrace, and the drives on the esplanade, form the chief promenades of the inhabitants.

Madras differs from Calcutta, in having properly no European town, except the few houses within the fort. Most of the European settlers reside in suburban houses, and repair in the morning to their offices in the Black-town, returning in the afternoon. Their residences are chiefly on the Choultry plain, a large extent of surface, S.W. of the fort, and separated from it by the river Triplicane, which, in the neighbourhood of the city, is crossed by numerous bridges. The houses all stand in large plots of ground, shaded by trees, and divided by hedges of bamboo or prickly pear. Few are of more than one story, but they are in a pleasing style of architecture, having their porticoes and verandahs supported by stuccoed pillars. According to Heber, the rooms are not quite so large as those of the houses in either Calcutta or Bombay, but they are more elegant and agreeable. On the Choultry plain, near fort St. George, is the governor's residence, a large building, with a spacious banqueting-hall; but opinions vary greatly as to its architectural merit. Heber says, it has some bad paintings of Coote, Cornwallis, Meadows, &c., and one good one of Sir R. Strange, but all are fast going to decay from the moisture of the sea-breeze. Near it are the Chepauk gardens, in which is the residence of the Nabob of the Carnatic; and adjacent to these, is a mosque of grey-stone, with five arches in front, and two handsome minarets, the only Mohammedan structure of any note at Madras. The

MADRAS.

—descendants of the former Portuguese inhabitants chiefly reside at San Thomé, a suburb on the shore, about 3 m. S. from the fort, with a small cathedral, and two neat chapels under the charge of a Portuguese bishop, and a few priests from Goa. The Protestant places of worship are St. George's cathedral on the Choultry plain, four other episcopal churches and chapels, a Scotch and an Armenian church, and independent, Wesleyan, and Unitarian chapels. There are also three Roman Catholic churches. The number of native Christians is, however, stated to be very small, though increasing. There are male and female orphan asylums, many schools, and other charitable institutions, conducted in a manner that has been highly eulogised; and numerous missionary establishments, both European and American.

Madras is the seat of all the chief government offices for its presidency, of the supreme court, a board of revenue, marine board, &c. In consequence of its unfortunate maritime position, it has less foreign trade than the capitals of either of the other presidencies. Its commerce is still, however, considerable, as it is the principal emporium of the Coromandel coast, and trades direct with Great Britain, and other European countries, the United States, the South American states, China, the Eastern Islands, the Birman empire, Calcutta, and Ceylon. The principal articles of import are rice, and other grain, chiefly from Bengal; cotton piece-goods, iron, copper, spelter, and other British manufactures; raw silk, from Bengal and China, with betel or areca nut, gold dust, tin, and pepper, from the Malay countries; and rice and pepper from the coast of Malabar, with teak timber from Pegu. The exports consist of plain and printed cottons, cotton-wool, indigo, salt, Ceylon pearls, chank shells, tobacco, soap, natron, some dyeing drugs, and coffee, from the table-land of Mysore, the quantity of which is increasing. The great staples of sugar, rice, opium, saltpetre, and lac dye, of such importance in Bengal, are hardly known as exports here. The importation of sugar from foreign countries is prohibited at Madras. (See *Report on E. India Produce*, 1840.)

In Madras roads, large ships moor in from 7 to 9 fathoms, with the flagstaff of the fort bearing W.N.W. 2 m. from shore. From Oct. to Jan. is generally considered the most unsafe season of the year, in consequence of the prevalence of storms and typhoons. On the 15th of Oct. the flagstaff is struck, and not erected again till the 15th of Dec., during which period a ship coming into the roads, or, indeed, anywhere within soundings on the coast of Coromandel, violates her insurance. The light within the fort may be seen from the deck of a large ship at 17 m. distance, or from the mast-head at a distance of 36 m. By the port regulations, no articles are to be shipped or landed without a permit, or after 6 P.M. Any merchandise attempted to be landed without the prescribed forms, or that is not entered in the manifest, is liable to double duty; and where a fraudulent intention shall appear, to confiscation. All goods (except on account of the E. I. Company) are to be shipped or landed at the ghaut opposite to the Custom-house, or pay double duty. Goods exported in British or native vessels are exempted from duty, but they must, nevertheless, pass through the customs' books.

Meat, poultry, fish, and other provisions, are to be procured for shipping at Madras, but they are neither so good nor so cheap as in Bengal. Wood and fuel are rather scarce, and dear in proportion. Water is of very good quality. On account of the dearth of provisions, wages are considerably higher than at Calcutta, and comparatively few servants are kept. The style of living is much the same in Madras as at Calcutta, but visiting is not carried on upon so extensive a scale. In the cool season monthly assemblies are held in the Pantheon, a building erected in the suburb of Vepery, and occasional balls take place throughout the year. During the cool season, also, races are held at St. Thomas's mount, about 7 m. from Madras. The road to the racetrack is certainly the finest in India, and shaded by trees through its whole length. At the foot of mount St. Thomas is the principal cantonment for the artillery of the Madras army, with a noble parade ground, considered one of the best military stations in S. India.

Madras experiences less extreme heat than Calcutta, taking the average of the year, though so much nearer the equator. The minimum temp. in Jan. 1837, was 65° Fahr.; the maximum in May of the same year, 99°; the mean annual temp. was 81°. Several extensive tanks and some swamps surround the city and its territory; but Madras is not said to be particularly unhealthy.

The territory on which Madras is situated formed the first acquisition made on the continent of India by the British, who obtained it by a grant from theajah of Bijnagur in 1639, with permission to erect a fort thereon. The latter, which was forthwith built, was besieged in 1708 by one of Aurangzeb's generals; and in 1744 by the French

MADRID.

under M. de la Bourdonnais, to whom it surrendered after a bombardment of three days. It was restored to the English at the peace of Aix la Chapelle, and sustained, with credit and success, a memorable siege by the French under Lally in 1758-9; since which it has experienced no hostile attack. (*Hamilton's E. I. Gaz.*; *Modern Traveller*, 1.; *Malcolm's Travels* in S. E. Asia; *Madras Almanack*, *Part. Reports*; *Commercial Dict.*, &c.)

MADRID, a celebrated city, and the modern cap. of Spain, in the centre of the kingdom, on the Manzanares, a tributary of the Tagus, 39 m. N. by E. Toledo, the former cap. 330 m. E.N.E. Lisbon, and 940 m. S.W. Bayonne; lat. 40° 25' N., long. 3° 38' 15" W. Pop. in 1836, according to Mifano, 181,400, exclusive of about 30,000 occasional residents, designated *forasteros*; but the present pop. is estimated by good authorities to amount to about 210,000, exclusive of 26,000 *forasteros* and foreigners; making a total of 236,000. This city, which, till the time of Philip II., was little more than an obscure country town, stands in a stony barren district, more than 2000 feet above the sea, having as navigable river near it, and scarcely any potable water, and being, at the same time, extremely cold in winter and unbearably hot in summer; the thermometer, at the former season, falling to 15°, and during the latter, rising to 115° or 115° Fahr. This variability of temperature, combined with the prevalence of piercing E. and N.E. winds during the greater part of the year, renders the climate very unhealthy, and especially prejudicial to persons threatened with pulmonary complaints, some thousands of whom are said to have died during the winter of 1839-30. (*Oak's Sketches*, I., 176.) All authors, indeed, agree that it would have been difficult to fix on a more unfavourable site. "From the Somo-Sierra," says Lagia, "to the gates of Madrid, a distance of nearly 30 m., not a tree, garden, nor country house is to be seen, scarcely an isolated farm-house or cottage, and only three or four very inconsiderable villages. The land is chiefly uncultivated, and even that part under tillage and producing grain is mostly covered with weeds and stones. In the midst of this desert stands Madrid, which is not visible more than two leagues' distance. From this side it appears small and not striking; and although we may count upward of 50 spires and towers, none are so elevated or imposing as to awaken curiosity, like that felt on first discovering the towers of churches in other Spanish cities. Even 4 m. from the gate, the traveller might still believe himself to be 100 m. from any habitation: the road stretches away, speckled only by a few mules; there are no carriages, no horsemen, scarcely even a pedestrian; there is, in fact, not one sign of vicinity to a great city." (I., 53.)

It occupies a space of nearly 4 sq. m., on a slope inclining S.E.W. toward the Manzanares, usually an insignificant stream crossed by two magnificent bridges, the size and beauty of which contrast so strongly with the river beneath as to have given rise to the saying, that "the kings of Spain should sell the bridges, and purchase water with the money." The river, however, sometimes swells to a great height, and pour down a magnificent volume of water. (*Strabo*, l., 184.) The town is surrounded by a shabby brick wall, in which are 15 stone gates, the handiwork being those of Alcalá, San Vicente, and Toledo. The interior comprises an old and a more modern quarter, the former, built before Madrid, was the metropolis of Spain. The E. and more modern part is certainly not devoid of beauty; and its wide and well-paved streets, lined with handsome and lofty houses, chiefly built with brick and grey granite, the extensive and well-planted walks, the squares with their elegant fountains, and the many large and well-built public edifices, remind the traveller that he is in one of the finest, though perhaps the duller, capitals in Europe. The best entrance to the city is by the Saragossa road, through the gate of Alcalá, a noble Ionic structure, which, three arches, the central one being 70 feet high. Within the walls, right and left, is the long, wide *Paseo*, with its rows of trees stretching in fine perspective for more than 3 m., and in front is the *Calle de Alcalá*, reaching into the heart of the city, 4 m. in length, wider than Regent-street, and flanked by a splendid range of unequal buildings, but all of large size, and good proportions. At its end is the great centre, in which most of the better streets terminate, and now at least rather inappropriately, designated the *Puerta de Sol*. Here, close to the *Bolsa*, or exchange, is the great morning rendezvous, either for business or pleasure. The best streets uniting in this point are the *Calle Mayor*, the *Calle de la Montera*, and the *Calle de las Corrientes*, all busy thoroughfares, with good and showy shops. The *Calle del Arsenal* leads to the palace, and the *Carrera de San Gervasio* is the direct road to the gardens of the Buen Retiro. Among the squares of Madrid, the largest, with the exception of the space fronting the palace, is the *Plaza Mayor*, a rectangular area, 430 feet in length, and 330 feet broad, surrounded by a uniform range of stone buildings, five stories

MADRID.

high, the lower part being open in front, and supported by pillars forming a handsome colonnade. The chief streets running into it are those of Atocha and Toledo, the latter passing through the *Plaza de Cobada* (formerly the place of execution for criminals), and through the gate to the bridge of its own name. None of these streets, however, will bear any comparison with the Calle de Alcalá: many are good, and very many respectable, tolerably wide, and formed with lofty and well built houses; but there is no other magnificent street. The bye-streets are narrow and crooked, especially in the S.W. quarter, where decay of material, closeness of building, and extreme filth, are the almost unvarying characteristics.

Among the public buildings, the most conspicuous is the royal palace, occupying, with its gardens, a space of nearly 80 acres, on the E. bank of the river. It stands on the site of the old Alcazar of Philip II., burnt down in 1734, and has four fronts of white stone (each 470 feet in length and 100 feet high), enclosing a spacious quadrangle. The interior is fitted up in a style of costly magnificence, perhaps not surpassed in any place of Europe. The ceilings are *chefs-d'œuvre* of Mengs, Velasquez, Corrado, and Tiepolo; the richest marbles of Spain adorn its walls, and the rooms are hung with paintings by the best masters, and noble mirrors from the manufactory of St. Ildefonso. (Swinburne, ii., 168-177.) Many of the best pictures, however, have been removed to the royal picture-gallery in the Prado. Its armory is especially curious, and presents numerous specimens of arms and accoutrements taken from the Moors by Ferdinand the Catholic and his victorious generals. (Sir C. Brooke, ii., 305.) The other chief public buildings are—the custom-house, a handsome range of building, 390 feet in length; the Buena-vista palace, now used as a museum of civil engineering; and the palace of the council of Castile, in the Calle de Alcalá; the postoffice, in the Puerta del Sol; the king's printing-office, in the Calle de las Carretas; the duke of Liria's palace, containing a fine collection of pictures, near the gate of St. Bernardino, in the N. quarter of the city; the palace of the duke of Berwick; and the national gallery, in the Prado. Madrid, though a bishop's see, has no cathedral: but there are 67 churches; among which, however, the churches of San Isidro and the Visitation are alone worthy of notice, the rest being externally and internally barbarous. "No mad architect," says Swinburne, "ever dreamt of a distortion of members so capricious, of a twist of pillars, cornices, or pediments so wild and fantastic, but that a real sample of it may be produced in some one or other of the churches of Madrid. They are, with two or three exceptions, small and poor both in marbles and pictures. Their altars are piles of wooden ornaments heaped up to the ceiling and stuck full of wax-lights, which more than once have set fire to the whole church." (Swinburne, ii., 164.) Previously to 1834 there were 66 convents; but several have since been pulled down to widen the streets, while others have been converted to different and, no doubt, more useful purposes than the maintenance, in pampered idleness, of hundreds of dissolute monks and nuns. The great walks constitute another grand feature of the city. The Prado, or public promenade, is as fashionably attended, especially on Sunday, as Hyde park in London. It is nearly 2 m. long, and comprises a broad walk, called the *salon*, flanked by several of less width, thickly shaded with elm trees: contiguous to it is the garden of the *Buen Retiro*, the palace of that name having been demolished; and still farther S. are the shady gardens called *Las Delicias*, leading to the Canal de Manzanares, which was once intended to connect Madrid with the Tagus at Toledo. These walks, in the afternoons of autumn, are crowded with the most respectable inhabitants, nor can any better idea of the out-of-door appearance of the population be got than by observing them on the Prado. In the spring, however, the scene is varied by visits to Aranjuez, a beautiful park near the Tagus, forming a verdant oasis in the midst of a desert. "The ladies," says Quin (p. 114), "wear, with few exceptions, black silk dresses and shawls, or rather mantillas, of various colours, while their head-dress consists only of a slight veil attached to the hair by a comb, and falling on the shoulder; and the graceful manner in which they wear the mantilla and veil gives to them all a smart and attractive air. The dress of the men is in every respect similar to that of the French or English; but they usually cover their persons with large *chambraks*, which, from the manner of wearing them, have rather a graceful appearance."

The state of education in Madrid cannot be satisfactorily ascertained. Miñano, indeed, mentions the existence of 166 primary schools and two colleges; but nothing can be inferred from such a statement, as every thing depends on the sort of instruction and the number of the pupils. The schools being generally, however, at least till very recently, under the guidance of the priests, there can be no doubt that the education they afforded was of the very worst description;

and that, instead of expanding and improving the mind, it was only fitted and intended to imbue it with the grossest prejudices. Schools on the Lancastrian system have recently been introduced; but they are opposed by large classes, and at this moment the bulk of the population is involved in the grossest ignorance. The *Colegio Imperial* and the *Seminario de Nobles*, the two schools or colleges frequented by the better classes, are but little superior to the others: no choice is, however, left to parents as to the education of their children, the only alternative being the government school or no school. The instruction given to females is most superficial; reading, writing, and a little geography are taught, in connexion with music and other accomplishments: but few ladies attain to anything like literary distinction, and the majority are "ignorant almost beyond belief." Closely connected with the educational establishments are the various literary and scientific societies, most of which are under the protection of the crown. The Academy of History, which has a handsome mansion in the Plaza Mayor, was instituted in 1735, for the purpose of collecting authentic materials for the history and geography of Spain and her possessions, and has published, among other useful works, an historic-geographical dictionary of Spain and Navarre. The *Academia de la Lengua* has for its object the perfection of the Castilian language, and with this view has published a dictionary, grammar, and other works on Spanish philology. There are also academies of science, the fine arts, medicine, and rural economy, all of which are more or less useful in promoting their respective objects. The public collections comprise, 1. the royal library, with 300,000 printed volumes, besides many valuable Arabic and other MSS., and a fine collection of coins; 2. the library of San Isidro, formerly belonging to the Jesuits, and containing upward of 60,000 vols.; 3. the museum of natural history, in which, besides other good specimens, is the great *megatherium*, described by Cuvier; 4. the botanical garden and library; and 5. the national picture-gallery, equal in extent, and perhaps little inferior in excellence, to the largest in Europe. "To the lover of the Spanish school," says Inglis, "this gallery possesses attractions which no other can offer. Besides 42 pictures of Murillo, it contains 53 of Velasquez, 29 of Espinoleto, 17 of Juanes, 6 of Alonso Cano, and many by other native painters; there are also nearly 500 pictures of the Italian schools, and about 300 of the Flemish school; and in the *Sala Reservada* are several *chefs-d'œuvre* of Titian and Rubens. A full description of these pictures is given by Inglis in ch. vi., vii., of his valuable work; also by Cook, vol. i., 166-170.

Several newspapers are now published at Madrid, many of which are violent and abusive in the expression of their political sentiments; but few are sufficiently well conducted to exercise much influence on the public mind. The reprinting of Spanish works has been during some years conducted with great spirit, and translations have been made of popular English and French novels, scientific and elementary works, &c.; and many light writings, with a few more solid productions of unquestionable talent by Castilians of our own day, indicate a gradually increasing taste for literature, which, however, is far from general, even among the better classes.

The theatrical amusements of Madrid are confined to two small establishments, managed by the ayuntamiento or city council. At these theatres, called the *Teatro de la Cruz* and the *Teatro del Principe*, Spanish comedy and Italian operas are indiscriminately represented; the musical department is on the whole well conducted; the plays are of the most trifling description, more resembling low farces than regular comedies; but, at any rate, they represent pure and unadulterated pictures of the intrigues and low life of Spain, and exhibit a truth and spirit unknown on any other stage. A large theatre, begun some years ago near the palace, has not been completed. The great and all-absorbing amusement, however, of the people of Madrid (called by their countrymen *Madridense*), is the bull-fight, held on the Monday afternoons during the season, in a large open amphitheatre, outside the gate of Alcalá. Monday in Madrid is always a kind of holiday, and in the afternoon all the avenues leading to the bull-ring are in commotion; the street of Alcalá is filled throughout its whole extent with a dense crowd of all ranks, some on foot and others in carriages, all hastening to the same point. The amphitheatre will accommodate 17,000 spectators; the central area has a diameter of 330 ft., and is surrounded by a double fence, behind the exterior of which the benches rise tier above tier to the outer wall, where, at the top of all, and shaded with awnings and blinds, are the boxes occupied by persons of rank and property. The intense interest which the spectators of all classes, women as well as men, feel in this butcher-like sport, is visible throughout, and often loudly expressed; and, says Inglis, "it is certainly a fine spectacle to see thousands of spectators rise simultaneously, as they always do when the interest is intense; the greatest and most crowd-

MADRID.

ed theatre in Europe presents nothing half so imposing as this." The expenses of these exhibitions are very heavy; but the receipts are greater, leaving a handsome sum for the general hospital, which it is said, draws from them a revenue of 300,000 reals, or £3000 sterling.

Ingles says there is less wretchedness in Madrid than in Paris, London, and other great towns of France and England; but the condition of the lower orders has been since much altered for the worse, by the suppression of the convents, on which they were greatly dependent; many of the ecclesiastics have also fallen into the most abject distress, though distress arising from this source, in so far at least as the public are concerned, can only be temporary. There are numerous benevolent institutions for the relief of indigence, and the cure of disease, many of which are supported by handsome endowments. The royal hospital of San Fernando, a very large establishment somewhat like an English workhouse, and the mendicity institution for the reception of beggars, formerly the greatest nuisance in Madrid, are doing much good; and the general hospital not only gives relief to the sick poor, but serves as a practical school for the students of the Academy of Medicine. A *mont de piété*, like that in Paris, lends money on security, with this difference, that at Madrid no interest is taken, the expense of the establishment being borne by the government.

Madrid has scarcely any manufacturing industry, nor is it possible, from its situation, at a distance from any navigable river, and in the midst of a stony, unproductive desert, that it can, in this respect, materially improve, even if that love of the *doles far niente* should be given up which seems to be the *sui generis* besom of the Madrilenian. As it is, the workmen of the city are Catalans, Valencians, Aragonese, Asturians, and Galicians: in short, every article in Madrid, whether of manufacturing or farming industry, is exotic. Its fruit comes from a distance of 50 m., butter from Aragon, oranges and lemons from Valencia, and dates from Murcia. A manufactory of porcelain and another of carriages are carried on at the expense of the government, and most probably with as little profit as the mirror manufactory at St. Ildesfonso and the salt-petre works described by Townsend, as entailing a heavy annual loss (vol. 1, p. 280-278). The consumption of Madrid, in 1835, is stated, by Ingles, to have been as follows: 290,000 sheep, 12,500 oxen, 70,000 hogs, 660,000 bushels of corn, 18,000 bushels of salt, 2,417,357 arrobes of charcoal, 4900 arr. of oil, 13,950 arr. of soap, and 500,000 arr. of wine. (The arroba is equal to 35 lbs. avoird.) The price of provisions, and the general expenses of living, are very high, in consequence of the necessity of bringing almost every article from a distance, and the want of water carriage. The markets are well supplied with meat, poultry, and vegetables; but fish and milk are scarce. Beef and mutton are sold at about 4½ d. the lb. of 14 oz., veal fetches 7½ d., and pork 5½ d. per lb.; bread of the best quality (and finer can nowhere be had than in Madrid) is 3½ d. per lb., ordinary wine of La Mancha about 6d. the arroba (4½ galls.). Fowls are sold from 2s. to 3s. 6d. the couple, ducks at 2s. each, geese at 3s. 6d., and turkeys from 4s. to 10s., according to the season. Coffee is about one third cheaper than in England; but tea and sugar are scarce, dear, and bad. Fruit is abundant, and very cheap. Fuel is one of the most expensive articles, and lodgings fetch as high rents as those in the best situations in London.

The state of society in Madrid will be best learnt from viewing the habits of the middle classes; for, indeed, it is next to impossible for a stranger, even with good introductions, to know enough of the aristocracy to form a correct judgment of their domestic habits, owing, we believe in a great measure, to the general poverty, which, with the high rate of living in Madrid, is a very effectual barrier to hospitalities. Almost all families, except those in the very highest ranks, live as in Paris and Edinburgh, in stories or flats, each story being a distinct house. The outer door, which is of enormous strength, has a small window or grating, with a sliding shutter, and the usual salutation from the porter, when one rings for admittance is *¿Quién es?* to which the proper reply is, *Gente de paz* (people of peace); and the door, in ordinary cases, is opened. This precaution of surveying strangers before admittance is, perhaps, attributable to a feeling of personal insecurity, consequent on bad government and religious persecution. A suite of apartments usually consists of a large, well lighted, and respectably furnished saloon, with a recess on one side, in which is a bed, wholly uncanopied, and without curtains; and at another side is a door-way leading into a smaller chamber, similarly furnished to that just described. The lady's boudoir is always handsomely decorated; and the worst rooms in an establishment are invariably the library or study and the dining room, both of which are small, and wretchedly furnished. The apartments are always kept remarkably clean. The manner of living in Madrid is somewhat more generous than in the N. provs. A rather rich soup is usually added to the everlasting *olla*, or *cassidie*, which is

MADRIDEJOS.

much better made and more highly seasoned than in the rest of Spain; and dinner is always followed by cakes, sweetmeats, and fruits, accompanied by a moderate supply of Val-depenas and other good native wines. The inhabitants, except the tradespeople, rise late, and breakfast on chocolate between 10 and 11. Lounging, reading, or a stroll to the cafés (where, however, they spend nothing) occupies the men, dressing and visiting the ladies, till dinner (about three), after which follows the *siesta*, a season of almost universal repose in Madrid. The shops then are either shut, or a curtain is drawn before the door: the shutters of every window are closed; scarcely a respectable person is seen in the streets; the stall-keepers spread cloths over their wares, and go to sleep; groups of the poor and idle are seen stretched in the shade; and even the Gallician water-carriers, seized with the general drowsiness, make pillows of their water-casks. The *siesta* over, the ladies sit in the balconies, and the gentlemen smoke their cigars, till the time for the lounge on the Prado; and then comes the *tertulia*, a very pleasant and social meeting for chit-chat and music, closing the day of Madrid. Dinner parties are seldom or never given, and there are no regular parties except balls; and those not frequent, and unaccompanied by any refreshment beyond *agua fresca*. The best national manners are not, as in other countries, to be found in the capital, where thing is sacrificed to the rage for imitating the French and English, a feature which distinguishes the *Madrilenos* from all other Spaniards. Morals in all classes, especially the higher, are in the most degraded state. Vells, indeed, are thrown aside, and serenades are rare; but gallantry and intrigue are as active as ever. The men think little of their marriage obligations, and pay no real respect to the other sex; the women make dress and show the business of their lives; court admiration, and are willing victims of unprincipled gallantry. Infidelity in married women is perhaps more frequent in any of the towns of Italy, scarcely any married lady is without her *cortejo*. The connexion, however, if not less sensual, is more lasting than in Italy, and intrigues are usually carried on unknown to the husband, who is generally too proud to connive at his wife's dishonour. Sexual immorality is common also among the lower orders; but there is not that drunkenness, brutality, and insolence which characterise the *casseils* of Paris and London: and the stranger may now walk about the streets in any part of Madrid without fear of being stabbed or plundered, a circumstance attributable more to the improvement of the lower orders than to the excellence of the police, which certainly deserves no eulogium. (Swinsburne, ii.; Itin., i., 36-340; Quin's *Travels in Spain*; Cook's *Sketches of Spain* in 1698-33, vol. 1, c. 8; Galliano's *Lectures on Span. Lit. in the Athenaeum* of 1834; *Journal of Educ.*, vol. 12.; and *Private Information*.)

Madrid occupies the site of the ancient *Mantua Carpetanorum*, a fortified town belonging to the Carpetani. It was afterwards called *Majortium*, was taken and sacked in 1109 by the Moors, who gave it its present name. Henry III. repaired and enlarged it at the beginning of the 15th century, and Philip II. made it the capital of Spain. Its subsequent history to the time of the French war is unimportant. On the 23rd of March the city was entered by the French troops under Murat, and the royal family was induced to remove into France. Joseph Bonaparte was then made king; but both he and the French army were, two months afterwards, obliged by the inhabitants, who rose in a body, to evacuate the town. In the December following, Madrid was occupied by Napoleon in person, and his brother Joseph was reinstated. The English troops occupied it for a short time in 1813, and it was again visited in 1833, by the French under the Duc d'Angoulême.

MADRID, Franklin Co., Me. 58 N.W. Augusta. Incorporated in 1836. It contains four grist-mills, three saw-mills, four tanneries, seven schools, 151 scholars. Pop. 338.

MADRID, p. t., St. Lawrence Co., N. Y., 235 N.W. W. Albany, 505 W. Bounded N.W. by St. Lawrence r. Watered by Grass r. and streams flowing into St. Lawrence r. It has several islands in St. Lawrence r. It contains 17 stores, four fulling-mills, eight grist-mills, eight saw-mills, one paper-mill, two tanneries; 37 schools, 1195 scholars. Pop. 4511.

MAD, r. O., a large eastern branch of Great Miami r. which it enters at Dayton. It has a rapid and broken current, and affords extensive water-power, particularly at Dayton.

MAD RIVER, t., Champaign co., O. Watered by Mad r. and Nettle cr. It has two stores, one flouring-mill, four grist-mills, seven saw-mills, one oil-mill, two tanneries, two distilleries. Pop. 1004.

MAD RIVER, t., Clark co., O. The line of Mad r. and Lake Erie railroad is laid through it. Pop. 1340.

MADRIDEJOS, a town of Spain in New Castle, prov. La Mancha, 39 m. N.N.E. Ciudad-Real, and 65 m. S.

The curious reader is referred to Sir A. C. Brooker's entertaining travels through Spain and Morocco (ii., 245) for a recipe for making this dish in its different varieties.

MADURA.

Madrid. Population according to Mifano, 6900. It is situated in an extensive and exposed plain on the great road from Madrid through Aranjuez to Jaen and Granada, the neighbourhood being rendered not only unhealthy, but also, in some parts, unproductive by the inundations of the Amar-guillo, which often greatly injure the town and deprive the people of their means of support. The only public buildings are two parish churches and a hospital; nor are there more than a dozen good houses in the place. A manufactory of serge is the only branch of industry in the town: but the neighbourhood is remarkable for its rich crops of saffron and for extensive sheep-farming. (*Mifano*.) Inglis describes the inhabitants as "almost a population of beggars," and states that the agriculture of this district is in the lowest state, a great part of the soil being poor and barren, while the indolence and absurd prejudices of the farmers render the rest all but unproductive. (vol. ii. p. 19.)

MADURA and DINDIGUL, a collectorate of British India, presid. Madras, prov. Carnatic, near the S. extremity of Hindostan, between lat. 9° and 10° 45' N., and long. 77° 10' and 79° 10' E., having N. Trichinopoly and Coimbatore, W. Cochin and Travancore, S. Tinnevely and the gulf of Manaar, and E. the latter and Tanjore. Area 7656 sq. m. Pop. (1836-37) 1,135,411, chiefly Hindoos of the Sudra caste. The N. and W. parts of this district are mountainous, the S. and E. level. The hilly parts are interspersed with fertile valleys, the principal being that of Dindigul; but the plain country of Madura is by far the most productive portion of the surface. It is intersected by the river Vighay, which rises in this district, and after a course eastward for about 145 m., falls into the gulf of Manaar. A few swamps exist on the shore. The island of Ramiseraam belongs to this district. The climate of the hills is cool and healthy, but the wind often blows with great violence: in the S. it is much warmer, the temperature, in April and May ranging between 70° and 90° Fahr. Different kinds of paddy are grown in the low country, irrigation being there facilitated by plenty of streams and tanks; the husbandry is tolerably good, though not so perfect as in Tanjore. In Dindigul, the dry culture is to the wet as four to one; and the inhabitants are in much less comfortable circumstances than those of the S. Property is much subdivided; some individuals occupy only the 20th part of an acre, and few have more than 135 acres. Madura is celebrated for its piece goods, and its dyers; and its artisans in gold, silver, &c., are in many places much above mediocrity. Its chief exports are piece-goods, cotton, paddy, and chanks; its chief imports, betel nut, chary root, cocoa nuts, and oil seeds. The road, bridges, and other public works in this district, have been of late put into very efficient repair by the government. Total public revenue (1837-38) £319,054, of which the land-tax made £163,363. This district is supposed to be the *Regia Pandionis* of Ptolemy, having been anciently governed by a Pandian family, and is one of the holy countries of Southern India. It has numerous fine temples, and other monuments of former Hindoo grandeur. It was transferred to the British by the nabob of Arcot in 1801.

MADURA, a town of S. Hindostan, cap. of the preceding district, on the Vighay, 134 m. N.N.E. Cape Comorin, and 370 m. S.W. Madras: lat. 9° 55' N., long. 78° 14' E. It is surrounded by a bastioned but dilapidated stone wall; streets wide and regular, public edifices magnificent, but private dwellings mean and wretched. It has some of the most extraordinary specimens of Hindoo architecture extant. The palace is a vast pile, with a dome 90 ft. in diameter; but it is much dilapidated; the great temple, with its spacious areas, choiceries, and four colossal poricoes, each a pyramid of 10 stories, covers an extent of ground almost sufficient for the site of a town. In front of the latter is a celebrated choultry, or inn, 319 ft. in length, ornamented with polished green stone columns, and grotesque sculptures. During the Carnatic wars, from 1740 to 1760, Madura underwent many sieges. The British civil station, and seat of the collector, &c., is in a pleasant situation, about 1½ m. S. the town. (*Hamilton's E. I. Gaz.*; *Madras Almanac*, 1838-39.)

MADURA, an island of the eastern archipelago, immediately adjacent to the N.E. coast of Java, with which island it is politically included, under the Dutch government. (See JAVA.)

MAESE. (See MEUSE.)

MAESTRICHT (an. *Trifectus ad Mosam*), a fortified town of Holland, prov. Limburg, of which it is the capital, on the Mae-e, 14 m. N. by E. Liere, and 57 m. E. Brussels: lat. 50° 51' 7" N., long. 5° 41' E. Population, in 1834, 22,000. It is one of the strongest towns in Holland, being defended by numerous bastions, trenches, &c.: it is well built, with wide, clean, and well-paved streets. The market is held in the great square, the centre of which is occupied by the *hôtel-de-ville*, built in 1692 and said to be one of the finest structures in the kingdom. *Le place d'armes* is also a fine open space planted with rows of trees, and much frequented as a promenade. Among the other public

MAGDEBURG.

buildings are comprised the exchange, the church of St. Servais, the *ci-devant* college of Jesuits, the arsenal, and the theatre; and in the town are 10 churches, two hospitals, two orphan-asylums, a lazaretto, athenæum, fine public library, and society of agriculture. Maestricht is the residence of the governor of the province and the seat of a court of assizes and primary jurisdiction, as well as of a chamber of commerce; and it sends six deputies to the states of the province. The industry of the town comprises the manufacture of woollen cloths and flannels, cotton and woollen yarn, fire-arms, pins, starch, and tobacco; besides which there are soap factories, tanneries, breweries, and dye-houses. A considerable trade is carried on with various places on the Mae-e by means of barges, and packets ply daily between Maestricht, Liège, Namur, &c. Three large fairs are held here during the year for horses and cattle. On the other side of the river (crossed here by a stone bridge) is the citadel or fort of Petersburg, in the suburb of Wyk, famous for its extensive subterranean stone quarry, containing numerous intricate galleries and passages, and abounding with curious marine and saurian fossils, some specimens of which may be seen in the museum of the Jardin des Plantes at Paris. (*Vandermaelen, Dict. de Limburg*, &c.)

MAGDALENA, a river of S. America, and next to the Orinoco the principal in the republic of New Granada, through the centre of which it flows, from S. to N., through 9 deg. of lat. It rises in the small lake of Papa, in the Andes, about lat. 2° N., and long. 70° 25' W., and runs for at least 500 m. between the middle and E. chains of the Cordillera. Its entire course may be estimated at about 800 m.: it enters the Caribbean sea about 65 m. N.E. Cartagena, and 40 m. S.W. Santa Marta. Its principal tributary, the Cauca, flows between the central and W. chains of the Cordillera, and joins it from the W., between 150 and 200 m. from its mouth. Its other affluents are the Sogamosa, Somar, and Bogota. The towns of Nayva, Honda, and Monpor are on its banks. The descent of the Magdalena is said to be as much as 30 inches a mile (*Dict. Geog.*); and the strength of its waters is such, that they preserve their freshness to a considerable distance from its mouth. The Magdalena is navigable as far as Honda, in lat. 5° 14' N., near which the navigation is interrupted by cataracts; but its rapidity is such, that a distance of 10 leagues a day is reckoned very good progress in ascending the river, for a *champan*, or flat-bottomed boat, manned by 24 *bogas*, or rowers. The oppressive heat of the climate, the abundance of caymans, and the swarms of musquitos and other insects that infest the river, contribute to render the navigation both dangerous and unpleasant; but the Magdalena is, notwithstanding, the main route for the commercial and other intercourse of the inland province of New Granada with the ocean.

MAGDEBURG, a fortified city of Prussian Saxony, of which province it is the capital, on the Elbe, 74 m. S.W. Berlin, and 50 m. E.R.E. Brunswick, lat. 52° 8' 4" N., long. 11° 38' 46" E. Population in 1837, with its suburbs (ex. garrison), 51,347. Magdeburg is a fortress of the first class, and, from the augmentation and improvement of its defences since the war, it is now considered one of the strongest in Europe. The citadel, on an island in the Elbe, serves also as a state prison, Baron Trenck and Lafayette having, among others, been confined in it.

Magdeburg is divided into the old town, with the suburb Friedrichstadt, together composing the ancient fortress; and the new town and suburb of Sudenburg. The latter, however, has been for the most part surrounded with walls, and the fortifications are now so extensive that it is said it would require an army of 50,000 men to invest the city. Magdeburg has one good and spacious street, called the Broadway; but all the other streets are narrow and crooked. There are two large public squares, in one of which is the cathedral. This, which is one of the finest Gothic structures of N. Germany, was erected between 1311 and 1363, and has been recently repaired at a cost of \$200,000. It has two towers, each 340 feet in height, a lofty vault, a handsome high altar, and numerous tombs and monuments, among which is that of Otto the Great and his empress.

Magdeburg has in all 12 churches, one of which is for Roman Catholics, a synagogue, an ecclesiastical seminary, a female high school, or royal boarding house for the education of girls, a teachers' seminary, with schools for agriculture, commerce, surgery, &c.; five hospitals, a lunatic asylum, a workhouse, a humane institution a savings' bank, and various charities; an arsenal, extensive barracks, and other military establishments; several public libraries, and a theatre. It is a bishop's see, and is the seat of the government, of the board of taxation, the superior courts of justice, the council, and the military commandant of Prussian Saxony. From its position on the Elbe, it is an important entrepôt for the merchandise imported into and exported from the central parts of Germany by that river. In other

MAGELLAN.

respects, also, it is very favourably situated for commerce. A canal, commencing about 30 m. below the city, connects the Havel with the Elbe, giving Magdeburg a direct water communication with Berlin and Frankfurt on the Oder; and it is also the centre of a number of great roads which lead to all the cities and towns of importance within a radius of 50 m. Its manufactures, which are pretty considerable, consist of silk, linen, cotton, and woollen fabrics; oil-cloth, hats, gloves, tobacco, soap, earthenware, refined sugar, chicory, vinegar, &c., with numerous tanneries, breweries, and distilleries. A large quantity of salt is made in its neighbourhood. It has several native banking establishments, and a branch of the royal bank of Berlin. Several newspapers are published in the town; which has uniformly an air of bustle and activity.

Magdeburg was repaired by Charlemagne, and improved and enlarged by Otto the Great. It has suffered numerous enlarges. In 1631 it was taken by assault by the Imperialists under Tilly, by whom it was given up to military execution, and was nearly burned to the ground. It is the birthplace of the celebrated natural philosopher Otto de Guericke, and of the poet Schütz. (*Von Zedlitz, Der Preussische Staat*, iii., 304, 305; *Berghaus, Allg. Länder*, &c., iv. 655, 656; *Stora Handb.*)

MAGELLAN, or MAGELHAENS (STRAIT OF), a strait at the S. extremity of S. America, separating Patagonia from Tierra del Fuego, Clarence Island, and the Isle of Desolation. It extends from capes de las Virgenes and Espritu Santo, on the Atlantic, to capes Victoria and de los Pilares, on the Pacific ocean, a distance of about 300 m., having a breadth varying from 1½ to 40 m. It has an additional communication with the Pacific by Cockburn channel and Magdalen sound. Its shores are lofty and generally rugged, and its depth is in some parts very great, no bottom having been found with upwards of 1500 feet of line. Some safe and excellent bays communicate with it; but, generally speaking, its passage is extremely dangerous, both from the violence of the currents and the sudden and heavy tempests to which it is subject. It was discovered by Magelhaen, a famous Portuguese navigator in the service of Spain, in 1520. Drake traversed it in his voyage round the world; and it has since been frequently explored by British navigators.

MAGGIORE (LAGO DI), or Lake of Locarno, (an. *Lacus Verbanus*), a famous lake of N. Italy, lying partly between Piedmont and Lombardy, and partly within the Swiss canton of Tessin. It is long and narrow, stretching above 40 m. from Magadino at its N., to Sesto-Calende at its S. extremity, while in its widest parts, opposite to the mouth of the Toce, it is about 6 m. across, but its ordinary breadth does not exceed from 2 to 3 m. Its general direction is S.S.W. and N.N.E., and it may, in fact, be considered as an expansion of the Tessino, which enters it at its N. and leaves it at its S. extremity. In addition to the Upper or N. Tessino, it receives on its W. the waters of the Toce, and on its E. side those of the Tresa, flowing from the Lago di Lugano. Its only outlet is the Lower or S. Tessino. In some places it is not less than 300 fathoms deep; its waters, which are clear and of a greenish tinge, are well stocked with fish; and, like all Alpine lakes, its navigation is dangerous from sudden squalls.

The scenery of the Lago Maggiore is very varied. That of the upper part is bold and mountainous, its northern branch opening into one of the most beautiful valleys of the Rhetian Alps, which form a magnificent amphitheatre in the back ground. Towards the E. and S., the mountains gradually decline to the plain of Lombardy; and the lower part of the lake is of a more quiet and softened character, yet still very beautiful. Its immediate shores are richly fringed with wood, occasionally broken by picturesque crags, topped with castles and churches, and with numerous villages stretching along the water's edge. Though inferior in wildness and sublimity to the lake of Como, and perhaps, also, to that of Lugano, the softer beauties of this lake are generally allowed to be the more attractive, contrasted as they are, with the distant grandeur of the Alpine chain. (*Corder's Italy*, i., 313.)

The Borromeo islands, from which this lake has derived a great portion of its celebrity, are situated in a bay, on its W. side, opposite to the mouths of the Toce. Of these the *Isola Bella* and the *Isola Madre* are the most famous. They are of small size, and, previously to the middle of the 17th century, were little better than bare rocks; but being the property of Count Vitaliano Borromeo, a descendant of the celebrated St. Carlo Borromeo, he resolved to make them his residence, and to convert them, according to the taste of the time, into a sort of Italian paradise. They were consequently covered with earth brought from the adjoining mainland, formed (especially the *Isola Bella*) into splendid terraces, lined with trees and statues, and ornamented with superb palaces. Unluckily, however, nothing is natural, all is art.

MAHABALIPOORAM.

"On every side you look, behold the wall!
No planing intricacies intervene,
No artful wildness to perplex the scene;
Groves made at grove, each alley has a brother,
And hail the platform just reflects the other.
The mid'ling tree inverted nature sees
Trees cut to staves, statues thick as trees!"
Pope's Moral Essays, iv. l. 114.

For a lengthened period, however, these islands were the theme of universal admiration; but as a simpler and purer taste began to prevail, they came to be regarded with very different feelings, and have latterly, perhaps, been too much depreciated. These are now usually looked upon by Englishmen, at least, as little better than "quarries above ground;" and as evincing only the wealth, extravagance, and bad taste of their founder. (*Enstace's Italy*, vol. iv. 8vo. edit.; *Simons's Italy*, p. 2, &c.)

MAGINDANAO, or MINDANAO, the most S. of the Philippine islands, which see.

MAGNESIA ad Sipylum (now MANISA), an ancient town of some celebrity, in Asiatic Turkey, 28 m. N.E. Smyrna. Pop. according to Elliott, about 30,000, of whom 4000 are Greeks, 3000 Armenians, and a few Jews. It is situated near the Kodus, or ancient *Hermus*, embosomed in hills long noted for the production of loadstones, and is one of the cleanest and neatest towns of Asia Minor, being in the width of its streets, and other respects, far superior to Smyrna. The principal buildings are two mosques, with double minarets, indicating a royal foundation, and the interior of each is adorned with paintings, lamps, ivory balls, ostriches' eggs, &c., such as are to be seen in the mosque of Constantinople. There are 98 other mosques, and the mausoleum of Amurath II. are the only other public edifices, except the khans, which are numerous, and well built. The manufacture of cotton and silk goods, and goat's hair shawls, employs many of the inhabitants, and the town derives some importance from being on the great road between Smyrna and the interior of Asia Minor. (*Elliott*, ii. 56-64; *Chandler*, i. 308.)

Magnesia was in all probability colonized by the Magnesians of Thessaly, not long after the foundation of Cyme and Smyrna, two other Æolian cities. It is celebrated as the scene of a signal victory obtained by the Romans, under the two Scipios, over the forces of Antiochus the Great, who was consequently obliged to retire beyond the chain of Taurus, and leave Asia Minor at the disposal of the conquerors. The inhabitants afterwards displayed great bravery in defending their town against Mithridates. In the reign of Tiberius, A.D. 17, Magnesia, in common with 11 other cities, was all but destroyed by an earthquake, and owed its restoration in a great measure to the emperor's generosity. *Duodecim celebres Asia urbes collapsas nocturna motu terrore; quo improvisis, gravioris pestis fuit: neque solitum in tali casu effugium subveniebat in aperta prorsum pendis, quia diductis terris hauriebantur. Asperissima lucis in eorum miseris cordibus traxit: centies castorum pollicibus Caesar et quantum arario pendebat in quinquennium remansit. Magnates a Sipyle prozimi damno ac remedio habiti.* (*Tac. Ann.* ii. 47.)

It was a flourishing city at a late period of the Roman empire, but at the commencement of the 14th century passed into the hands of Sarhkan, sultan of Ionia, and finally was annexed, in 1448, to the dominions of Mahomet II., the conqueror of Constantinople.

The above city must not be confounded with *Magnesia ad Maandrum*, close to the modern Inek-bazar, and about 50 m. S.S.E. Smyrna, which, though a place of some consequence, was greatly inferior to the *Magnesia ad Sipylum*. It is remarkable, however, for the ruins of a theatre, stadium, and magnificent octastyle Ionic temple, said to have surpassed in the harmony of its proportions even the temple of Diana at Ephesus. (*Leak's Asia Minor*, p. 245.)

MAHABALIPOORAM, or MAVALIPOORAM, a village and a curious assemblage of rock temples in Hindostan, on the Coromandel coast, district Chingleput, about 33 m. S.S.W. Madras; lat. 12° 36' N., long. 80° 16' E. The temples in their general character closely resemble those at Ellore and elsewhere, on the W. side of Hindostan; but, from their being cut in a granite rock, they are in better preservation. They have been chiefly consecrated to Vishnu, whose worship appears to have predominated on this, as that of Shiva on the opposite coast of India. At the foot of a hill N. of the village is a pagoda, about 96 ft. high, nearly as long, and about half as broad, hewn from a single rock, and covered with sculptures. Near this temple, the surface of the rock, about 90 ft. in extent, by 30 in height, is covered with bas-reliefs, including a gigantic figure of Krishna, another of his favourite Arjuna, and representations of a number of animals. Opposite to this, and surrounded by a stone wall, are two brick pagodas of great antiquity; adjacent to which are two excavations in the rock, one sup-

MAHADEO.

ported by pillars, in a manner somewhat like the cave at Elephanta, and the other fronting a sculptured group, supposed to represent one of Krishna's adventures. Still proceeding S., the traveller crosses a rocky hill, in which is a spacious excavation, in the middle compartment of which is a figure of Shiva between Brahma and Vishnu; while at one end of the temple is a gigantic figure of Vishnu sleeping upon a cobra-de-capello, and at the other an eight-armed goddess, mounted on a lion, rescuing a human figure from a buffalo-headed demon. Several of the figures are erected in a very superior style. About a mile further S. are other sculptured rocks, said to surpass those already noticed. One pagoda is about 46 ft. in height, by 29 in length and breadth; and another 40 ft. in length and breadth, and 25 ft. in height, but rent, as by some violent convulsion, from top to bottom; besides which there are three smaller structures, and large figures of a lion and an elephant, the last extremely true to nature. E. of the village, and washed by the sea, is an ancient stone pagoda, within which, also, are several sculptured figures. The sea has obviously encroached on this part of the coast, and it has probably submerged many temples that formerly existed here. Mahabalipuram is believed to have been anciently of considerable importance as a metropolis of the kings of the race of Pandion, in Hindoo mythology. (*Goldingham, in Asiat. Researches, v.; Habel, &c., passim.*)

MAHADEO TEMPLE, a celebrated place of Hindoo worship in British India, prov. Gundwana, on the Nerbudda, 60 m. S.E. Humberghat; lat. 23° 22' N., long. 78° 35' E.

MAHANUDDY (*Maha Nadi*, the great river), a considerable river of Hindostan, having its source in the prov. of Gundwana; lat. 21° 30' N., long. 81° E., and flowing mostly E. to the bay of Bengal, which it enters by numerous mouths, about lat. 20° N., and between long. 85° 30' and 87° E., after a course of more than 500 m. At Cuttack, about 70 m. from the sea, the river, in the rainy season, has a breadth of about 2 m.; but it is, notwithstanding, fordable at this point from Jan. to June. During the rains it is navigable for a distance of almost 300 m. from the sea. Its deposits consist of a coarse sand, hostile to vegetation, but frequently containing diamonds of the first quality, and which are occasionally of considerable size. (*Hamilton's E. I. Gaz.*)

MAHE, a seaport town of Hindostan. It belongs to the French, and was formerly their principal settlement on the coast of Malabar, but is now of little importance. It is admirably situated on rising ground, beside a small river, navigable for boats to a considerable distance inland, 40 m. N.E. Calicut. Pop., in 1835, 3353, nearly all of native races. The town is well built, and has several handsome houses, three churches, &c. Its commerce is, however, small; and mostly confined to cocoa-nuts, pepper, arrack, &c. (*Official Returns.*)

MAHIM, a town of Hindostan, prov. Aurangabad, on the island of Bombay, near its N. extremity, in lat. 19° 2' N., and long. 73° 35' E. It has a Portuguese church and a E. Catholic college, and, in 1816, its population with that of some adjacent villages, amounted to 15,600.

MAHONING, *t. Mercer co., Pa.*, 16 m. S.W. Mercer v. Watered by Mahoning river. It contains 19 stores, three fulling-mills, one woolen factory, two furnaces, 11 grist-mills, 11 saw-mills, five tanneries, one distillery, two potteries; 20 schools, 663 scholars. Pop. 3069.

MAHONING, *t. Columbia co., Pa.* Bounded S. by Susquehanna river. Drained by Mahoning creek, which flows into Susquehanna river. It contains 10 stores, one fulling-mill, one furnace, one tannery, three distilleries, one brewery, one pottery, one printing office; 20 academies, 41 students; six schools, 314 scholars. Pop. 1937.

MAHONING, *t. O., and Pa., rises in Portage co., O., and passing Warren, in Trumbull co., enters Pa., and falls into Beaver river.* The Pennsylvania and Ohio canal passes along this river in its lower part.

MAHONING, *p. L. Indiana co., Pa.*, 173 W. by N. Harrisburg, 286 W. Drained by Great and Little Mahoning creeks, on the latter of which, iron ore is found. It contains seven stores, seven grist-mills, eight saw-mills, two tanneries, three distilleries; one school, 41 scholars. Pop. 9890.

MAIDA, a small town of the Neapolitan dom., prov. Calabria Ultra II., 8 m. S. by E. Nicastro. It is chiefly noted for an engagement fought in its vicinity, on the 4th July, 1806, when an English army under Sir John Stuart entirely defeated a greatly superior French force under Regnier.

MAIDEN CREEK, *p. t. Berks co., Pa.*, 60 m. E. Harrisburg, 153 W. Watered by Schuylkill river, and Maiden creek, its tributary. It contains two churches, a Friends, and one common to Lutherans and Presbyterians, two stores, four grist-mills, four saw-mills. Pop. 1749.

MAIDENHEAD, a man. bor. and market town of England, co. Berks, hund. Bray, on the S. bank of the Thames, 11½ m. E. by N. Reading, and 37 m. W. London. Pop. of

MAIDSTONE.

the bor., in 1831, about 9400. The town consists almost entirely of one street extending from the river about one mile along the high road to Oxford, and lined with numerous respectable and a few handsome houses: it is tolerably well flagged and macadamized, but only partially lighted with gas. The guildhall, in the market place, is a spacious stone building: there is also a handsome chapel of ease, and the Wesleyan Methodists and Baptists have their respective places of worship. A national and infant school, with three Sunday schools, furnish instruction to the children of the poor, and there are almshouses and other charities for the sick and aged. The Bristol, Bath, and Exeter branch of the great western road is here carried over the Thames by a handsome stone bridge of 13 arches, and about 300 yards S. from it is another bridge of three arches, forming part of the Great Western railway, which skirts the town in its whole extent. Maidenhead appears to be in a thriving condition: it has no manufactures, but is in the centre of an opulent neighbourhood, and derives considerable trading importance from its position on one of the most frequented roads of the empire. The borough was first chartered by Edward III., and the corporation now comprises a mayor and three other aldermen, with 12 councillors. Corporation revenue, 2723. Markets on Wednesday; horse and cattle fairs, Whit-Wednesday, Sept. 29, and Nov. 30.

MAIDSTONE, a parl. and mun. bor., market town, and par. of England, co. Kent, hund. of its own name, in the E. div. of the lathe of Aylesford, on the E. bank of the Medway (crossed here by a bridge of five arches), 30½ m. E.S.E. London, and 35 m. W. Canterbury. Area of par. and parl. bor., 4420 acres. Population, in 1831, 15,367. The town which is about one mile in length from N. to S., and three quarters of a mile in breadth, consists principally of a well-built street, leading N.E. from the bridge to a lengthened narrow street, along the road from Rochester to Tenterden; but exclusive of these there are many smaller streets. Among the principal public buildings are the county hall, a modern structure, well adapted for the business of the assizes, the new jail, an immense structure, erected, in 1818, at an expense of £300,000, covering more than 13 acres of land, and ranking as one of the largest and best arranged in England, the barracks near the jail, the county ballroom, and a small but pretty theatre. The markethouse, the lower part of which is appropriated to the sale of corn, stands in the centre of the town, and behind it is a new market place, conveniently arranged for the sale of provisions. The church, one of the largest in the kingdom, is an extremely handsome embosomed edifice, with a lofty tower, formerly surmounted by a spire, destroyed by lightning in 1730: it was made collegiate in the reign of Richard II., and attached to an ecclesiastical college, destroyed with many others at the Reformation: the living is a perpetual curacy, in the gift of the Archbishop of Canterbury. There is also a new district church, erected by the church-building commissioners, at an estimated cost of £13,000, the incumbency of which is in the gift of the curate of Maidstone. Places of worship are also supported by the Wesleyan Methodists, Independents, Baptists, Unitarians, and the Society of Friends. A free grammar school was founded, in the reign of Edward VI., by the corporation, which has two exhibitions at University college, Oxford: freemen have the privilege of sending their sons here gratis, for classical instruction, the master making a charge for other branches of education. This school is not in a very flourishing state, and its inefficiency has led to the establishment of a proprietary school, which is well supported and attended. A blue-coat hospital was founded, in 1711, for the clothing and education of 53 boys and 43 girls, and there are three other endowed charity schools, and a Lancasterian school. Four sets of almshouses furnish lodging, clothing, and money allowances to 20 old women, and various bequests and charities exist for the relief of the sick and aged poor. A philosophical society was instituted here in 1824, a good library and reading-room is established, and a newspaper is published once a week.

Maidstone is in a very prosperous state, and there is no want of employment. There is a demand for houses of a superior class, and many have been built since the census of 1831; but many of the cottages are unoccupied, owing to the completion of public works, which had been going on for some years. The only manufactory of any importance is that of paper: there are six paper-mills in the parliamentary, employing about 800 hands. The felt, blanket, and hop-bag manufactories are of much less extent. There is a considerable traffic on the river, which has been for many years gradually increasing; and the annual tonnage of vessels passing through Hallington lock, about two miles from the town, is, at present, supposed to average 120,000 tons, on which tolls are paid to the amount of about £2600. The principal articles of mer-

MAILCOTTA.

chimney brought up the river, are coals and timber for the supply of the neighbourhood, and also of Tanbidge, Seven-Oaks, and the whole world of Kent. A portion of the latter article is imported direct from the Baltic and America. The neighbourhood is celebrated for its abundant produce in hops and fresh, both of which are carried down the river with pepper and stone." (*Mss. Corp. Report.*)

Maldstone received its charter of incorporation from Edward VI. in 1549, but forfeited it in the following reign, owing to the connection of its inhabitants with the insurrection of Sir Thomas Wyatt. Queen Elizabeth granted another charter, with increased privileges; but this also became void, by a *quo warranto*, soon after the Revolution of 1688; and a new charter was granted in 1748, by George II. Under the Municipal Reform Act of 1837 the borough is divided into three wards, the corporate officers being a mayor and five other aldermen, with 18 councillors. Corporation revenues in 1839, £4137, exclusive of £33 resulting from the sale of property. The Lent and summer assizes are held here, as also the quarter-sessions for the W. division of Kent. The recorder holds, also, quarter and petty sessions within the borough; and there is a court for the recovery of small debts. This borough has sent two members to the House of Commons from the 6th of Edward VI. Down to the Reform Act, the right of election was vested in the freemen (by birth, apprenticeship, and purchase) not receiving alms. The limits of the borough were not altered by the Boundary Act. In 1830-40, it had 1687 registered electors. Maldstone is also the chief place of election for the members for the W. division of the county. Large markets on Thursday for hops, corn, horses, and cattle: fairs for cattle, &c., first Tuesday in each month, Feb. 13, May 19, June 30, and Oct. 17.

MAIDSTONE, L. Essex co., VI., 8 m. N. Guildhall, 54 m. N.E. Montpellier. Bounded E. by Connecticut river. Watered by Paul's stream. It has one grist-mill, three schools, 90 scholars. Pop. 371.

MAILCOTTA, a town of Hindoos, prov. Mysore, and a celebrated place of Hindoo worship, on a rocky hill, 17 m. N. Seringapatam; lat. 13° 30' N., long. 76° 43' E. The town, which is open and paved, has about 400 good houses, mostly occupied by Brahmans, and several rich pagodas, choultrys, &c. The most striking edifice is a temple dedicated to Narsingha (the man-lion), which stands on the highest pinnacle of the mountain, and is approached by a staircase cut in the rock, and ornamented at intervals with smaller temples and arches. It has, besides, a temple to Krishna, a square building of vast dimensions, entirely surrounded by a colonnade, and which is said to be extremely rich in jewels and other articles of value; and held in such esteem that Tipoo did not venture to outrage the prejudices of his Hindoo subjects by plundering it. There is also a large and fine reservoir at Mailcotta, surrounded by numerous buildings for the accommodation of devotees. Near this town the Mahahrats defeated Hyder Ali, in 1773. (*Hamilton's E. I. Gazetteer.*)

MAINE, the northeastern of the United States, is bounded N. by Lower Canada, E. by New-Brunswick, from which it is separated by the St. Croix river and a line due N. from the Monument at the source of the St. Croix river, as designated by the commissioners under the 5th article of the treaty of 1794, between the government of the United States and Great Britain; thence N. following the exploring line marked by the surveyors of the two governments in the years 1817 and 1818, under the 5th article of Treaty of Ghent, to its intersection with the St. John river, and to the middle of the channel thereof; thence up the middle of the channel of the said river St. John, to the mouth of the river St. Francis; thence up the middle of the channel of the said river St. Francis, and through the lakes through which it flows to the outlet of the lake Poughnagog; thence southwesterly, in a straight line to a point in the N.W. branch of the river St. John, which point shall be 10 miles from the main branch of the St. John, in a straight line, and in the nearest direction; but if the said point shall be found to be less than seven miles from the nearest point or crest of the highlands, that divide the rivers which empty themselves in the river St. Lawrence from those which fall into the river St. John, to a point seven miles in a straight line from the said summit or crest; thence in a straight line in a course about S. 80° W. to the point where the parallel of lat. 46° 25' N., intersects the S.W. branch of the St. John; thence southerly by the said branch to the source thereof in the highlands at the Mijarmette portage; thence down along the said highlands which divide the waters which empty themselves into the St. Lawrence from those which fall into the Atlantic ocean, to the head of Hall's stream; thence down the middle of said stream till the line thus run intersects the old line of boundary surveyed and marked by Valentine and Collins previously to the year 1774, as the 45° of N. lat., and which has been known and understood

MAINE.

to be the line of actual division between the states of New-York and Vermont on the one side, and the British province of Lower Canada on the other; and from the said point of intersection W. along the said dividing line, as heretofore known and understood, to the Iroquois, or St. Lawrence river. Such are the terms of the late treaty, now ratified by both governments, and which has happily settled a controversy of the standing of a quarter of a century. The line designated as the old line, run as the 45° of N. lat., is found to be nearly a mile N. of the true line of 45° N. lat., as is proved by the accurate taking of the latitude, by the more perfect instruments now used. Maine is bounded W. by New-Hampshire, and S. by the Atlantic ocean. It lies between 43° 5' and 47° 30' N. lat., and between 69° 50' and 71° 0' W. long. It is computed to contain 30,000 sq. m., or 19,900,000 acres. The population in 1790, was 96,340; in 1800, 151,719; in 1810, 258,705; in 1820, 398,335; in 1830, 399,955; in 1840, 501,793. Of these 352,909 were white males; 94,740 were females; 790 were coloured males; 635 in females. Employed in agriculture, 101,630; in commerce, 3981; in manufactures and trades, 91,679; in navigating the ocean, 10,091; in the learned professions, 1894.

The state is divided into 13 counties, which, with their population in 1840, were as follows:

York	54,034	Somerset	33,918
Cumberland	60,688	Penobscot	45,785
Lincoln	63,517	Waldo	41,380
Hancock	98,605	Piscataquis	13,138
Washington	98,337	Franklin	39,601
Kennebec	55,682	Aroostook	9,413
Oxford	38,257		

Augusta at the head of sloop navigation on Kennebec river, 50 m. from its mouth, is the seat of government.

Maine is diversified, and has an uneven surface, but is not generally mountainous. On the western side of the state, east of the White mountains in N. H., an irregular chain of high lands commences, and passing N. of the sources of the Kennebec and Penobscot rivers, and S. of the sources of Aroostook rivers extends eastwardly to the eastern boundary of the United States, and terminates at an isolated peak denominated Mars Hill, 1633 feet high. This chain which is not continuous, the British, before the late treaty, claimed as the highlands described in a perivous treaty. Katahdin between the E. and W. branches of the Penobscot, 5300 feet above tide-water, is much the highest land in the state, and constitutes a part of the above range, if such it can be called. But the vexed question is now happily settled. The British have ground for their road from Halifax to Quebec, which in fact occasioned all the difficulty, and the United States have received an equivalent. The rest of Maine is hilly, though the hills are not very elevated. The land on the sea coast, for the distance from it of from ten to twenty miles, is not generally very fertile; but further inland, its quality is greatly improved. In the N.W. and S.E. parts, the soil is light and indifferant. Between the Penobscot and Kennebec rivers, is a tract of land not exceeded in fertility by the best portions of the United States. The principal productions are grass, Indian corn, wheat, barley, rye, oats, and flax. The uncleared lands are of great extent, and furnish a vast amount of pine and other lumber, which in the form of masts, plank, boards and timber, is exported to a great extent. Lumber cut and sawed may be regarded as the staple production of the state, and is exported to the amount of about \$10,000,000 annually. The state is well adapted to grazing, and the wool produced is estimated at \$3,000,000 annually. Lime is manufactured, particularly at Thomaston and the vicinity, to the annual amount of \$100,000. A fine building granite is found at Hallowell, and is extensively exported. The Hall of Justice in the city of New-York, is constructed of it. Previously to the year 1807, the wars in Europe gave to the United States much of the carrying trade of the world, and Maine engaged largely in commerce, and neglected her lands for this superior source of wealth. But when the embargo, non-intercourse, and war crippled her commerce, her agricultural resources were developed. Cattle and sheep are raised in great perfection. Maine produced much and good wheat. The crop of Indian corn sometimes suffers from the shortness of the season. Among the fruits, apples, pears, plums and melons succeed well.

According to the census of 1840, there were in the state, 59,308 horses or mules, 337,355 neat cattle, 649,964 sheep, 117,386 swine. There were produced 848,166 bushels of wheat, 137,941 of rye, 950,538 of Indian corn, 353,161 of barley, 1,070,409 of oats, 10,382,380 of potatoes, 691,359 tons of hay, 1,463,531 pounds of wool, 257,464 of sugar. The products of the dairy amounted to \$1,496,902; and of lumber to \$1,808,663. The amount of wheat and Indian corn had been greater, in some previous years.

Maine has a sea coast of over 220 miles, indented by an

MAINE.

marous bays, and protected by numerous islands; and has more good harbours than any other state in the Union. Ships are extensively built, not only for their own use, but for a foreign market. The fisheries employ many of the inhabitants, and are not only a source of wealth, but are a nursery of seamen. Maine in point of shipping is the fourth state in the Union.

The climate of Maine, though subject to great extremes of heat and cold, is generally healthy. The cold of winter, though severe is steady, and is much less trying to health than sudden changes. Near the seashore the heat of summer is greatly tempered by the sea breezes. In July 9th, 1838, the thermometer, in some places, rose to 100 degrees above zero; and in January 26th, 1837, it sunk to 27 degrees below zero. These may be regarded as the extremes of temperature, which are of short continuance. The season of vegetation, at its greatest length, extends from April 21st, to October 16th; though it does not continue in its vigour for more than three months and a half.

Maine has a number of fine rivers. The Penobscot is 250 m. long, and is navigable for large ships to Bangor, 52 m. from the ocean. The tide here rises 17 or 18 feet, and greatly facilitates the entrance and departure of vessels. The Kennebec is 250 m. long, and is navigable for large ships 12 m. to Bath, for sloops of 150 tons, 40 m. to Hallowell, and 2 m. further to Augusta for vessels of 100 tons, and for boats to Waterville, 18 m. above Augusta. The Androscoggin rises in New-Hampshire, but runs chiefly in Maine. Its numerous falls afford great water-power. It enters the Kennebec, 20 m. from the ocean. The Saco river rises in N. H., but soon enters Maine, and flowing S.E., enters Saco bay, and is navigable 6 m. to the falls. Damariscotta is chiefly an arm of the sea, has a tide of 10 feet, and is navigable 18 m. to Nobleboro'. The Sheepscot is a small river, but has an extensive bay at its mouth, forming the harbour of Wiscasset, one of the best in the state.

It is computed that one tenth of the surface of the state is covered with water. In the interior are many ponds and lakes. The largest, Moosehead, is 50 m. long and 10 or 12 broad. Umbagog, which lies on the border of New-Hampshire, is 18 m. long and 10 broad. The largest island of Maine is Mount Desert, in Frenchman's bay, and is 15 m. long and 12 broad. Long island, Deer island, and Fox island are on the E. side of Penobscot bay. There are many others. Penobscot bay is large and open, being 30 m. long and 18 wide, at its mouth. Casco bay extends for 90 m. between cape Elizabeth and cape Small Point.

The most commercial places in the state are Portland, (city), on Casco bay, the third or fourth in commercial importance in New-England; Bangor (city) on the Penobscot, Bath, Hallowell and Augusta on the Kennebec, Thomaston on St. George river, Belfast on a branch of Penobscot bay, Wiscasset on a bay at the mouth of the Sheepscot, Wells, Gardiner, Brunswick, Frankfort Prospect, Bucksport, Camden, Castine and Eastport.

The exports of Maine, for the year ending September 1841, were \$1,078,533, and the imports were \$700,961. There were in 1840, 70 commercial and 14 commission houses in foreign trade, employing a capital of \$1,646,926; 2280 retail dry goods and other stores, with a capital of \$3,972,593; 3065 persons employed in the lumber trade, with a capital of \$305,650; 153 persons employed in internal transportation, who with 56 butchers, packers, &c., employed a capital of \$65,150; 2610 persons employed in the fisheries, with a capital of \$935,967.

The manufactures of Maine are considerable. Home-made or family manufactures amounted to \$504,397; 24 woollen manufactories employed 538 persons, producing goods to the amount of \$412,366, employing a capital of \$314,105; six cotton manufactories, with 29,736 spindles, employed 1414 persons, producing goods to the amount of \$70,267, with a capital of \$1,266,000; 16 furnaces produced 6123 tons of cast iron, and one forge for bar iron, employed 48 persons, and a capital of \$185,950; 15 persons produced 50,000 bushels of salt, with a capital of \$95,000; six paper-mills employed 59 persons, producing to the amount of \$64,600, with a capital of \$30,600; 280 persons produced granite and marble to the amount of \$38,730; 37 persons manufactured tobacco to the amount of \$18,150, with a capital of \$60,650; hats and caps were manufactured to the amount of \$74,174, and straw bonnets to the value of \$36,000, together employing 219 persons, and a capital of \$308,038; 285 tanneries employed 754 persons, and a capital of \$571,793; 530 other manufactories of leather, as saddlery, &c., produced articles to the amount of \$443,845, with a capital of \$191,717; 21 potteries employed 31 persons, producing to the amount of \$20,250, with a capital of \$11,352; 864 persons produced bricks and lime to the amount of \$691,593, with a capital of \$300,692; 330 persons produced machinery to the amount of \$39,752; 119 persons produced hardware and cutlery to the amount of \$65,555;

four rope-walks, employed 34 persons, producing cordage to the amount of \$32,960, with a capital of \$23,000; 779 persons produced carriages and wagons to the amount of \$174,310, with a capital of \$75,012; flouring, grist, saw and other mills, employed 3630 persons, producing to the amount of \$3,161,592, with a capital of \$2,900,565; ships were built to the amount of \$1,844,903; furniture was manufactured to the amount of \$304,375, employing 1453 persons, and a capital of \$662,539; 34 brick, and 1674 wooden houses were erected, employing 949 persons, and cost \$753,067; 34 printing-offices, 14 binderies, three daily, two semi-weekly, and 30 weekly newspapers, and five periodicals, employed 196 persons, and a capital of \$69,300. The total amount of capital in manufactures was \$7,147,324.

The principal colleges are Bowdoin college at Brunswick, named in honour of its principal benefactor, Hon. James Bowdoin, founded in 1794, and went into operation in 1802; Waterville college, under the direction of the Baptists, founded at Waterville in 1820; Bangor theological seminary, at Bangor, founded in 1816; the Wesleyan seminary, under the direction of the Methodists, founded at Readfield in 1822. These institutions had in 1840, 266 students. There were in the state 86 academies, with 8477 students, 3395 common and primary schools, with 164,477 scholars. There were 3941 persons over 20 years of age, who could neither read nor write.

The principal religious denominations are the Methodists, Baptists and Congregationalists. The Baptists had in 1836, 282 churches, 145 ordained ministers, and 15,000 communicants; the Methodists had 115 travelling preachers, and 15,493 communicants; the Congregationalists had 161 churches, 119 ministers, and 12,370 communicants. There are also some Free-will Baptists, Friends, Episcopalians, Unitarians, Universalists, and Roman Catholics.

On the 1st of January 1842, there were 40 banks, with an aggregate capital of \$3,414,000, and a circulation of \$1,583,890. At the close of 1840 the state debt amounted to \$1,678,367.

Maine has executed several works of internal improvement. The Cumberland and Oxford canal was completed in 1839. It connects Portland with Sebago pond, 204 m. long; and by a lock in Songo river, the navigation is extended into Brandy and Long ponds, a further distance of 30 m. The whole distance is 304 m.; 34 feet wide at the surface, and 18 at the bottom, with 26 wooden locks, and cost \$250,000. Bangor and Orono railroad was completed in 1836, is 10 m. long, and connects the two places. The Portland, Saco and Portsmouth railroad was incorporated in 1837 and with the Eastern railroad connects Boston with Portland. From Salmon falls, opposite to Portsmouth, its length is 48 miles, and it was completed in 1842, at a cost of \$781,508. Several other railroads have been projected.

The government consists of a governor, senate and house of representatives. The governor is elected by the people, and holds his office for one year from the first Wednesday in January. A council of seven persons to advise the governor is elected annually, by the joint ballot of the Legislature. The senate consists of 31 members elected by the people. The house of representatives consists of 151 members, elected annually by the people. The right of suffrage is possessed by every male citizen of the United States, of 21 years of age and upwards, excepting paupers, persons under guardianship, and Indians not taxed, who have resided in the state for three months next preceding an election. The election must be by written ballot. The judiciary is vested in a supreme judicial court, and such other courts as the legislature shall from time to time establish. The judges are appointed by the governor, with the advice and consent of the senate, and hold their offices during good behaviour, or until they are 70 years of age. In a similar manner are appointed the attorney general, the sheriffs, coroners, registers of probate, and notaries public.

The first permanent settlement in Maine was made in Bristol as early as 1623, at Pemaquidpoint. In an old fort once called William Henry, and afterwards Frederick George, built of stone in 1692, and taken by the French in 1696, are found grave stones of a very early date, and streets regularly laid out and paved, in the vicinity of the fort. On the side of Pemaquid river, opposite to the fort, tan pits have been discovered, the planks of which remain in tolerable preservation, and in other places coffins have been dug up, which bear indubitable evidence of a remote antiquity." In 1635, the district was granted by the British crown to Sir Ferdinando Gorges, and he appointed a governor and council. In 1647 a government was established by the settlers. In 1652 the state of Massachusetts purchased the territory of the helm or Gorges for \$5324. In 1661 it was incorporated with Massachusetts, by a charter of William and Mary, and continued under its jurisdiction until it became an independent state. It had long a sufficient population to become a state, and efforts were made

MAINE-ET-LOIRE.

for this purpose in 1785, 1786 and 1802. The inhabitants were averse to a separation. But in 1890 a constitution was formed, and it was admitted to the Union as a sovereign state.

MAINE, a river of W. Germany. (See MAYN.)

MAINE, one of the old provs. of France, now distributed between the depa. Mayenne and Sarthe.

MAINE-ET-LOIRE, a dep. of France, reg. W., formerly comprising the greater part of the prov. of Anjou, chiefly between lat. 47° and 47° 50' N., and long. 0° and 10° W., having N. the depa. Mayenne and Sarthe, E. Indre-et-Loire, S. Vienne, Deux-Sèvres, and Vendée, and W. Loire-Inférieure. Greatest length, E. to W., about 70 m., breadth usually about 40 m. Area, 722,163 hectares. Pop. (1836) 477,270. Surface undulating. The Loire intersects the department from E. to W., dividing it into two nearly equal parts; and is joined within its limits by the Maine, Authion, Thouet, Layon, &c. The Maine is a continuation of the Mayenne, which changes its name after it has been joined by the Sarthe. It passes by Angers, and unites with the Loire about five miles below that city. Its entire length is eight miles, throughout which it is navigable. In 1835, 440,186 hectares of the surface of this department were estimated to be arable, 80,023 in pasture, 32,260 in vineyards, 61,836 in woods, and 48,271 in heaths, wastes, &c. More corn is produced than is required for home consumption. Nearly 2,128,000 hectolitres are said to have been harvested in 1835, of which 1,005,000 were wheat, and 547,680 rye. Agriculture, as in the contiguous departments, is very backward: the lands in lease are all held on the *metayer* principle, the rent being a certain proportion, usually about half the produce: the occupiers are poor, uneducated, and, of course, strongly attached to routine practices. Hemp and flax, prunes, melons, walnuts, apples, and various other fruits, are said to be of superior quality. The produce of wine is estimated at about 500,000 hectolitres a year. Some of the white wines are rather well esteemed; but the greater portion of the vintage is either converted into brandy or vinegar. The latter, which enjoys a high reputation, is known in commerce as *vin blanc de Saumur*. Exclusive of wine, this department produces annually from 50,000 to 60,000 hectolitres of cider. The industry of the rural population is, however, chiefly exercised in rearing and fattening cattle for the Paris markets, and in breeding horses. In 1830 there were stated to be 223,539 head of cattle in Maine-et-Loire—a greater number than in any other department of the W. of France: but, on the other hand, the stock of sheep (180,000) was comparatively small. In 1835, of 140,411 properties subject to the *contribucion fonsaria*, 68,596 were assessed at less than 5 francs, and 21,645 at from 5 to 10 francs. At the same time 332 properties were assessed at more than 1000 francs. This department has the largest and most important slate quarries in France. These are situated near Angers, and are extensive excavations, in one place to the depth of 450 feet below the surface. They employ more than 3000 workmen, and several steam-engines, and are said to yield about 80 millions of slates a year. At Chollet (which see), and other parts, some extensive woollen, cotton, and other manufactures are established, employing a large number of hands, and producing goods of the estimated value of 20,000,000 francs a year. At Angers is a large sail-cloth factory; wooden shoes are made at Moullichers; and the department has numerous sugar refineries, breweries, distilleries, paper-mills, dyeing-houses, &c. &c. and at Angers is one of the two royal schools of arts and trades established in France (the other is at Châlons-sur-Marne), at which about 450 pupils are supported, partly at the expense of government. Maine-et-Loire is divided into five arrondissements, chief towns, Angers, the capital, Baugé, Beaupréau, Saumur, and Segré. It sends eleven members to the chamber of deputies. Number of elections (1838—39), 2744. Total public revenue (1831) 11,104,099 francs. (*Hist.*, art. *Maine-et-Loire*; *Official Tables*, &c.)

MAINLAND. See BATTLELAND.

MAJORCA (Span. *Mayorca*), the largest of the Balearic Islands in the Mediterranean sea, belonging to Spain, from the E. coast of which it is 110 m. distant, Palmae the chief town, being in lat. 39° 38' N., long. 2° 45' E. Greatest length, 48 m.; do. breadth, 42 m.; estimated area, 1340 square miles. Population, according to Mifano, 181,805. Its shape is that of an irregular four-sided figure, the sides of which are formed W. by cape Tramontana, N. by cape Formentor, E. by cape Feri, and S. by cape Salinas. The surface is extremely uneven, and is divided into two pretty equal parts by a range of mountains, the highest of which, the Silla de Torillos, rises 5114 feet above the sea. These mountains are not volcanic, but consist chiefly of granite, syenite, and porphyry, over which lie beds of gneiss, clay, slate, and coal; lead and iron are found, but not in sufficient abundance for mining purposes. The rivers or rather torrents of Majorca are short, rapid, and very nu-

MAJORCA.

merous, affording great facilities to irrigation. The climate is exceedingly mild, salubrious, and agreeable; the thermometer during winter scarcely ever falls below 48°, its average height being 65°, and cold and strong N. winds are of rare occurrence. The temperature of summer varies between 84° and 89° F.; but the heat is seldom oppressive, owing to the constant sea-breezes. The red, loamy soil of the mountains, though stony, is extremely rich, producing spontaneously great numbers of wild olives, grapes, &c.; in the plains it is much less fertile, owing to the superfluity of moisture, and the absence of any system of drainage. Agriculture is in a very rude and debased state; and the growth of corn, which in wet years totally fails, meets only half the consumption of the island, the annual imports of this article being about 6000 fanegas, chiefly from Catalonia and Valencia. Olives are raised in very large quantities, the crops averaging about 180,000 arrobas a year; the fruit is smaller than that of Andalusia, but as juicy as the best of the growth of Provence. Wine, both red and white, is abundant, especially near Banalbufer and Falaniche; considerable quantities are exported, and much is likewise used in the distillation of brandy. Fruit and vegetables, especially oranges, figs, melons, carobs, pumpkins, and cauliflowers, grow plentifully, and attain a large size. Large quantities of saffron also are produced, of preferable quality to that of La Mancha. There is no want of fine pasture in the island; but little attention is paid to cattle-breeding. The sheep are large, and hogs sometimes attain the weight of 600 lbs. or about 35 stone. Mules and asses are reared in great numbers, and sent to Valencia and other provinces in the S. of Spain. Hares and rabbits, partridges, quails, snipes, &c., are abundant, and the coast swarms with fish of various kinds and good quality.

The trade of Majorca is, relatively to its size, very considerable, chiefly with Spain, France, and England; its exports comprise oil, wine, brandy, oranges, and other fruits; capers, saffron, wine, mules, and asses, with smaller quantities of home-made goods, as palm brooms and baskets, turnery wares, and water-proof hats for sailors, its imports consisting of wheat, salt beef, iron, sugar, groceries, woolen and cotton goods, hardware, &c., chiefly from France, England, and the N. of Europe; but the precise amount of the trade of Majorca cannot be ascertained.

The inhabitants are described by Fischer as bearing a striking resemblance, "both in their external appearance and general character, to the Catalans, being equally hardy and courageous, equally blunt and jealous of their honour, equally industrious and ingenious, equally good sailors and skilful farmers, with their continental neighbours; and their language is, in fact, nothing but a corrupt dialect of the Catalan."

Majorca comprises only two towns of any importance and 38 villages, the rest being mere hamlets. Numerous detached farms and country houses, however, are scattered over different parts of the island; and in all the fine valleys, one may meet with numbers of elegant villas, in which the higher classes, who are usually much attached to a country life, spend the greater part of the year. The roads have also been considerably improved within the last eight years, and there is a tolerably good communication between different parts. The capital of Majorca is Palma (sometimes also called *Mayorca*), situated in a bay of its own name, on the S. side of the island, and having a population (according to Mifano) of 34,343 persons. It is agreeably placed in a delightful country, and is pretty strongly fortified; the houses are large and well built, but the streets, being narrow, dark, and ill paved, give it a wretched and mean appearance. The chief public buildings are the governor's palace, a large structure with extensive gardens, a cathedral, exchange, town-hall, and theatre. The inhabitants are active, enterprising, and laborious; and almost the whole trade of the island is concentrated in its port. The road of Palma affords excellent protection for shipping, except during storms from the S.E.; but the little harbour, called Puerto-Pi, is more secure, and furnishes anchorage for the largest frigates: the port is defended by two well-fortified castles. Among the other towns of Majorca, the largest, with their respective populations, are Llanuysor (8630), Campos, remarkable for its mineral waters and salt-pans (4681), Santany, celebrated for its stone-quarries (3650), Falaniche, where is made the best brandy of the island (8800), Manacor (8905), Pollensa (7293), and Soller (5614). The small island of Cabrera lies 8 m. S.E. of cape Salinas: it is covered with trees, and wholly uninhabited, except by convicts, of whom there is here a small depot.

The *Balearic Islands*, of which Majorca is the chief, were more anciently known as the *Xorpaies*, so called, probably, from rising out of the sea, like the backs of hogs. The Phœnicians made settlements in them at a very early period; and they were succeeded by the Carthaginians and

MALABAR.

der Hanno, who founded *Maje* (Mahon) and *Jammen* (Cudadele), both towns of Minorca. The islands were celebrated as the most expert slingers in the Carthaginian service during the Punic wars, and were afterward equally noted as successful pirates, till Quintus Metellus subdued them, and hence obtained the surname of *Balearius*. He was the founder also of two cities in Majorca, *Palma*, the present capital, and *Pollentia*, now Pollenzia. Under the Roman empire, these islands belonged to the judicial district (*conventus iuridicus*) of New Carthage in Tarracensis, and from the reign of Constantine I. to that of Theodosius I., they had their own government. On the breaking up of the W. empire, they became an easy conquest for the Vandals and Huns, from whom they were afterward wrested by the Moors. The people becoming notorious as pirates and robbers on the coast of Christian Europe, Charlemagne headed an expedition against them, and succeeded, not only in taking the islands, but in keeping possession of them for six years, at the end of which they were retaken by the Moors: nor were the latter finally expelled till 1365, when the entire group was formally annexed to the crown of Aragon.

MALABAR. This term is usually applied to designate the whole W. coast of Hindostan from cape Comorin to Bombay, but, strictly speaking, Malabar only extends as far N. as the Malabar language is spoken, or to lat. 19° 30'. The British province of Malabar is a district or collectorate under the Madras presidency, extending between lat. 10° 12' and 19° 15' N., and long. 75° 10' and 76° 50' E., comprising several portions of territory, as Wynad, &c., not belonging to Hindoo Malabar; and having N. Camara, Coorg, and Mysore, E. Coimbatore, S. Cochin, and W. the Indian ocean. Length, N.W. to S.E., about 150 m.; average breadth about 45 m. Area, 6923 sq. m. Pop. (1836-37) 1,460,916, of whom 844,186 were Hindoos, 292,037 Mohammedans, and 14,403 Roman Catholics. In the E. the surface is mountainous, comprising a portion of the range called the W. ghats; the coast is low, and indented by many shallow inlets. Between these two regions the country mostly consists of undulating hills, separated by narrow valleys in general watered by a rivulet. Nearly all the rivers have a W. course. The chief are the Cochín, Beypore, Ballapatam, Ponany, &c.: the bar of the first is navigable for ships drawing 15 ft. water, and the mouth of the second will admit vessels of 200 tons. Lakes and tanks inconsiderable. The year is divided into three seasons: the hot, from February to May; the wet, from May to October; and the cool, during the remaining months. Dense fogs are rare on the coast, but they usually envelope the ghats from April to the end of the year. The soil on the coast is sandy, but well adapted for the culture of the cocoa-nut, jack, areca, plantain, cinnamon, and other trees, pepper, coffee, the sweet potato, and other farinaceous roots, garden vegetables, &c. In the interior the soil is of the red kind common in the S. of India, and highly favourable for rice, which frequently yields two and sometimes three crops a year. The rice lands are sown after the first rains in April, and in four months the grain is ripe for the sickle. The second crops are raised by the transplantation of plants a month old, and are reaped in three months. The third crop is assisted by small reservoirs and tanks, and by turning water from streams. About 788 sq. m. are estimated to be under rice, and 130 in gardens and inclosures of productive trees. The sides of the hills are often formed into terraces for cultivation. The rest of the surface, especially in the uplands, is chiefly covered with forests, among which the teak-tree is very prevalent, and an important source of wealth to the district, the teak of Malabar being considered, upon the whole, superior to every other variety. Besides the above articles of culture, the mulberry, mango, tamarind, sugar-cane, ginger, turmeric, mustard, arrow-root, hemp, cotton, &c., are grown, and wheat and barley on the hills. There are few cattle. The elephant and wild hog do great damage on the borders of the forests they inhabit; the tiger, lion, elk, deer, &c., are also met with. Towns are rare in the interior, and villages there are spread over a large space, families usually living separate from each other within gardens inclosed by ditches and high banks. Iron is pretty generally found, and gold, though in small quantities, in the sands of some of the rivers. Coarse cotton cloths are manufactured in a few places from the raw produce of the district; oil is made from the fibrous covering of the cocoa-nut; oil from its kernel, and arrack from the toddy in very large quantities. The chief exports consist of the products of the coconuts, amounting to about 805,500 rupees annually. From 10,000 to 15,000 candelils of pepper, betel-nut to the value of 550,000 rupees, and cloth from the districts to the E. to the value of from 1,700,000 to 2,300,000 rupees, are annually exported. At Calicut, Tellicherry, Cananore, and Ponany, the chief commercial towns, there are numerous Parrees and other opulent merchants. The roads throughout the

MALACCA.

district are in good order, and have convenient bungalows every 10 or 15 m. Public revenue (1836-37), £310,236, of which the land-tax amounted to £161,162. In Malabar, as in S. Canara, inheritance goes by the female line, among the Nairs and other Hindoo castes which inhabit the country. On the coast, a large proportion of the inhabitants are Mohammedans, and many Mopla, a people originally derived from Arabia. The Christian religion appears to have been planted in this part of India at a very early period, and many churches were found existing by the Portuguese. Malabar was governed by various Nair dynasties, previously to its conquest by Hyder Ali, in 1761, on the fall of Tippoo Saib, it became subsidiary to the British, and was incorporated with the Madras presidency in 1803. (*Madras Almanack* for 1838 and 1839; *Hamilton's E. I. Gazetteer*, vol. II.)

MALACCA AND NANING, a British colony, on the W. coast of the Malay peninsula, between lat. 2° and 3° N., and long. 102° and 103° E.; having N.W. the territory of Singapore, N.E. those of Bumbow and Johole, S.E. that of Johore, and S.W. the straits of Malacca. Area estimated at 1000 sq. m. Pop. in 1826, 37,706, of whom about 21,000 are Malays, 4000 Chinese, and 2400 Europeans, chiefly English, Dutch, and Portuguese. Surface mostly undulating; the hills are covered with jungle, and the valleys rendered swampy by the rains. The coast also is swampy S. of the town of Malacca, but to the N. it is generally bold and rocky. There are several rivers, but the largest is only navigable by small vessels for 10 or 12 m. from its mouth. Opposite the coast are many small granitic islands, which serve for burial places to the Malay inhabitants of the colony. The country is geologically composed of a granitic formation, overlain by laterite, and this again by a layer of vegetable mould, which becomes thicker or nearer the coast. The soil near the sea shore is very productive, but in the interior it is otherwise; and Naning is much more valuable for its tin mines than for the products of its agriculture. The climate is more salubrious perhaps than that of any other British coast settlement in the East. It has been found that during a period of seven years, the deaths among the troops stationed here amounted to less than two per cent.; and instances of longevity are frequent among both Europeans and natives. The mean annual temperature is about 77° F. Fahr., and there is but little change throughout the year in the barometer, which stands at about 30". Rain falls continually at intervals of a few days; but as rather more occurs between September and January than at any other time, that period is termed the wet season. Violent squalls and storms of lightning, &c., occur during the S.W. monsoon. The produce of Malacca consists chiefly of rice, jagerry, sago, pepper, rattans, timber, coconuts, a few nutmegs, cloves, dammer, gambier, gum lac, ivory, gold dust, tin, fruits, poultry, and cattle. A few years ago the rice raised in the colony was scarcely sufficient for four months' consumption, the additional supply being brought from Acheen, Java, and Bengal. A principal cause of this was the former policy of the Dutch, who, while Malacca belonged to them, prohibited the raising of any kind of grain, in the view of rendering the inhabitants wholly dependent for their supplies on Java. The British government, however, has given every encouragement to native agriculture; and, in 1835, the crop of rice amounted to two thirds the annual consumption. Coconuts form a considerable portion of the food of the lower classes of natives, who also subsist partly by fishing. For the trade of the colony, see post.

This settlement is included in the presidency of Bengal, and is governed by a resident, with an assistant resident at Malacca, and a superintendent at Naning. The Dutch drew from it a surplus revenue, but since it came into our possession, the expenditure has always exceeded the income by about 100,000 rupees a year. In 1837-38, the revenue only amounted to 55,543 rupees, or £235,4.

MALACCA, a town on the W. coast of the Malay peninsula, cap. of the above British colony, at the mouth of the river of the same name, lat. 2° 14' N., long. 102° 19' E., about 100 m. N.W. Singapore, and 230 m. S.E. Pinang. Pop. in 1833, 12,120, of whom about 4000 were Chinese, 3000 Malays, 2000 Chulaha, and 3000 Europeans. The town of Malacca is divided by the river above mentioned into two parts, connected by a bridge. On the left bank rises the verdant hill of St. Paul, surrounded by vestiges of an old Portuguese fort. Around its base lie the barracks, lines, and most of the houses of the military; the stadthouse, courthouse, jail, church, civil and military hospitals, the site of the old inquisition, convent, the police-office, the school, postoffice, and master attendant's office. On its summit stand the ruins of the ancient church of our Lady del *Messa*, erected by Albuquerque, and the scene of the labours and miracles of that 'Apostle of the East,' St. Francis Xavier; also the light-house and flag-staff. A little to the S. rises the hill of St. John's, and in the rear rises

MALAGA.

that of St. Francis. On these eminences are the remains of batteries erected by the Portuguese and Dutch, commanding the E. and S. entrances to the town. Smaller knolls intervene, covered with the extensive cemeteries of the Chinese. The tombs are white, and constructed with much care, and surrounded by low walls of brick and chiselled, in shape resembling a horse-shoe. The bazaars, and by far the greatest part of the town, are situated on the right bank of the river. The anchoring ground in the roads is secure; and though large vessels are obliged to lie at a distance of 2 m. from the shore, accidents have been rarely known to happen. Native craft anchor much nearer, under the lee of one of the islets close in shore." (*Newbold's Malacca*, i., 109-111.)

The principal public institution at Malacca is the Anglo-Chinese college, established in 1818. Its main objects are the cultivation of Chinese literature by Europeans, and of European literature by the Chinese, Malays, and surrounding nations, and the diffusion of Christianity. The college has a library well stocked with European and Chinese books, Siamese MSS., &c.; and attached to it is an English, Chinese, and Malay press. This college was founded by Dr. Morrison, the Chinese scholar, from whom, also, it received a small endowment. But at present it depends almost wholly on the fees paid by the pupils; and its funds are by no means in a prosperous state. Such an institution would, however, appear to be deserving of public support. There are also in the town five Chinese schools, with about 100 scholars, besides several Hindoo and female schools, and schools established by the Malays for their own instruction in English. A full account of the mode of education in the Chinese schools may be seen in Newbold's work on Malacca.

Malacca was formerly a place of considerable trade; but, owing to the superior advantages of Pinang and Singapore, its commerce has rapidly decreased within the last 10 years, and it is now very limited. It exports small quantities of gold dust, balachong, hides, fowls, jaggers, pepper, dammer, cordage, little ebony and ivory; iron implements, fire-arms, nails, &c., manufactured by the Chinese smiths at Malacca, with rattans, lac, and aloes-wood. The gold and tin are not the produce of the British territory, but of the adjacent native states, whence they are brought to Malacca by native boats, or overland by coolies. The principal imports are earthenware, iron, rice, sugar, opium, nankeens, European and Indian piece-goods, woollens, paper, provisions and liquors for the European and Chinese inhabitants; salt, sugar, tea, tobacco, &c., partly for home consumption and partly for re-shipment. The total value of the imports, 1834-35, amounted to 467,459 doll.; total do. of exports, 536,193 doll.

Malacca is said to have been founded in 1583, by Iskander Shah, a chief from Singapore, and it soon became a large and flourishing city, its influence extending over all the peninsula and the adjacent islands. It was first visited by the Portuguese in 1509, and captured by them in 1511. In 1641 it was taken by the Dutch, and in 1795 by the English. The latter held it till 1818, when it was restored to the Dutch; but in 1825 the latter finally exchanged it with us for the settlements of Bencoolen, &c., on the coast of Sumatra. But we much doubt whether its possession be of any material advantage, or, at least, whether the advantage be at all adequate to counterbalance the expense it occasions. (*Newbold's British Settlements in Malacca; Hamilton's E. I. Gaz.*, &c.)

MALACCA (STRAIT OF), a channel of the Eastern seas, extending from lat. 1° and 6° N., and long. 98° and 104° E., between the Malay peninsula on the N.E. and the island of Sumatra on the S.W. Its length, N.W. to S.E., may be estimated at about 520 m.; its breadth varies from 25 m. opposite the Nanning territory, to nearly 300 m. at its N. extremity. It is the best and most frequent passage from the Indian ocean to the China sea.

MALAGA, an important city and seaport of Spain, kingd. Granada and prov. of its own name, at the bottom of a deep bay, on the Mediterranean, 98 m. N.E. Gibraltar, and 254 m. S. by W. Madrid; lat. 36° 43' 30" N., and long. 4° 25' 7" W. Pop., according to Mifano, 51,899; but little dependence can be placed on this statement, and the population is believed to amount to near 65,000. It is built along the shore, at the foot of mountains gradually descending towards the sea: westward is the Vega, watered by the great river of Malaga, which delivers a large body of water from the E. end of the Serrania de Ronda; and on the other side rise naked rugged mountains, overhanging the shore, and scarcely leaving room for the town. But the most imposing view of Malaga is from the sea. "It stands in the centre of a wide bay, flanked by lofty mountains, and by the picturesque ruins of its ancient fortifications and castle, which cover the hill rising immediately to the E., and seem, from their great extent, like the remains of a former state." (*Inghis*, ii., 136.) The streets, as in

all Moorish towns, are very narrow, many being only 8 feet wide, with others still narrower, badly paved, and dirty to a proverb: the houses are high and large, built round a court, the interior having a clean and neat appearance, owing to the abundant use of whitewash. There is only one square in the town, and the churches, as well as convents, are so crowded among the houses that their beauty, if they have any, is effectually concealed. "Indeed," says Mr. Inghis, "the only handsome feature of the town is the Alameda, or public walk, the buildings round which are certainly magnificent: the other parts present a labyrinth of narrow, intricate streets, inhabited by the tradespeople." (*Vol. ii.*, p. 136.) The chief public buildings and establishments are a cathedral, with a chapter, four parish churches, a bishop's palace, four hospitals (one of which is for military), a legal seminary, royal college of medicine and surgery, a foundling asylum, a large depot for convicts, a custom-house, and two endowed schools. Among these, however, the only edifice worth notice is the cathedral, a large building, having a spire 270 ft. in height: like that of Granada, it is in the transition style, between the Gothic and classic; the roof, instead of being groined, is divided into numerous small circular domes, somewhat like the semicircular windows of Gothic architecture; and the modern additions to the building, though not quite in keeping with the whole, designed with good taste. (*Cook's Sketcher's Spain*, ii., 100.) The high altar and the pulpit are of fine-coloured marble; but the part which most attracts the attention is the choir, called by the biographers the perfection of the eighth wonder of the world, and admirable for the perfection of its carved work, representing in very bold relief the twelve apostles, and most distinguished of the saints." (*Travels*, iii., 12.) On a sharp point of rock commanding the city stands a fine old Moorish castle, in good preservation, called the *Gibral-ferr* (prob. *Gib-el-ferr*, the great watch-tower), built on the site of a Roman fortress, but still wholly of Arabic architecture: it is altogether, both from its shape and situation, a very curious structure, and, if fortified on the modern system, might be rendered impregnable. Another Moorish building, in tolerable preservation, was formerly the *serena* or *doak* for the ancient galleys, now used as a storeroom. (*Swinhurne*, i., 232.) The *Alacapan*, an Arabian palace, once occupied a site near the shore; but the greater part of it was pulled down to make room for the custom-house. At a short distance from Malaga is one of the magnificent but unfinished undertakings of Charles III., a bridge and aqueduct over the great river of Malaga, which flows about a league distant from the city; but this work, on which a great outlay was incurred, was rendered useless a few years afterwards by a work undertaken by a bishop, who, at his own expense, brought water into the city by a much shorter line. (*Cook*, vol. i., p. 19.)

Malaga is probably entitled to rank as the third or fourth port of Spain; but, owing to the want of official record, and the prevalence of smuggling, it is impossible to obtain any accurate account of its trade. The principal articles of export are wines and fruit, particularly raisins, olives, grapes, figs, and lemons: there is likewise a considerable, though smaller, exportation of olive oil, with brandy, nutmegs, cummin-seed, anise-seed, basil, soap, &c. Lead is also brought thither for shipment from the mines of Alca in Granada. The imports comprise salt fish, iron, hemp, iron, and nails; cotton fabrics, hides, earthenware, &c.; with woollen cloths, all sorts of colonial produce, butter and cheese from Holland and Ireland, linens from Germany, &c. The trade with England has been for some time flourishing, owing to our small demand for Malaga wine; but the trade with America has considerably increased, owing to the very large consumption both of the fruit and wine shipped at this port. Mr. Inghis has given the following details with respect to the trade of this port, which may be interesting to some of our readers: "The wines of Malaga are of two sorts, sweet and dry; and of the former of these there are three varieties: 1st, the common 'Malaga,' known and exported under that name, in which there is a certain proportion of burnt wine, which communicates its peculiar taste to the 'Malaga;' the grape from which this wine is made is white, and every butt of Malaga contains no less than 11 gallons of brandy; 2dly, 'Mountain,' made from the same grape as the other, and, like it, containing colouring matter and brandy, the only difference between the two being, that for 'mountain' the grape is allowed to become ripe; 3dly, 'Lagrimas,' the richest and finest of the sweet wines of Malaga; it consists of the droppings of the ripe grape hung up, and is obtained without the application of pressure. The dry wine of Malaga is produced from the same grape as the sweet wine, but pressed when greener: in this wine there is one eighth more brandy than in the sweet wine; at least one twelfth part of the dry Malaga being brandy. The whole produce of the Malaga vineyards is estimated at from 25,000 to 40,000 butts; but, owing to the increasing cost of

MALAGA.

Id wine in the cellars, it is impossible to be precise in this situation. The export of Malaga wines may be stated at about 57,000 butts. The principal markets are in the United States and the states of S. America, to which countries the exports are rather on the increase. The average price of the wine shipped from Malaga does not exceed 35 dollars or but; but wines are occasionally exported at so high a price as 170 dollars. Many attempts have been made at Malaga to produce sherry, but not with perfect success. The vines grape has been reared at Malaga, upon a soil very similar to its native soil; and the sherry made at Malaga might be introduced into the English market as sherry, nor, from its cheapness, could it fail to command a sale. One reason of the very low price of the wines of Malaga, is the cheapness of labour; field labour is paid by 2½ reales a day (¼d.), wages during the fruit and vintage time being about double.

* Next to its wines, the chief exports of Malaga are fruits; raisins, almonds, grapes, figs, and lemons. During September and October, 1830, the export of raisins amounted to 388,845 boxes, and 31,916 smaller packages. Of this quantity, 125,334 boxes were for the United States; 45,513 to England; the remaining quantity being for France, the West Indies, the Spanish ports, S. America, and Holland. The raisins are of three kinds, muscatel, bloom or sun raisins, and lexis. The muscatel raisin of Malaga is the finest in the world, and in its preparation no art is used, the grapes merely placed in the sun, and frequently turned. The bloom, or sun raisin, is a different grape from the muscatel, at the process of preparing it is the same; like the other, it is merely sun dried. The lexis acquire this name from the liquor in which they are dipped, and which is composed of water, ashes, and oil; these, after being dipped, are also dried in the sun. All muscatel raisins are exported in boxes, and also part of the bloom raisins. In 1830 the number of boxes of muscatel and bloom raisins exported amounted to 380,000, each box containing 25 lbs.; 8,080,000 lbs. in all. His quantity is independent of the export of bloom raisins (lexis, and of lexis, the annual export of which does not exceed 35,000 arrobas. The export of raisins to England as follows:—off; the export to America has constantly increased. In 1834, 75 ships cleared from Malaga for England, with fruit. In 1830, up to the 1st of November, 34 vessels had cleared out. Of the other fruits exported from Malaga, grapes, almonds, and lemons are the most extensively exported. In the months of September and October, 530, 11,613 jars of grapes were sent to England; 6439 to America; and 1860 to Russia. During the same period of the 5335 arrobas of almonds (133,375 lbs.) were exported to England; and this constituted nearly the whole export: during these months, also, there were exported to England 750 boxes of lemons; to Germany, 4301 boxes; and to America, 840 boxes. There is also a large export of oil from Malaga." (*Spain*, iii., 145-146.)

Malaga has an excellent harbour, formed by a fine mole, 70 yards in length, at the end of which is a lighthouse furnished with a powerful light, revolving once a minute. A vessel that had grown up round the mole-head has been removed by dredging. The harbour, which will accommodate more than 450 merchant ships, may be entered with all winds, and affords perfect shelter. The port dues to a Spanish ship of 300 tons amount to about £11 10s.; those to an English vessel of the same burden being about £21. Mole may be warehoused for any time not exceeding 12 months, on paying two per cent. *ad valorem* in lieu of all taxes; but at the end of the year they must be either stored for consumption or reshipped. (For weights and measures, commercial details, &c., see *Com. Dict.*, art. *Malaga* and *Spain*.)

Malaga, independently of its export trade, has manufactures of linen and woollen cloth, sail-cloth, ropes, paper, sugar, hats, and soap; an iron foundry and a cigar manufactory, but, excepting the latter, they are all on a small scale, and insufficient for the consumption of the inhabitants. Richard and anchovy fisheries also give employment to a considerable number of the lower classes. The market is well supplied, the show of fruit in particular being unequalled in Spain. Mr. Inglis quotes the prices of several leading articles, as follows: Beef and mutton, 10 quartos (about 1s.) per lb.; pork, 14 quartos; a fowl, 7 reales (13d.); a duck, 1 real; a turkey, from 20 to 30 reales; a rabbit, 10 reales; a partridge, 4 reales. Poultry, however, is here not only spoiled whole, but also cut up into joints, like butchers' meat. A barrel of anchovies may be bought for two reales (¼d.), and many other varieties of fish are remarkably cheap and plentiful. Potatoes are sold for seven quartos the 6½ lb., and excellent wine may be procured for two reales a bottle. Bread, one of the dearest articles of food, fetches 1 quarto (¼d.) per lb., and eggs are sold for 1d. each. Nuts, pomegranates, and prickly pears, which, with fish, constitute the principal food of the lower orders, are so cheap as scarcely to form an article of expenditure.

MALAY PENINSULA.

The general aspect of the population of Malaga is even more Moorish than that of Seville, and affords innumerable pictures of idleness. Hundreds of the lower classes appear in the streets doing nothing, sitting on the ground, jolling against a wall, or lying on the steps of church-doors, wrapped in brown, ragged, and patched cloaks. In fact, Malaga is noted for idleness and demoralization. The necessities of life being so cheap, there are few motives to industry; begging is very common, and has been encouraged by the ill-judged bounty of the monasteries, which, however, were suppressed in 1835: but, when deprived of their legitimate resources, the *mala gente* (such being the sobriquet of these people) are at a loss to find, owing to the inefficiency of the police, a few quartos in some other way. The whole of them, indeed, are thieves; and in so degraded a state is public justice in this city, that crimes of the darkest hue pass unpunished. The clasp-knife is in frequent use to gratify revenge, and murders often follow acts of robbery. (Compare *Anglia*, ii., 138, with *Townsend*, iii., 18.) This degraded state of morals is attributed, by Sir C. Brooke, partly at least, to the fact that convicts, called *presidarios*, are detained here previous to their departure for, and after their release from, the penal settlement of Ceuta, in Africa, which see. (I., 592.) An efficient government would, however, speedily change the whole aspect of society; the impunity that crime has so long enjoyed in this miserable country being the great cause of its prevalence. The more respectable classes of the people are described as agreeable, hospitable, and generally fond of society, the ladies being equally witty and high-spirited with those of Seville, quite as showy in dress, and not a whit more strict in morals. The Italian opera is a favourite resort, and many ladies are good musicians. Numerous foreigners also reside in Malaga, especially English and Americans, who constitute, with a few of the government officers and merchants, the *élite* of society. Most of these have country seats in the environs, the beauty of which is not surpassed in any part of Andalusia. The weather during summer is intolerably hot, and at this season, especially during the prevalence of the hot southern winds, the inhabitants exclude the sun as much as possible, and remain at home during the day; but when the heat is succeeded by the refreshing coolness of the evening, the whole population is astir, and after nightfall the young people bathe for hours in the sea, a practice quite as conducive to health as pleasure. Nervous and epidemic fevers are still, however, very prevalent, and sometimes carry off great numbers of people.

Malaga, like most other cities of Spain, has had various masters. Built by the Phœnicians, and called by them *Malsaka*, it came successively into the hands of the Carthaginians and Romans, both of whom procured from it considerable supplies of salt fish and provisions. It then passed into the hands of the Goths; and from them, in 714, to the Moors, who were at length driven hence by Ferdinand the Catholic, in 1487. The yellow fever carried off nearly 98,000 of its inhabitants in 1803, and reappeared, though attended with less fatal consequences, in 1813. Malaga was taken by the French in 1810, after an obstinate conflict with a body of Spaniards, offered by monks, and commanded by a Capuchin friar; and remained in their possession till 1812. (*Legisl. Spain*, ii., 136-153; *Townsend's Journal*, iii., 10-42; *Cook's Sketches*, i., 18-94; *Seisburne*, i., 290-337; *Sir A. de Capell Brooke's Spain and Morocco*, i., 303-307.) MALAGA, p. 1, Monroe co., O., 110 m. E. Columbus, 290 W. It contains one church, two stores; two schools, 55 scholars. Pop. 1442.

MALAY PENINSULA, a long and narrow territory, forming a part of India beyond the Brahmaputra, and the most S. portion of continental Asia, lying chiefly between the 1st and 8th degs. of N. lat., and the 98th and 104th of E. long. It has N. Lower Siam, with which it is connected by the Isthmus of Kra; and is on all other sides surrounded by the sea, called on the W. and S. the straits of Malacca and Singapore; and on the E. the China sea and gulf of Siam. Length, N.N.W. to S.E. 450 m.; breadth varying from 50 to 150 m. Area estimated at 45,000 sq. m.

MALAY PENINSULA.

As far as lat. 6° S. the country is claimed by the Siamese; but beyond that point the peninsula is subdivided among independent native states and British colonies, which may be enumerated as in the preceding table, with their probable population, as estimated by Lieutenant Newbold.

Physical Geography.—The central and longest of the mountain chains, passing S. from the table land of Yunnan, through the Ultra-Gangetic peninsula, traverses this territory in its entire length. This mountain chain diminishes in height as it approaches the equator; and its highest peaks in Rumbowé and Jahore probably do not exceed 3000 feet in elevation; while many peaks in the N. part of Quedah are supposed to rise to upward of 6000 feet above the sea. M. Ophir, a detached mountain in about lat. 3° 30' N., and long. 102° 30' E., has been roughly estimated at nearly 5700 feet in height, but it is much more lofty than any other summit in the S. part of the peninsula. Between the above mountain chain and the coast the surface is undulating, covered with dense primeval forests, or interspersed with grassy plains, which are by far the most numerous and extensive in the N. An abundance of rivers descend to either coast, in their progress frequently forming marshes and lakes, some of which are of considerable size. Their banks are generally low, swampy, and covered with mangrove and other thickets; and, though several of them are broad, and moderately deep, the sand-banks, coral reefs, &c., at their mouths, usually preclude their navigation by vessels of any magnitude. A number of verdant islets stud the coasts, especially the north-western and the southern.

Geology and Minerals.—The Malay mountain chain, as far as it has been hitherto explored, consists chiefly of gray stanniferous granite and clay-slate. At its S. extremity porphyry occurs; hornblende is met with near Malacca; and quartz is very abundant around M. Ophir, and elsewhere. The geology of the E. coast is almost wholly unknown; but along the W., laterite, similar to that of the Malabar coast, is a very prevalent formation. Clay-slate, sandstone, argillaceous schist, Jasper, limestone, and grailwacke are the other most prevalent rocks. Limestone composes a portion of several of the islands off the W. coast, while those off the S. coast are chiefly of granite or syenite. The Elephant rock in the Quedah territory is a mass of calcareous breccia, having many stalagmitic caverns, and interspersed with an abundance of fossil remains. At the S. extremity of the peninsula are evident traces of volcanic action; and numerous thermal springs, scattered over the country, testify the activity of subterranean heat at no great distance below the surface. These are sulphurous and saline. The springs at Ayer-pannas, near Malacca, were found by Newbold to have a temperature of 120° Fahr. at noon, and of 113° at 6 A.M.

The Malay peninsula produces tin, gold, and iron: tin is, in fact, among its principal articles of export. Mr. Crawford observes, that tin, wherever found, has a limited geographical distribution; but that, where it does exist, it is always in great abundance. The tin of India has, however, a much wider range of distribution than that of any other region, being found in considerable quantity from long. 96° to 107° E., and from lat. 8° N. to 3° S. (*Indian Archip.*, iii., 450.) It has been latterly stated that it is found in abundance at Bakana, in the interior of Tavoy, lat. 19° 40', and in Siam even as far N. as 14°. At any rate the Malay peninsula appears to be the centre of the region in the eastern seas in which tin is distributed; and, including the island of Junkceylon, it has been roughly estimated that its annual produce of this metal amounts to 34,600 piculs of 133½ lbs. avoird. The ore of the peninsula is extremely pure, being that which is called stream. The ore of Sunje-ujong, Nanning, and Perak is reported to yield 76 per cent. metal, whereas the ore of Cornwall, with all the advantages of European science and ingenuity, do not yield more than 75 per cent. But the process of smelting, as conducted by the Malays, being very defective, and adulteration frequent, the peninsular tin fetches only from 14½ to 15 dollars the picul; while the tin of Banca, wrought by Chinese, sells at from 16 to 16½ dollars. The export of peninsular tin may amount to about 2000 tons a year, including from 400 to 500 tons received from the Malacca straits and Banca. A large portion is brought to England, Malay tin being now very extensively imported for warehousing; large quantities are also carried to Holland, where there are refining houses.

The Malay peninsula does not by any means so well merit the term, *Aurea Chersonesus*, which has been before applied to it, as the neighbouring island of Sumatra. The exports of gold from the S.W. coast of that island amount, according to Marsden and Hamilton, to 26,400 oz. a year, while the annual produce of the peninsula is roughly estimated at less than 20,000 oz. It comes chiefly from the E. coast, and M. Ophir, where it occurs disseminated through quartz, in thin granular veins, and in alluvial deposits. Iron is found in Quedah, but only in small quantities.

The climate is remarkable for its continual moisture, to

which circumstance the perpetual verdure of the peninsula is mainly owing. The year is divided into the wet and dry seasons; but the term "dry season" must not be understood in the same sense as when applied to the climate of Hindostan; for, during its continuance, even three successive days rarely pass without a shower. On the W. coast the dry season comes in with the S.W. monsoon in May; the wet season, with the N.E. monsoon in October. Thunder storms, whirlwinds, waterspouts, and other atmospheric phenomena are frequent, especially during the S.W. monsoon.

Vegetable Products are both numerous and valuable. They include a host of trees, the timber of which is adapted for house and ship building; the finest fruits of tropical climates, bamboos, canes, rattans, &c., of which the jungles are in great part composed; the areca, mango, and gumm palm, the catechu, dragon's blood, and India rubber plant, the upas of the Javanese, &c. It has been denied that wheat is indigenous to the country; but, according to Newbold, the inland Malays affirm that it is occasionally found, and is known under the name of *jati*. The wild man is a native of the country. The true nutmeg, cinnamon, and clove have been long introduced, and thrive well. Tobacco, coffee, sugar, cotton, and the true indigo (*Indigofera tinctoria*) are cultivated with much success. Mr. Crawford (*Embassy to Siam*, &c., i., 178) estimates that the Malay peninsula produces 25,000 piculs of pepper a year, or about one thirteenth part of the total produce of the E. Arc, and other kinds of grain, are not grown in quantities sufficient for home consumption, and are, therefore, imported chiefly from Bengal and Sumatra.

Elephants roam over the peninsula in great numbers; the rhinoceros, tapir, wild hog, the royal and the spotted black tiger, two kinds of bears, and two species of leopards, the wild cat, musk-deer, and several other kinds of deer, the vampire, and many varieties of bats, and numerous monkeys, are among the wild animals. The buffalo is a native, and is domesticated; but neither the cow, camel, horse, nor ass, are met with in a state of nature. The great density of the jungles is considered unfavourable to the increase of feathered game; but waterfowl are plentiful, and there are a great many pheasants of the richest plumage. Crocodiles, alligators, and several kinds of formidable serpents, are met with. The dragon, many snakes, and a plentiful supply of fine fish, are caught in the surrounding seas.

People.—The Malays have been ranked by some authors as one of the five great families, or varieties, of the human race. But this opinion is by no means generally entertained. Newbold says, "Both their features, and those of the aborigines in the native states around Malacca are decidedly characterized by the Mongol stamp." (i., 422.) It is independent of the Malays, having no peculiarity of form or feature to entitle them to be called a distinct variety, there appears to be sufficient evidence to show that they are a mixed race of comparatively recent origin. Antecedent to the 19th century of our era, the coasts of the peninsula, and the adjacent islands, were inhabited, though thinly, by a tribe of *ichthophagi*; and the interior by a race of savage savages, by whose descendants it is still occupied. In the course of the above century, a body of colonists, the ancestors of the present race of Malays, arrived on the continent, from Menangkabow, in Sumatra; and whether by intermarriage (as traditionally reported) or by conquest, extended their dominion over the whole peninsula. During the succeeding centuries they conquered Sumatra, the Banda, Philippine, and Molucca Isles, with many smaller groups; and are now found in all those regions, and in Borneo, &c.; but without any centre of unity or power. The chief physical characters of the Malay race consist in a brown colour, varying from a light tawny to a dark brown; black hair, more or less curled, and abundant; the head rather narrow; the bones of the face large and prominent; the nose full, and broad towards the apex; and the mouth large. The average height of the man is about five feet 2 inches. A general character can hardly be assigned to a people so widely distributed. The Malay inhabitants of the peninsula are, however, active, restless, and courageous; but their courage is not of a steady, deliberate character, but is rather a sudden ungovernable impulse, arising from a paroxysm of rage. "To their enemies they are remorseless, to their friends capricious, and to strangers treacherous." (*Hamilton*.) Perhaps their treachery to strangers may, in part at least, be occasioned by the behaviour of the latter, or the antipathy excited against them by the behaviour of former strangers. Malcolm, who resided for some time in this region of Asia, says, that "in their intercourse with each other, domestic and private virtues prevail to as great an extent as among the adjacent nations. A propensity to gambling is a distinguishing trait in the Malay character; and more especially a taste for cock-fighting, to which sport the Malay is so passionately attached."

MALDA.

iced, that his last morsel, the covering of his body, his wife and children, are often staked on the issue of a battle to be fought by his favourite cock." Malcolm admits that "disregard of human life, revenge, idleness, and piracy, may be considered common to Malays. The universal practice of going armed makes thoughts of murder familiar. The right of private revenge is universally admitted, even by the chiefs; and the taking of life may be atoned for by a small sum of money." (*Travels*, II., 194.) In the arts of peace they are greatly inferior to their neighbours of Java, Japan, Siam, China, and Siam. The Malay language coincides with monosyllabic tongues in its general construction and idiom, but is properly polysyllabic in its form. It consists chiefly of Polynesian, an intermixture of Sanscrit and Arabic, and a dialect purely Malayan, which last, however, constitutes little more than 1-4th part of the written and spoken language. The literature of the Malays is almost entirely derived from Hindostan, Persia, Arabia, Java, and Arabic is exclusively their sacred language; and their religion also has been derived from Arabia, all the alays, with trifling exceptions, being Mohammedans.

The negro tribes which inhabit the interior of the peninsula are called by the Malays *Orang Benua*, men of the island. They appear to be a distinct variety, differing from being inferior to both the African and Papuan negro. The average height of the men is only 4 feet 8 inches. The Malay negroes are thinly spread over a considerable extent of territory in and behind Malacca, and thence N. to Meril; but they probably amount in all to only a few thousands. They are divided into several tribes, some of which are said to dwell altogether in trees or clefts in the mountains. A few have learned a little Malay, and occasionally trade among the adjacent Malay tribes, to purchase tobacco and utensils; but of letters they know nothing. Copies of accounts of both the Malays and this people may be found in *Nesbitt's Malacca*, &c., vol. II., ch. 12, 14, 15; in various details respecting the races inhabiting the Malay countries are found in the art. E. ARCHPELAGEO in its Dict. (I. 142.) For the Commerce of the British settlements, see MALACCA, SINGAPORE, &c.

The principal articles of export from the native states are a, gold dust, spices, elephants' teeth, pepper, sugar, wax, timber for ship and house building, dammer, ebony, betel nut, sapan, and eagle-woods, hops, poultry, silks, dyes, and an immense variety of fruits; in return for which, opium, salt, cotton, cloths, tobacco, rice, and European manufactures, are the chief imports. The trade is principally with the British and Dutch settlements in the East, Siam, China, and the adjacent parts of the E. Asiatic archipelago.

In the 15th century a large proportion of this peninsula appears to have been under the sway of the Siamese, but since that time it has been mostly divided into the petty states before enumerated, the historical details of which are of little interest. The successive settlements made by Portuguese, Dutch, and British at Malacca, &c., are nowhere noticed. The only recent event worthy of mention has been the subjugation of Quedah (or Keddah) by the Siamese, begun in 1821, and completely effected within not 10 years afterwards. (*Nesbitt's Malacca*; *Crawford, Malacca, Hamilton's E. I. Gaz.*; *Lawrence's Lectures on Asia*, &c., passim.)

MALDA, a town of Hindostan, prov. Bengul, district Dinapore, on the Mahananda, built chiefly of the ruins of a town from which it is distant about 12 m. N. Early in the 17th century it had 3000 houses huddled together along a bank of the river, which, during the rainy season, nearly inundates the town. The E. I. Company established a factory here as early as the 17th century; and there were formerly some prosperous French and Dutch silk and cotton factories in the town; but the trade of Malda has now almost entirely decayed, its manufactured goods being unable to withstand the competition of those introduced into the country from Europe.

MALDEN, p. t., Middlesex co., Mass., 5 m. N. Boston, U. S. First settled in 1648. It contains 1000 acres of salt meadow, in the S. part of the t. Malden bridge, over Mystic river, is 950 feet long, and connects it with Charlestown. contains four churches, a Congregational, Methodist, Baptist, and Universalist; 13 stores, three grist-mills; eight hotels, 600 scholars. Pop. 3514.

MALDIVE ISLANDS, or MALDIVES, a chain of islands in the Indian ocean, extending between the 1st deg. of and the 7th of N. lat., a distance of about 560 stat. m.; and between 73° 48' and 73° 48' E. long. The Laccadive Islands, to the N. of the Maldives, may not improperly be considered a continuation of this island-system. They are of coralline formation, arranged in round or oval groups, called atolls, separated by several channels, which may be easily navigated by ships of the largest size. The different atolls are surrounded by coral reefs, on which the surf runs violently; but between the islands the sea is perfectly

MALDON.

smooth, and forms safe harbours for small craft. These islands have been rarely visited by Europeans, though lying in the direct route to India. All that are of any extent are richly clothed with palms and other trees; but no edifice has been seen in sailing past them, whence it may be concluded that none exists higher than a cocoa tree. The Maldives produce millet and other small grains, of which they have two harvests a year; but they are unsuitable for rice and wheat, which are imported. Esculent roots and fruits are found in the greatest profusion; and poultry are extremely abundant, and bred with little or no attention. There are neither horses nor dogs, and but few horned cattle. Fishing is an important occupation, especially that of cowries, a species of shells used as money in small payments in Hindostan and other Asiatic countries, and in extensive districts of Africa. The inhabitants trade with Hindostan, Sumatra, &c., arriving at Belsore and other ports of British India during the S.W. monsoon with cowries, coral, the produce of the cocoa tree, salted fish, tortoiseshell, &c.; and sailing homeward with the N.E. monsoon, taking rice, sugar, manufactured goods, tobacco, &c. The people of the Maldives are Mohammedans, and probably of an Arabic stock. They live under a sultan, who, according to Hamilton, resides in Male, on an island about 3 m. in circuit, fortified by walls and batteries, on which above 100 pieces of artillery are mounted. The sultan, however, considers himself dependant on the British government of Ceylon, to which he sends an annual embassy. (*Geog. Journ.*, II., 72-73; *E. I. Gaz.*)

MALDON, a pari. and mun. bor. river port, and market town of England, co. Essex, hund. Dengy, on the Chelmer, 14½ m. S.W. Colchester, and 37 m. E.N.E. London. Area of pari. bor. (which includes the pari. of Heybridge with the old bor.) 4719 acres. Pop., in 1831, 4905. "The town, which is neither paved, lighted, nor watched, and does not appear to be in a flourishing condition, occupies the ridge of a hill on the S. side of the Chelmer, and consists principally of one long street, running parallel to the river, the E. end of this street forming the portion called 'the Hythe'; two other streets, one from the centre of the town, and the other from its W. end, unite at the bottom of the hill, and extend across the Chelmer into an almost insulated flat called 'Potman's Marshes.'" (*Mss. Bound. Rep.*) The town-hall is an old building near the junction of the streets at the W. end of the town, and not far from it is an extensive range of barracks: there is also a small borough jail. Maldon had formerly three parishes; but two of them have been long consolidated. The largest church, that of All Saints, near the town-hall, is an ancient and very large edifice, with a square tower, surmounted by a curious triangular spire. St. Mary's is a spacious building, at the lower end of the town, said to have been founded before the Norman conquest; but the tower and W. end were rebuilt in the reign of Charles I. The united vicarage of All Saints and St. Peter's is in private patronage, the rectory of St. Mary's being in the gift of the dean and chapter of Canterbury. St. Peter's tower is the only part now standing of that disused parish church, and annexed to it is a building formed of the old materials, which has been long used as the depository of a valuable library, containing 5530 volumes, bequeathed to the town, in 1704, by Archdeacon Plume, founder of the Plumian professorship of astronomy in the university of Cambridge: the tower part, which has since been much enlarged, is occupied by the national school, furnishing instruction to about 270 poor children of both sexes. The grammar school, founded in 1631, received an additional endowment from Dr. Plume, who also gave it an exhibition in Christ's College, Cambridge. The estates vested in the hands of trustees yield about £23, which, after some slight deductions for land-tax, and repairs, are paid over to the head-master; six free scholars receive classical instruction gratis, paying a fee for other branches; and there are, besides these, about 12 day-scholars. Dr. Plume left also a considerable property (the annual produce of which amounts to about £180) for the clothing and instruction of 15 poor boys, and the foundation of a week-day lecture in the church; besides which, he built a workhouse, lately sold under the provisions of the Poor-law Amendment Act. There is also a large Lancastrian school, with two or three minor charities, and money-bequests. (*Char. Comm. 32d Report*, p. 1.) The Roman Catholics, Wesleyan Methodists, and Baptists, have their respective places of worship; attached to which, as well as to the churches, are respectfully-attended Sunday-schools.

"Maldon is not a manufacturing town; but it carries on a considerable home trade in coal, iron, chalk, and timber, which it exchanges for corn, and other farming produce. There belonged to the port, in 1836, 126 ships, of the aggregate burden of 6955 tons. Gross customs revenue, in 1840, £2190." The trade of the town, however, is said to be declining; and the principal cause assigned is the new navigation to Chelmsford, which has been carried 1 m. N.

MALDONADO.

of Maldon along the adjacent village of Heybridge to the Blackwater. (*Mass. Corp. Report.*)

Maldon claims to be a borough by prescription; but its first charter dates as far back as 1155, and was confirmed by Edward I. and subsequent monarchs. The present municipal officers comprise a mayor and three other aldermen, with 12 councillors; a commission of the peace is held under a recorder. Corporation revenues in 1833, £783. Maldon has sent two members to the House of Commons since the reign of Edward I. Down to the Reform Act, the franchise was vested in the resident and non resident freemen, by birth, marriage, servitude, gift, or purchase. The Boundary Act enlarged the limits of the borough, by including in it the parish of Heybridge. Registered electors, in 1839-40, 876. In cases of succession to burgage tenures, the custom of borough-English prevails here. Markets, well attended, on Saturday; cattle-fairs, Sept. 13 and 14. (*Parl. Rep., &c.*)

MALDONADO, a fortified seaport town of the Banda Oriental in S. America, on the N. bank of the Plata, not far from the mouth of its estuary, and 85 m. E. Monte Video. Its harbour is sheltered from S.E. winds by the small island of Gorriti, but it has little depth. Population uncertain. "Maldonado is a quiet, forlorn, little town, built with the streets running at right angles to each other, and having in the middle a large plaza or square, which, from its size, renders the scantiness of the population more evident. It possesses scarcely any trade, the exports being confined to a few hides and live cattle. The inhabitants are chiefly landowners, with a few shopkeepers, and the necessary tradesmen, such as blacksmiths and carpenters, who do nearly all the business for a circuit of 50 miles round. The town is separated from the river by a band of sand-hillocks about a mile broad: it is surrounded on all other sides by an open, slightly undulating country, covered by one uniform layer of fine green turf, on which countless herds of cattle, sheep, and horses graze." (*Darwin's Voyage of the Adventure and Beagle*, vol. iii, p. 45.)

MALLOW, an inland town and pari. bor. of Ireland, co. Cork, prov. Munster, on the Blackwater, and on the high road between Cork and Limerick, 18 m. N. by W. the former, and 37 m. S. the latter city. Mallow, properly so called, is built on the N. side of the river, being united by a bridge of 11 arches, with its suburb of Ballydaheen, on the S. side of the river. The latter is included in the parliamentary borough as fixed by the Boundary Act, which comprises an area of 350 acres, and had, in 1831, a population of 7099. It consists principally of one main and well built street, nearly parallel to the river, and has a handsome parish church, a Roman Catholic chapel, two Methodist chapels, an independent meeting house, a courthouse, a bridewell, barracks, and infirmary, with commodious baths, a public reading-room, library, &c. On its W. side are the ruins of its old castle, the property of the lord of the manor. There are here two schools, one attended by about 300 boys, and the other by about 130 girls, both under the control of the Board of Education. The town is surrounded by thriving plantations, and is situated in a peculiarly rich and well cultivated part of the country. "Though the river be not navigable, and that Mallow has no manufactures, it is yet considered one of the best country towns of its sort in Ireland. It is resorted to in summer on account of the mineral waters that it possesses, the properties of which are much the same as those of Clifton, and in the neighbourhood there is a very unusual number of country gentlemen's houses, occupied by families of the first respectability." (*Parl. Boundary Report.*) Several flour-mills have been established on the Blackwater, and there is a brewery in the town, and a salt work and some quarries in its immediate vicinity; but the great dependence of the inhabitants is on its extensive retail trade, and on the resort of visitors to the Spa. Branches of the provincial and agricultural banks were opened here in 1835. Postoffice revenue in 1830, £700, in 1838, £930. Mallow was incorporated by charter of James I. in 1612, which vested the right of sending two members to the Irish House of Commons in the provost and 12 burgesses. But this charter fell, in no very long time, into disuse; for above a century since the corporate body was extinct, and the right of electing the members for the borough vested in the freeholders of the manor, which comprised 1196 acres, and had, in 1831, a population of 7548. Since the union, Mallow has returned one member to the Imperial House of Commons; and the Boundary Act altered the limits of the parliamentary borough, as already stated, by including in it the suburb of Ballydaheen, and excluding the country part of the manor. Registered electors, in 1839-40, 663. The borough has a court met twice a year, and a court for debts under £3 every third Wednesday. General sessions are held in April, and petty sessions every Tuesday. Markets on Tuesdays and Fridays; fairs on 1st January (for pigs), Shrove Monday, 11th May, 25th July, and 29th October.

MALMEDY a town of Rheinish Prussia, gov. Aix-la-

MALMESBURY.

Chapelle, cap. circ. on the Wargo, close to the Belgian frontier, and 30 m. S. Aix-la-Chapelle. Population in 1838, 4312. It has a noble church, formerly belonging to a rich Benedictine abbey, a fine private cabinet of medals, antiquities, &c., and is the seat of the council for the clergy, a police court, and board of taxation. It has some mineral springs, similar to those at Spa, and manufactures of fine woollen cloth, glue, and soap; but it is chiefly noted for its manufacture of leather for boot soles, with which it supplies a considerable portion of Germany. There are said to be 30 tanneries in active employment: hides are imported principally from S. America, and bark from the forest of Ardennes. (*Bergheuss; Schreiber; Guide du Reis, &c.*)

MALMESBURY, a pari. bor., market town, and par. of England, co. Wilt, hund. of same name, on the Avon, 1½ m. N.N.W. Bath, and 86 m. W. London. Pop. of pari. bor. (which includes, with the old bor. two out-par., and the several pars. of Brokenborough, Charlton, Gandon Lea, Great and Little Somersford, Foxley, and Bromham), in 1831, 6185. The town, formerly fortified and more extensive, is pleasantly situated on a hill close to the Avon, by which it is nearly encircled, and which is here crossed by six bridges. It consists of three principal streets, two of which running parallel are intersected by the third. In an open space near the centre of the town is the market-cross, an octagonal turreted structure, with flying buttresses and highly carved, supposed to have been erected in the reign of Henry VIII. There appear to have been formerly several churches in Malmesbury; but it now contains only one, the living being a vicarage in the gift of the lord chancellor. The Wesleyan Methodists, Baptists, Unitarians, and Moravians, have likewise their respective places of worship, and there are three Sunday schools. Two free-schools, one of which is conducted on the national system, and well attended, furnish instruction to poor children of both sexes, and there are two sets of almshouses. "Malmesbury is not a place of any trade, nor is it even a considerable thoroughfare. No new buildings are rising in the suburbs, and it contains few houses appearing to be occupied by persons in independent circumstances; indeed, it has altogether the air of a place on the decline, and must now be considered as entirely an agricultural town." (*Parl. Boundary Report.*)

The borough, which is of high antiquity, received its governing charter from William III.; and it was considered too insignificant to be included in the provisions of the Municipal Reform Act. It has sent two members to the House of Commons from the 23 Edward I.; the franchise, previously to the Reform Act, being in the high medieval, knight, and 12 chief burgesses. The Boundary Act enlarged its limits, by including with it the two out-parishes, as above mentioned. Registered electors, in 1839-40, 927. Markets on Saturday, and a cattle market on the last Tuesday of each month, except March, April, and June. Horse and cattle fairs, March 28, April 28, and June 5.

A nunnery was founded here at the close of the 8th century. Other monasteries were founded here in the two following centuries; and it was a place of considerable and rising consequence as the resort of religious recusants, including among other establishments an abbey, which afterwards attained to high celebrity. The Danes destroyed the town at the close of the ninth century; but monastic wealth and the beneficence of princes soon restored its prosperity, which it enjoyed almost without interruption till the Reformation. The chief monument of Malmesbury's departed greatness is its abbey, the entire buildings of which, with the church, covered about 45 acres. Little beyond mere foundation walls, is now left except the church, which appears to have been a very magnificent structure, and presents some fine specimens of different eras of architecture, but chiefly of the early English. It was cruciform, with a tower rising at the intersection of the transepts, and another at the W. end, the front of which was exquisitely finished and adorned with sculpture, having also a very fine window filled with painted glass. During the civil wars, however, when Malmesbury was repeatedly besieged both by the royalists and parliamentarians, the church, already partly dismantled, suffered great injury; both its towers were battered down, its cloisters demolished, and now only a fourth part of the building is standing; but the ruins are highly interesting, and the S. porch is one of the finest specimens of its kind in England. In the town are several other remains of ancient monastic and ecclesiastical buildings; and about one mile from it is a field called Came-hills, in which are evident vestiges of a Roman encampment.

Malmesbury claims the honour of having given birth to Aldhelm and Johannes Scotus, William of Malmesbury, second only to the Venerable Bede among our early historians; and Hobbes, an eminent by his metaphysical and political speculations, was a native of Malmesbury, where he first saw the light in 1588. (*Parl. Rep.; British Ant.*

MALMO.

MALMO, a strongly fortified seaport town of Sweden, on the sea. Malmöhus, on the Sound, nearly opposite Copenhagen, and 110 m. S.W. Christianstadt. Pop. (1836) 769. It is irregularly built, but has wide streets and a fine market place. It has a citadel, two churches, two hospitals, manufactures of woollen cloth, stockings, prepared skins, carpets, hats, gloves, tobacco, starch, soap, looking-glasses, &c., and a brisk trade in the products of these establishments, and in corn; its port, however, admits only small vessels.

MALO (ST.), a fortified seaport town of France, dep. Ile-et-Vilaine, cap. arrond., on the British channel, 40 m. N.W. Rennes, and 200 m. W. by S. Paris. Lat. $48^{\circ} 39' N.$, long. $2^{\circ} 0' 51' W.$ Pop. (1836) 9409. The town is built at the mouth of the Rance, on the peninsula of Aron, connected with the mainland by a causeway. It is defended by strong walls with four bastions constructed by Vauban, and a castle built by Anne, Duchess of Brittany. On its N. side it is inaccessible; but, from the want of outworks, it could not hold out against a regular siege. The town is in many parts well built, and has some excellent houses. Its chief public edifices are a cathedral, bishop's palace, town-hall, theatre, hospital, foundling asylum, communal college, and exchange. The port, on the S. side of the town, is commodious and secure, but is rather difficult of entrance, and dries at low water; though at high water it has a depth of above 40 feet. In 1836, however, the French Chamber passed a resolution for the construction here of a floating dock or basin. It has a good road leading N.W. of the town, and opposite the mouth of the Rance, which is defended by various forts; the principal, a Conchee, being constructed on an all but inaccessible rock, a considerable distance off shore. St. Malo is the seat of tribunals of primary jurisdiction and commerce, a board of artillery, &c., and is the residence of various foreign consuls. It has a hydrographical school of the first class, a number of manufactures, a royal tobacco factory, naval arsenals, and dry docks for the building of vessels of various sizes. It has also manufactures of fishing-nets and oiled pulleys, and other marine fittings, soap, &c.; a considerable trade in provisions with the French colonies, a brisk coasting trade, and numerous vessels employed in the whaling, cod, and whale fisheries. St. Malo has given birth to several distinguished persons; among whom may be mentioned the brave admiral Duguay de Trouin, Jacques Brier, Manportuis, La Bourdonnaye, &c. (*Hugue, art. Vieux-Filsine, &c.*).

MALONE, p. l. capital of Franklin co., N.Y., 314 m. N. of W. Albany, 529 W. Watered by Salmon and Trout rivers. It contains six stores, one lumber-yard, one fulling-mill, one forge, two grist-mills, eight saw-mills, two tanneries, one printing-office, one weekly newspaper; 18 schools, 63 scholars. Pop. 3629. The village is situated on both sides of Salmon river, over which is a bridge of a single arch, 80 feet wide, and 65 feet above the surface of the water. It contains a courthouse, jail, county clerk's office, three churches, a Presbyterian, Methodist, and Baptist; Franklin academy, a state arsenal, a large stone cotton-factory with 5000 spindles, and 80 looms, a grist-mill, saw-mill, and various other manufacturing establishments; 8 dwellings, and about 700 inhabitants.

MALPAS, a market town and par. of England, co. Chester, hund. Brorton, 13 m. N.N.W. Chester, and 153 m. I.W. London. Area of parish, 25,140 acres; ditto of township, 2116 acres. Pop. of township in 1831, 1004. The town, which stands on an eminence near the S. extremity of Cheshire, and on the E. side of the valley of the Mersey, comprises three tolerably built and well-paved streets. The living is divided into two rectories, in the patronage of the Bishops and Drake families. The church (formerly the chapel to a Chivalric monastery), a structure of unwhitened stone, consists of a nave and chancel, without either steeple or spire; it is highly ornamented, and some of its decorations are supposed to belong to the Saxon era. There are two chapels of ease within the parish; and several denominations of dissenters have their respective places of worship. A grammar school was founded here in the 17th century; but the free instruction is limited to six boys, appointed by Lord Cholmondeley. The master's salary from the endowment is £25, with a good house, &c.; and he is also permitted to receive pay scholars, of whom there were 5 in 1836. Alport's school (founded in 1719) has property yielding an income of £119, and furnishes good plain instruction to boys, girls, and recently also, to infants, with lodging for 14 boys. In 1836, there were in attendance 49 scholars, 87 boys, and about 50 girls. The other charities comprise an almshouse for six poor women, with an allowance of bread and money; and large sums have been left, at different times, for the relief of the poor. (*Char. Com. for Malpas*.) Malpas is an agricultural town, and derives its chief importance from its large market for cheese, and its position in the centre of a great dairy-farm district. Mar-

MALTA.

bets on Monday: cattle and cheese fairs, April 5, July 25, and Dec. 8.

MALPLAQUET, a small village of France, dep. du Nord, 16 m. N.N.W. Avesnes. This place is celebrated as the scene of one of the bloodiest and most obstinate conflicts of modern times. On the 11th of September, 1709, the allied army, under the Duke of Marlborough and Prince Eugene, attacked the French army under Marshal Villars in their entrenched camp near Malplaquet. The combat was maintained on both sides with undaunted courage and resolution; but in the end the allies succeeded in forcing the entrenchments. The victory, however, was purchased by the sacrifice of above 30,000 men, killed and wounded. Though vanquished, the loss of the French did not exceed half that number, and they effected their retreat in good order. According to Voltaire (*Siècle de Louis XIV.*, cap. 21), who derived his information from Marshal Villars, the army of the allies amounted to 80,000, and that of the French to 70,000, though other accounts represent each army as about 100,000 strong; but, whichever be the more correct statement, there are certainly very few, if any, instances of so great a carnage in an engagement where the defeated army effected an orderly retreat.

MALTA (an. *Melita*), an island of the Mediterranean sea belonging to Great Britain, 62 m. S.S.W. cape Passaro, in Sicily, and 198 m. N. Tripoli, in Africa, Valetta, its port and capital, being in lat. $35^{\circ} 34' 6'' N.$, long. $14^{\circ} 31' 10'' E.$ Extreme length, 17 m.; do. breadth, 9 m.; area, 98 sq. m. Estimated pop. in 1836 (exclusive of Gozzo), 103,000; pop. of Gozzo, 16,334; the number of British in both islands being estimated at 4530, and that of the other foreigners at 3116. It is of an irregular, oval shape, rising precipitously from the water's edge on the S. and S.W. The surface presents the appearance of an inclined plane, sloping gradually from its highest elevation (about 1900 ft. in the S.W.) to the more level land on the N.E. side, where it dips into the ocean. The substratum consists of soft calcareous sandstone only scantily covered with soil, great part of which has been carried thither from other countries, or artificially created by breaking the surface of the soft rock into small fragments, which crumble by exposure to the air, and in the course of two or three years become good soil. It has neither lake nor river; and from its geological formation, and the absorbent nature of the soil, has no marshy or swampy ground, except, indeed, two spots of very limited extent at the head of Great Harbour and St. Paul's bay, where the sea has receded and left an accumulation of moist soil, from which noxious exhalations have been supposed to emanate. There is no exuberant vegetation, brushwood, or forest; the verdure is scanty, and the greater part of the surface is an arid rock. The climate of Malta, from its being exposed to the winds blowing from the African and Syrian deserts, is unusually hot, especially during summer, when the heat almost equals that experienced in tropical regions. This heat not only lasts during the day, but, owing to the radiation of the caloric absorbed while the sun is up, it continues, with little abatement, throughout the night; so that, by an excess of heat for months together, a feeling is induced among the inhabitants of extreme lassitude and oppression. The medium temperature of the three coldest months (December, January, and February) is 57° Fahrenheit, the maximum 61° , and the minimum 53° ; while the medium of the four hot months (June, July, August, and September) is 76° , the maximum 89° , and the minimum 73° . Frequent showers occur in September, increasing in frequency during October and November; but from December to February, the rain falls with nearly the same violence as in the tropics, and the atmosphere continues surcharged with moisture till March, when the weather begins to clear; and during the five following months scarcely a drop falls, the sky being generally without a cloud. The most prevalent winds in Malta are from the S.E., S., and N.W.: the first of which, well known as the *sirocco*, is at once the most prevalent (especially in autumn), and the most disagreeable in its effects on the human frame; neither are there any regular land and sea breezes, as in some southern countries, to modify the temperature. With respect to the salubrity of Malta, the most favourable opinions have been entertained by some writers; but it appears from the following facts, deduced from medical observations and records during sixteen years, that the average deaths between 1819 and 1834, inclusive, amounted to 2568 a year, being about 1 in 39, or nearly 2.5 per cent. for all ages; whereas in England the mortality, at an average of the same years, was only 1 in 474, or .24 per cent.; so that, even as regards the indigenous inhabitants of both countries,* Malta would appear to be less healthy than Brit-

* This is the statement given by Major Tulloch; but to make the comparison between England and Malta quite accurate, allowance should be made for the rapid increase of population in the former, which makes the mortality appear less than it really is.

MALTA.

ain, and seems only to enjoy the average salubrity of the S. of Europe, in which the mortality varies from 1 in 35 to 1 in 40 of the population annually. The mortality, moreover, is sometimes increased by the prevalence of epidemics, and on two late occasions by plague and cholera, the former of which, in 1813, cut off 4500 of the inhabitants, being 80 per cent. of those attacked. For farther particulars as to the climate of Malta, we beg to refer the reader to Major Tulloch's elaborate *Report on the Sickness, Mortality, &c., of Troops in the Mediterranean*.

Cultivation in Malta is pursued with equal diligence and success. In former times the entire surface was but one mass of barren rock; but continued industry has not only rendered a large part of it capable of tillage, but given it fertility. The rock having first been levelled in terraces, the small particles were pulverized and mixed with soil, while the larger masses were employed in erecting walls to sustain these artificial beds. Soil was also, at first, brought from Gozzo, and even Sicily; but after a time this was found unnecessary. Owing to this laborious perseverance, Malta is now, on the whole, a fertile island, the cultivated parts "yielding annual or often double crops, without a fallow, and frequently 80 or 90 fold." (Sir R. C. Hoare's *Tour*, ii., 296.) Cotton is the principal product both of Malta and the neighbouring island of Gozzo, the annual crops of which average about 4,000,000 lbs. It is sown in May, and gathered before sunrise in October, the chief vent for it being in the ports of Trieste, Leghorn, Genoa, and Marseilles. The corn crops suffice for the supply of the inhabitants with bread during four or five months a year; the remainder is imported from Sicily and the Black sea, the duties on its importation making it rather high priced. The grass of the island, called *sultz*, is similar to salinfum, and some, though small crops, are raised of cummin and aniseed. The vine has been cultivated with some care; but its produce is very inferior, and wine as well as oil, is imported from Sicily. Figs and oranges are very abundant, and of superb flavour. Brydone says, that "the Maltese oranges are deservedly considered the finest in the world. The season continues upward of seven months, from November till the middle of June, during which time the trees are covered with an abundance of delicious fruit. Many of them are of the red kind, and these are certainly the best. They are produced from the common orange bud engrafted on the pomegranate stock, and the juice of the fruit is red as blood." (Brydone's *Tour*, p. 181.) Some good springs of fresh water are made available for the purposes of tillage; and numerous large cisterns and aqueducts are constructed for the purposes of irrigation. Still, however, Malta imports the principal necessities of life. Sicily and Odessa supply her with corn, oil comes from the ports of Italy, and wine from Naples and Sicily; from which latter, also, snow and ice are brought, no trifling luxuries in an arid climate like that of Malta. Horses and oxen come chiefly from Barbary, but also from Greece and Albania.

Port and Trade.—The central position, excellent port, and great strength of Malta, make it an admirable naval station for the repair and accommodation of the men-of-war and merchant ships frequenting the Mediterranean, and render its possession of material importance to Great Britain. It is also of considerable consequence, particularly during war, as a commercial *dépôt*, where goods may be safely warehoused, and from which they may be sent, when opportunity offers, to any of the ports belonging to the surrounding countries. Malta likewise presents unusual facilities for becoming the *entrepôt* of the corn-trade of the Mediterranean and Black seas. Her *caricatori* for corn are like those of Sicily and Barbary, excavated in the rock, and are, perhaps, the best fitted of any in Europe for the safe keeping of grain. The harbour of Valetta, which lies on the N.E. side of the island, is divided into two sections by a promontory or tongue of land, on which stands the capital, defended by the castle of St. Elmo. The S.E. side, called the Grand Port, is the most frequented, having an entrance about 250 fathoms in width, with an average depth of 10 or 12 fathoms; it runs inward about 13 m., has deep water and excellent anchorage throughout, the largest men-of-war coming close up to the quay. N.W. fort St. Elmo is port Marmuscet, which is also a noble harbour, used exclusively by ships performing quarantine; near its centre is an island on which are built a castle and lazaretto. The Custom-house and storehouses are in the Grand port and furnish every facility for landing and warehousing goods. An excellent dock-yard, victualling office, naval hospital, &c., have been constructed for the use of the navy. As a trading-port and *entrepôt*, Valetta rose to high distinction during the war with France; but at the general peace, when commerce reverted to its natural channels, the other ports of the Mediterranean took from Malta a large portion of its trade, which was also depressed by the imposition of various oppressive discriminating duties. In 1819 this vexatious system was partially obviated; but it con-

tinued to exercise a very pernicious influence till 1837, when, in consequence of a commission of inquiry, the then existing tariffs of customs-duties and port charges were wholly abolished, and a new tariff was substituted, imposing moderate duties, for the sake of revenue only, on a few articles in general demand, without regard to the country whence they came, at the same time that it equalized the tonnage duties, and reduced the warehouse rent on articles in bond to the lowest level. Everything has thus been done that was possible to second the natural advantages enjoyed by Malta for becoming the grand *entrepôt* of the Mediterranean, and there can be little doubt that they will powerfully contribute to bring about the most favourable results.

The following is an official statement of the ships which arrived at and left Malta in 1836, distinguishing those belonging to Great Britain, the British colonies, and the United States.

Places.	In-wards.		Outwards.	
	Ships.	Tons.	Ships.	Tons.
Great Britain	112	16,152	60	16,548
British Colonies . . .	14	1,814	13	1,526
United States	14	3,410	5	1,246
Foreign	1,285	172,229	2,007	302,651
Total	1,425	198,595	2,087	324,971

There belonged to Malta, in 1836, 171 vessels, of the aggregate burden of 17,500 tons, and since Malta-built ships were admitted into the ports of the United Kingdom on the same terms as British-built, the trade of ship-building has materially increased. The vessels, which rank among the best in the Mediterranean, are built with oak timber from Dalmatia; the Maltese are diligent, expert shipwrights, and their wages being moderate, Valetta is a favourable place for careening. Owing, however, to the want of a dry dock, all ships, above the size of a sloop-of-war, requiring to have their bottoms examined, are obliged to come to England for that purpose. The articles of export comprise British and foreign manufactures, with colonial produce, chiefly to the ports of the Mediterranean, cotton, both raw and manufactured, of island growth, wool, cigars, gums, and pulses, wine, spirits, of the value of between £300,000 and £400,000 a year: the imports comprise manufactured goods (chiefly from Great Britain), colonial produce, wheat from Sicily and Odessa, wine and spirits, tobacco, and salt-fish, with numerous minor articles of the average value of about £700,000 a year. At an average of the six years, ending with 1836, the value of the exports of the produce and manufactures of the United Kingdom to Malta amounted to £164,632 a year. Latterly, however, the exports have begun to increase, though they are still comparatively trifling. Malta has, within the last few years, become the centre of a very extensive steam-packet system, the steamers from and to England, the Ionian islands, Alexandria, &c., anchoring here. The French steamers, between Marseilles, Alexandria, and other parts of the Levant, usually perform quarantine at Malta. The industry of the island comprises the manufacture of cotton fabrics, the annual value of which may amount to from £70,000 to £80,000. Cabinet work is made for exportation to Greece and the Ionian islands; soap, leather, maccaroni, iron bedsteads, &c., are made on a smaller scale; and the Maltese goldsmiths are remarkable for the elegance of their gold filigree-work, neck chains, &c., the exports of which are valued at about £7000 a year. The currency of Malta consists partly of British silver and copper, introduced in 1835, but partly also of Maltese gold of the value of 1s. 8d. English, of Spanish dollars valued at 4s. 4d., and of Sicilian dollars at 4s. 2d. each. The weight most in use are the *rotolo* or pound = 12.916 English grains, and the *caratere*, comprising 190 rotoli, or 147½ lbs. avoirdupois. Corn is measured by the *salmu* = 6.22 Winchester bushels, and oil is sold by the *cafese*, which contains 5½ English gallons. Bills on London are usually drawn at 30 and 60 days' sight; and the deputy commissioners-general must, at all times, grant bills on the treasury of Great Britain for British silver tendered to him, at the rate of the £100 bill for every £101 10s. silver, receiving the silver of other countries at a fluctuating rate of exchange. There are two joint-stock banks in Malta, the united capital of which may amount to £300,000; they discount good bills, of short date, at 6 per cent., keep cash without charge, and issue notes payable at sight, which pass current through the island, except in transactions with the government. Any person may establish himself as a merchant, and numerous Englishmen, Frenchmen, and Sicilians carry on an extensive commerce; while among the native traders, perhaps the wealthiest of all are those who speculate in articles of consumption for the island, buying a great variety of goods in small quantities for ready money, and reselling large returns, by retail as well as wholesale trade. (For farther particulars as to the trade, port regulations, and tariff, see *Commercial Dictionary*, art. MALTA.)

MALTA.

Government and Garrison.—Malta is a crown colony, the local government of which is conducted by a governor immediately responsible to the secretary of state for the colonies. In legislative matters, however, he is assisted by a council of seven persons, appointed by the crown, and at present consisting of the Roman Catholic bishop of the island, the military officer second in command, the chief justice, and chief secretary, with three unofficial members, appointed by the governor. All orders in council have the force of laws. The principal administrative departments are the chief secretary's office, quarantine department, custom-house, land-revenue department, and audit-office. There are numerous courts of justice, in all of which the procedure is both intricate and expensive; besides which, the laws themselves are frequently contradictory, and generally require revision. The public revenue amounted in 1837 to about £100,000 a year, of which about £23,000 were derived from the rents of government property, £70,000 from customs and quarantine dues, and about £7,000 from internal taxes; but it is believed that some reduction in the public burdens has recently taken place, in consequence of the recommendations of the late commission of inquiry. The above revenues not only defrayed the salaries of the various government officers, but the expenses attending the maintenance of the public roads, as well as liberal contributions for the support of schools and public charities. The military force of Malta consists almost entirely of British troops, varying between 3000 and 3500 men. There is also an engineer and artillery corps, the entire maintenance of which, as well as of the army generally, falls on England. There is likewise a native regiment, comprising about 500 men, called the Malta fencibles, but their duties being exclusively local, and rather of a civil than military nature, the maintenance of this body (costing about £11,000 a year) is defrayed out of the revenues of the island.

Religion and Education.—The national religion of the Maltese (secured by the English government) is Roman Catholic, to which the people are strongly attached, scrupulously observing its rites, and celebrating its festivals; but, notwithstanding their sincere adherence to the church of Rome, they entertain little or no jealousy of the Protestants: both parties observe the greatest moderation and tolerance for the religious opinions of each other. There are in all no fewer than 1000 Roman Catholic clergymen, the church property producing about one fourth part of the rental of the island. The Protestant places of worship comprise the governor's chapel, naval chapel, Church missionary chapel, and Wesleyan mission chapel; besides which, a church has recently been erected at Valetta, for the exclusive use of the English garrison. The total number of Protestants does not, however, exceed 4500. Education is recently has been much neglected; but within the last 5 years several new schools have been established, the principal being the normal free schools at Valetta, Senglea, Nobile, in Malta, and Rabato in Gozso, giving instruction in 1836 to about 1500 children. Other primary schools are scattered through the villages, and there are about 80 private schools. The university of Valetta, founded in 1771 by the grand master, Pinto, and now occupying the convent of the suppressed Jesuits, is supported by the government, at an expense of £1000 and £1900 a year, and had (including the lyceum) 375 students in 1836. The bishop has an ecclesiastical seminary at Nobile, giving religious instruction to about 50 boys. Instruction is commonly conveyed in these schools in the Italian language, the mother-tongue of the Maltese (a *patois* of Arabic, mixed with a little Italian), being wholly unwritten, and ever applied to the purposes of literature. English is spoken by many of the higher classes, and is making considerable progress even among the lower orders in the cities. In the rural districts, however, Maltese is spoken almost without exception.

Manners of the People.—The Maltese are as dark as the natives of Barbary, but without the Arab features, the men being of middle height but erect stature, robust and active; while the women, though small, and of dark complexion, are graceful, with regular and sometimes handsome features. The working classes are described as laborious and frugal, living on very slender fare, the great bulk of them being employed either in agricultural labour, or carrying and cutting stone for exportation to Constantinople and Alexandria. The Maltese are celebrated all over the Mediterranean for their good and intrepid seamanship. The dress of the higher orders is similar to that of other Europeans; but among the inferior or working classes the men wear a short loose waistcoat, covering a cotton shirt; short loose trousers leave the leg bare from the knee, and on the feet are worn *kochs*, a kind of sandals, early resembling those of the ancient Romans. The women wear short cotton shifts, blue striped petticoats, corsets with sleeves, and a loose jacket covering the whole. A black veil, called the *faldetta*, is the out-of-doors head-dress

of the women; whereas the men wear woollen caps in winter, and straw hats during summer. (*Sir R. C. Hoare's Travels*, ii., 393.) The morals of all classes are much higher than in most parts of S. Europe; and if there be less refinement of manners in the Maltese than among their continental neighbours, there is less vindictiveness and intrigue, while drunkenness and gambling are almost unknown. A few of the aristocratic families, ennobled by the knights of Malta, yet remain, but they form a very small portion of the population, and few of them possess large property.

Cities and Towns.—The principal towns are Valetta, built in 1568, by the famous grand master, John de Valetta, as being more conveniently situated for a capital than the old inland city called Citta Vecchia, the former capital of the island, and identical with the ancient Melita. Valetta, on the N.E. coast, in the centre of a fine double harbour, in lat. 35° 54' 6" N., long. 14° 31' 10" has a population, including the garrison, and its suburb, Vittoriosa (on the S.E. side of the great harbour), of about 60,000. It is very strongly fortified, and, from its position on a hill, as well as the almost impregnable works and trenches that surround it, has a most imposing appearance; nor is the water less struck with its internal beauty. The streets, though generally steep, are wide and well paved with lava, while the public squares and quays along the harbour are of noble proportions, indicative of the former wealth of the knights of Malta. The governor's palace and gardens, lying outside the walls, were formerly occupied by the grand master: a public library (once belonging to the order) contains upwards of 40,000 volumes; and the general hospital is not only used for the reception of sick troops, but has ample room for stores, and other purposes; the Floriana hospital is also a large building, occupying two sides of a quadrangle; and in the suburb of Vittoriosa is a third military hospital. Other hospitals are open for the relief of the native sick, and among the other public buildings may be mentioned the barracks, prison, theatre, university, collegiate church of St. John, and 19 other churches, including those in the suburbs. Valetta has a bustling animated appearance, from its being the great centre of the industry and commerce of Malta. Citta Vecchia stands on a very high ground, overlooking nearly the whole island, about 7 m. W. of Valetta. The rock on which it is built is excavated into large catacombs, "some of which are said to extend 15 m. under ground!" (*Brydson*, p. 186.) This old and decayed city is strongly fortified, and the cathedral is an extremely large and lofty structure, underneath is a grotto in which, as the monks inform us, St. Paul concealed himself for some time after his shipwreck. They have equally authentic legends respecting other localities close to the city. The towns are mere villages, besides which there are about 40 hamlets, chiefly remarkable for their picturesque and well-built churches. The roads, generally speaking, are good, many of them having been recently much improved; but the inland transport is, notwithstanding, chiefly by horses, mules, and asses, nor do the few carts lately introduced meet with much favour from the natives.

Neighbouring Islands.—About 4½ m. W. of Malta is the small island of Gozso. It produces considerable quantities of cotton, the cultivation of which constitutes the chief occupation of the islanders, who differ in no essential respect from the Maltese. An English garrison is stationed at Chambray, a strong fort elevated about 500 ft. above the sea, and there are other military works well adapted for the defence of the island. Between Gozso and Malta is another, though very small island, called Cumino, which belongs to a single proprietor, who derives from it the title of a prince palatine.

History.—Malta was probably first discovered by the Phœnicians, who communicated to the Greeks its oldest known appellation of *Ἰνδύα*. From the Phœnicians it passed to the Carthaginians, from whom it was taken by the Romans in the first Punic war, and made a prefecture subject to the pretor of Sicily. St. Paul, during his voyage from Palestine to Rome, was wrecked here; and being kindly received by the people, performed some miraculous cures, which made him be "honoured with many honours, and, when he departed, laden with such things as were necessary." (*Acts*, xviii., 39-44; and xxviii., 1-10.) On the decline of the Roman empire, Malta fell under the dominion of the Goths, and afterwards of the Saracens. It was subject to the crown of Sicily from 1190 to 1525. When the emperor Charles V. conferred it on the knights hospitaliers of St. John of Jerusalem, who had a short while previously been expelled from Rhodes, giving them

* There are, however, no good grounds for believing that the island was known to the Greeks in the time of Homer, and we regard the notion that either Malta or Gozso was the island of Calypso, referred to in Homer's *Odyssey*, as unworthy of credit. Several German critics on the *Odyssey* have written learned essays on the subject but a glance at the island, which of course was before their notice, would have sufficed to show the facility of their elaborate trifling.

MALTON (NEW).

power to levy taxes, import duties, &c., for the maintenance of the order, on condition that they should wage perpetual war against the Turks and Corsairs. It was besieged by a powerful Turkish armament for four months, in 1565, but without success; the knights, under their heroic grand master, John de Valette, founder of the city called by his name, having succeeded in repelling all their attacks, and compelling them in the end to retreat with vast loss. During more than 150 years, the island maintained itself against the Ottoman power; but the order was never sufficiently wealthy to attempt foreign conquests, or equip numerous fleets. At length, however, the inexpediency of the continuance of the piratical contests, in which the knights had been so long engaged, became obvious; and, in 1794, they concluded a truce with the Turks, which secured for the Maltese in Turkey the same privileges as the French. The subsequent history of Malta till its surrender to the French has little worthy of notice. In 1798, a French fleet of 18 ships of the line, with 18 frigates, and 400 transports, arrived off Valetta, having Napoleon on board; and the treachery of the French knights, who desired to be the subjects of France rather than Russia, rendered the capture of the island, with its capital, no very tedious or difficult task; and accordingly, after some fighting, the island capitulated 12th July, 1798, one month after the arrival of the fleet, when the order of Malta was virtually extinguished. In consequence of the irreligious practices and oppressions of the French, the Maltese rose en masse to expel them; and compelled them to take refuge in the towns, where they were closely blockaded for upwards of two years. At length, the French, being reduced to extremities, surrendered on the 5th September, 1800. The English immediately took military possession of Valetta, and have since retained it; the treaty of Paris, in 1814, having definitively annexed it to the crown of Great Britain. (*Reports of Commissioners of Inquiry; Brydson, Sir C. Hoare, and other Travellers; and Private Information.*)

MALTA, p. t., Saratoga co., N. Y., 6 m. S.E. Ballston Spa, 20 m. N. Albany, 400 W. Saratoga lake lies in its N.E. part, and Round lake in its S.E. part. Watered by Anthony's kill, the outlet of Round lake. Saratoga lake is a beautiful sheet of water, is 9 m. long and 2 m. wide, and lies partly in Saratoga Springs t. It has three stores, three falling-mills, two woolen factories, two grist-mills, three saw-mills, three tanneries, two distilleries; 10 schools, 257 scholars. Pop. 1457.

MALTA, p. v., Morgan t., Morgan co., O., 73 m. E. by S. Columbus, 331 W. Situated on the W. side of Muskingum river, opposite to Mac Connelville, the capital of the county. It contains three stores, 30 dwelling and about 300 inhabitants.

MALTON (NEW), a parl. bor., market town, and par. of England, N. riding co. York, wap. Ryedale, on the Derwent, 16 m. N.E. York, and 181 m. W. by W. London. Area of parliamentary borough, which comprises the parishes of St. Leonard and St. Michael in New Malton, with the parishes of Old Malton and Norton, 6646 acres. Pop., in 1831, 6902. The town, which occupies an eminence on the W. bank of the river, is very irregularly laid out; but the buildings, chiefly of stone, are decidedly improving in quality: on the opposite side of the Derwent, crossed here by an ancient bridge, shaped somewhat like an inverted Y, is the suburb of Norton in the E. riding, a thriving and increasing place; and about 1 m. N.E. of the town is the village of Old Malton, formerly of some consequence, but now exhibiting all the symptoms of decay. (*Parl. Bound. Rep.*) The public rooms, theatre, and workhouse, are handsome modern buildings; and near the bridge stand the remains of a castle, built by the Veseli family, and destroyed by Henry II. There are two churches, one of which is surmounted by a tall unfinished spire: the livings are curacies, dependent on Old Malton, and in the gift of Earl Fitzwilliam. The Wesleyan Methodists, Presbyterians, and the Society of Friends have their respective places of worship; and there are three well attended Sunday schools. New Malton has two subscription schools for children of both sexes; but the grammar school, founded by Archbishop Holgate, is at Old Malton. The Derwent being navigable up to New Malton bridge, is made available for the shipment of large quantities of corn, hams, bacon, and other farm produce. Malting and tanning are carried on to a considerable extent, and there are two large porter breweries; but the chief dependence of the town is on its retail trade with the opulent gentry of the neighbourhood. New Malton is a borough by prescription, governed by a bailiff. It has returned two members to the House of Commons since the 23d Edward I. Previously to the Reform Act, the franchise was vested in the burgage holders and inhabitants, rated to church and poor. The limits of the borough were enlarged by the Boundary Act so as to include the entire parishes of New Malton, and the parishes of Old Malton and Norton. Registered electors, 1839-40, 603. New

MALWAH.

Malton is also one of the polling-places at elections for the N. riding; and the petty sessions are held here for the E. div. of wap. Ryedale. Markets on Tuesday and Saturday, but chiefly on the latter for horses and cattle, corn, bacon, and farming implements. Very large cattle fairs, Monday before Easter, day before Whitsunday, and Oct. 11.

MALVERN, GREAT, a town, par., and celebrated watering-place of England, co. Worcester, hund. Farnore, 7½ m. S.S.W. Worcester, and 104 m. W.N.W. London. Area of parish, 4340 acres. Pop., in 1831, 3610. This town, which for many years has been a place of fashionable resort, in consequence of its delightful situation in

"The vale of Severn, Nature's garden wide,
By the blue steep of distant Malvern wall'd,
Solemnly west —" *Dryden's Plots.*

stands on the E. declivity of the well-known hills bearing its name, and is neat and well built, comprising, besides good houses for the tradespeople, several hotels and substantial private residences for visitors. The church, a fine cruciform structure of Anglo-Norman and pointed architecture (lately renovated in excellent taste), is 171 feet in length, with an embattled and pinnacled tower rising 114 ft. above the intersection of the nave and transept. It formerly belonged to a Benedictine monastery, founded here in 1083, and long one of the wealthiest and most important religious establishments in England. At the dissolution of the monasteries, when the rest of the property was sold, the church was bought by the inhabitants and made parochial. Malvern has long been noted for two medicinal springs, the chief of which (St. Anne's well) is bicarbonic, and enjoys a good reputation for the cure of nervous and cutaneous diseases: the other is a simple chalybeate, and little frequented.

About 3 m. S. is the village of Little Malvern, the road to which skirts the Malvern Hills, an extensive range composed of greenstone and quartz covered in parts with blue limestone, and running from N. to S. about 10 m., with an average breadth of 3 m. The activities in many parts are very gentle: but the summit of the ridge, which attains a height of 1444 ft., commands magnificent views over Wales and the counties of Hereford, Worcester, and Gloucester.

MALWAH, a prov. of Hindostan, chiefly between lat. 25° and 30° N., and long. 74° and 80° E., having N. Rajpootana and Agra, W. Gujrat, E. Allahabad, and S. Candahar and Candelah, from which it is separated by the Nerbuddah. The central part of this province is a tableland, extending from the Vindhyan mountains, on the E. to the Chittore and Mokundra ranges on the N. and E. and W. from Bhopal to Dohud; but which seldom rises more than 2000 ft. above the sea. It declines gently towards the N., in which direction flow most of the principal rivers, as the Chumbul, and its chief affluents, the R. Sind and Betwah, tributaries of the Jumna, and the Mhyt, which falls into the gulf of Cambay. The climate is usually mild and salubrious, except for about two months after the rains, when fevers are very prevalent. The total fall of rain from June to September has been estimated at 39 inches. The soil consists either of a loose black loam, or a more compact ferruginous mould, both noted for their fertility. Wheat, grain, peas, jowares, bajree, mung, and malzo, are among the chief grains cultivated; the first two furnishing the largest export. Rice is raised only in small quantities sufficient for home consumption; but opium, sugar, tobacco, cotton, linseed, garlic, tumeric, and ginger, are grown to a considerable extent. A little indigo, and the rest of the *Morinda citrifolia*, which supplies a red dye, are also raised, and fruits, including grapes, flourish in great abundance.

Opium is by far the most valuable product of Malwah, the soil and climate of which appears singularly well adapted for the cultivation of the poppy. The Malwah opium is considered by the Chinese, for whose consumption it is chiefly grown, superior in strength, in the proportion of seven to five, to that of Bahar and Benares, though inferior in flavour. Since the pacification of central India, the quantity of opium produced in Malwah has increased very rapidly, so much so, that while the total exports of Malwah opium to China, in 1831, did not amount to 3000 chests, they amounted to about 21,000 chests in 1839, worth about £2,000,000. (*Documents relating to the Opium Trade, p. 79.*) In Malwah the culture of opium is freely carried on; the cultivator paying a proportionally heavy land-tax for the land occupied in its culture. Previously to 1808, the Bombay government endeavoured to obtain a monopoly of the sale of opium exported from the ports under that presidency, but with little success; for 9-3ds of the Malwah produce were carried to the Portuguese settlement of Diu, and elsewhere, to be exported. But at the above period, the attempted monopoly was abandoned, and a permit, or transit-duty, similar to that imposed in other parts through which the opium passes, was laid on its sale.

MAMAKATING.

Since then 9-10ths of the Malwah opium have been shipped at Bombay; and in 1832, the trade yielded to the British government an annual revenue of £300,000 (see *Reports on E. I. Affairs*, 1830-1833), which has since been materially augmented. The tobacco of the province, especially that of the Bileah district, is also, beyond all comparison, the best in Hindostan.

Malwah is the chief seat of the Bheel race, it was of the Pindarry and Maharrata powers. It is almost wholly divided among the dominions of native princes, the chief of whom are Scindia, Holkar, and the rajahs of Bhopaul, Kotah, Dewas, &c. Except the Maharajah of the Punjab, Scindia is the only prince in Hindostan who can be called independent of British authority; but his independence has more of semblance than reality, for the power of his dynasty has been completely broken by a succession of reverses: his dominions are surrounded by the territory of the British, or their allies, who are bound to negotiate with foreign states only through the intervention of the British. A stationary British camp is kept up in his neighbourhood; and he is obliged to receive an English resident at his court, and to furnish a contingent of 15,000 men to the Anglo-Indian army. The dominions of Scindia are estimated to comprise 32,940 sq. m., with a population of nearly 4,000,000; and to yield a gross annual revenue of 2,300,000 rupees, out of which the chief derives a nett subsidy of 1,561,000 rupees yearly. The chief cities belonging to Scindia are, Gwalior, his modern, and Oojein, his ancient capital. The states of the other chief native princes of Malwah have been briefly noticed under INDORE, BHOPAUL, KOTAH, &c. (*Parl. Reports; Hamilton's E. I. Gaz.*)

MAMAKATING, L. Sullivan co., N. Y., 13 m. E. Monticello, 101 m. S.S.W. Albany. Watered by Basha's kill, along which passes the Delaware and Hudson canal. It has twenty-three stores, nine lumber-yards, five grist-mills, 14 saw-mills, six tanneries, three distilleries: one academy, 36 students; 16 schools, 833 scholars. Pop. 3418.

MAMARONECK, p. t., Westchester co., N. Y., 23 m. N.E. New York, 143 m. S. Albany, 348 W. Bounded S. by Long Island sound. Watered by Mamaroneck creek. It has two churches, an Episcopal and a Methodist, several stores, three schools, 64 scholars. Pop. 1416. Several sloops ply to New-York city.

MAMERS, a town of France, dep. Sarthe, cap. arrond. 24 m. N.N.E. Le Mans. Pop. (1836) 5565. It is indifferently built, but has of late been greatly improved. It is a town of great antiquity, and was surrounded with entrenchments by the Normans, some remains of which are called "the fosses du Robert le Diable." It has a handsome Gothic parish church, a college, a prison, some public baths, a theatre, manufactures of hempen, cotton, and woollen fabrics, pearl buttons, &c., and several tanneries and breweries. (*Guide du Voyageur*.)

MAN, ISLE OF (an. *Mona*, *Manapia*, or *Manada*), an island belonging to the United Kingdom, in the Irish sea, between lat. 54° 4' and 54° 37' N. and long. 40° 17' and 40° 34' W.; its N.E. extremity (the point of Ayre), being 17 m. from Burrow-head, in Wigtownshire, its E. coast 34 m. from St. Bee's head in Cumberland, and the town of Peel, on its W. side, 30 m. from Ballyquintin Point, in Ireland; greatest length 35 m.; greatest breadth, about 13 m. Area, 260 sq. m., exclusive of the Calf of Man, a small disjointed fragment of the island, at its S. extremity. Pop., in 1831, 41,000. Its general aspect, as viewed from the sea, is bold and precipitous; a ridge of mountains runs through its whole length, and three of the highest points reach an elevation of more than 1000 ft. above the sea; Snaefell, the loftiest, being 2004 ft. high. Several rills and streams flow from the high grounds in different directions; but there are no rivers nor lakes of any considerable size. The prevailing feature in the geology of the island is clay-slate, interspersed with mica-slate; and covered, near the coast, with grauwacke and old red sandstone. Limestone also is found on the S. side, near Castletown, intersected in some parts by veins of trap. The clay-slate is quarried at a place called Spanish-head, near Castletown; and stones are raised in blocks averaging about 7 ft. in length, by 1 ft. in breadth, and 6 inches in thickness. Drawing and roofing slates are quarried on the W. side of the island, not far from Peel. Close to Castletown, on the shore, are limestone and marble quarries, which have been worked for many years, and furnished a part of the stone for St. Paul's Cathedral, London. The island also produces lead, zinc, and copper, raised in considerable quantities by the Chester mining company, and by private parties. But mining and quarrying are in a very depressed state; the tools employed are of the rudest description; and not even a common crane is to be seen in the quarries. (*Head's Hems Tour*, vol. III, p. 19.)

The climate of Man is considered milder during winter than that of the adjacent parts of Great Britain and Ireland. Frost and snow are rare; and when they do occur, they are seldom of long continuance. Owing, however, to

MAN (ISLE OF).

the frequency of fogs and daws, as well as to the prevalence of E. winds, during many weeks of spring, the summers are deficient in heat, and the harvest is generally rather late. The climate, however, is, on the whole, favourable to health; cases of longevity are frequent, epidemics rare, and agues unknown. The soil is extremely various. Clay and marl, covered with white sand, predominate in the N. and N.W. extremity of the island, which is covered with scanty herbage, affording sheep pasture; but, proceeding S. and E., the quality of the soil improves, and, in the valleys especially, are some tracts, partly sand and loam, and partly stiff clay. No part of Man is, however, very productive; nor are any great pains taken to improve its natural resources. The mountains, commons, and other waste lands, include about 54,000 acres, leaving above 100,000 acres for tillage. Agriculture has considerably improved since the diminution of the herring fishery has made the men turn their attention to farming, which used to be exclusively the occupation of women: wheat, barley, and potatoes are raised in sufficient quantities for exportation, and within the last few years, the turnip husbandry has been introduced with some success by the English and Scotch settlers. The implements, however, are very rude; and the division of land into small farms has combined with the herring fisheries and smuggling to retard improvement. The extent of land under white crops, and the average produce of each in 1835, were estimated as follows:

Wheat	85,000 acres, at 24 qrs. per acre	21,250 qrs.
Barley	5,000 "	30,000
Oats	13,000 "	39,000

This was supposed to leave a surplus of about 5000 qrs. of wheat, and 3000 of barley, over the consumption. Peas are cultivated in the N. parts, clover is a favourite crop, and flax is raised by almost all the farmers for domestic use. The cattle of Man, which at present consist of a mixture of Irish and British breeds, are small and short-boned, running to fat, and not yielding milk till they are six years old. Anyrhire cows have, however, been recently introduced with much advantage. The native sheep, which are small, hardy, and usually of a white or gray colour, are slow feeders, long in coming to maturity, and very coarse-woolled; they are now, however, confined to the hills, the lowlands being mostly stocked with improved breeds. The island yields a race of hardy ponies, capable of much labour, and requiring little food; but for draught and farming purposes other breeds, chiefly Irish, have been imported of larger size and strength. Man had formerly a peculiar breed of dogs, now totally extinct, the animals at the present day being of various kinds, some of which resemble the Chinese variety. Red deer formerly ranged in the mountains, but the game at present consists of hares, rabbits, partridges, snipes, and woodcocks. Foxes and polecats are not found, neither are there any poisonous animals on the island; but wasps and rats are very numerous, and detrimental to the farmers. The Manx tenures are remarkable: the different parishes (of which there are 21), are divided into *towns*, each comprising four quarters, varying in size from 60 to 150 acres, and rising in yearly value from £10 to £125: there are 760 quarterlands, and they are esteemed by the islanders as property of the highest nature, in fact strictly entailed estates. Other lands, called *intacks* and cottages, are devisable by will, and, on the whole, considered to be of a far inferior nature. The yeomen are very proud of these little freeholds, which range from 10 to 200 acres, and usually comprise portions of pasture as well as arable land; but there can be no doubt," says Lord Teignmouth, "that the system is practically vicious, diminishing the wealth both of the farmers themselves, and of the public at large, containing indeed within itself the seeds of its own dissolution." (*Sketches of Scotland and the Isle of Man*, vol. II, p. 302.) Most of the yeomen have large and expensive families, which the law of Man compels them not only to rear and educate, but to provide for; and hence their estates soon become encumbered, and they are effectually prevented from pursuing any improved system of management, even if they felt inclined to its adoption, which is seldom the case; there being no more obstinate adherents to routine and ancient practices than the Manx husbandmen. Many of them thus become involved in debt, and mortgage their property, the redemption of which being seldom in their power, they are dispossessed of it, and compelled to leave the island, or to resort to trade or predial labour.* Hence the class of small proprietors is gradually disappearing: numbers of them having been swallowed up in the extending estates of the Scotch and English residents.

Man used to be one of the principal seats of the herring-fishery; but for several years past it has been comparatively deserted by the herring-shoals, and the fishery has, in

* The average on land held chiefly by the English, amounted, it is said, in 1835, to 100 000*l.*, which, at 5 per cent, would amount to 5000*l.* a year.

MAN (ISLE OF).

consequence, become quite inconsiderable, though even now it is the frequent practice of the farmers to purchase a boat, and share in the excitement and profit of the season. This diminution, however, is not to be regretted, as the fishery was carried on from July to October, exactly when the services of the yeomen and others engaged in it were most necessary at home. Being also a kind of lottery, in which by a few weeks' labour, large sums were occasionally realized, it attracted crowds of adventurers, without either capital or skill: while the irregular life led during these pursuits tended to encourage intemperance, and was a main cause of the indolence for which the Manx have been long notorious. There has, in fact, been a material improvement in the habits and industry of the people since the decline of the fishery; and there are, perhaps, few things less to be desired for the island than its revival. The herrings appear off the coast of Man in June, remaining till September, when they seek the E. coast of Ireland to deposit their spawn. The fishing vessels now built are much larger than formerly; they are half-decked, with very short keels, and are good sea-boats, though apt to pitch to a dangerous extent in rough weather: they vary from 18 to 30 tons burden, and are manned by 8 or 10, and sometimes 12 men. Cornish, Welsh, and Irish fishers also visit Man; and, according to Sir J. Rennie's estimate, it appears that out of 250 boats, and 2000 men employed in 1835, only 110 boats with their crews belonged to the island, 100 being Cornish or Welsh, and about 50 Irish. The cod-fishery was neglected, owing to the want of adequate capital for the supply of proper vessels and lines.

The manufactures are chiefly domestic, and carried on by women, most of whom, when not in the field or farmyard, are employed at their looms or spinning-wheels, producing woollen, linen, and cotton cloths, both for the home and foreign supply, as well as nets for the use of the fisheries. Bleaching is conducted on a large scale in Laxey Glen, stuffs being sent thither from all parts of the island. A paper-mill and brewery are also established in the same neighbourhood. A woollen manufactory is established at Douglas; and hats, made of coarse wool, which cost about 2s., are said to wear extremely well. The exports consist principally of corn, potatoes, eggs, lime, and limestone, lead and copper ore, herrings, lime, sail-cloth, and paper. Owing to the Isle of Man having been formerly independent, a discrepancy has, for a lengthened period, existed between the duties on commodities in it and in Great Britain, the former being considerably lower than the latter. This distinction, which still subsists, has occasioned, at different times, a great deal of smuggling, particularly on those articles on which high duties have been imposed in this country. This, however, is now materially reduced by adopting the plan of allowing only certain quantities of those goods on which the Manx duties are lower than those of England, to be imported into the island (viz. wine, 110 tons; spirits, except British, 80,000 gallons; tea, 75,000 lbs.; coffee, 8000 lbs.; sugar, 10,000 cwt.; and tobacco, 60,000 lbs.); and by maintaining an extra number of customs officers and revenue cruisers for the suppression of smuggling. Nothing, however, can be more impolitic than the continuance of such a system. The public has, at a very heavy expense, purchased all the feudal rights of the Atholl family; and that being the case, it is high time that an end should be put to the anomalous absurdity of having a considerable island lying, as it were, in the very centre of the empire, and in the direct line between some of the principal trading towns, with discriminating duties on many important articles. In making any change, it would of course, be necessary to make the inhabitants some compensation for the temporary inconvenience that it would occasion; but this might be done with advantage to the natives, and without expense to the public, by modifying and improving the internal regulations and legislative policy of the island, which would eventually lose nothing by the change. In 1836 there belonged to the island 942 vessels of the burden of 7229 tons, being a considerable increase on previous years; and as it lies in the line of the steamers plying between Liverpool and Glasgow, most of which touch at Douglas, it has begun to be largely frequented by visitors from these cities and other parts of the empire, whose influx has materially contributed to the improvement of its principal towns. To this cause, indeed, the present improved state of Man may be chiefly ascribed. It is also the residence of numerous half-pay officers, and others, who are induced to live here in consequence of the lower duties on many articles of domestic consumption.

The condition of the labouring population is moderately prosperous. Ordinary labourers receive about 1s. a day; and skilled labourers, if we may so call their clumsy tradesmen, get about 3s. a day, which, considering the low price of provisions, is certainly ample. There is no legal provision for the poor, who have to depend wholly on voluntary

charity. Generally speaking, the cottages are of a very inferior description: they are frequently built of earth or sod, and thatched with straw, having a funnel of sail-cloth, as a substitute for a chimney. There are, however, a few improved cottages, and their number will, no doubt, increase with the spread of improvement.

The feudal sovereignty of Man, which was a *kingdom* prior to 1504, was held by the Stanleys, afterward Earls of Derby, and their successors, the Dukes of Atholl, from 1626 to 1763, when parliament, conscious of the injury which the revenue and the public generally received from the contiguity of an island only feudally subject to the crown, and hence affording refuge to debtors, outlaws, and smugglers, purchased from the Duke of Atholl, for £70,000, his civil and military rights and patronage, but with certain reservations as to fiscal matters and titular dignity. A further arrangement was made in 1826, and Great Britain now enjoys all the rights and privileges of sovereignty of the island. The constitution, however, was left untouched; and for many years, at least, the legislative power has been vested in the House of Keys, a body comprising 94 members, now self-elected, but formerly chosen by the statesmen or owners of entailed estates. Their acts are binding in all cases, and the laws are so few and brief as to admit of being included in a small volume. Attorneys occasionally plead in the courts; but the suitors quite as frequently defend their causes in person: law is cheap, and, as was to be expected, litigation is very common. There are two supreme judges in the island called *deemsters*, or "awards of the law," officers of high antiquity, and exercising jurisdiction over all civil and criminal cases; being the presidents (under the crown and governor) of the two courts of chancery and exchequer, each of which is held eight times a year. The former of these has little more to do than to confirm or annul the decisions of the deemsters, who hold a primary court of judicature; and the exclusive business of the latter is to punish offences against the revenue laws. The common-law courts are held at different places for the six different *seckings* into which the island is divided, and may be considered as courts of "common pleas," in which all actions personal or real, may be tried, as in the deemster's court, by a jury of six in real, or of four in personal actions. The appeals from this court are first to the house of keys, afterwards to the governor, and finally to the queen's privy council. A half-yearly jail-delivery is made compulsory, and bailiffs act in the five chief towns to hear and determine cases of debt under 40s. (*Falkland's Tour*, p. 35-44; *Lord Trigram's*, ii., 227-241.)

The established religion is that of the Church of England; all sects, however, enjoy full toleration. The clergy are under the bishop of Sodor and Man, suffragan to the archbishop of York, but holding no English barony, and hence having no voice in the legislature, though privileged to sit in the house of lords. This see has been held by several highly celebrated divines; and among others by Barrow, Wilson, and Ward. An ecclesiastical court is held twice a year, either by the bishop or his vicar-general, and an archdeacon regulates fabrics and the minor concerns of the 17 parishes. These cures are commonly well attended to by respectable clergymen; but their stipends do not average £90 a year; and the churches, though externally pretty, are miserably deficient in accommodation. The dissenters have made considerable progress in the present century; but the Methodists comprise even now only one tenth of the population, and the other bodies of dissenters are unimportant. Bishop Wilson and other prelates have done much to promote education, not only by establishing schools, but also by translating the Scriptures and other books into the Manx language. Each parish has its school more or less richly endowed; and while elementary instruction is given in the Manx, every endeavour is made to instruct the natives in the English language. Indeed there can be no doubt, that, at no distant period, the population will be familiarly acquainted with our language; and this will be the surest method to disabuse them of the prejudices which so many entertain against a union with England. A collegiate school was established a few years ago, through the exertions of the late Bishop Ward; and though the funds were far too small for the expected outlay, the establishment, being well conducted, attracted numerous students, and has, on the whole, been successful.

The Manx, like the Welsh, and Scotch Highlanders, belong to the great Celtic family, which probably occupied the whole United Kingdom, previously to the immigration of the Belgæ. Their Celtic origin is clearly evinced by their language, which is a mere dialect of the Irish, Erse, or Gælic. They have a swarthy complexion, stout, with an air of melancholy pervading their countenances. Indolence, and a love of litigation, are distinguishing characteristics of the male part of the population. Even, at present, workmen rest for two hours in the middle of the day, when they

MANAAR.

may be seen stretched under hedge-rows by the road-sides. The women, however, are extremely industrious; and on them devolve not only the production of domestic manufactures, but also a large share of the labours of agriculture. They are hospitable, superstitiously attached to existing institutions and religious forms, and treat bishops and clergymen as beings of an exalted nature; but they are, notwithstanding, drunken, indelicate, dirty, and addicted to pilfering. Their old habits and prejudices are now, however, gradually giving way; the increasing influx of visitors, during the summer season, having, in this respect, effected an important and beneficial change. The *elite* of society is composed of the government officers and the large landholders, with a few church dignitaries; the other clergy, the attorneys, and medical men being too poor to mingle with the first circle.

The rocky islet, or Calf of Man, already alluded to, at the S. extremity of the island, was formerly the resort of vast numbers of puffins (*Procellaria Puffinus*, Lath.). At present, however, the bird is there entirely unknown. It was supposed to have been driven from this favourite haunt by the too great destruction of its young. These were held in considerable estimation; and Pennant mentions that, in his day, great numbers of them were taken every year by the person who farmed the islet. It appears, however, that rats that had escaped from a vessel wrecked on the coast, were the real exterminators of the birds. (*Quayle's Survey*, p. 8.)

The early history of Man is obscure. It was the Mona of Cæsar, and the Monapia of Pliny; but we know little more of it beyond mere traditions of its being held by the Druids, and subsequently by Norwegian monarchs, till, in 1264, it was purchased by Alexander III. of Scotland, who appointed a viceroy, and made it tributary. The Scotch were soon afterward expelled by the English, but the power of the latter was not established till the reign of Henry IV., who granted it to the Percys, from whom it fell, by attainder, and thence passed by gift of the same monarch to the Stanley family, by whose heirs it was sold to the British crown.

The chief towns of Man are: 1. Castletown, in which is the college above mentioned, the seat of legislature, and the residence of the governor (pop. in 1831, 3077); 2. Douglas (which see), the chief trading town, with upwards of 7000 inhabitants; 3. Peel, formerly celebrated both as the residence of the earls of Derby and the capital of the kingdom, but now decayed, and having only a population of 1739 persons, which is about the same as that of Ramsey, one of the steam-packet stations between Liverpool and Glasgow, on the N.E. side of the island. (*Quayle's Survey*, and *Fitzthum's Tour*; *Lord Teignmouth's Scotland and I. of Man*, ii., 181-202, and appendix, &c.; *Head's Home Tour*, ii., 1-90.)

MANAAR (GULF OF), an inlet of the Indian ocean, dividing Ceylon from the S. extremity of Hindostan; extending between lat. 7° 30' and 9° N., and long. 75° and 80° E. It is in general too shallow to be navigated by vessels above the size of sloops; and is separated by the islands Ramissiram and Manaar, and the chain of rocky islands and sandbanks called Adam's bridge, from another inlet of the sea called Palk's strait, also between Ceylon and the continent. The island of Manaar is 18 m. in length, by 2½ m. broad; but has little importance of any kind. For farther particulars, see Ceylon (l. 365).

MANAYUNK, p. v., Roxborough t., Philadelphia co., Pa. 7 m. N.N.W. Philadelphia, 99 m. E. by S. Harrisburg, 144 W. Situated on the E. bank of Schuylkill river, and on First rock canal, a part of the Schuylkill chain. It has an extensive water-power, created by the waste water of the canal, with an average fall of 22 feet. It contains five churches, a German Reformed, two Methodist, an Episcopal, and Roman Catholic, 12 or 15 stores, 25 or 30 mills and manufactories, and about 500 dwellings. Two bridges cross the Schuylkill river, and the Schuylkill canal and the Norristown railroad pass through the place.

MANCHA (LA), a prov. of Spain in the S. part of New Castile, bounded S. by Granada, E. by Cuenca and Murcia, and W. by Extremadura. Area about 7500 sq. m. Pop. 230,000? This district consists chiefly of lofty and barren plains, upwards of 3000 feet above the sea, and is, without exception, the least picturesque and productive in the whole peninsula. But it produces corn, wine, olives, and saffron; the Val-de-Penas, a light red wine, is highly esteemed all over Spain. The mules of this province also, are the largest and strongest in the peninsula. La Mancha, however, derives its chief celebrity from the inimitable work of Cervantes; and many of the customs he has depicted are still prevalent in the province. The capital of La Mancha is Ciudad Real, once a flourishing city, but now in decay, and having at present a population of only 8000 persons.

MANCHA (REAL), a town of Spain, in Andalusia, prov. Jaen, 8 m. E. the city of Jaen. Pop. according to Mithamo, 4939. It is situated in a spacious plain, and com-

MANCHESTER.

prises some regular-built streets and handsome squares; its chief buildings being a parish church, Carmelite convent, and hospital. Woolen and linen cloths, bedticks, and sack- ing, are made here, with bricks and tiles in large quantities, for the supply of the province. The neighbourhood is both picturesque and fertile, producing, with little tillage, abundant crops of olives, with smaller quantities of wine and grain.

MANCHE (LA), a marit. dep. and peninsula of France, formerly included in the prov. Normandy, between lat. 46° 40' and 49° 40' N., and long. 0° 40' and 2° W., encircled on the W. and N. sides, and partly on the E., by the English channel (Manche), whence its name; and elsewhere bounded, on the E. by the depts. Calvados and Orne, and S. by Mayenne and Ille-et-Vilaine. Length N. to S. about 85 m.; greatest breadth nearly 40 m. Area, 563,776 hectares. Pop. (1836) 504,382. Surface is generally undulating. A chain of hills, of no great elevation, runs through the dep. in a N.W. direction, dividing it into two nearly equal parts. Near its N.E. and S.W. extremities are some marshy tracts. The chief rivers are the Vire and the Ouve. The coast is mostly abrupt and rocky, especially in the N., but it has several good roadsteads and commodious harbours, of which Cherbourg is the finest. In 1835, about 380,400 hectares were estimated to be arable, 94,000 in pasture, 24,000 in woods, 20,300 in orchards, and 46,290 in heaths, wastes, &c. Agriculture is better conducted than in many other deputies. The produce of corn, which is chiefly wheat and barley, exceeds the home consumption: potatoes are an important substitute for grain; and, in 1835, the crop amounted to nearly 607,400 hectolitres. Beans, peas, and a good deal of hemp and flax, are raised. The deputy is beyond the limits of the vine-culture; but about 1,000,000 hectolitres of superior cider are annually produced, and some perry. In 1830 there were about 180,000 black cattle in the deputy; and fat cattle and butter are among its principal products. It had also, in the same year, about 391,000 sheep, estimated to yield annually 411,500 kilogr. of wool, though chiefly of inferior quality. There is a considerable traffic in horses and mules. Poultry are reared in great abundance; large quantities of eggs being exported from Cherbourg and Valognes to England and the channel islands. In 1835, of 192,038 properties subject to the *contribution foncière*, 62,792 were assessed at less than 5 fr., and 36,550 at from 5 to 10 fr. The oyster and other fisheries on the coast are important; but, according to Hugo, fish are less plentiful than formerly. Among the mineral products are iron, lead, coal, marble, slate, and granite; which last is found of excellent quality in the Chauey isles, a group of small islands off the coast of this deputy. Salt-works are established at several places on the coast. Manufacturing industry is employed on iron, copper, zinc, woolen, linen, cotton, and various other materials. Cutlery, glass, paper, hair fabrics, lace, &c. are produced; and in some cantons, baskets, panniers, willow sieves, &c., are made, and sent into other parts of Normandy, and into Brittany. But its principal trade is an agricultural produce and fish, fresh or salted. Manche is divided into six arrondissements; chief towns, St. Lô, the capital, Cherbourg, Coutances, Avranches, Valognes, and Mortain. It sends eight members to the chamber of deputies. Number of electors (1838-39), 3568. Total public revenue (1831), 15,145,636 fr. This deputy is rich in Celtic and Roman antiquities. (*Hugo*, art. *Manche*; *Official Tables*, &c.)

MANCHESTER, a mun. and parl. bor. and parish of England, the great centre of the cotton manufacture of Great Britain, and the principal manufacturing town in the world, co. Lancaster, hund. Salford, on the Irwell, an affluent of the Mersey, 31 m. E. of Liverpool, 35 m. S.W. Leeds, 70 m. N. Birmingham, and 163 m. N.N.W. London; lat. 53° 39' 50" N., long. 2° 15' W. The entire parish of Manchester includes an area of 34,280 acres, comprising 30 townships, and had, in 1831, a total population of 271,000 persons.

Manchester and Salford, which, being separated only by the small river Irwell, form a single large town, covering 3000 acres, with a dense mass of buildings, stand on a large plain, encompassed by hills on every side except the W., and dotted with towns and villages, the inhabitants of which are all industriously engaged in the production of woven fabrics. The Irk and the Medlock join the Irwell close to the town, and all three are made extensively useful in moving machinery, and for other purposes. Six bridges connect Salford with Manchester: the handsomest being Victoria bridge, having a single arch of 100 feet span, opened in 1839. The streets are irregularly laid out, and many are narrow and inconvenient, especially in the more central part. Great improvements, however, have been made within the last 30 years: narrow lanes have been pulled down to make way for broad avenues; noble public buildings, which would be ornamental to any capital in the world, have been erected in the chief thoroughfares. fac-

MANCHESTER.

ories and warehouses of gigantic proportions have arisen in every direction; confined and mean-looking shops have been replaced by superior establishments, some of which will bear to be compared with the best in London; the paving of the streets, though still in parts very defective, has been much improved; and flagging has been generally introduced, with macadamizing, in the principal streets. The whole town is lighted with gas; but in the poorer districts the lamps are but thinly dispersed, and are extinguished at too early an hour. It is well supplied with water, sufficiently drained (except in some poor districts) by an underground sewerage, and well watched by a day as well as night police. There are three main lines of street, which run in a curve S.E., nearly parallel to each other. The central line, which is the principal thoroughfare of the town, comprises Market-street (formerly a narrow lane, but now vastly improved, having some of the finest shops in town), Piccadilly, and the London road: more to the N., joined to the last mentioned line by Oldham-street, is Great Ancoat-street, with its continuations; and S. is the avenue known in different parts as Quay-street, Peter-street, and the Oxford road, connected with Piccadilly by a handsome line called Mosley-street, and a long narrow street called Doanage.

The following table exhibits the area, population, and rate of the parliamentary boroughs of Manchester and Salford, the limits of which pretty correctly define the extent of the town and its suburbs:

Townships.	Pop. in 1801.	Pop. in 1831.	Increase per cent. in 30 yrs.	Houses worth 10 <i>l.</i> in 1831.
<i>Bor. of Manchester.</i>				
Manchester, town	70,400	145,008	103-1	8,004
Ardwick . . .	1,762	5,534	213-5	547
Blackwick . . .	6	948	4,033-3	7
Bradford . . .	84	166	85-3	10
Cheetham . . .	742	4,035	437-5	622
Chorlton Row	678	30,560	2,547-2	1,505
Harpurhey . . .	119	463	292-4	9
Hulme . . .	1,477	9,824	473-8	754
Newton . . .	1,295	4,577	356	85
Total (Manchester)	74,778	187,026	143-5	12,723
<i>Bor. of Salford.</i>				
Salford town . . .	12,611	40,766	473-2	968
Broughton . . .	58	1,569	132-4	58
Pendleton . . .	3,611	8,455	133-5	240
Pendlebury— (part of)	437	1,556	256-0	42
Total (Salford)	16,525	52,366	182-7	1,268
Manchester and Salford	91,303	239,392	161-1	14,009

From the above table it appears, that the rate of increase in the two boroughs, during the 30 years ending with 1831, was 151-1 per cent.; and in the borough of Salford, 182-7 per cent., a rate exceeded only by Preston, and one or two other towns. In 1773, the population of the township of Manchester was estimated by Dr. Percival at 22,481, and that of Salford at 4755, making together 27,246; that is, about one sixth part of the population in 1831. The present (1841) population of the parliamentary boroughs of Manchester and Salford is certainly not under 360,000.

The public buildings of Manchester are too numerous to admit of individual description; but the following are the largest, best built, and most important. The Exchange, which stands in the market-place, at the lower end of Market-street, is a large but somewhat low semicircular stone building, fronted with Doric pillars. In the lower floor are the commercial room, a magnificent hall, having an area of 6750 sq. feet; and a spacious newsroom (added in 1830 from a space previously occupied by the postoffice, in the rear of the building): there are upper rooms on a corresponding scale, used for public meetings, dinners, &c.: the establishment is supported by subscription, and had, in 1840, about 2000 members. The chief business day is Tuesday, on which, about noon, all the principal manufacturers of Lancashire may be seen in or near this building. The Town-hall, in King-street, which has been recently widened, is of Ionic architecture, and extremely elegant, being formed on the model of the Temple of Erechthus at Athens, with a central octagonal cupola, resembling Andronicus's Tower of the Winds. It cost upwards of £40,000; and comprises, besides rooms for the police business, gas-offices, &c., a spacious and well proportioned public room (ranking among the finest in Europe), 131 feet long, and 38 feet broad. The fresco paintings, however, with which the walls are covered, are said to display little taste, elegance of design, or correctness of execution. Smaller town-halls are situated in Salford and Chorlton, the former of which township has its separate police establishment, &c. The Corn Exchange, in Hanging-ditch, is a handsome building, erected from a design adapted to it from the temple of Ceres at Athens. Six Ionic columns support the central pediment; and on each side are wings, very slightly projecting, and ornamented with pilasters; between which are the entrances to a square hall, inclosing an area of about

6000 square feet, and affording standing room for 2000 persons. Of the buildings devoted to charitable purposes, to literature, or to public amusement, the following deserve notice, from their architectural beauty. 1. The Royal Infirmary and Lunatic Asylum, finely situated in Piccadilly, recently faced with stone, and now constituting one of the chief ornaments of Manchester. 2. The Athenaeum in Bond-street, a peculiarly elegant structure, designed by Barry, in the Italian style, and completed at an expense of about £13,000. 3. The Royal Institution in Mosley-street, built at a cost of £30,000, from Barry's design, having a noble front, with a portico in the Ionic style, and comprising, besides other apartments, a handsome gallery for the exhibition of pictures, and a theatre for lectures, capable of accommodating 800 persons. 4. The Portico News-room, in the same street as the Institution, having an Ionic portico. 5. The Union Club-house, also in Mosley-street, a fine modern stone building, with internal accommodations equal to those found in the best London establishments of the same description. 6. The Natural History Society's hall in Fawcett-street, a large square building, having in the principal front a portico supporting a pediment and comprising a fine hall, lighted from a cupola, and different apartments stored with numerous specimens of birds, insects, fossils, shells, &c., and a few quadrupeds. 7. The Concert-hall, near the last mentioned building. 8. The Assembly-room, below which is a billiard and newsroom; and 9. The Asylum for the blind, and the school for the deaf and dumb, at Old Trafford, designed by Mr. Richard Lane, in the Elizabethan style, having a fine frontage of stone, consisting of two wings and a projecting centre formed by the chapel of the two institutions. There are three theatres, one of which has a royal patent; but neither is much patronised.

Among the sacred edifices of Manchester, the collegiate church far surpasses the others, both in size and architectural beauty. It stands close to the Irwell, near Victoria bridge; and was erected in the 15th century, in the ornamental Gothic style, having been frequently since repaired and in part rebuilt. The interior is about 180 feet long and 60 feet broad; but only a portion of the building is fitted up with stalls and pews for choral service, the remainder consisting of private chapels, which cover a large area, and render the form of the edifice exceedingly irregular. The choir is one of the finest in England, and the tabernacle-work is unrivalled: the monuments are numerous, and full of interest: the carved figures, with which the church is liberally adorned, are as quaint and grotesque as an antiquary could desire; and there are several beautiful stained-glass windows, with inscriptions and paintings. The college was founded in the reign of Henry VI., dissolved by Edward VI., and again chartered, in 1573, by Queen Elizabeth, who directed that the establishment should comprise a warden, four priests, two chaplains, and eight chorists. This charter was, for the most part, confirmed by Charles I. In the charter dated September 30, 1635, it is ordered that there shall be a warden (appointed by the crown) and four fellows (elected by the warden and fellows), who shall be a body corporate and politic of themselves forever. The charter further directs that there shall be two chaplains or vicars, and two clerks (one to be in holy orders), four singing men (whether clerks or laymen), and four boys skilled in music. (There are now six singing men and six boys.) It is also ordained that there shall be a subwarden continually in the college, a treasurer, a collector (all of the number of the fellows), a registrar, a master of the choristry, an instructor, an organist, and a ballif. Whenever either of the sees of Bangor or St. Asaph becomes vacant, they will be united, and Manchester will be raised into a bishopric. Preparatory to this change, the title of warden and fellows has already been changed for that of dean and canons; and this, in due course, will be followed by the appointment of an archdeacon of Manchester to superintend the clergy of the district. A chapel of ease was erected in Salford in 1634: this, St. Anne's, erected in 1712, and St. Mary's, erected in 1735, being the only places of worship in the town till 1760, between which and 1800 eight additional churches were built. Nine other churches, two of which (St. Luke's, Cheetham, and St. George's, Hulme) are very elegant, and cost £14,000 each, have been erected in the present century; so that, on the whole, there are 36 episcopal places of worship in the borough, served by 46 clergymen, and accommodating 29,400 individuals. The Roman Catholics raised their first chapel in 1748, but one belonging to the Presbyterians was opened at an earlier period. The Independents opened a chapel in 1762, and the Wesleyan Methodists in 1780. The dissenting meeting-houses now open comprise, one for seceders from the Scotch Kirk, five belonging to Roman Catholics, 11 belonging to Wesleyan Methodists, 16 occupied by various seceders from Methodism, nine belonging to Independents, six to Baptists, four to Unitarians, and six others to Swedenborgians, &c., the whole being calculated to accommodate about 140,000 persons.

MANCHESTER.

Three cemeteries have been laid out in Chorlton, Ardwick, and Harpurhey; and the anxious practice of interring bodies within the town is slowly but gradually going out of use. The two boroughs of Manchester and Salford have above 130 Sunday schools.

The means existing in Manchester, in 1834, for the diffusion of elementary instruction, may be learned from the following summary, drawn up from the report of the Manchester Statistical Society:

Description of Schools.	Manchester.			Salford.		
	Schools.	Scholars.	Per cent. to Pop.	Schools.	Scholars.	Per cent. to Pop.
I. Sunday schools:						
Bazil. Church	95	10,384	5.14	9	2,741	4.98
R. Cath.	8	3,920	1.94	2	613	1.11
Dissenters	61	19,020	9.62	29	6,400	11.64
Total of Sun. schools . .	164	33,164	16.60	38	9,754	17.73
Children returned as day scholars		10,011	5.01		3,410	6.20
Sund. scholars only . . .		33,164	11.59		6,344	11.53
II. Free or subscription day schools . . .	36	4,177	2.05	16	1,776	3.23
III. Evening schools . . .	86	1,429	.78	26	886	.96
IV. Schools supplied by the children's payment						
Primary	400	11,094	5.81	107	3,257	6.11
Higher	114	2,884	1.47	29	862	1.60
Total	781	65,378	31.45	311	13,885	25.43

It would appear from this statement that, in 1834, about 26,000 children were receiving daily instruction in Manchester and Salford, and that 30,000 more were taught on Sundays. But doubts have been entertained as to the accuracy of these returns; and of the day scholars, nearly 19,000 were reported to be educated in private schools, and daines' schools, in two thirds of which the instruction is extremely defective. Within the last half dozen years considerable additions have been made to the better class of schools supported by the church and the manufacturers; still, however, there can be no doubt that the education of the working classes is defective, and that it admits of being very materially improved. From the report of the Inspector of "the Chester Diocesan Board of Education," read at a meeting of that body on the 11th of March, 1841, we derive the following particulars relative to the church schools in the town of Manchester:

	On the Books.	Average Attendance.
21 Day schools	2,780	2,900
11 Infant schools	1,900	1,265
10 Evening schools	650	650
59 Sunday schools	15,186	11,540
Total	16,500	15,865

Among the schools deserving particular notice, the first place is due to the grammar school, founded in 1530, by Hugh Oldham, bishop of Exeter. Its revenues amount to upwards of £4500 a year; and in consequence of a decree of Chancery in 1833, its usefulness was increased by the opening of a lower school, and a general augmentation of the establishment. The decree of 1833, however, was *ex parte*, and as it did not effect all the alterations that were necessary, a suit was instituted to obtain farther reforms, in which a judgment was given by the lord chancellor on 10th Nov., 1840, from which it appears that "the income in 1833 was £4530, and the salary awarded to the head master was £600 per annum; and the salaries of all the masters together was £2050, while the number of scholars, including boarders, was only 198." The lord chancellor concluded his judgment as follows: "I propose, therefore, to declare, that in all future appointments of fees and trustees, regard should be had to the qualification required by the statutes; that all children of an age capable of instruction are entitled to be admitted into the school; that no part of the funds of the charity are hereafter to be applied towards paying premiums for exhibitions to boys who are or have been boarders in the house of any of the masters, except in continuing to pay exhibitions already granted; and that such boarders are not in future to derive any benefit from the funds of the charity in any manner by which the expenditure of such funds may be increased; and with these declarations, I shall refer it to the master to approve of such alterations in the scheme contained in the report of 1833 as may be necessary to carry the same into effect, and as the master shall find to be proper for the purpose of more effectually carrying into effect the objects of the charity." We understand, however, that the whole case is in a train for being again brought before the court in another shape. Few establishments in England confer so many university advantages on their *alumni*. It has 16 exhibitions of £40 a year, tenable for four years; 16 Bournemouth scholarships at Brasenose college, Oxford, averaging

£30 a year; and several others of less value both at Oxford and Cambridge; besides which it derives great, though not exclusive advantages from the valuable Hume's exhibitions, connected with Brasenose college, and tenable for three years after the degree of B.A. The instruction is efficient; and, should it be placed on the footing directed by the lord chancellor, it will no doubt rank among the best grammar schools in the kingdom. The college, founded by Humphrey Cheetham in 1665, is likewise a wealthy scholastic establishment, comprising, besides lodgings and school-rooms for boys, a valuable library of 25,000 volumes; but it is said that the modern part of this library is deficient, and that it is better suited for the scholar and the antiquary than for men of business: this college has also a museum of curiosities of little real value, but much visited by strangers and holiday people. The number of scholars is restricted to 80, 40 of whom must belong to Manchester and Salford, the rest belonging to Droylsden, Crumpsall, Bolton, and Turton. A plain education is furnished, and the scholars are afterward apprenticed and fitted out in trade. Seven other endowed charities for instructing children are amalgamated with national and other schools, very liberally supported, and conducted in the most efficient manner; and, besides these, the town has an asylum for the blind, erected by public subscription, and supported by an endowment bequeathed by Thomas Henshaw, Esq., of Oldham, and a deaf and dumb school, established in 1832, and remodelled in 1836: there are 80 scholars on the establishment, which is in every respect well conducted. A chapel is connected with the school, to which the public are admitted.

A college (removed by the Unitarians from York) on the plan of King's college, London, under the denomination of the Manchester New college, was opened for the reception of students on the 5th Oct., 1840. Instruction is given by distinguished professors in every department of literature, science, and theology. The erection of another college, to be called the Lancashire Independent college for the education of dissenters, is also in active progress, and will be soon completed.

The charitable institutions of Manchester, for the relief of the sick, disabled, and destitute, comprise an infirmary and dispensary, relieving 18,000 patients yearly, a fever hospital, or "house of recovery," a lying-in hospital, an eye institution, a lock hospital, a night asylum for the destitute poor, a female penitentiary, a provident society, a dispensary for children, a dispensary for diseases of the skin, and four other dispensaries, relieving altogether about 30,000 patients annually, and supported by funds from bequests and subscriptions, amounting to £14,000 a year; besides which, there are various minor charities belonging to Manchester and Salford, the aggregate income of which exceeds £4000 a year: so that upwards of £18,000 are annually expended in the relief of the poor, over and above the expenses of parish support, which in 1838 amounted to £40,000.

The literary and philosophical establishments of Manchester are very numerous, consisting of a philosophical society, instituted in 1781, and numbering among its past and present members Dr. Percival, the three Henrys (father and sons), Dalton, and other eminent men, whose science and discoveries have been of material advantage, not only to the town, but to the world generally: indeed, few provincial societies of the kind have earned so high a reputation; its memoirs (in 16 volumes) have been translated into both the German and French languages: a geological and mining society, founded in 1838, has already upwards of 200 members: a statistical society is actively engaged in collecting local information respecting education, morals, &c.: a botanical and horticultural society, established in 1827, possesses gardens that cover 16 acres: a zoological society has spacious gardens on the Bury road, tastefully laid out, and containing a good and increasing collection of animals: a society of natural history has a good museum, and is supported by about 600 subscribers. The Royal Institution was founded in 1823, for the promotion of literature, science, and the fine arts. We have already noticed its fine building, the principal hall of which has a statue of Dalton, from the chisel of Chantrey. Connected with this institution is a school of design, likely to be of material service to pattern-draughtsmen, machine-makers, and others. The Athenæum, established in the view of affording to the middle classes a suitable resort for reading, study, and conversation, is supported by about 1000 members, and has a library of 4000 volumes: two schools of medicine and surgery are superintended by able teachers, and provided with extensive museums, lecture-rooms, &c. There are two mechanics' institutes, and another establishment for similar purposes called the Christian Institute: these institutions are all well provided with libraries, museums, apparatus, &c., and are well attended. There are three lyceums, specially intended for the improvement and re-

MANCHESTER.

creation of the working classes by furnishing them with books, magazines, newspapers, lectures, and opportunities for friendly intercourse; and there can be no doubt that they have been of very material advantage. The Royal Victoria Gallery has an exhibition of objects in mechanics and science, and courses of lectures. A temperance society, formed in 1835, was the first to inculcate total abstinence from all intoxicating beverages: it has at present 12 branch associations, holding weekly meetings, and about 8000 members.

The banking establishments of Manchester, which are numerous, and conducted on a scale corresponding with the commercial importance of the place, comprise, besides five private banking-houses, mostly of great wealth and respectability, a branch of the Bank of England, and five joint-stocks: viz., the Bank of Manchester, founded 1829; the Manchester and Liverpool District Banking Company (1839); the Union Bank of Manchester (1836); the Manchester and Salford Banking Company (1836); the S. Lancashire Bank (1836); and the Alliance. A savings' bank was opened in 1818; and, from the report of 1830, it appears that it had then deposits to the amount of £337,880, received from 11,893 depositors. Five newspapers are published in Manchester; three of which, the *Guardian*, *Times*, and *Advertiser*, advocate whig and radical politics, the *Courier* and *Chronicle* being conservative. The *Guardian*, which has the largest circulation, and *Chronicle*, are published on Wednesdays and Saturdays; the others appear on Saturdays only.

Manchester possesses several large establishments connected with its internal economy. The workhouse, which occupies an eminence N. of the town, is a very extensive and well conducted establishment, accommodating at an average 780 in-door paupers, whose weekly cost is about 2s. 4d. each for food, and 5s. 4d. for clothing. The house expenditure, in 1830, amounted to about £8750, and £13,000 were distributed among the out-door poor; the total expenditure of the overseers being £41,000. The Salford workhouse, in Greengate, has accommodation for about 350 inmates, whose average cost per head is about 3s. 6d.: the expenditure of the establishment was about £3000, £2000 more being distributed among out-door paupers. The New Bailey prison in Salford, close to the New Bailey bridge, commenced by Howard in 1787, has been since greatly enlarged: it has accommodations for about 800 prisoners, and is well conducted; but, owing to the great increase of population and crime, it is inadequate to the wants of the borough, and is frequently so overcrowded that three persons have to sleep in one cell! A police-office court is held daily within the precincts of the prison, by a stipendiary magistrate, appointed by the chancellor of the duchy of Lancaster, with a salary of £1000 a year. The police of the borough is regulated by a recent temporary act (3 and 3 Vict. c. 87), which provides for the establishment of a police office, under a chief commissioner, who is to be a justice, and to have an annual salary not exceeding £800; and authorises the appointment of a sufficient number of fit and able men, to act under the commissioner as a day and night police, not only within the borough, but throughout the county of Lancaster. The force consists at present of 294 sergeants and constables, and 24 superior officers, costing in all about £21,700 a year. The police fire-engine establishment is perhaps the most effective in the kingdom, after that of the metropolis: it comprises seven engines, completely furnished with every necessary implement, fire-escapes and water-barrels, and a body of 40 firemen, commanded by a superintendent. The Manchester gas-works are the property of the town, and the profits are applied towards its improvement: the works were established in 1817, but the streets were not generally lighted with gas till 1824. The main pipes extend, in various directions, upwards of 80 m. in length; and the quantity of gas made in 1830 exceeded 160 millions of cubic feet. The Salford gas-works are on a much smaller scale, having only come into operation in 1835. The board of directors of the Manchester establishment paid over to the improvement committee, between 1830 and 1835, £54,000. The Manchester and Salford Water-works Company was originally established in 1805, but assumed its present shape only in 1823, when it received additional powers from parliament. There are two reservoirs, one at Beawick, 110 ft. above the level of the town, and the other at Gorton, 140 ft. above that level: the iron mains extend upward of 70 m., and the daily consumption of water is estimated at 1½ millions of gallons; besides which, 30,000 gallons are daily supplied to the railway companies. The markets of Manchester are not such as a town of great wealth and magnitude might be expected to possess; and this circumstance is most probably owing to the fact, that the tolls are not the property of the town, but belong to the lord of the manor. There are no general markets, like those of Liverpool, Birmingham, and Newcastle; but several are scattered in different parts of the town.

In Victoria-street, Swan-street (Smithfield), Camp Field and Deansgate, are markets for butchers' meat and vegetables; and a fish-market was erected near the exchange in 1828. The cattle-market is held every Wednesday, in Cross Lane, Salford; a large area on its sides is fitted up with stalls, fitted with various articles both of farming and manufactured produce.

The following table, drawn up from the *Reports of the Manchester Statistical Society*, shows the consumption of butcher's meat in Manchester and its environs (estimated pop. 343,500) in 1836:—

Description of Meat.	Average weight of Carcasses.	Number of		Quantity to each Person.
		Carcasses.	Pounds.	
Cattle . . .	585 lbs.	60,320	22,469,200	66 lbs. 3 oz.
Sheep . . .	93 ½ —	165,040	7,212,716	21 —
Lambs . . .	27 —	98,686	3,576,716	10 — 7 —
Calves . . .	90 —	11,791	1,051,199	8 — 1 —
		235,837	34,709,831	101 —
Offal (edible) . . .			1,267,308	4 — 9 —
Total . . .			36,077,139	106 — 9 —

The market-days are Tuesday, Thursday, and Saturday, the first named being the manufacturers' day, and the last the chief market for agricultural produce and provisions. The fairs are held in Easter and Whitson week, the first week in October, and on November 17. The first of these, called Knot-mill fair, is a more popular festival, and the rest are cattle fairs.

Manufactures.—Manchester, though situated close to an almost inexhaustible coal-field, and deriving great advantages from the vicinity of three streams, available for machinery, would never, in all probability, have attained to her present magnitude and importance, as the first manufacturing town of the world, but for the invention of the steam engine, and the wonderful improvements made since 1780 in the manufacture of cotton twist and fabrics, through the genius and discoveries of Arkwright, Crompton, Cartwright, Horrocks, and others. How astonishing the revolution effected by the ingenuity and enterprise of a few obscure individuals! Before the spinning frame, which was invented in 1767, came into operation, the imports of cotton wool did not amount to 4,000,000 lbs. a year, and the value of the exports hardly exceeded £300,000. Arkwright's patent was set aside in 1785, and since then the progress of the cotton manufacture of Great Britain, and especially of Manchester, has been rapid beyond all precedent. Previously to 1785, the imports of cotton wool had not reached 12,000,000 lbs. in any single year; but in 1787 they amounted to 23,250,963 lbs.! The progress of the manufacture was not impeded by the late war, to the successful termination of which it contributed more, perhaps, than anything else: and what is not less extraordinary, it has more than quintupled since the peace! The imports of cotton wool, in 1840, amounted to the prodigious sum of about 383,500,000 lbs., of which no fewer than 459,000,000 lbs. were manufactured! In 1803, the value of the exports of cotton goods equalled those of woollen, the long-established and staple manufacture of the country; and they now amount to about £35,000,000 a year, while the exports of woollens do not exceed £6,000,000. Indeed, the cotton manufacture now forms, next to agriculture, the principal business carried on in the country, affording an advantageous field for the accumulation and employment of millions upon millions of capital, and thousands upon thousands of workmen! About 1½ millions of people are supported by spinning and weaving cotton, and the different supplementary employments of the trade; and fabrics of great beauty and excellent quality, which a few years ago were out of the reach of all except the wealthy, have been so much reduced in price as to be within the command of all but absolute beggars. (For farther details, see ENGLAND AND WALES, vol. I., p. 707.) Of this gigantic manufacture Manchester is the grand centre, absorbing, with its neighbourhood 10 m. round, fully four fifths of the trade, and comprising, besides spinning-mills, most extensive power-loom factories, and large dyeing and printing establishments. The manufacture of silk goods, also, which was introduced in 1816, has been in a most flourishing state since the removal, in 1856, of the oppressive import duties on raw silk; and this branch of industry in Manchester now exceeds that of Macclesfield. In the infancy of the trade, silk handkerchiefs and mixed goods were principally made; in 1822, *gros-de-Naples* and figured sarretons were introduced; and at present (1840) nearly every kind of silk, from the rich brocade to the flimsy *Perlas*, is manufactured, consuming upwards of 1,600,000 lbs. of raw silk, and employing 4000 hand-loom, besides 2000 persons in throwing-mills, and 500 in dyeing and printing houses. Mixed goods of silk and cotton, silk and woollen, and cotton and woollen, occupy several hands; and many hundred persons are engaged in making machinery, and in various branches of handicraft nearly or

MANCHESTER.

more remotely connected with the principal object of industry. The following statement respecting the factories within the borough of Manchester is extracted from the *Parl. Returns of 1839*:

Descriptions of Mill.	Number.	Engines.	Power.	Hands employed.
Cotton-mills . . .	163	264	6,659	34,039
Woolen . . .	9	2	66	220
Woollen . . .	2	1	16	26
Silk . . .	19	19	369	4,132
Total . . .	193	297	7,140	38,437

There are also several flax-mills, and this branch of spinning is extending. In some of these factories the process of spinning only is carried forward; but in many others the whole process is carried on, from the first carding to the ultimate dressing of the woven and bleached fabric. Many of them are buildings of extraordinary size, comprising seven or eight stories, erected at a heavy expense, and filled with machinery costing £30,000 or £40,000. The rooms are kept in the most perfect state of cleanliness, and the strictest order, regularity, and silence prevail throughout the establishments. Several thousands of spindles are at work in each of the principal factories; and in many of them upwards of 600 power-looms are in action, each producing from 15 to 20 pieces of fabric, of 24 yards each, per week. Besides the population connected with the factories, which almost absorb the plain-goods' trade, including jaconets, twilled cloths, and fustians, upwards of 9000 hand-loom weavers are employed in Manchester and the neighbourhood in weaving cotton, silk, and mixed goods. "The cotton fabrics are quiltings, figured waistcoatings, twilled shawls and handkerchiefs, checked and striped gingham, tape-strips, dimities, apron-checks, checked handkerchiefs, buff-checks and buffs, coarse shirtings and sheetings. The silk fabrics comprise velvets, figured saracens, figured and plain levantines, plain satins, plain serges, saracens, and gros-de-naples, checked saracens, string-persians, ducape handkerchiefs, satin checked cravats, Brussels handkerchiefs, black bandanas, Welsh shawls, romule, turbans, Barcelona handkerchiefs, and grey bandanas. The mixed are chiefly for waistcoatings, handkerchiefs, cravats, shawls, &c. The weaving of each of these fabrics, with a variety of others, may be regarded as a separate branch of the weaving trade; and the earnings of the different weavers employed on each are as various as the fabrics. (*Hand-loom Weavers' Rep.*)

We subjoin a statement drawn up by the Manchester statistical society of the amount of steam power employed in the various branches of manufacture within the parliamentary boroughs of Manchester and Salford in 1836:—

Branch of Manufacture.	Horse Power.		
	Manch.	Salford.	Both Bors.
Cotton spinning and weaving . . .	8,272	304	8,576
Spinning, dyeing, printing, &c. . .	756	521	1,277
Machin-making, foundries, &c. . .	508	826	1,334
Silk-throwing and weaving . . .	237	704	941
Cotton thread and small wares . .	970	36	1,006
Collieries . . .	100	296	396
Saw-mills . . .	141	14	155
Expanding for calico-printing, &c. .	75	6	81
Fustian shearing . . .	46	34	80
Brusheries . . .	16	62	78
Flax-spinning . . .	—	70	70
Chemical works . . .	55	11	66
Woolries . . .	36	22	58
Various, all of minor importance .	408	28	436
Total . . .	7,905	1,595	9,501

The manufacture of machinery is conducted on a most extensive scale, employing many hundred hands. Steam-engines are made of different powers, varying from eight to 60 horse power; and the castings are often of gigantic size, weighing from 20 to 50 tons. The iron-planing and riveting machines are curious specimens of mechanical ingenuity, and have greatly tended to facilitate the manufacture. Many of the workmen receive from £3 to £3, and less than 30s. weekly wages. The business of locomotive engine and tool making, also, is most extensively carried on, the largest establishments of the kind being at Asticott; and at Sharp and Robert's; Peel, Williams, and Co.'s; Fairbairn's; and Whitworth and Co.'s, in Manchester; at each of which several hundred men are employed, and the arrangements in every way are most complete and systematic.

The speedy and cheap communication established with a port of Liverpool, and other places, has been at once a use and a consequence of the increase of manufactures in Manchester. It had become at the close of the last century, a great centre of internal navigation. Brindley constructed the duke of Bridgewater's canal, uniting with the Mersey at Runcorn, in 1761; the Bury and Bolton canal projected in 1791; that to Ashton and Oldham in 1793; that to Rochdale in 1794; and these communicate with

other canals, in such a manner as to establish an easy communication with the eastern, central, and southern counties, including the ports of Hull, London, and Bristol, as well as that of Liverpool, which is, *per excellence*, the port of Manchester. Large sums were sunk in excavating these canals; but the returns far exceeded expectation, and the profits to the shareholders were in some cases immense.

The Mersey and Irwell navigation company have recently commenced operations in the river Irwell, which will have a most important influence over the navigation and commerce between the two towns. The river at Manchester is being deepened between the New Bailey and Victoria bridges, in which portion it is not at present navigable; and a report, survey, and plans have been drawn up by Mr. Palmer, (president of the Society of Civil Engineers, London,) in compliance with which it is proposed to open the navigation to vessels of 300 tons burden the whole distance from Manchester to Runcorn. The inhabitants of Manchester have for some time been earnestly soliciting to be allowed the privilege of bonding goods; and bills to that effect have been introduced into the House of Commons. Hitherto, however, the opposition of interested parties has prevented the project being carried into effect; but should the Mersey and Irwell navigation company carry their designs into execution, Manchester will be entitled to claim the privilege of bonding from its being a port.

Notwithstanding the rivalry of railways, the tonnage on the canals continues to be very heavy. It was proved before the house of lords, in 1836, that the water-carriage between Manchester, Birmingham, the Potteries, Shrewsbury, &c., amounted annually to 364,100 tons; and if the trade with London, and other southward traffic, be added, it seems probable that the entire canal carriage of Manchester exceeds 700,000 tons a year. But the rapidity and ease of communication have been still more prodigiously increased by the construction of railways, which have brought Manchester within an hour's distance of its great warehouse for the raw material, within four hours of Birmingham, and nine hours of the metropolis: The Liverpool and Manchester railway, opened in 1825, cost £276,000, and the expense of maintenance amounts to £160,000 a year, the annual net profits being about £193,000 at an average of four years. The passengers on this railway have averaged for some years 400,000 a year; and the receipts from goods, as compared with those from passengers, bear the proportion of three to five nearly. The Grand Junction railway, connecting Manchester and Liverpool with Birmingham, is 82½ m. in length (15 m. of which are on the Liverpool and Manchester line), the original cost amounted to £1,400,000; the receipts, in 1836, were £178,000, the expenses averaging 53 per cent. on the returns. The Manchester and Leeds railway was opened the whole distance on the 1st of March, 1841, and in connection with the North Midland and the Midland counties, furnishes another route from Manchester to London. The Sheffield and Manchester railway, and that between Manchester and Birmingham, have been recently commenced, and will probably be completed by the end of 1841.

Manchester has recently received a charter of incorporation; and the municipal borough is divided into 15 wards, the government being vested in a recorder, mayor, 15 aldermen, and 48 councillors. Quarter sessions are held by the recorder; and there is a court for the recovery of debts under £20. Notwithstanding its vast importance, Manchester did not enjoy the privilege of sending representatives to parliament till the Reform Act gave to the manufacturing interests of the country that influence in the legislature to which they had been long entitled. Manchester was then erected into a parliamentary borough, with power to send two members to the House of Commons; its boundaries including, besides Manchester, the eight other townships enumerated at the commencement of this article. Registered electors, in 1832-40, 12,150. The same act conferred on Salford the privilege of sending one member to the House of Commons: its limits comprise two other entire townships, and a part of a third. Registered electors, in 1832-40, 2519. Manchester has also been formed into a union under the Poor Law Amendment Act, which came into operation in January, 1841. The union comprises the townships of Blakesley, Crumpeall, Chestham, Moston, Harphur-hey, Bradford, Newton, Fallowfield, Great Heaton, Little Heaton, Prestwich, and Manchester.

Condition of the People of Manchester.—The increase of wealth in Manchester, during the last half century, has been quite unprecedented, and it has at present, in proportion to its size, a greater number of opulent capitalists than any other town of the empire. The capital vested in mills, machinery, and stocks of goods, is immense; and, in addition to the vast sums that are thus employed in their peculiar business, the capitalists of Manchester, and the adjoining districts, have been the great promoters of railways in all parts of the empire, and hold a very large proportion of

MANCHESTER.

the stock embarked in these undertakings. To achieve such great results, a combination of all those qualities that go to form accomplished men of business has been required; and no where do we find the persevering attention to details, added to the sagacity to distinguish between the doubtful and the certain, and the enterprise to embark in remote and apparently hazardous, though really safe schemes, that characterise the highest class of commercial men, so generally diffused as in Manchester. It is, in fact, the grand arena of industry and enterprise. Every one is striving to raise himself to distinction, and to outstrip his neighbour in the accumulation of wealth. But there are no mean jealousies, or unfair jealousings: there is more than room enough for every one; and every one knows that his success is wholly dependent on his own efforts.

The shopkeepers and middle classes of Manchester are more attached to old habits than those of most other towns. In proof of this we may mention, that by far the greater number of them continue to dine at the primitive and unshakable hour of one. At no very distant period, indeed, they were accustomed to shut their shops from one till two; and though that be no longer the case, the banks will not, at present, with one or two exceptions, cash cheques sent to them at such a time, or allow their clerks to be interrupted when at dinner!

But it is not so easy to arrive at any very definite conclusions with respect to the condition of the lower classes in this great workshop. On the whole, however, we are inclined to consider it as tolerably satisfactory. No doubt, the condition of the English part of the population has been most injuriously affected by the prodigious influx of Irish immigrants, of whom there are probably not fewer than 45,000 in the town, where they, for the most part, occupy an inferior quarter, called "Little Ireland." The Irish, it is but fair to say, are neither peculiarly disorderly nor peculiarly dishonest; but their competition has depressed wages, or hindered them from rising, and their example has been most pernicious, by accustoming the English to a lower standard of food and comfort. But despite the influence of this fruitful source of degradation, the work-people of Manchester seem, when employed, with the exception of the hand-loom weavers, to be really well off. Unluckily, however, a number of individuals, partly belonging to the town, but mostly new comers from Ireland and other parts of England, are usually without employment, and in a state bordering on destitution. It is unfortunate, too, that so many of the workmen's wives should be employed in factories, as this takes them away from their families, and prevents them from bestowing sufficient pains on the training of their children, and their household affairs. It is singular, indeed, how ignorant workmen's wives, engaged in factories, and brought up as factory girls, are of most matters connected with domestic economy; and how much more comfortable their families might be were they familiar with such details, though their earnings were less. It is not true, however, that the condition of the work-people has been deteriorated, and, in point of fact, it has on the contrary, been very materially improved. Most descriptions of labourers receive good wages; and such skilled labourers as are temperate and industrious are, speaking generally, in decidedly comfortable circumstances.

The lower classes of Manchester live principally in houses above ground, consisting for the most part of cottages, of which many lengthened streets have been built of late years; but, in addition to these, great numbers inhabit cellars or underground floors, sometimes below the cottages, and sometimes below other houses. According to a statement published by the statistical society, the bulk of the population, in 1835, were lodged as stated in the following table:

	Man- chester.	Salford.	Total.
Persons occupying houses	94,250	31,698	125,948
" rooms of houses	9,351	3,124	12,475
" boarding with occupants of houses	8,671	2,891	11,562
" occupying cellars	14,574	3,310	17,884
" boarding with occupants of cellars	686	25	711
Total:—Persons resident in dwellings examined	126,292	40,991	167,283
Families resident in dwellings examined	28,186	9,533	37,719
Average rent per week of houses, rooms, and cellars, examined	4 55	4 29	4 43
Gross amount of rent for a year of houses, rooms, and cellars	£2,114 4d	£2,164	£4,278 4d
Number of dwellings comfortable	215,312	70,451	285,763
" uncomfortable	19,364	7,417	26,781
" unexamined	8,522	2,121	10,643

Of the 167,283 persons classified above, 84,233 were adults, 53,699 were children under 12 years of age, and 30,691 were children above 12 years of age, and mostly employed.

It appears, from a statement published by the Manchester statistical society in 1838, which may be regarded as nearly accurate, that 71,799 individuals, comprising nearly all below the rank of shopkeepers, were employed as follows:—

	Individuals.
In cotton factories in Manchester and Salford	18,533
Other factories in ditto	1,423
Hand-loom weavers	8,123
Persons employed in warehouses	7,807
" in manufactures	4,515
" in building trades	6,529
" in clothing trades	22,858
Occupations not classed	71,799

The following table, drawn up by the Manchester chamber of commerce, exhibits the average rates of wages paid to the different classes of labourers in and out of factories in Manchester in 1833, since which period no material alteration has taken place:—

	L. s. d.	L. s. d.
Spinners, men	1 0 0	1 5 0
" women	0 10 0	0 15 0
Stratherns	0 5 0	1 0 0

It is greatly to be regretted that effectual provision had not long since been made in Manchester and other large towns for their proper drainage and pavement, and for laying down rules as to the erection of houses. The authorities in Manchester have done all in their power, under the existing laws, to improve the streets; but there is no general building act for the town, and except in certain districts where the commissioners of police are entitled to interfere, each proprietor builds as he pleases. Hence cottages may be seen springing up row behind row, without the street or alleys between them being of sufficient width, or drained or paved; in some places, indeed, the streets are full of filth filled with stagnant water, the receptacles of all sorts of filth. (*Report on Health of Towns*, p. 18.) Such a state of things is discreditable alike to the local authorities and the government; and we do not know that any measure is more imperatively necessary, seeing the vast and rapid increase of towns, than the enactment of such regulations as may be required to provide for the proper construction of the streets and houses, and consequently for the health and comfort of the population.

Cellars, however damp and unhealthy, are preferred by a large proportion of the lower classes both here and in Liverpool, not so much from their cheapness, as because they afford facilities for dealing in various sorts of articles, and because their inmates either are or believe themselves to be more independent than if they resided as lodgers in houses rented by other parties.

It is unhappily true, as seen from the previous statement, that many of the dwellings of the lower classes, especially those of the Irish, exhibit a great want of furniture, of cleanliness, and comfort. This, however, is not owing, as many have supposed, to the growth of the factory system, but

MANCHESTER.

partly to the poverty, and still more to the perverse habits of the occupiers. In a tract written in Manchester, and published by authority in 1735, long before the factory system had any existence, the houses of the poor are said to be "most wretched," "filthy and nasty" in the extreme, and "noisome and infectious." (See extract from tract in *Manchester as it is*, p. 36.) There is really, therefore, no room or ground for saying, that any portion of the poor are worse lodged now than formerly; while on the other hand, of 17,764 dwellings of the labouring classes, examined by the agents of the Statistical Society, no fewer than 27,381 were decidedly "comfortable;" and as respects the clothing and other accommodations of the poor, they are infinitely superior at present to what they have ever previously been. Their prosperity is evinced by the great average consumption of butcher's meat.

A good deal of fever necessarily prevails at most periods of the year, in the poorer districts of Manchester, especially in those where the streets are in the disgraceful state already noticed. But, on the whole, Manchester is less unhealthy than Glasgow, or than the old town of Edinburgh, which was no manufactures.

The idle and absurd stories that were so industriously propagated with respect to the influence of factory labour on health and morals, are now pretty well exploded. Latterly, indeed, there would appear to be a considerable increase of crime; but this increase is apparent only, and is mainly a consequence of the improved state of the police, and of trivial offences that formerly escaped notice being whether wisely or not, we shall not stop to inquire) now visited with fine or imprisonment. The truth is that, in respect of morality, the labouring population of Manchester has but little to fear from a comparison with that of any large town in the empire. An unexceptionable witness, the Rev. E. Parkinson, canon of the collegiate church, Manchester, in a speech at a public meeting in Feb., 1839, said, "I am aware that an able and well-known poet has said (and the saying has almost passed into a proverb)—

* God made the country, but man made the town."

meaning, of course, that the country was the most proper place for man to dwell in, and that the occupations of towns were unnatural. I think, on the contrary, that instead of an agricultural population, the people of this country were meant to be one of a very different character. I have no natural predilections for my present opinions. My birth and early education put me in a very different position from that which I now hold; but being at present an inhabitant of this town, having enjoyed ample opportunities of observing and judging, and being in a position which gives me no motive for a partial judgment, I maintain that, taking an average of all classes of our population and that of other districts, we shall find the morality of this district not below that of the most primitive agricultural population. I have the best authority for saying, that the streets of Manchester, at ten o'clock at night, are as retired as those of most rural districts. When we look at the extent of this parish, containing at least 300,000 souls, being more than the population of half our counties, can we be surprised that here is a great amount of immorality? But a great proportion of that immorality is committed by persons who have been already nursed in crime in districts supposed to be more innocent than our own, and who swell our police reports, not so much because we hold out greater facilities of rearing them, as that they are apprehended through the superior vigilance of our police." This is pretty conclusive; and we may add, that the regard paid by females to decency, both of language and deportment, is stated by intelligent witnesses before the factory commissioners of 1833-34 to be greater in Manchester than in most rural districts. It is a fact, too, that the proportion of illegitimate to legitimate children in the country is only 1 in 13, a very low ratio for so dense and varied a population, and not greater than in the purely agricultural counties of Hereford and Salop.

We believe that the doctrines of charism and ultra-radicalism have made less progress in Manchester than in most other great towns, the metropolises excepted, certainly less than Glasgow. Stagnations of trade, by occasioning want of employment and reducing wages, necessarily, also, occasion discontent and dissatisfaction; and in such periods demagogues are not wanting to recommend political nostrums of all sorts as infallible remedies for the grievances under which they labour. But the great bulk of the population are, notwithstanding, attached to the principles of the constitution, orderly, and opposed to violence. And in this, no doubt, their opinions are in accordance with their own obvious interests; for, were they to become disorderly, or to cease to respect and uphold the rights of property, the prosperity of Manchester would be instantly terminated: capitalists would withdraw from and shun her as if she were infected with a pestilence, and the mass of the population would sink into a state of squalid and irremediable poverty.

It is needless to observe that the interests of the employers of labour and those of the labourers, though apparently conflicting, are, at bottom, the same; and that neither party can prosper without that prosperity redounding to the advantage of the other. But, notwithstanding this identity of interests, there is, it must be admitted, but little sympathy between the great capitalists and work-people in this or any other large manufacturing town. This is occasioned by the great scale on which labour is now carried on in factories; and by the consequent impossibility of the manufacturer becoming acquainted with the great bulk of the people in their employment. They do not, in fact, so much as know their names; they look only to their conduct when in the mill; and are wholly ignorant of their mode of life when out of it, of the condition of their families, &c. The affections having nothing to do in an intercourse of this kind; every thing is regulated on both sides by the narrowest and most selfish views and considerations; a man and a machine being treated with precisely the same sympathy and regard. It is not to be denied that this is a state of things fraught with considerable danger; and that no society can be in a really sound or healthy state where the bond of connection between the different ranks and orders is such as now prevails at Manchester, and other great towns. Indifference, on the one hand, necessarily produces disrespect, insubordination, and plotting, on the other. However, it is easier to point out a condition of this sort, than to suggest any means by which it may be obviated. We doubt, indeed, whether it admit of any effectual remedy. The whole tendency of society, in modern times, is to make interest, taking the term in its most liberal and sordid sense, the link by which all classes are held together; and should any circumstances occur to make any considerable portion of society conclude that their interest is separate from or opposed to that of the others, there would, we apprehend, be but few other considerations to which to appeal to hinder the dissolution of such society.

In 1838 there were in Manchester 1763 beer-shops, and 625 public-houses, many of the establishments for the sale of spirits vying in splendour with the gin-palaces of the metropolis. Intemperance, however, is not on the increase. Great numbers of coffee-shops have recently been opened; and the influence of the temperance societies has also been most beneficial.

Climate, Temperature, &c.—Manchester, as already seen, is a healthy town; indeed, taking its size and the occupation of its inhabitants into consideration, the mortality is less than in most towns of the north of England; and if means were adopted for the improvement and cleaning the poorer streets and buildings, and for consuming the smoke which at present issues in dense clouds from innumerable factory chimneys, there can be little doubt that its salubrity would be materially increased. The mean annual quantity of rain falling in Manchester (at an average of 33 years) is 36.140 inches, while the mean annual quantity falling in Lancaster (at an average of 30 years) is 39.714 inches; the comparatively slight variations in the temperature likewise contribute greatly to the healthiness of the town. [See table top of next page.]

According to Whitaker, the historian of Manchester, "the Roman invaders of this country fixed a military station in a place since called Castlefield, to which they gave the name Mancunium," whence Manchester has been derived. In the time of the Saxons the old town was deserted, and about 627 another was built on its site. In 929, according to Dr. Aikin, the Saxon king, Edward the Elder, ordered Manchester to be fortified. In Domesday Book the town is called a manor, and is described as having two churches. In the 14th and 15th centuries it received great additions and improvements, so that, in Leland's time, it was reckoned "the fairest, best builded, quickest, and most populous town of Lancashire." Camden also mentions it as being famed in his time for the manufacture of woollen cloths, then called "Manchester cottons," that is, coatings. The first authentic mention of the cotton manufacture in England is made by Lewis Roberts, in his *Treasure of Trade*, published in 1641, where it is stated, "The town of Manchester in Lancashire must be also herein remembered, and worthily, for their encouragement, commended, who buy the yarn of the Irish in great quantity, and, weaving it, return the same again into Ireland to sell. Neither doth their industry rest here; for they buy cotton wool in London that comes first from Cyprus and Smyrna, and at home work the same, and perfect it into fustians, velvets, dimities, and other such stuffs; and then return it to London, where the same is vented and sold, and not seldom sent into foreign parts, who have means, at far easier terms, to provide themselves of the said first materials." (*Orig. ed.*, p. 33.) In 1650, the inhabitants of Manchester were reckoned the most industrious in the N. of England. The town was stated to be a mile long, with open and clean streets, and good buildings; and, in 1730, it is described as

MANCHESTER.

The following Synoptical View of the Temperature, &c., of Manchester, during the year 1840, cannot fail to be interesting. It is extracted from the private Diary of Dr. Dalton:—

		Thermometer.				Baromet.	Rain.	Anem.
		Morn.	Noon.	Night.	Mean.			
Jan.	Mean, &c.	40° 3'	43° 4'	40° 6'	41° 4'	29.41	3.540	1

							24.201	8

"the largest, most rich, populous, and busy village in England, having about 24,000 individuals within the parish." Fustians were the earliest article of manufacture, and other fabrics were made soon afterward; but the great increase of population and commercial prosperity did not take place till 1770, when machinery was first introduced into the town. From that year down to the present time Manchester has been a scene of rapidly increasing industry, and has been distinguished by the invention and enterprise of its citizens; its working population supplies every quarter of the world with clothing; and wealth, the reward of successful labour flows in from all sides in a large, rapid, and uninterrupted current. (*Baines's Hist. of Lancaster* (4th ed.), II, 149-393; *Wheeler's Manchester*; *Manchester as it is*; *Parl. Rep.*; but principally *Priv. Inform.*)

MANCHESTER, p. v., Hillsborough co., N. H., 21 m. S. S. E. Concord, 461 W. Incorporated in 1751 by the name of Derryfield, which was, by the legislature, changed to Manchester in 1810. Bounded W. by Merrimack river, E. by Massabesic pond, the outlet of which, Cohasset brook, flows into Merrimack river. The canal around Amoskeag falls, with a descent of 45 feet, about a mile long, was completed in 1816, at an expense of over \$60,000. It contains five churches, a Congregational, Baptist, Free-will Baptist, Methodist, and Universalist, 31 stores, three lumber-yards, one fulling-mill, one woollen factory, four grist-mills, five saw-mills, one brewery, two printing-offices, three weekly newspapers; eight schools, 250 scholars. Pop. 3235.

MANCHESTER, p. t., semi-capital of Bennington co., Vt., 95 m. S. S. W. Montpelier, 428 W. Watered by Battenkill river and its branches, which afford good water-power. White marble is extensively found and exported. It contains three churches, a Congregational, an Episcopal, and a Baptist, four stores, three fulling-mills, two woollen factories, one grist-mill, 12 saw-mills, one academy, 105 students; 10 schools, 510 scholars. Pop. 1594. The village is pleasantly situated on elevated ground, and handsomely built, chiefly on one street. It contains a courthouse, jail, a Congregational church, several stores, and the Burr seminary, a flourishing academy, founded by a donation of \$10,000 by Joseph Burr, Esq., in 1699, who gave property to the amount of \$150,000 to different literary and benevolent institutions.

MANCHESTER, p. t., Essex co., Mass., 23 m. N. E. Boston, 463 W. Incorporated in 1645. Bounded S. E. by Mass-

achusetts bay. Vessels of 190 tons come to the village, and vessels of any size find good anchorage in the harbour, which is safe. It contains two churches, a Congregational and a Universalist, six commercial houses in foreign trade, two grist-mills, four saw-mills; four schools, 200 scholars. Pop. 1353.

MANCHESTER, p. t., Hartford co., Ct., 10 m. E. Hartford, 346 W. Incorporated from E. Hartford in 1823. Watered by Hockanum river and its branches. It contains two churches, a Congregational and Methodist, seven stores, six fulling-mills, five woollen factories, two cotton factories, with 3800 spindles, two grist-mills, seven paper-mills, two powder-mills; seven schools, 407 scholars. Pop. 1665.

MANCHESTER, p. t., Ontario co., N. Y., 8 m. N. Champlain, 203 m. W. Albany, 348 W. Watered by Champlain outlet. It contains two churches, a Methodist and Baptist, three stores, three fulling-mills, three woollen factories, two flouring-mills, two grist-mills, five saw-mills, one paper-mill, two tanneries, two distilleries; 10 schools, 975 scholars. Pop. 2912.

MANCHESTER, t., Passaic co., N. J., 18 m. N. W. New-York. Organized in 1836. Bounded S. by Passaic river, N. W. by Ramapo river. Watered by Pompton river. The village lies opposite to Paterson, with which it is connected by two bridges. It has nine stores, seven grist-mills, six saw-mills, two tanneries, one distillery; one academy, 24 students; six schools, 265 scholars. Pop. 3114.

MANCHESTER, p. t., York co., Pa., 18 m. S. Harrisburg, 96 W. It contains four stores, one flouring-mill, eight grist-mills, five saw-mills, two tanneries, 15 distilleries, one pottery. Pop. 2152.

MANCHESTER, t., Morgan co., O. It has one store, one grist-mill, two saw-mills; eight schools, 263 scholars. Pop. 1567.

MANCHESTER, p. v., Chesterfield co., Va., 2 m. S. Richmond, 119 W. Pleasantly situated on the S. side of James river, opposite to Richmond, with which it is connected by Mayo's bridge. It contains two churches, a Methodist and Baptist, six grocery stores, one cotton seed oil mill, one cotton factory, with a capital of \$70,000, eight tobacco factories, one flouring-mill, 300 dwellings, and 1500 inhabitants.

MANCHESTER, p. v., capital of Coffee co., Tenn., 68 m. S. E. Nashville, 653 W. Situated on the head waters of Duck river, and contains a courthouse, and several stores and dwellings.

MANCHOORIA.

MANCHOORIA (Chin. *Kirin-soo*), an extensive region of N.E. Asia, belonging to China, and the original seat of the present ruling dynasty (Ta-shing) of the Chinese empire, lying between lat. 41° and 57° N., and between long. 117° and 140° E., bounded N. by the Russian gov. of Yakoutsk, E. by the gulf of Tartary and sea of Japan, S. by China Proper, and W. by the Russian gov. of Irkutsk and Mongolia, from which latter it is separated by a wooden palisade, connected with the great wall of China, and by a line running down the Songari and other rivers to the Daourian range, on the S. of Siberia. Estimated area, 700,000 sq. m. Population unknown. The S. provinces are the only parts of the country that have been visited by Europeans; our knowledge of the remainder being derived only from the doubtful statements of a Chinese geographer. It is, therefore, more than probable, that, should any events lead to the admission of competent travellers into the country, it will be found necessary to make considerable alterations in our maps and descriptions of what is now little better than a *terra incognita*. Manchooria lies chiefly in the great valley formed by the Amur and Songari, with their numerous tributaries, and is bounded by three principal mountain chains, 1, one on the E., running from the peninsula of Corea along the whole line of coast to the N. boundary, and having a probable elevation of 5000 feet; 2, the Daourian mountains (called, by the Chinese, the outer Hing-an-ling), which form the entire N. boundary of Manchooria, but also send out minor offsets into the centre of the country; 3, the inner Hing-an-ling, or Sialkoi chain, which appears to be a continuation of the Shan-see mountains, and to extend, with little interruption, over a great part of Mongolia. Besides the above principal ranges, there are, to the N. of Corea, some chains of inferior importance, bearing several different names; but this part of the country, near the coast, though nominally a part of Manchooria, is inhabited, almost exclusively, by Ainos, a people similar to those inhabiting Jesso and Tarakal, in the empire of Japan. The chief river of Manchooria is the Amur, Sagalien or Kwentung (for it is thus variously called), which, measured along its windings, is about 2500 m. in length, and, with its tributaries, drains a territory of about 900,000 sq. m. Several of these streams afford pearls; but the principal pearl-fishery is on the E. coast, in the channel of Tartary. It is a government monopoly, and is carried on by Manchoo soldiers, who are required, annually, to deliver into the Imperial coffers, a fixed quantity of pearls. The chief lakes are the Hinkal-nor, a large sheet of water near the source of the Ousouri, in the province of Kirin, and the Hoorun and Pir, which give their names to the most W. district of the province Taitshar: there are a few others in different parts of the country, but only of small size.

The nature of the Manchoo soil, and its mineral productions generally, are little known. The people in the N. being chiefly nomads, subsisting by the produce of the chase, pay little attention to tillage; but agriculture is common in the S. districts, and the *cerealia*, as well as hemp and cotton, are extensively cultivated. The staple productions, however, are ginseng and rhubarb, the former being an exclusive government monopoly. The province of Shing-king, on the gulf of Pecheleo, produces corn, millet, and peas, large quantities of which, with ginseng, are sent by sea to the S. provinces of China. The forests, which clothe the sides of most of the mountains, comprise oaks, pines, firs, and birches; lime-trees, maples, oleanders, acacias, &c., being found on the plains towards the S. The domestic animals of central Europe are common in the more cultivated districts; but the cattle are small, and the breed of sheep peculiar to this country, called *argali*, is small, and coarse-wooled. Near the Yablood range, reindeer are kept, and camels are to be seen in many parts of the S. provinces. The wild animals comprise the ermine, sable, fox, and bear, hunted for their furs, which are a considerable article of trade with the Russians. Fish, especially salmon, and remarkably fine sturgeons, are abundant in the rivers, and held in high estimation by those living near the banks.

The Manchoo territory is divided into three provinces, 1. Shing-king, (comprising the ancient Leao-tung), near the borders of China; 2. Kirin, occupying the country E. of the Songari; and 3. Taitshar, comprising the whole country W. and N.W. that river. The government of the first of these provinces is conducted by civil officers, on the same plan as in China; but the other provinces are under a government more strictly military than any other portion of the Chinese empire. The governors and magistrates are all military men; and the law makes all males, above 16 years of age, liable to serve under the standards to which they belong by birth, of which there are eight, each being distinguished by its peculiar flag. Kirinsoo is the metropolis of the country, and the residence of the supreme governor. Ningoota, on the Hooka, a tributary of the Songari, is also held in high esteem, in consequence of its having

MANDURIA.

been the residence in former times of the reigning family of China. With respect to trade, however, both are inferior to Fung-hwang-ching, on the borders of Corea. The seaports frequented by the Chinese junks are Kin-tchou, at the N. end of the gulf of Leautung, and Kaichou, on the same gulf, E. of that last mentioned. The other cities of Manchooria, except Moukden, the old capital, and still denominated "the affluent metropolis," have no claim to rank higher than villages, though most of them are surrounded by walls, and garrisoned by small bodies of soldiery.

The general history of the Manchocs, or Eastern Tartars, with an account of their physical conformation, has already been given at some length in the article ASIA, in this work, (l. 183-185), to which the reader is referred for farther particulars. (See, also, MONGOLIA. Ritter's *Asien*, i. 85-153, ii. 210-330; *Klaproth's Magazin Asiatique*, and *Asia Polyglotta*, Appendix; *Chinese Repository*, vol. i., p. 113-118; and also vols. v. and vi.)

MANDAN, district, a portion of the territory of the United States, bounded N. by the British possessions, E. by Wisconsin, S. by the N. fork of Platte river, and W. by the Rocky mountains. It is about 580 miles from N. to S., and 600 miles from E. to W., containing about 300,000 sq. m. It is an elevated plain or table land, and the soil, though light, bears sufficient grass to support extensive herds of buffalo, elk, and deer; but some parts of it are barren. It appears that the vast chain of the Rocky mountains is broken through by a pass which admits of a road. The passage is up the N. branch of Platte river, and by the Sweetwater branch, which flows from the Wind river mountains, the highest portion of the Rocky mountains; thence across the height to Snake or Lewis river, a branch of the Columbia. The pass at the dividing ridge is in 49° 24' 32" N. lat., about 7000 feet above the ocean, but approached by a gradual, and almost imperceptible ascent. A man has actually travelled with a one horse wagon from Hartford, Ct., to the falls of the Columbia. This territory gives rise to the Missouri, Yellowstone, and Platte rivers, and derives its name from the extinct tribe of the Madan Indians, who inhabited a part of it.

MANDAVEE, a town and seaport of Hindostan, being the most populous town, and principal emporium of Cutch, on the S. coast of which it stands, 35 m. S.S.W. Bhooj; lat. 23° 50' N., long. 69° 34' E. Pop. probably 50,000; of whom, upward of 15,000 are Bhattias, 10,000 Banyans, 5000 Brahmans, and the rest Lohannas, Mohammedans, and Hindocs of low caste. "The town is within gun-shot of the beach, and is surrounded with fortifications in the Asiatic style. Its environs are laid out in gardens well stocked with cocoa-nut and other trees. The bed of a river, nearly dry, except in the rains, covers the E. face, and joins the sea, forming the only harbour which Mandavee has. Small boats, laden, can cross the bar at high tides; larger vessels unlade in the roadstead. A brisk trade is kept up with Arabia, Bombay, and the Malabar coast, in which upward of 800 boats, of from 40 to 500 candelis tonnage, are employed. The exports are chiefly cotton, ~~wool~~ of silk and cotton thread, piece goods of a coarse kind, alum, and glue. The imports are, bullion from Mocha; Ivory, rhinoceros' horns, and hides, from Powahil; dates, cocoa-nuts, grain, and timber, from Malabar and Damau. There is a considerable inland trade, by means of ~~charons~~ and other carriers with Marwar and Malwah." (*Bombay Transac.*, ii. 217; *Geog. Journal*; *Hamilton's E. I. Gaz.*)

MANDURIA, a town of the Neapolitan dom. prov. Otranto, cap. cant., in an arid plain, 92 m. E.S.E. Taranto. Pop. about 5000. It is a straggling but well built town, with wide unpaved streets, many handsome churches, several convents, an orphan asylum, and a large palace, formerly belonging to the Francavilla family. The town during the middle ages, and until 1790, was called Casalnuovo; but at the latter epoch it re-assumed, by royal privilege, the name of the ancient city, on the site of a part of which it is built. When Swinburne visited it, it was noted for nothing except the taste of its inhabitants for dog flesh, the skins of the slaughtered dogs being, at the same time, tanned into an imitation of Turkey leather for the supply of the neighbourhood. It had no other trade or manufacture. The remains of Manduria, destroyed by Fabius Maximus in the second Punic war, consist of its walls, standing several feet above ground, and double, except on the S. side, where the fortifications appear to have been left incomplete. The outer wall, and its ditch, measure 8 yards in breadth; behind this bulwark is a broad space, and then an inner wall, which together measure 14 yards. According to Craven, the walls are no where more than 6 feet in height, having probably been lowered to furnish materials for the construction of the modern town, in the vicinity is a well, mentioned by Pliny, as constantly preserving the same level, whatever quantity of water be

MANFREDONIA.

added to or taken from it; *lucus ad marginem planus, neque exhaustus aqua ministrat, neque infusus angitur.* (Hist. Nat., lib. II.) This singular well still exists, and was visited by Swinburne and Craven, (*Craven's Tour*, &c., p. 165-169; and Swinburne's *Trav.* I., 233, 234.)

MANFREDONIA, a seaport town of the kingdom of Naples, prov. Capitanata, on a bay of the Adriatic, about 19 m. S.W. the promontory (Testa di) di Gargano, and 30 m. N.E. Foggia; lat. 41° 37' 33", long. 15° 55' 40". Pop. 6000. "In point of symmetry, it may vie with any town in Europe, having been constructed on a regular plan, which never underwent any alteration; and which, notwithstanding the unfinished state of some of the edifices, and the dilapidated aspect of others, gives it an air of grandeur and uniformity very remarkable. It is walled towards both land and sea: from the last a narrow ledge of rocks, almost always under water, divides its bulwarks. One long and wide street runs throughout the city, from one gate to the other; for there are but two gates on the land side, though two others open to the port, which is protected from the effects of the N. wind by a small mole, and commanded by a strong castle, defended by a ditch and drawbridge. The walls are furnished with large round bastions. The harbour is reckoned safe; but its want of depth renders it fit for small vessels only." (*Craven's Tour*, 66, 68.) Four streets run parallel with the principal thoroughfare, and are intersected at right angles by smaller ones. Though narrow, the streets are well kept; and the inhabitants are both cleanly and industrious, in a degree not at all usual in S. Italy.

Vegetables and fish are good, plentiful, and cheap at Manfredonia, but water and wine are indifferent, as are oranges, which form an important article of commerce throughout Apulia. It exports considerable quantities of salt, obtained from the salt lagoons which border the coast of the bay to the S. of the town. It has also a considerable trade in cora, quantities of which are shipped from its port.

About a mile S.W. of the town stood the ancient Sipontum, once a considerable city of *Magna Græcia*, and traditionally said to have been founded or colonized by Diomed. Its site is now principally occupied by a low marsh, abounding with wild fowl, and productive of the malaria which infects Manfredonia. The only remains of the ancient city are its cathedral, and two columns of cipolino marble, both in a dilapidated condition. The former is a small Gothic edifice, with a handsome portico, but little adorned within. It is still the seat of an archiepiscopal see, founded in 1094. Sipontum, which was colonized by the Romans A.U.C. 568, had fallen into such prosperous decay in the 13th century, that Manfred, king of the Two Sicilies, having founded, in 1266, the town which bears his name, but which he called *Novum Sipontum*, removed thither the few inhabitants of Sipontum, bestowing on them many valuable privileges and exemptions. But, though it has always enjoyed some commerce, Manfredonia never attained to the prosperity or celebrity of its ancient predecessor, and has long been stationary. (*Swinburne's Travels in the Two Sicilies*, i., 149-151; *Craven's Tour in the S. Provs. of Naples*, 67, 70; *Craven's Ancient Italy*.)

MANGALORE, or CORREAL BUNDER, a seaport town of Hindostan, prov. Canara, of which it is the cap., on a sandy promontory between a salt lake and the Indian ocean, 440 m. S.S.E. Bombay; lat. 13° 53' N., long. 74° 37' E. Early in the present century it had 30,000 inhabitants. The town is well built, and has a fort, now dismantled, which opposed a gallant and successful resistance to Tip-poo, in 1783. The port does not admit vessels drawing more than 10 feet water, except at spring tides; but there is good anchorage in the roadstead, in from 5 to 7 fathoms. The exports are chiefly rice, to Muscat, Goa, Bombay, and Malabar; betel nut, black pepper, sandal wood, camellia, and turmeric. Raw silk and sugar are imported from China and Bengal, and oil and ghee from Surat. Mangalore was at an early period much resorted to by Arabian traders; and most of its present inhabitants are of Arabian descent. The vessels employed in its trade belong chiefly to other ports. Salt is made at Mangalore, but it is of bad quality. (*Hamilton's E. I. Gaz.*; *Parl. Report*.)

MANHATTANVILLE, v., New-York co., N. Y., 8 m. N. of the city hall, N. York. Situated on the E. side of Hudson river, where is a convenient landing and wharf. It contains an Episcopal church, four stores, a white lead factory, 70 dwellings, and about 500 inhabitants. The New-York Lunatic asylum is on elevated ground, half a mile S.

MANHEIM, p. t., Herkimer co., N. Y., 64 m. W.N.W. Albany, 397 W. Bounded S. by Mohawk river, East Canada creek, flows near its E. border. It contains seven stores, three grist-mills, nine saw-mills, three tanneries; nine schools, 496 scholars. Pop. 3945.

MANHEIM, p. t., Lancaster co., Pa., 33 m. E.S.E. Harris-

MANILLA.

bury, 123 W. Bounded E. by Great Comestoga creek, S.W. by Little Comestoga creek. It contains three stores, three flouring-mills, one grist-mill, three saw-mills; one school, 35 scholars. Pop. 1829.

MANHEIM, t., Schuylkill co., Pa. Watered by Schuylkill river and its tributaries. It contains a Lutheran church, 13 stores, one furnace, one forge, four grist-mills, 16 saw-mills, one powder-mill, two tanneries; five schools, 136 scholars. Pop. 3441.

MANHEIM, t., York co., Pa., 16 m. S.W. York. Drained by Hammer creek, a branch of Codorus creek. It contains five stores, one woollen factory, 11 grist-mills, 12 saw-mills, one oil-mill, one paper-mill, four tanneries, 36 distilleries, one pottery; four schools, 71 scholars. Pop. 1523.

MANILLA (Sp. *Manila*), a fortified seaport city of the Philippine islands, and the cap. of the Spanish settlements in the east, on the E. side of the bay of Manilla, island of Luzon, and on the river Pasig, about $\frac{1}{2}$ m. from its mouth; lat. 14° 38' 8" N., long. 120° 33' 39" E. The pop. of the city and its suburbs was said to amount, in 1818, to from 70,000 to 80,000; and is at present variously estimated at from 100,000 to 150,000, including, besides Tagalans, or natives, from 4000 to 5000 Spaniards and other Europeans, with Chinese, negroes, the descendants of the foregoing races, and foreigners from all parts of the world. The bay and city of Manilla have a very picturesque and imposing aspect from the sea. The former is surrounded by mountains covered with verdure, which, on the E., declines gradually towards the shore. At their feet, on this side, is a small plain, on which the city stands; its buildings consisting almost entirely of the volcanic tufa, of which the plain and its vicinity are geologically constituted. Manilla comprises the city proper and ten suburbs. The former is on the left or S. bank of the Pasig, across which it communicates by a handsome stone bridge of 10 arches, with its important suburb of Bidondo, and thence of Tondo, San Cruz, &c. This bridge, which is about 149 Castilian (or yards) in length, by 8 in breadth, was founded in 1529; but has been rebuilt since 1814, when it was for the most part destroyed by carabanks. The city proper, little more than 9 m. in circumference, is surrounded with a wall, and a broad ditch, and has not more than 10,000 or 12,000 inhabitants. At the mouth of the river is a small bay, and the town is farther protected by the citadel of Santiago, near its N.W. extremity; but Manilla could not make any effectual resistance to a European force. The city, which is entered by six gates, is regularly laid out; and, according to Mayen, by whom it was visited, in 1831, it is superior in point of appearance to either Lima or Santiago. (*Reise um die Erde*, ii., 307.) The streets have carriage-ways, composed of a mixture of loam and quartz, and are provided with footpaths, and lighted at night. The houses in the city are solidly constructed, though, on account of earthquakes, they are seldom more than one story above the ground floor. The houses in the suburbs, however, are not so substantial. In Bidondo, for example, they are almost wholly composed of bamboo, and are raised from the ground, to the height of 8 or 10 feet, on thick poles, as is customary among ultra-Gangetic nations. Most of the houses are furnished with balconies and verandas; the place of glass in the windows is supplied by thin semi-transparent pieces of shell, which, though more opaque, repel heat better. Bidondo is the most interesting portion of Manilla, and that in which its trade mostly centres. It is principally inhabited by Chinese and Tagalans, and looks very like a Chinese town.

The public edifices are mostly within the walled city. The new *adana*, or custom-house, is a large fine building, constructed at a great expense; but, like the Dublin custom-house, its size is out of all proportion to the business to be transacted in it. The residence of the Captain-General, and the principal government offices, are also in a large edifice, occupying one of the sides of the *Plaza Mayor*, or principal square. This square measures about 129 yards either way, and has, in its centre, a bronze statue of Charles IV., on a marble pedestal, presented to the city by Ferdinand VII. in 1824. There are, in Manilla, a vast number of churches and ecclesiastical establishments; and the number of clergymen is said to exceed that of the garrison, which is estimated at about 7000 men! We need not, therefore, be surprised to learn that religious observances are here scrupulously complied with, while real piety and sound morality are at the lowest ebb. The city was erected into an archbishopric in 1598; and the cathedral and archbishop's palace are among its most conspicuous structures. The Augustines, Franciscans, Dominicans, and Jesuits convents, the arsenal and cannon foundry in the citadel, the university (founded in 1645), the missionary college, the various schools for natives and Europeans, the hospitals,

* *Mayen Reise*, &c., ii., 310. The Dict. Geog. says that the bridge was restored in 1814, made on *grande arête renversée par le tremblement de terre de 1814*.

MANILLA.

orphan asylums, and other charities, and the royal cigar manufactory, in which 350 males and 9000 females are said to be employed, include the other principal public buildings and establishments. The promenades round the city are frequented in the evening by the more opulent classes on horseback, or in their carriages. The neighbourhood is interspersed with orange, acacia, tamarind, and mango groves; gardens; coffee, cocoa, and cotton plantations; rice grounds, &c.

The Passig is navigable for vessels of 800 tons in ballast, or for laden vessels of from 250 to 300 tons, as far as the bridge; and for large shallow boats, drawing from two to three feet water, as far as the lake in which it rises, about nine miles inland. There are 13 feet water, at low ebb, in the channel through the bar at the entrance of the river; for the farther deepening of which a steam dredging-boat has been employed since 1837. The rise and fall of the tide in the river is from two to three feet. A lighthouse, at the end of the pier, marks the entrance of the Passig on the left-hand side.

Ships of all sizes anchor in Manila roads, at from one to two miles off shore, except during July, August, and

September, when the S.W. moonsoon throws in a heavy sea, which extends quite to the entrance of the river. At this season, therefore, small vessels load and unload in the river, and large vessels at Cavite, an anchorage sheltered by a neck of land to the S.W., and about six or seven miles by water from the mouth of the river; their cargoes being conveyed, to and from Manila, in secure decked boats, of from 50 to 70 tons burden.

Manila is the only port in the Spanish Philippines with which Spanish vessels to or from Europe, or foreign vessels from any quarter, are allowed to trade. Spanish vessels trading to China, Singapore, &c., are, however, allowed to proceed to various outports, and there take on board their outward cargo. The principal articles of export are sugar, which is by far the most important; hemp, and stuffs made of hemp; rice, of which large quantities are sent to China, Indigo, mpan and other woods, tobacco, cigars, coffee, cotton, tortoise-shell, hides, ebony, &c. The tobacco of the Philippine islands is excellent and might be produced in any quantity; but its growth is comparatively limited by its being made a government monopoly. (See PHILIPPINE ISLANDS.)

The following is an Account of the Quantities and Values of the Principal Articles exported from Manila in 1837.

Articles.	By Foreign Vessels.	By Spanish Vessels.	Total.	Prices.	Gross Amount.
				Dols. <i>Rs.</i>	Dols. <i>Rs.</i>

Subjoined is a statement of the import trade of Manila in 1836, which we have procured direct from that city; but it is right to bear in mind that the official accounts from which it has been drawn up are so defective, that the amounts specified can only be considered as rough approximations; and are, no doubt, under the mark.

Account of the Quantities and Values of the principal Articles exported from Manila in 1836.

Articles.	Quantities.	Value.
		Dollars.
Rice	21,974 piculs	87,496
Cotton, gray	4,623,275 yds.	260,424
Do. white	1,136,282	171,050
Gunpowder	62,158	62,208
Stripes	206,179	86,445
Handkerchiefs	87,361	134,722

Woolens	561,015	197,364
Unfinished	No.	22,398
Glass and earthenware	peaks	77,740
Sundries		214,503
Total value in Sp. dollars		1,665,265

Of the above, goods to the value of 1,145,000 dollars were imported, in Spanish vessels, from China, Singapore, and elsewhere. About 120 ships entered the port of Manila in 1836; of which, 46 were Spanish, 36 British, 28 American, and 11 Chinese.

The port-charges on foreign vessels consist of a tonnage-duty of two reals, or a quarter-dollar, per register ton; and fees, varying from 15 to 30 dollars, according to the size of the vessel, for port-captain's and health officers' visits,

passport, &c. The tariff is bottomed on a custom-house valuation, fixed every five years. Most foreign commodities, imported in foreign vessels, pay an import duty of 14 per cent. *ad valorem*, except wines and spirits, which mostly pay a duty of from 30 to 60 per cent., unless the produce of Spain. Cotton-twist of certain colours, cutlery, ready-made clothes, European fruits, confectionery, and vinegar, pay 40 per cent. if imported in Spanish vessels, and 50 per cent. if in any other. British and other foreign cotton and silk manufactures made in imitation of native cloth, Madras and Senegal cottons, &c., pay 15 per cent. if imported in Spanish, and 25 per cent. if in other ships. Machinery of all sorts for the promotion of industry, cotton-twist of certain colours, gold and silver, plants and seeds, are imported duty free; but tropical products, the same as those of the Philippines, gunpowder, swords, and other warlike stores, &c., are prohibited, unless landed in bond for re-exportation. Exports of nearly all descriptions, by Spanish vessels, pay only from one and a half to two per cent. *ad valorem*, and by foreign vessels double this duty; but manufactured tobacco, rope from Manila, hemp, and gold and silver, coined or uncoined, if exported to Spain, go duty free. The principal currency of Manila consists of Spanish dollars, of 8 reals and 96 grains; but 8. American dollars are also current. The weights in use are the Spanish lb., which is nearly two per cent. heavier than the English; the arroba = 25½ English lbs. nearly; the quintal = 102 lbs.; and the picul of five arrobas, or one and a quarter cwt. English. The coyan is a measure for rice, &c., varying from 96 to 135 lbs. According to a recent list, there are in Manila 47 Spanish merchants and 11 foreign firms. The Spanish merchants have a chamber of com-

MANNHEIM.

merce and a joint-stock insurance society. The United States, France, and Belgium have consuls, and each of the Canton marine insurance companies has an agent here. There are, however, neither fire nor life offices nor agencies; nor is any newspaper, price-current, or other periodical publication issued in Manilla.

Manilla existed as a native town prior to the Spanish invasion; it was taken by the Spaniards, and made the capital of their E. dominions, in 1571. It has frequently suffered very much from earthquakes, especially in 1645 and 1762, and 1824. In 1762, it was taken by the English; but ransomed by Spain for £1,000,000 sterling. (*Meyen, Reise um die Erde* ii., 203-213; *Hamilton's E. I. Gazetteer*; and *valuable Private Information*.)

MANNHEIM, or MANHEIM, a town of W. Germany, grand duchy of Baden, lower circ. of the Rhine (*Unter-rheinische*), of which it is the cap., on the Rhine, where it is joined by the Neckar, 32 m. N. Carlsruhe, and 37 m. S.S.E. Mayence; lat. 49° 39' 15" N., long. 8° 28' 7" E. Pop., in 1838, 30,000. It was once strongly fortified, and has at different times suffered severely from sieges and bombardments; but towards the end of last century its defences were levelled by the French, and their site is now laid out in gardens and public walks. Mannheim is a regularly-constructed, handsome town; though it is, notwithstanding, monotonous and tiresome. It consists of 11 streets, crossed at right angles by 10 others, all perfectly straight, broad, well paved, and equidistant; and its houses being uniform, it is difficult for any one, not resident, to distinguish one part of the town from another. It has several handsome public squares, which, though the town be deficient in good water, have mostly fountains. The spacious *Parkadeplatz* and the *Planken*, or principal thoroughfare, both planted with trees, afford pleasant promenades. The principal public edifice is the palace, a huge structure of red sandstone, built by the elector palatine when he made Mannheim his capital, in 1730, but more remarkable for size than elegance. A part of it is inhabited by the dower grand duchess Stephanie, the adopted daughter of Napoleon and Josephine; and in one wing are museums of antiquities and natural history, the picture-gallery, with some fine Dutch and Flemish paintings, collections of plaster casts and engravings, and a library, said to consist of 70,000 volumes. (*Horschelmann's Stein*); but the other wing, comprising the old theatre, was mostly laid in ruins during the bombardment of Mannheim in 1795, in which state it remains. The new theatre, a handsome fabric, is neatly fitted up, and is rich in scenic decorations: it is said to be one of the best theatrical companies and orchestras of Germany; and is celebrated as being the place at which Schiller's tragedy of the Robbers was originally produced. Opposite the theatre is the house in which Kotzebue was assassinated. Mannheim has about an equal number of Lutheran and Roman Catholic churches, of which the last formerly belonging to the Jesuits is the finest. It has also a synagogue, an observatory, with a tower 115 feet high, and a good collection of instruments, an arsenal and cannon foundry, an exchange, surrounded by arcades, several hospitals, a savings' bank, a lyceum, with schools of drawing, painting, sculpture, surgery, &c. The Rhine is bordered by a fine terrace in the spacious grounds belonging to the palace, whence an extensive view of the surrounding country is obtained; and, like the Neckar, is crossed by a bridge of boats. Mannheim has some public baths, and a club called "*The Harmony*," with a reading-room, &c. The cheapness of living has attracted a good many English residents.

This town is the seat of the supreme court of justice for the grand duchy, and of one of the four subordinate courts of appeal in Baden. It was formerly a manufacturing town of some importance; and, among other articles, trinkets, of a compound called Mannheim-gold, were made in large quantities, but this branch of industry is nearly extinct. It still, however, produces carpets, linen and silk goods, tobacco, liqueurs, starch, glue, pasteboard, and sealing-wax; and has several coach-building establishments, tanneries, breweries, and bleaching-grounds. Its neighbourhood produces hops and garden stuff in large quantities; and besides its traffic in cattle and agricultural produce, it has a considerable transit trade by the Rhine and the Neckar. Previously to 1806, when it was fortified by the Elector Frederick IV., Mannheim was a mere village. It soon after received numerous Flemish and other immigrants. In 1777, it was ceded to Bavaria; but, since 1802, has been again united to Baden. (*Schreiber, Guide du Rhin*, 65, 66; *Berghaus; Allg. Länder, &c.*, iv., 313; *Stein; Germany and the Germans*, &c.)

MANITOWOC, county, Wis. Situated in the N.E. part of the territory, and contains 468 sq. m. Bounded E. by lake Michigan. Drained by Manitowoc river and its branches. It had in 1840, 81 neat cattle, ninety swine; and produced 235 bushels of wheat, 175 of Indian corn,

MANSFIELD.

1750 of oats, 1900 of potatoes, 2900 pounds of sugar. It had one flour-mill, six saw-mills. Pop. 235. Capital, Manitowoc.

MANITOWOC, p. v., capital of Manitowoc co., Wis., 178 m. N.E. Madison, 900 W. Situated on Manitowoc river, at its entrance into lake Michigan. Nett proceeds of the postoffice, \$70.

MANISTEE, an unorganized county of Mich., bounded W. by lake Michigan. Watered by Manistee river.

MANLIUS, p. t., Onondago co., N. Y., 10 m. E. Syracuse, 121 m. W. by N. Albany, 346 W. Bounded N.W. by Chittenango creek. Watered by Limestone creek. It contains six churches, two Presbyterian, two Methodist, an Episcopal and Baptist, 23 stores, three grist-mills, seven saw-mills, three tanneries, one printing-office, one weekly newspaper; three academies, 578 students; 24 schools, 142 scholars. Pop. 3509.

MANNINGTON, t., Salem co., N. J., 6 m. N.E. Salem. Bounded N. and W. by Salem river. Drained by Mannington creek. It contains two churches, a Methodist and Baptist, the county poor house, with from 80 to 120 inmates, a famous nursery, from which, besides other trees, 15,000 peach trees have been sold in one year, one store, one grist-mill; seven schools, 169 scholars. Pop. 3064.

MANOR, p. t., Lancaster co., Pa., 6 m. S.W. Lancaster, 33 m. S.E. Harrisburg, 105 W. Bounded S.E. by Conestoga creek, by branches of which it is watered. It has seven stores, one woollen factory, 10 flouring-mills, 10 grist-mills, four saw-mills, 18 distilleries; 18 schools, 644 scholars. Pop. 4153.

MANRESA (*Minerisa*), a town of Spain, prov. Catalonia, 34 m. N.W. Barcelona. Pop. 13,000. It stands on a rocky height, in the midst of a country irrigated by the Llobregat and its tributaries; is walled and strongly fortified; has good streets, and comprises among its public buildings and establishments a collegiate church, with a chapter, four parish churches, five oratories, a well endowed asylum for female orphans, infantry barracks, free school, and hospital. The inhabitants rank among the most industrious in Catalonia, and are pretty equally divided between agriculture and manufacturing pursuits. Cotton and silk fabrics, cotton thread, fine broadcloths, tapes and ribbons, paper, brandy, and gunpowder, are made in considerable quantities for exportation to Cuba and the West Indies. The neighbouring district, one of the best cultivated in Spain, produces corn, hemp, oil, and wine, which, with the goods above mentioned, find a ready sale at the weekly markets, and the two fairs held here Sept. 1, and Nov. 20.

MANSFIELD, t., N. div. of county, par. of England, co. Nottingham, in the N. div. of par. Broxtow, 13 m. N.N.W. Nottingham, and 118 m. N. by W. London. Area of par., 9070 acres. Pop., in 1831, 9426. It is situated in the forest of Sherwood, near the small river, Mann, from which it takes its name; and, though old-fashioned, and irregularly laid out, it contains many good modern houses, and is paved and lighted with gas. The chief buildings are the moot-hall, a structure well adapted for county meetings; a theatre, and the church, a commodious Gothic edifice, containing some curious monuments, and fine specimens of painted glass. The Presbyterians, Wesleyan and Calvinist Methodists, and the Society of Friends, have their respective places of worship; to which, as well as the church, are attached well supported Sunday schools. A grammar school was established here in 1567, by Queen Elizabeth, who endowed it with one third part of the church land of the parish, and founded for it two scholarships, of £10 each, at Jesus college, Cambridge; but the management appears to have been unsatisfactory, and it had, in 1833, only 27 scholars, including the master's boarders. (*Char. Comm.*, 25th Rep.) There are two other charity-schools: one of which was founded in 1725, for teaching and clothing 30 boys and 30 girls, and for paying apprentice fees with the former. Besides the above, there are several other charities and money-begquests. The tenants are chiefly engaged in the hosiery and lace trade, and in cotton spinning; it had, in 1839, five cotton-mills, which employed above 400 hands. There are some large iron foundries, for light castings; and the town has also a considerable trade in corn and malt, as well as in the valuable building-stone, quarried in its vicinity. A railway connects it with the Fintona canal; and, from its proximity to the N. Midland railway, it seems probable that it will, at no distant period, be united with that line. Petty sessions for the hundred are held here; and it is the election-town for the N. division of the county. Markets on Thursday; large cattle fairs, 5th April, 10th July, and the 2d Thursday in October.

About one and a half miles from Mansfield is the village and township of Mansfield-Woodhouse (population, in 1831, 1859), near which are some curious and pretty perfect remains of two Roman villas. Within a few miles are Worknop Manor, formerly belonging to the Duke of Nor-

MANS.

silk, but now the property of the Duke of Newcastle, who has decided on pulling it down; Clumber, the seat of the latter; Thersby, of Lord Newark; and Welbeck, of the Duke of Portland. Hence, in popular language, this part of the county is called the dukery.

MANFIELD, L. Lamouille co., Vt. 90 m. E. by N. Burlington, 90 m. N.W. Montpelier. It contains the highest peak of the Green mountains, 4370 feet above tide-water. Drained by Waterbury and Brown's rivers. It has two saw-mills; four schools, 77 scholars. Pop. 293.

MANFIELD, P. T. Bristol co., Mass., 30 m. S.S.W. Boston, 621 W. Chartered in 1770. Watered by branches of Taunton river, called Rumford, Cossamet and Canoe rivers. It contains two churches, a Congregational and Methodist, five stores, one woollen factory, three grist-mills, three saw-mills; eight schools, 345 scholars. Pop. 1392.

MANFIELD, P. T. Tolland co., Ct. 94 m. E. Hartford, 360 W. Watered by Willimantic river, Nachaug river and its branches, which afford water-power. It is noted for the production of silk, which has progressed from 1793 to the present time. A large amount of sewing silk is exported. The amount of silk cocoons produced in 1840, was 6151 pounds, roiled silk, 9356 pounds, value \$18,050. It contains four churches, two Congregational, a Methodist and Baptist, five stores, one woollen factory, one cotton factory with 1000 spindles, four grist-mills, five saw-mills, three tanneries, one pottery; 17 schools, 613 scholars. Population 2378.

MANFIELD, P. T. Cattaraugus co., N. Y. 5 m. W. Ellipticville, 300 m. W. by S. Albany, 342 W. Drained by Cattaraugus creek, and tributaries of Allegheny river. It has one store, two saw-mills; six schools, 323 scholars. Pop. 942.

MANFIELD, P. T. Warren co., N. J. 48 m. N.N.W. Trenton, 297 W. Drained by Musconetcong and Pohatcong creeks. It contains iron ore and a chalybeate spring. The Morris canal winds through the town. Some farmers sell 3000 bushels of wheat, annually. It contains eight stores, one grist-mill, three saw-mills; 12 schools, 1097 scholars. Pop. 2057.

MANFIELD, T. Burlington co., N. J. 7 m. N. Mount Holly. Bounded N.W. by Delaware river. Drained by Black's Cr. and Amecunk creeks. It contains several villages, and has five stores, one fulling-mill, one grist-mill, one saw-mill, two distilleries, one pottery; 12 schools, 144 scholars. Pop. 2401.

MANFIELD, P. V., capital of Richland county, O. 63 m. N.N.E. Columbus, 378 W. It is pleasantly situated on elevated ground, near a branch of Mohican creek, and contains a courthouse, jail, six churches, 17 stores, two printing-offices, 300 dwellings and 1338 inhabitants.

MANS (LE) (an. *Swindonia* and *Commaria*), a town of France, dep. Sarthe, of which it is the cap., on the Sarthe, here crossed by three bridges, 50 m. N.E. by N. Angers, and 120 m. S.W. Paris. Pop. in 1836, ex. com., 19,103. It stands partly on the declivity of a hill, and partly beside the river. The latter portion is very ill-built, and has narrow crooked streets, impassable for carriages; but the upper town, though irregular, is open, and tolerably well built, its houses being of stone, roofed with slate. A handsome new quarter has been laid out, having a large square in its centre; and there are two good public promenades, one along the bank of the Sarthe. The Romans surrounded the ancient city with walls, a portion of which, on the N.N.E. side, remains nearly perfect; but the modern town is of no strength. Le Mans has several remarkable ecclesiastical structures. Its cathedral, begun in the 9th, but not finished till the 16th century, is a fine Gothic edifice, 416 feet in length, with a large square tower, 912 feet in height, the supports of which in the interior are ornamented with numerous statues. The choir is inferior in elegance only to that of Beauvais; and the stained glass window in the S. arm of the cross is much admired for its richness. The church of St. Julian is an interesting edifice of the 11th century. Another church, built in the 13th century, presents a combination of the Gothic and antique style. The new prefecture, the town-hall, and the theatre, are handsome buildings. Le Mans has two hospitals, a seminary, with a library of 15,000 volumes, a public library, with 45,000 printed volumes and 500 MSS., in excellent preservation; several other libraries, museums of natural history, antiquities, and painting, the latter having several works by Guido, A. Durer, Teniers, Vandyk, &c.; a royal society of arts, a communal college, schools of drawing, midwifery, &c. It has manufactures of linen and coarse woollen stuffs, wax candles, &c.; and a considerable trade in these, and in rags, iron, salt, wine, brandy, and agricultural produce. Le Mans has suffered much from the ravages of war at different periods; and, in 1793, it was the scene of the last struggle between the Republican and Vendean forces. (*Histo. art. Sarthe; Guide de l'Yppagour, &c.*)

MANTUA.

MANTINEIA, a celebrated city of ancient Greece, in Arcadia, the ruins of which, close to the wretched hamlet of *Lamota*, in a marshy plain watered by the Ophis, and enclosed S.E. by the rugged heights of *Parthenion* and *Artemisium*, are about 7 m. N. Tripolizza, and 17 m. W. by S. Argos. The walls, probably built soon after the battle of *Leuctra* (B.C. 371), are similar to those of *Messene*, and enclose an oval space in which the city stood; they have square towers, and the whole exhibits an interesting specimen of Grecian fortification. A ditch, or fosse, round the walls, is supplied by the Ophis; which, at certain seasons, would inundate the plain are it not absorbed by a chasm (*καρδισσος*), through which its waters find a subterraneous vent. Mantinea had eight temples, besides a theatre, stadium, hippodrome, and several other monuments enumerated by *Pausanias*. (*Arcadia*, chapter 8-11.) Some imperfect remains of the theatre are still visible, no other ancient building can be identified; and everything, except the enclosing walls, is in a state of total dilapidation. (*Diodori*, li. 422.)

But Mantinea is wholly indebted for its long-continued celebrity to the great battle fought in its vicinity, anno 362 B.C. between the forces of Sparta and Thebes, and their allies; in which *Epaminondas*, the leader of the Thebans, and the most illustrious, perhaps, of all the warriors of Greece, fell in the moment of victory. Xenophon is very brief in his account of the battle; but it may be collected from his statement that, on the whole, the plan of the Theban general succeeded in all its parts. The charge of the Theban and Theban cavalry, which commenced the attack, was completely successful and prepared for the deeper impression made by the column of Theban and Arcadian infantry. But, in the critical moment, when the phalanx of the Lacedæmonians had been broken, and a decisive victory appeared to be secured, *Epaminondas* received a mortal wound; and, being carried to a rising ground, whence he might view the scene of combat, would not allow the weapon to be extracted till assured that the victory had been won, when he almost immediately expired. But his fall, and the consternation thence arising, paralysed the successful army. They kept the ground they had gained, but did little or nothing more. Hence it was that the result of this great contest disappointed the expectations of those who had supposed that it would be decisive of the fate of Greece. "The Gods," says Xenophon, "decided otherwise. Each party claimed the victory, and neither gained any advantage; territory, town, and dominion was acquired by neither; but indecision, trouble, and confusion, more than ever before prevailed throughout Greece." (*Xen. Hæll.* l. vii., c. 5, *ad finem*.) This, however, is the statement of a partisan of Sparta, and is not quite fair. The Theban confederacy was, on the whole, decidedly successful. They effectually broke the power and humbled the pride of Sparta; and, by re-establishing the independence of the Messenians, the old and inveterate enemies of the Lacedæmonians, they obtained a new guarantee against any dangerous increase of their power in future. (*See Mitford's Greece*, sect. viii., cap. 35.)

Mantineia was taken and sacked by Antigonus during the wars of the Achaean league; and its name was changed, in honour of the conqueror, to *Antigonia*, which it retained till the time of Adrian, who restored its original appellation.

MANTUA (Ital. *Mantova*), a fortified town of Austrian Italy, prov. Lombardy, cap. deleg. Mantua, on both sides the Mincio, 21 m. S.S.W. Verona, and 37 m. E. by N. Cremona; lat. 45° 9' 16" N.; long. 10° 48' 10" E. Pop., in 1837, 26,965. Its situation is peculiar, being in fact nearly surrounded by lakes, partly natural, and partly formed by damming up the waters of the river. The mounds, or dams constructed for this purpose, are sometimes called bridges, from their being perforated with arches, to allow the superfluous water to escape; and by these the town is connected with the *Borgo di Fortezza*, or strong citadel of Porto on the N., and with the *Borgo di San Giorgio*. The latter, as well as the town itself, is surrounded by strong walls; to the S.E. is the outwork of *Pradelba*, and to the S. the fortified island of *Ceresio*, or T., from its alleged resemblance to that latter. The fortifications, though not imposing in their appearance, are very strong, and kept in excellent order; and their strength and the position of the place render it one of the bulwarks of Italy. Mantua has some good streets and squares, but, on the whole, it is ill-built and dirty. Many of the inhabitants live in cellars, its population has declined, and it has a decayed appearance. Its best part is the Piazza Virgiliana, a large square, surrounded with trees, and open to the lake. The climate is subject to great extremes, and in summer the exhalations from the surrounding swamps make it very unhealthy; though, of late years, the Austrian government has exerted itself, by draining part of the marshes, and opening a passage for the stagnant waters, to lessen its insalubrity. Several of the public edifices in Mantua were designed or adorned by Giulio Romano.

MANZANARES.

But the cathedral, planned by that great artist, is said by Woods to be a bad imitation of the church of Santa Maria Maggiore, at Rome; it has double ranges of side aisles, and the columns stand very wide apart. The church of St. Andrea, begun in 1470, but not completed till 1782, was designed by Alberti, and is said by Woods to be very superior to the cathedral, and to be, indeed, one of the handsomest churches in Italy: it has fine statues of Faith and Hope, by Canova. The old ducal palace (*Palazzo Vecchio*) is a large imposing building; and, were it perfect, would be one of the finest palaces in Europe. It is beautifully floored with porcelain, and was formerly splendidly adorned with Flemish and Mantuan tapestry and rich furniture; and, though repeatedly despoiled, it has still to boast of a room painted in fresco, by G. Romano. But the most celebrated fresco of Romano, "the Fall of the Giants," is in the palace of the T. At the extremity of one of the bridges is a handsome gateway, attributed to Romano, who also erected the open arcade on the bridge over the Mincio, in the heart of the city. Romano inhabited a house opposite the church of St. Barnabas, in which is his tomb. There are numerous convents, a Jews' synagogue, a civil hospital, two orphan asylums, a *monte-di-pieta'*, a workhouse, an asylum for 50 poor Jews, an arsenal, cavalry barracks, a large prison, a new and a summer theatre, an imperial academy of arts and sciences, a lyceum, a gymnasium, a public library with 80,000 volumes and many MSS., attached to which are a museum and a fine gallery of sculpture, which has a celebrated bust of Virgil, a botanic garden, and various other scientific and literary institutions. Mantua is a bishop's see, the residence of an Austrian delegate, and the seat of the council, and civil, criminal, and commercial tribunals for the delegation. In the days of her prosperity, and when governed by her own dukes, Mantua is said to have had a population of 50,000, and extensive manufactures; and, though the latter be greatly fallen off, she still produces limited quantities of silk, woollen, and linen fabrics, with leather, parchment, paper, cordage, &c., and carriages and boats for the navigation of the Po.

Mantua is very ancient, her foundation being probably antecedent to that of Rome. She derives her principal celebrity from her being the native country of Virgil, that great poet having been born in her immediate vicinity, *anno* 70 B.C.

Mantua Museum domus, aique ad sidera castra
Evecta Aonio, et Smyrnatia amula placita.
Silvius Italicus, lib. viii., lin. 586.

Mantua appears, from the contrast, in the first Eclogue, between her and Rome, not to have been a place of much importance in Virgil's time; and Martial applies to her the epithet of *parva*. (Ep. xiv., 193.) Her unlucky vicinity to Cremona made her territory be divided among the veterans of Augustus. (See art. CREMONA, in this work.)

After the conquest of N. Italy by Charlemagne, Mantua became a republic, and continued under that form of government till the 12th century, when the Gonzaga family acquired the supreme direction of its affairs. They were subsequently raised to the title of dukes, and held possession of Mantua till 1707, when it was taken by the Austrians. Under the French, it was the capital of the deputy of the Mincio. (*Ferryth; Eustace; Woods; Oesterr. Nat. Exped.*, &c.)

MANTUA, p. t., Portage co., O., 150 m. N.E. Columbus, 337 W. Watered by Cuyahoga river and its branches. It is distinguished for its fine orchards, and contains a church, an academy, 10 schools, 463 scholars. Pop. 1187.

MANZANARES, a town of Spain, prov. La Mancha, 24 m. E. by N. Ciudad Real, and 100 m. S. Madrid. Pop. 9100. It stands in the loftiest and bleakest part of the province, on the high road between Madrid and Seville; being, according to Ingis, "a place of considerable size, and proportionate poverty." A parish church of Gothic architecture, a castle, hospital, and cavalry barracks are the only public buildings; the private houses are better built than in most towns of Spain. The inhabitants are chiefly employed in the production of saffron, for which the neighbourhood is celebrated, and of the Val-de-Peñas wine, highly esteemed all over Castile; the only other branches of industry being the manufacture of coarse woollens and linens for home supply. Not far from Manzanares are the ruined walls and tower of the ancient *Nervus*; a city described, in Antonine's *Itinerary*, as being on the road from *Laminium* (Alhambra) to *Thibetum* (Toledo).

MANZANARES, a small river of Spain, tributary to the Tago, and flowing by Madrid, which see.

MARACAYBO, MARACAIBO, or NUEVA ZAMORA, a fortified city of Venezuela, cap. dep. Zulia, and prov. Maracaybo; on the W. shore of the strait connecting the lake of Maracaybo with the sea, 175 m. E.S.E. Santa Marta, and 330 m. W. by N. La Guayra. Lat. 10° 39' N., long. 71° 45' W. In 1801, its population, including a number of Spanish refugees from St. Domingo, was estimated at 24,000;

MARAGA.

and it may still, perhaps, amount to 30,000. It stands on an arid and sandy soil, partly on the shore of a small inlet of the strait, and partly on a tongue of land which projects into it. Several of its houses are built of a compound of lime and sand, without stone, but they are nearly all thatched with reeds; and, as the greater number consist wholly of reeds and straw, the town has a mean appearance, and is very subject to fires. A handsome parish church, a chapel, a Franciscan convent, and a hospital, are the only public buildings of which modern travellers make mention. The harbour of Maracaybo, within the bar at the entrance of the strait, has deep water; and is defended by the three castles of San Carlos, Zapara, and Bajo Seco, situated on the islands of the same names, among the shoals forming the bar. The *Bajo Seco*, or dry shoal, is in advance of the other islands; and the best channel to the harbour, on the N.W. side, has 13 feet water. The climate of Maracaybo is oppressively hot; during a part of the year water is scarce; and in the summer, when violent thunder-storms and earthquakes occur, the city often suffers greatly from very heavy rains. This port has superior facilities for ship-building, and its shipwrights have produced some fine schooners. A brisk traffic is carried on with the interior by the numerous vessels which navigate the lake. The inhabitants are said to be good sailors, and they have generally a taste for a seafaring life. Many, however, devote themselves to the care of cattle, large herds of which are reared in the vicinity. (*Geog. Ac. Account of Colombia*, i., 217-235; *Mod. Trav.*, xvii.; *Encyclopaedia Americana*; *Encyc. of Geog.*, American edition.)

MARACAYBO (LAKE or LAGOON OF), a large lake, or inlet of the sea, in the N. part of S. America, repub. Venezuela, dep. Zulia, prov. Maracaybo. It extends between lat. 9° 5' and 10° 30' N., and long. 71° and 73° 30' W., and is of an oval, or rather "decanter-like" shape; communicating, at its N. extremity, with the gulf of Maracaybo, by a strait nearly 20 m. in length, and varying in breadth from 5 to 19 m. Length of the lake, N. to S., nearly 100 m.; greatest breadth, about 70 m.; circ. probably about 250 m. Inside it has water enough to float the largest vessels; and, being easily navigated, serves for the conveyance to Maracaybo of the produce of the interior intended for consumption in, or exportation from, that city. But a shifting bar, at the mouth of its strait, where it unites with the sea, in lat. 11° 2', having only 14 feet water, renders it inaccessible to large ships. It receives several considerable rivers, so that its waters are perfectly fresh, sweet, and fit for drinking, except in the spring, when strong N. winds impel inwards a swell from the gulf, which renders them brackish. The lake is not very subject to violent tempests. It abounds with fish and waterfowl; but tortoises, elsewhere so common in Colombia, are not met with in it. Its banks are in many parts sterile, and only cultivated on the W. side; and they are, in general, so unhealthy, that the Indians prefer mounting their huts on iron-wood posts in the water, to fixing them on the shore. It was from the Indian villages or towns, built in this way, that the whole country is said to have derived from the Spaniards the name of Venezuela, or Little Venice. Four of these towns are still standing on the E. part of the lake, at unequal distances from each other; the iron-wood on which they are founded having become a mass of stone, from the petrifying quality of the water. (*Geog. Account of Colombia*, i., 216, 217.)

Towards the N.E. border of the lake is a remarkable mine of asphaltum (*pix montana*); "the bituminous vapours of which are so easily inflamed that, during the night, phosphoric fires are continually seen, which, in their effect, resemble lightning. It is remarked that they are more frequent in great heat than in cool weather. They go by the name of the 'Lantern of Maracaybo,' because they serve for lighthouse and compass to the Spaniards and Indians, who, without the assistance of either, navigate the lake." (*Depons, Trav.*, i., 70; *Mod. Trav.*, xxviii., 209-211; *Geog. Account of Colombia*; *Blunt's American Coast Pilot*.)

MARAGA (an *Gamaraga*?), a city of Persia, prov. Azerbaijan, 50 m. S. by W. Tabreez, and 305 m. W.N.W. Teheran. Pop. about 15,000. It is a well built walled town, in a low valley, at the extremity of a fertile plain, opening to the lake Urumes, which lies 10 m. W. Maraga. The chief buildings are a large and handsome bazaar, spacious public baths, and the tomb of Holakou, one of the most able princes of the dynasty of Jenghis-khan. Maraga is also celebrated for its beautiful and highly productive gardens and plantations, watered by canals drawn from a small river, over which are two bridges, erected in the 11th century. The town has a large manufactory of glass; but the inhabitants are chiefly employed in the cultivation of the fertile country round the town.

On the top of a mountain rising behind Maraga are the remains of an observatory, built by Holakou, for the use of Nuzer-a-Deen, one of the most famous Oriental astronomers; and at the foot of the hill are several cave-temples, similar

MARAMEE.

in form, though not equal either in size or beauty, to those of Hindostan. (*Kinners's Persia*, p. 156, &c.)

MARAMEE IRON WORKS, p. v. Crawford co., Mo., 63 m. S.W. by W. Jefferson city, 935 W. It is situated at the "Big Spring" of Maramee river, which issues 30,000 cubic feet of water per minute. There is erected on its outlet a saw-mill, a grist-mill with two runs of stones, a blast furnace, three forges, capable of manufacturing 1000 tons of bar iron annually. It has been called the head of Maramee river, but two branches, called Water fork and Dry fork, come in on each side of it.

MARANHAM, or **SAN LUIS**, a city and seaport of N. Brazil, cap. of the prov. Maranhão, on the W. coast of the strand of the same name, in the bay of Marcos, 300 m. E. by S. Para. Lat. 9° 31' 30" S., long. 44° 16' W. The inhabitants are variously estimated at from 15,000 to 30,000, of which a large proportion are negroes. The city is built on unequal ground, extending inwards about 1½ m. from the water's edge. It is laid out in a straggling manner, with numerous squares and broad streets, the latter being only partially paved. There are many neat and good-looking houses; the better sort consist of a ground floor, and a story above; the lower part being usually employed as a shop, and lodging for servants, and the upper as the apartments of the family. These houses have mostly balconies, and are handsomely fitted up. In the poorer and unpaved streets the houses consist of only a ground floor, and having thatched roofs and unglazed windows, their appearance is extremely mean and shabby. Adjoining the shore is an open space, one side of which is nearly taken up with the governor's palace, town-hall, and prison, which occupy a long, uniform, handsome stone building of one story in height; another of its sides is occupied by the cathedral. This, which was formerly the Jesuit's church, is said to be the finest of any in the maritime cities of Brazil, except that of Para. The Jesuits' college is now the episcopal palace. There are a great number of other churches and convents, a treasury, two hospitals, various public schools, and a custom-house, which, though small, was till recently quite large enough for the business of the place. Latterly, however, its commercial importance has been much increased, and it is the principal port of the empire for the shipment of cotton and rice; the other articles of export consist principally of hides and horns, caoutchouc, isinglass, sarsaparilla, cocoa, &c. We subjoin an

Account of the Number and Tonnage of the Ships which cleared out from the port of Maranhão in 1837 and 1838, specifying the Countries to which they belonged, and the Value of the Cargoes:

Countries.	1837.			1838.

We have no authentic information as to the importation of slaves into Maranhão; but there can be no doubt it is very considerable, and may, perhaps, be estimated at above 800 a year.

The harbour of Maranhão is rather difficult of access. It is usual for vessels arriving on the coast to make the light-house on the island of St. Anna, about 40 m. N.E. Maranhão. The harbour of the latter consists of a narrow creek, defended by some indifferent forts. It is so beset with shoals and islets, as to render a pilot always necessary, but with such there is no real danger. It has about 18 feet water at low ebb; but it is said to be filling up, and that the probability is that the port will, at no very distant period, be transferred to Alcantara, on the opposite side of the bay. The latter, indeed, is in all respects a preferable port, being more easily accessible, having deeper water, and greater facilities for getting to sea. The island of Maranhão is fertile, and densely peopled; having a number of villages, which uniformly consist of four large timber huts, from 300 to 800 paces in length, and about 90 or 30 feet in depth, each capable of accommodating from 300 to 300 inhabitants.

This city was founded by the French in the early part of the 17th century. (See *Brazil*, in this Diet.; *Mod. Trav.*, xi., 279, 281; *Encyc. Americana*; *Blaux's American Pil.* &c., p. 515.)

MARBURG.

aries. It has two stores, one grist-mill, two saw-mills; seven schools, 359 scholars. Pop. 1063.

MARAZION, or **MARKET-JEW**, a decayed bor., seaport, market town, and township of England, St. Hilary par., co. Cornwall, E. div. of hund. Penwith, 43 m. S.S.W. Bodmin, and 253 m. W. by S. London. Pop. 1383. It is situated on the shore of St. Mount's bay, on the side of a hill, which shelters it from the cold N. winds. The parish church is 9 m. distant; but it has a chapel of ease, and places of worship for Wesleyan Methodists and other dissenters. An endowed school is held in the guildhall; a national school and three Sunday schools furnish instruction to the children of the poor; and there are a few charities. Its principal trade consists in the importation of timber, coals, and iron, for the supply of the town and neighbouring mines. The market, held on Saturday, is well supplied, especially with ready-made shoes; and two large cattle fairs are held 34 Thursday in Lent and September 29.

Though a borough by subscription, this town was chartered by Queen Elizabeth; the corporate officers being a mayor and eight aldermen, with 12 capital burgesses, whose privileges were not interfered with by the late Municipal Reform Act. It is supposed to have sent members to the House of Commons at a former period, but certainly not subsequently to 1638. Its name, Market-Jew, has been supposed to be derived from its having been, in the period of its prosperity, a great trading place for the Jews, but the presumption is unsupported by history; and it appears more rational to conclude that it is a corruption of its ancient name *Marbassan*, or *Marbassalew*.

MARBELLA (an. *Salduba*), a seaport town of Spain, in Andalusia, prov. Málaga, 30 m. S.W. Málaga, and 38 m. N.E. Gibraltar. Pop. according to Milano, 4382. "It stands slightly elevated above the sea; and its turreted walls and narrow streets declare it to be thoroughly Moorish. The town is particularly clean, and respectfully inhabited; the fishing portion of the population being located more conveniently for their occupation in a large suburb on its E. side." A church, two hospitals, and an old Moorish castle, are its principal public buildings. The trade of Marbella is only trifling; its valuable mines of lead and iron, which formerly secured for it a certain degree of prosperity, have been for many years totally abandoned, its sugar refinery and tan-yards have disappeared, and fishing now forms the chief occupation of the inhabitants. There is no harbour; but vessels find excellent holding-ground, in deep water, near the shore. The landing also is good, on a fine hard sand; and a small pier has lately been constructed. (*Scott's Ronda and Granada*, ii., 378.)

MARBLEHEAD, p. t. port of entry, Essex co., Mass., 18 m. N.E. Boston, 4 m. E. by S. Salem, 458 W. Incorporated in 1649. Situated on a rough and rocky peninsula, extending from 3 to 4 m. into Massachusetts bay. It has a good harbour, defended on the N.E. by Fort Swall. The harbour, in front of the village, is a mile and a half long, and half a mile wide. The place is inhabited chiefly by fishermen, and has about 100 vessels employed in the coasting trade, the fisheries and foreign trade. Its tonnage, in 1840, was 12,478 tons. The t. has five churches, a Congregational, Unitarian, Episcopal, Methodist, and Baptist; two banks, with an aggregate capital of \$250,000; two insurance companies, capital \$100,000; 29 stores; two academies, 126 students; 20 schools, 886 scholars. Pop. 5375.

MARBLETOWN, p. t. Ulster co., N. Y., 7 m. S.W. Kingston, 64 m. S.S.W. Albany, 318 W. Watered by Esopus and Rondout creeks. The Delaware and Hudson canal passes through it. It contains 15 stores, seven lumber-yards, two fulling-mills, one woollen factory, one flouring-mill, six grist-mills, 10 saw-mills; 13 schools, 687 scholars. Pop. 3813.

MARBURG, a town of Hesse Cassel, cap. circ. Upper Hesse, on the Lahn, a tributary of the Rhine, 50 m. S.W. Cassel, and 53 m. N.E. by E. Coblenz; lat. 50° 48' 41" N., long. 8° 48' 12" E. Pop., including the suburb of Weidenhausen, on the opposite bank of the Lahn, 7700. It is built on the slope of a hill, crowned by a ruined castle; and has narrow and dirty streets, and indifferent houses. Its only building worth notice is the church of St. Elizabeth, an elegant edifice, and one of the earliest existing specimens of the pointed Gothic style, having been commenced in 1225, and finished within the succeeding 48 years. The tomb of St. Elizabeth, in this church, has been long resorted to by pilgrims, and was formerly adorned with numerous gems and articles of value, mostly carried off by the French in 1810. In the transept are several curious monuments of the land-graves of Hesse. The university of Marburg, founded in 1527, has 40 professors, and a good library of 70,000 vols. In 1833, it was attended by 493 students, but, in 1840, the number of pupils had declined to 285. Marburg has also the Wilhelm's Institute, a school of surgery; and a philological seminary, teachers' seminary, botanic garden, school

MARCELLUS.

of veterinary medicine, Lutheran and Catholic orphan asylums, a workhouse, a free-school of industry, &c. The inhabitants derive their principal support from the university, and from the manufacture of linen fabrics, stockings, hats, tobacco, and tobacco-pipes, &c. It is the seat of the chief judicial and other state establishments for Upper Hesse. (*Bergbau; Stein.*)

MARBURG, a town of the Austrian empire, being, next to Grätz, the principal in the prov. of Styria, cap. circ. on the Drave, and on the road from Grätz to Laybach, 36 m. S.E.E. the former city. Pop. in 1837, 4578. Mr. Turnbull says, "It is a good town, and surrounded by a beautiful country, richly planted with vines. The climate here is far more congenial to their growth than on the N. side of the hills, and excellent wine is produced." (*Trav., i., 379.*) Near it, the Archduke John has a vineyard and villa. Marburg has three suburbs, an old castle, a church, in which are several good pictures, a hospital, theatre, gymnasium, military school, swimming school, &c. It is the seat of the council for the circle, furnishes leather and rosoglio, and has some trade in corn, wine, and iron; but its inhabitants derive their chief subsistence from the active transit trade between Hungary and Croatia and Illyria. (*Turnbull's Austria; Bergbau; Oester. Nat. Encey.*)

MARCELLUS, p. t., Onondago co., N. Y., 141 m. W. by S. Albany, 343 W. Drained by Nile-mile creek. It contains three churches, a Presbyterian, Methodist, and an Episcopal, seven stores, four fulling-mills, two woollen factories, two flouring-mills, two grist-mills, six saw-mills, two paper-mills, five tanneries, two distilleries; 19 schools, 571 scholars. Pop. 3796.

MARCH, a market town, township, and par. of England, belonging to Doddington par. Isle of Ely, hund. Witchford, on the Old Nen, 13 m. N.W. Ely, and 74 m. N. London. Area of township, 30,440 acres. Pop. in 1831, 5117. Excepting the church, which is large and handsome, the town contains nothing worthy of remark; the streets being generally narrow, and the houses, for the most part, low and meanly built. Its situation on the Nen, which is navigable, makes it the centre of a considerable trade; corn, hemp, flax, cheese, &c., being shipped here; and coal, timber, and London goods, imported. Markets on Friday; fairs, Monday before Whitsuntide, Whit-Monday, and 3d Tuesday in October, chiefly for horses, cattle, and cheese.

MARCY, p. t., Oneida co., N. Y., 6 m. Utica, 98 m. W.N.W. Albany, 343 W. Organized in 1839. Bounded S.W. by Mohawk river and its tributary Nine-mile creek. It contains one fulling-mill, four saw-mills, three tanneries; nine schools, 674 scholars. Pop. 1790.

MARENGO, a village of N. Italy, Sarlinian States, near the Bormida, in an extensive plain, 34 m. E. by S. Alexandria. This village will be ever memorable for the great battle fought here, on the 14th of June, 1806, between the French under Napoleon, and the Austrians under Melas. Napoleon, believing that the Austrians had withdrawn from the neighbourhood of Marengo, had, on the day previously to the battle, despatched Desaix with a strong corps to Rivolta. By this means, his army was reduced, when attacked by the Austrians on the following morning, to little more than 20,000 men, whereas the Austrians had nearly 40,000 troops in the field. The contest was most obstinate and bloody; but, despite a desperate resistance, the Austrians carried the village of Marengo, broke the left wing of the French, and compelled them to retreat. But, at this critical moment, when the fate of the day appeared all but decided, Desaix, who had returned by a forced march, came upon the field. This gave the French new strength, and inspired them with new courage. The Austrians, exhausted by their previous efforts, were immediately attacked at all points, forced back, and completely defeated, with the loss of all their cannon and baggage, and of a vast number of men left dead on the field and taken prisoners. Desaix, whose opportune arrival turned the fortune of the day, was killed, charging at the head of his division.

MARENGO, county, Ala. Situated in the W. part of the state, and contains 975 sq. m. Bounded W. by Tombigbee river, and N.W. by its branch, Black Warrior river. It contained in 1840, 15,126 neat cattle, 2175 sheep, 36,819 ewine; and produced 9785 bushels of wheat, 1021 of rye, 649,734 of Indian corn, 32,933 of oats, 36,906 of potatoes, 3815 pounds of rice, 1146 of tobacco, 6,358,093 of cotton. It had 34 stores, one flouring-mill, 18 grist-mills, seven saw-mills, two tanneries, one distillery, one printing-office, one weekly newspaper; three academies, 131 students; nine schools, 901 scholars. Pop.: whites, 5350; slaves, 11,093; free coloured, 13; total, 17,964. Capital, Linden.

MARENGO, p. t., Calhoun co., Mich., 100 m. W. by S. Detroit, 573 W. It contains one store, one grist-mill, three saw-mills, one distillery; 10 schools, 307 scholars. Pop. 879.

MARGARETTA, p. t., Erie co., O., 100 m. N.W. by N. Columbus, 414 W. Bounded N. by Sandusky bay. Wa-

MARGATE.

tered by Cold creek. It contains four stores, one flouring-mill, one grist-mill, two saw-mills; one school, 20 scholars. Pop. 1001.

MARGARITA, an island off the N. coast of S. America, belonging to the republic of Venezuela, and attached to the dep. Cumana. It lies in about lat. 11° N., and long. 66° W., separated from the continent by a channel, 20 m. in width, through which all ships coming from Europe, or windward of Cumana, Barcelona, or La Guayra, must pass in going to those ports. Length of the island, E. to W., 124 m.; breadth varying from 5 to 30 m. Population estimated at 15,000. Viewed at a short distance from the N. it appears like two islands, there being a tract of low swampy land in its centre, which is in some parts not more than from 20 to 12 ft. above the level of the sea; but other parts of the island rise to a considerable elevation; and Maracaibo, near its W. extremity, a micaceous schist, is upwards of 2000 ft. in height. The coast-lands are arid and barren; but the interior is comparatively fertile, producing maize, banana, and various fruits, with sugar, coffee, cocon, and other W. Indian products, though not in sufficient quantities for the demands of the inhabitants. A good deal of poultry, and other live stock, is reared, and exported to the continent; and Margarita has an active fishery, and some salt-works. It was formerly much celebrated for its pearl-fishery; but this has greatly declined, and the pearls now found are said to be of inferior size and quality. The pearl-fishery was principally conducted at the rocky island of Coche, between Margarita and the main land. The inhabitants have some manufactures of cotton stockings and hammocks, of very good quality. Asuncion, the capital, and residence of the governor, in the centre of the island, is pretty well built. There are three seaport towns or villages; one of which, Pampatar, on the S.E. coast, has a pretty good harbour, with anchorage in 7 or 8 fathoms water. (*Blair's American Coast Pilot, p. 440.*) This island, which is of little value in any other point of view, might, were it occupied by a European power, be of considerable service as a depot for the supply of the adjacent continent. It is better situated for such a purpose than Trinidad. It was discovered by Columbus in 1498. (*Geog. Account of Colombia; Humboldt's Personal Narrative, &c.*)

MARGATE, a seaport town and much-frequented watering-place of England, co. Kent, in the Isle of Thanet, lathe St. Augustine, 16 m. E.N.E. Canterbury, and 62 m. E. London. Area of parish, 3810 acres. Pop. in 1831, 28,329. The town is finely situated, partly along the shore, and partly on the declivities of two hills, one of which presents a bold cliff towards the sea. The older streets are narrow and irregular, lined with inferior-looking houses; but in the upper parts and outskirts of the town are several handsome streets and squares formed by houses which are in regularity of construction would not disgrace the metropolis. The whole is well paved, lighted with gas, and plentifully supplied with good water. The town-hall and market-house is a plain but substantial building of great erection, supported on cast-iron pillars, and fronted by a Tuscan portico. The assembly-rooms in Cecil-square have long ranked among the largest and most elegant in England; a neat theatre stands on the E. side of Cecily-square, where also is a large public library. Numerous bathing-houses lie one side of High-street, and near the Parade E. of the town is a very complete establishment formed in the cliff, and furnishing hot and cold baths of a very superior description. There are two churches; one an old heavy-looking building, with a low square tower; the other at the opposite side of the town being a very handsome modern Gothic structure, with a light octagonal tower, built at an expense of £26,000. The Roman Catholics, Independents, Baptists, and Society of Friends have also their respective places of worship, to which are attached well-attended Sunday-schools. A national school furnishes instruction to about 250 boys and 200 girls, and there are two other large day-schools. *Infant Asylum*, founded in 1709, a dispensary, and *lying-in* charity, are the principal charitable institutions; and in the immediate vicinity, close to the beach, is a large sea-bathing battery, founded in 1792, and since so much enlarged as to furnish accommodation for about 190 patients. The bathing-dries at low water. To obviate this defect a stone pier, projecting 900 ft. into the sea, was erected from the donation of the late John Reanle; still, however, this was insufficient for the purpose, there not being more than from 4 to 5 ft. water at the pier head at low-ebb. Since 1859, a wooden jetty, connected with the pier, has been constructed, which projects into deep water, and may be approached by numbers or other vessels at any time of the tide, except when it blows a gale from the N. or N.N.E. The pier is a delightful promenade for the town's folk and visitors.

Margate enjoys a considerable coasting trade, and has some commerce with Holland and Germany; but neither these nor its fishery are of any importance compared with

MARIA-THERESIANOPEL.

the advantages that accrue to it from the thousands of visitors who annually resort thither from the metropolis. The town, indeed, like many others, owes its present importance to the invention of steam; for though prior to 1817 it was a respectable and well-frequented watering-place, the means of access to London were so difficult and tedious, that some but those who could afford a week or two of uninterrupted leisure were ever induced to visit it. But within the last fifteen years, the water-communication with London has been so greatly facilitated, that Margate may now be considered as within five or six hours of the metropolis. Several handsome steamers ply regularly between London bridge and Margate; and for some years past the number of persons landed from these steamers at Margate is supposed to have averaged above 90,000 a year. The fares being extremely reasonable, Margate is frequented chiefly by the families of tradesmen and others belonging to the middle classes, for whose amusement there are numerous bazars, libraries, &c., with the Tivoli gardens, in the suburbs, very similar to the well-known, but now extinct, Vauxhall of London. Great numbers of persons engaged in business during the week join their families here on the Saturday, returning to London early on the Monday morning; and it is from the flying visitors that the steam-packet companies derive their chief revenue.

Margate is within the jurisdiction of Dover, by the lord-warden of which the constable of the town is appointed; and as a port, it is subordinate to Ramsgate. It is the chief place of a poor-law union, comprising all the parishes in the Isle of Thanet.

MARIA-THERESIANOPEL, or THERESIENSTADT (Hungar. *Székes*), a royal free town of Hungary, co. Bacs, in the great plain between the Danube and Theiss, 25 m. S.W. Eszseg, and 100 m. S.S.E. Pesth. Population said to be about 35,000, chiefly Hungarians and Servians. Its territory, or commune, comprising an area of 300 sq. m., is larger than that of any other town of the Austrian dominions. (*Borghes*.) The "National Encyclopedia" says, it is well built, and has numerous handsome public edifices; including several churches, a gymnasium, large barracks, a town-hall, &c. It has manufactures of linen cloth, leather, and tobacco, and a large trade in horses, cattle, sheep, raw hides, and wool.

MARIANNA, an episcopal city of Brazil, prov. Minas Geraes, of which it is the capital, on the Carmo, a tributary of the Doce, 8 m. E.N.E. Villa Rica. Its population, in 1828, was estimated at from 6000 to 7000. (*Mess's Brazil*, 328.) It stands principally in a small plain, bounded by rocky hills, the small knolls, and projections of which are crowned by its churches. The city itself is nearly square, and consists principally of two well-paved streets, regularly laid out, and conducting to a kind of square. The houses are whitened, and have a neat appearance. The supply of water is ample, and is of material importance in the cultivation of several extensive gardens; but, being surrounded by lofty eminences, the air is close and hot, and the season unhealthy. There are several churches and a large cathedral. The Carmelite and Franciscan convents, the ecclesiastical college, which has sundry privileges, the bishop's palace, surrounded with fine gardens, and the town-hall, are among the other chief public buildings. It has very little trade, and depends chiefly on the mines and farms in its vicinity. (*Mess's Brazil*; *Diet. Géog.*)

MARIANNA, P. V., capital of Jackson co., Flor., 77 m. N.W. Tallahassee, 257 W. Situated on the W. side of Chipoka river. It contains a courthouse, and several stores and dwellings. Nest proceeds of the post-office, 6414.

MARIAVILLE, P. V., Ham. co., Me., 103 m. N.E. Augusta, 625 W. Watered by Union river and its branches, which afford water-power. Incorporated in 1830. It has one grist-mill, two saw-mills, one tannery; two schools, 66 scholars. Pop. 275.

MARIAZELL, or MARIANZELL, a village of the Austrian empire, prov. Styria, in a mountainous district, about 35 m. S.W. Vienna. Pop. about 1800. It would be unworthy notice in a work of this kind, but for its celebrated shrine of the Virgin, which renders it the "Loretto" of the Austrian empire, and a principal place of Christian pilgrimages. The town, which stands at an elevation of about 2900 ft. above the sea, is small and mean-looking; and consists principally of lanes and alleys, for the accommodation of the visitors, the influx of which only ceases when the roads are impassable by snow. The only building of note in the church, rebuilt, since 1837, on the site of one erected in 1363, by Louis I., king of Hungary, over the chapel, in which the image of the Virgin is placed. The church, as it now stands, is of Roman architecture, except the porch, which is Gothic. It is a spacious edifice, 296 English ft. by 90 inside, and is surmounted by a spire 375 ft. in height. Some of the side altars and chapels are undecorated; but its principal object of curiosity and devotion is the small stone chapel, erected by a mar-

MARIAZELL.

grave of Moravia, in 1203, instead of the wooden hut in which the *Graden Statue*, 'Statue of Grace,' had stood from about 1150, when it was luckily brought thither by a Benedictine monk. This image, like that of Loretto, is ascribed to St. Luke; and, like it, also, is but an indifferent specimen of the apostle's skill in statuary. It is a rudely-carved wooden figure, only 18 in. in height, representing the Virgin, with the Saviour on her knee. Both are as splendid as brocade, gold, gems, and bad taste can make them; their faces are of a negro hue; the effect, perhaps, in part, of the smoke of the solitary lamp kept constantly burning in the dark and gloomy recess in which they are cooped up. The altar and other decorations of the shrine are said to be of solid silver, and the chapel is surrounded by a costly fence of the same metal. A thousand acres of land were assigned for the support of the church; and its treasury was very rich previously to the reign of Joseph II., having received many valuable donations from preceding sovereigns, princes, and private individuals. But Joseph, though he succeeded to the dominions of his mother, inherited none of her superstition: unwearied by the sanctity of the place, he did not hesitate to strip the shrine of the greater portion of its wealth; and profanely threw the silver angels that guarded the high altar, and even the figures of his father and mother, into the melting-pot! The present emperor and empress have, however, made a propitiatory visit to the cell; and have endeavoured, by their pious liberality, to atone, in some measure, for the sacrilegious depredations of their less scrupulous predecessor.

The ecclesiastical establishment of Mariazell consists of about 90 resident priests, deputed from the Abbey of St. Lambrecht, who here form a kind of subsidiary Benedictine college, under a pro-rector. During half the year all find abundant employment among the penitents, who arrive here from all parts of the empire. Shortly after the erection of the church, the popes granted the same indulgences to the shrine of Mariazell, as were attached to St. Peter's at Rome; and thenceforward it became crowded with pilgrims. Previously to the reign of Joseph, the pilgrims are stated to have amounted to about 100,000 annually; and it is alleged that, at the celebration of the 16th jubilee of the miraculous image, in 1757, so fewer than 380,000 individuals did homage to the sabbie Maria! We confess, however, that we do not attach implicit credit to this statement; but it is, at all events, certain that the number was very great. The *Austrian Encyclopedia* says that the shrine is, at present, annually visited by 100,000 pilgrims; and, according to Mr. Turnbull, the number is fully 88,000. (*Austria*, i. 194.)

It is customary for the pilgrims from different places to set out together; and, formerly, it was no unusual circumstance for a band of pilgrims from one province or city to have a contest for precedence with those from another; so that disturbances, which frequently ended in bloodshed, were pastually occurring. The government has, however, put an end to these unseemly brawls by ordering that the pilgrims from different places should take care at different times. Accordingly, most of the towns of any importance in Upper and Lower Austria, Styria, Bohemia, and Moravia, and some in the W. parts of Hungary, have their stated days on which the devotees assemble, and form their processions of piety and pleasure after the manner described by Chaucer in his Canterbury Tales. In all, about 80 processions take place annually from different parts of the empire. Vienna furnishes four distinct parties, three in June or July, and one in August; the last, which is also the largest, generally consists of about 2000 persons of both sexes, and all ages, travelling chiefly on foot, and performing the journey in four days. In their progress, they are jammed together, without any regularity, until they come within about a mile of the shrine. Here they halt; and some hours are generally occupied in marshalling the confused assemblage into regular devoted to view; the male ones are unfurled; sacred emblems exposed to view; the male and youths are placed in the van of the procession, after whom follow the elder pilgrims, male and female, in distinct parties: and thus they advance to the church, by slow and measured steps, stopping at certain appointed stations on the way, and chanting in their native tongue, whatever it may be, some of the words in general chorus. Arriving by thousands in a day, they fill to suffocation every lane and house of accommodation within the town; but the larger portion are, notwithstanding, obliged to bivouac in the fields around; where they spend the night in jollity, drinking and singing songs, which are frequently of a kind not especially suited for virgin ears. (*Turnbull*, i. 197-199; *Russel*.) It is needless to add, that by far the largest proportion of those who join these processions are but little influenced by religious motives. The enlightened portion of the community despise them as miserable mummers; and the motley crowd principally consists of the ignorant, the idle, the full-blown, and the profligate. They are, in fact, an outrage upon religion and morality.

MARIE-GALANTE.

The holy image has been but an indifferent protectress of the village of Mariannell. Six times has it been destroyed by fire, and its population temporarily reduced to ruin. The last conflagration occurred in 1837; when the roof and towers of the church were destroyed, and, out of 111 houses, only 90 escaped. The inhabitants are generally poor. They depend principally on the supply of necessaries, and of roses, tapers, relics, and such like articles, to the pilgrims.

The iron foundries, 9 or 3 m. distant from Mariannell, are the most important of the Austrian empire. Every species of casting is executed in them, from the largest cannon and steam-engines, down to trinkets, which are said to rival those of Berlin. Mariannell has also some copper and sulphur works: a great deal of timber is sent from its neighbourhood to Vienna and the Black sea. (*Oesterr. Nat. Encyc.*; *Thurnell's Austria*, i., 185, 190; *Germany and the Germans*, ii., 901-905; *Herschelman's Stein*, &c.; *Russell*, p. 349-354.)

MARIE-GALANTE, one of the French W. India islands. (See *GUADELOUPE*.)

MARIENBURG, a town of the Prussian dom. prov. W. Prussia, cap. circ. Marienburg, on the Nogat, an arm of the Vistula, here crossed by a bridge of boats, 27 m. S.E. Danzig. Pop. (1837) 5708. This little town is chiefly interesting as having been the seat of the grand masters of the Teutonic order for nearly two centuries. "To the N.E. of the town, and on the summit of a small hill, 50 ft. above the level of the Nogat, and an equal number of feet from the bank of the river, stand the ruins of the Teutonic castle, so often mentioned in the history of chivalrous times. The whole mass is at once imposing and picturesque, bespeaking the grandeur of its former occupants, and the purposes to which it was destined." Most probably this castle had been commenced towards the end of the 12th, or the beginning of the 13th, century. In 1381 it was greatly enlarged, by the addition of that part which was afterwards known as the Old castle; and about the same time, the residence of the grand master was transferred to Marienburg from Venice. Succeeding grand masters built the middle and lower castle (erected, according to Zedlitz, chiefly between 1306 and 1309), and the church of Notre-Dame, in the immediate vicinity, which is still in existence, and forms a very prominent feature in the landscape of these ruins. In 1644, the Old castle was burnt to the ground; but the rest of the building escaped; and, after undergoing many vicissitudes, was put in complete repair by the present king of Prussia, when crown prince. It comprises a chapel, in which are numerous monuments of the grand masters, cells of the knight-monks, with their halls, dormitories, refectory, subterranean caverns, chapter-house, &c., in tolerable preservation. The chapter-house, by far the most interesting part of the edifice, is a large square apartment, with 30 windows, displaying the arms of the successive grand masters in stained glass. (*Granville's Tour to Petersburg*, i., 341, 342.) An antiquated tower, called the *Buttermilchturm*, and some singular water-mills in the neighbourhood, are among the other curiosities of the town. It has a Roman Catholic and a Calvinist church, a teachers' seminary, a deaf and dumb school, and numerous other schools: a work-house, hospital, &c. It is the seat of the council for the circle; and has manufactories of woollen and cotton cloths, stockings, and hats; various breweries, distilleries, and tanneries, and some trade in corn and timber. Marienburg fell into the hands of the Poles by their conquest of the Teutonic knights, in 1457, and was ceded to Prussia at the treaty of Thorn, in 1466. (Zedlitz; *Der Preuss. Staat*; *Bergmann*.)

MARIENWERDER (Slav. *Kwidzin*), a town of the Prussian dom. prov. W. Prussia, cap. of the gov. and circ. of Marienwerder, on the Little Nogat, a tributary of the Vistula, 44 m. S.E.E. Danzig, and 5½ m. N.N.E. Thorn. Pop. in 1837, 5590. It stands on elevated ground, is well built, and has four suburbs. Its cathedral, erected in the 13th century, has a steeple 170 ft. in height; and in its interior are the tombs of many church dignitaries and grand masters of the Teutonic order, and some curious mosaics. What remains of the old castle is now appropriated to the judicial courts for the circle and town, and a school of arts. Marienwerder is the seat of the head court of justice for the province of Prussia, and of the provincial council, and agricultural union for W. Prussia. It has a gymnasium, a royal school of agriculture, a school for the improvement of neglected children, a hospital for blind soldiers, to which is attached the *Louiscien*, an institution for the blind widows of soldiers, a large printing establishment, &c. It has, however, few manufactures, and little trade, except in retail; the inhabitants being principally employed in the supply of necessaries to the various public establishments. (Zedlitz; *Der Preussische Staat*, ii., 483, 484.)

MARIETTA, p. l., capital of Washington co., O., 104 m. E.S.E. Columbus, 174 m. below Pittsburg by the Ohio river,

MARION.

758 m. above the mouth of the Ohio, 390 W. Pleasantly situated on both sides, but chiefly on the E. side of Muskegon river, at its entrance into Ohio river. First settled in 1798, and is the oldest town in Ohio. The town plat contains 1000 house lots, 90 feet wide, and 180 feet deep, with spacious and airy streets, and extensive commons. It is neatly built, and contains a courthouse, jail, a United States land office, four churches, a bank, a market-house, a public library in a handsome brick edifice, the upper story of which is the hall of the Lyceum, a female academy, and the Marietta Collegiate Institute. The courthous, bank, and Collegiate Institute, are handsome specimens of architecture. The Marietta Collegiate Institute was founded in 1832, has a president and seven professors or other instructors, 50 students, and 3500 volumes in its libraries. The commencement is on the last Wednesday in July. The edifice is 75 feet long, 50 feet wide, and four stories high with the basement, the latter intended for store-rooms, and a kitchen. Manual labour is connected with the institution. The place has 17 stores, two steam saw-mills, one steam flouring-mill, two carding-machines, an iron foundry, a rope-walk, four tanneries, 250 dwellings, and 1814 inhabitants. According to the census of 1840, the village had one college, 100 students, including a primary department; one academy, 53 students; three schools, 369 scholars. The town had, in addition, six schools, 236 scholars, and 875 inhabitants. It was named in honour of *Maria Antoinette*, queen of France.

MARIETTA, p. v., capital of Cobb co., Ga., 113 m. N.W. Milledgeville, 676 W. Situated 3 m. W. of Chattahoochee river, and contains a courthouse, jail, three churches, two academies, about 30 dwellings, and 900 inhabitants.

MARIGLIANO, a town of the Neapolitan dom. prov. Neapolitano, cap. cant., 19 m. N.E. Naples. Pop. estimated at 5000. It has some ruins, which have been supposed to have formed part of an ancient palace of the Marit.

MARINO (SAN), a town and republic of Italy, under the protection of the Pope; being about the smallest, as well as the most ancient, state in Europe. The territory of the republic, enclosed on all sides by the legation of Urbino, is the Papal states, consists of a craggy mountain, about 2300 ft. high, and some adjacent hills, with one town and four villages; comprising an area of about 22 sq. m., and a pop. of 7600. The town stands on the side of the mountain above mentioned, about 15 m. S.W. Rimini, and 30 m. N.N.W. Urbino. Lat. 43° 56' 21", long. 12° 27' 5". Pop. 5500. It is accessible by only one road, and is irregularly built. It has a principal square, in which is the town-hall, five churches, in one of which are the tomb and statue of St. Marino, the founder of the town; four convents, and three castles. Its inhabitants are chiefly occupied in agriculture and cattle-breeding, or in the manufacture of silk. Most of the wealthy inhabitants of the republic reside in the village of Borgo, at the foot of the hill on which the town is situated.

The legislative powers of the government are vested in a senate, or council, of 60 members, elected for life; 30 from among the nobles, 30 from the citizens, and 30 from the rural population; and in a lesser council, or tribunal of appeal, composed of 12 senators. The executive powers belong to 2 *capitani reggenti*, chosen, every six months, by the inhabitants at large above 25 years of age; the *capitani* preside in the council of 60; and justice is administered by a *commissario*, who must not be a foreigner. Every family is obliged to furnish an individual capable of bearing arms to the military force of the republic, amounting, all, to between 800 and 900 men; but only about 40 men are ordinarily kept on duty. The state supports a hospital, and four superior and two elementary schools. Public revenue about 6000 *scudi* or crowns a year, which is sufficient to meet the expenditure. The town grew up round a hermitage formed here by an individual of the name of Marino, belonging to Dalmatia, afterwards enrolled in the calendar of saints, in the fifth century; and the insignificance and unenviable character of its territory appears by making it unworthy of attention, to have enabled it to preserve its independence during the disturbed periods of the dark and middle ages. It was occupied by Omar Benog, but for a short period only; and was taken, in 1728, by Cardinal Alberoni; but the pope disavowed the proceeding, and restored San Marino to its privileges. In 1796, Napoleon offered to increase the territory of the republic; but, this being wisely declined, he presented it with four pieces of cannon. (*Serristori*, *Stat. d'Italia*; *Addison's Tour in Italy*, &c.)

MARION, district, S.C., situated in the E. part of the state, and contains 1900 sq. m. Drained by Great and Little Pedee rivers and their branches. Bounded S.W. by Lynch's creek. It contained in 1840, 21,900 head cattle, 8352 sheep, 39,837 swine; and produced 4033 bushels of wheat, 1253 of rye, 377,041 of Indian corn, 16,416 of oats, 61,530 of potatoes, 67,943 pounds of rice, 1832 of tobacco, 603,496 of cotton. It had 12 stores, six flouring-mills &

MARION.

grist-mills, 90 saw-mills, three distilleries; two academies, 11 students; 11 schools, 330 scholars. Pop.: whites, 8963; slaves, 3551; free coloured, 86; total, 13,933. Capital, Marion, C.E.

Marion, county, Ga., situated towards the S.W. part of the state, and contains 330 sq. m. Bounded E. by Flint river, by branches of which it is drained. It contained in 1840, 4545 neat cattle, 1646 sheep, 8695 swine; and produced 3634 bushels of wheat, 110,743 of Indian corn, 9394 of oats, 8107 of potatoes, 3,256,323 pounds of cotton. It had four grist-mills, three saw-mills; one academy, 33 students, four schools, 105 scholars. Pop.: whites, 3741; slaves, 1070; free coloured, 1; total, 4812. Capital, Tazewell.

Marion, county, Alabama, situated towards the N.W. part of the state, and contains 1144 sq. m. Drained by branches of Tombigbee river and by Bear creek, which flows into Tennessee river. It contained in 1840, 13,366 neat cattle, 4315 sheep, 13,009 swine; and produced 17,467 bushels of wheat, 8130 of rye, 113,490 of Indian corn, 4395 of oats, 4153 of potatoes, 1160 pounds of tobacco, 118,064 of cotton. It had eight stores, eight grist-mills, four saw-mills, two tanneries, three distilleries. Pop.: whites, 5004; slaves, 73; total, 5077. Capital, Pikeville.

Marion, county, Miss., situated in the S. part of the state, and contains 1476 sq. m. Drained by Pearl and Leaf rivers, and Black creek. It contained in 1840, 16,763 neat cattle, 3164 sheep, 17,450 swine; and produced 102,006 of Indian corn, 4965 of oats, 39,065 of potatoes, 65,330 pounds of rye, 788,697 of cotton. It had seven stores, 30 grist-mills, 13 saw-mills, two tanneries; one school, 30 scholars. Pop.: whites, 3131; slaves, 1709; total, 3840. Capital, Columbia.

Marion, county, Tenn., situated towards the S.E. part of the state, and contains 600 sq. m. Drained by Sequatchie river and its branches. Bounded S.E. by Tennessee river. It contained in 1840, 13,051 neat cattle, 6673 sheep, 46,500 swine; and produced 77,763 bushels of wheat, 3530 of rye, 717,617 of Indian corn, 163,014 of oats, 12,073 of potatoes, 16,616 pounds of tobacco, 36,394 of cotton, 1950 of sugar. It had 31 stores, two flouring-mills, 60 grist-mills, 20 saw-mills, 19 tanneries, 54 distilleries, one pottery, one printing-office, one bindery; one academy, seven students; 19 schools, 70 scholars. Pop.: whites, 5658; slaves, 380; free coloured, 23; total, 6070. Capital, Jasper.

Marion, county, Ky., situated near the centre of the state, and contains 376 sq. m. Watered by the Rolling Fork of Salt river and its branches. It contained in 1840, 5963 neat cattle, 13,729 sheep, 31,419 swine; and produced 43,369 bushels of wheat, 16,091 of rye, 368,035 of Indian corn, 108,167 of oats, 11,561 of potatoes, 163,996 pounds of tobacco, 49,949 of sugar. It had 16 stores, three woolen-factories, 17 grist-mills, 11 saw-mills, one oil-mill, six tanneries, 30 distilleries; one college, 247 students; three academies, 228 scholars; 13 schools, 359 scholars. Pop.: whites, 6340; slaves, 9613; free coloured, 80; total, 11,033. Capital, Lebanon.

Marion, county, O., situated a little N. of the centre of the state, and contains 460 sq. m. Watered by Scioto, Little Scioto, and Olentangy or Whetstone rivers. Organized in 1834. It contained in 1840, 16,693 neat cattle, 19,641 sheep, 21,637 swine; and produced 147,153 bushels of wheat, 13,476 of rye, 328,410 of Indian corn, 9498 of buckwheat, 153,160 of oats, 77,913 of potatoes, 30,050 pounds of sugar. It had 26 stores, two flouring-mills, 15 grist-mills, 23 saw-mills, one oil-mill, 10 tanneries, five distilleries, one pottery, one printing-office, one weekly newspaper; 78 schools, 3153 scholars. Pop. 14,765. Capital, Marion.

Marion, county, Ia., situated in the centre of the state, and contains 400 sq. m. Watered by the W. Fork of White river and its tributaries. It contained in 1840, 15,406 neat cattle, 15,998 sheep, 33,463 swine, and produced 76,648 bushels of wheat, 3295 of rye, 604,366 of Indian corn, 1068 of buckwheat, 1190 of barley, 148,790 of oats, 32,432 of potatoes, 15,965 pounds of sugar. It had 94 stores, one fulling-mill, two woolen-factories, 36 cotton-factories with 1500 spindles, two flouring-mills, 36 grist-mills, 37 saw-mills, four oil-mills, 13 tanneries, 11 distilleries, three breweries, four potteries, six printing-offices, four weekly, and two semi-weekly newspapers; one academy, 75 students; 36 schools, 593 scholars. Pop. 16,090. Capital, Indianapolis.

Marion, county, Ill., situated S. of the centre of the state, and contains 376 sq. m. Drained by branches of Kaskaskia river, and by Skillet fork of Little Wabash river. It contained in 1840, 7332 neat cattle, 4783 sheep, 17,846 swine; and produced 10,667 bushels of wheat, 253,321 of Indian corn, 43,115 of oats, 5795 of potatoes, 6600 pounds of tobacco. It had five stores, two woolen-factories, 16 grist-mills, six saw-mills, two tanneries, one distillery; 17 schools, 17 scholars. Pop. 4742. Capital, Salem.

Marion, county, Mo., situated in the N.E. part of the state, and contains 423 sq. m. Bounded E. by Mississippi river. Drained by S. Pabius and North rivers. It contained 1,372 neat cattle, 10,104 sheep, 33,857 swine; and produced

MARKET-DRAYTON.

38,678 bushels of wheat, 533,785 of Indian corn, 9447 of buckwheat, 84,835 of oats, 29,654 of potatoes, 38,936 pounds of tobacco, 10,577 of sugar. It had 38 stores, four flouring-mills, 11 grist-mills, 19 saw-mills, seven tanneries, four distilleries, three printing-offices, three weekly newspapers; one college, 49 students; 24 schools, 648 scholars. Pop.: whites, 7330; slaves, 2342; free coloured, 42; total, 9623. Capital, Palmyra.

Marion, county, Ark., situated in the N. part of the state, and contains 880 sq. m. Watered by White river, which is navigable for steamboats to the N. part of the county, and by its branches. It contained in 1840, 3217 neat cattle, 760 sheep, 5430 swine; and produced 3097 bushels of wheat, 78,013 of Indian corn, 1951 of oats, 1601 of potatoes, 6187 pounds of tobacco, 3533 of cotton. It had two stores, four grist-mills, two saw-mills, one tannery, three distilleries. Pop.: whites, 1291; slaves, 39; free coloured, 66; total, 1335. Capital, Yellville.

Marion, t., Greene co., Pa. It has 12 stores, two tanneries, two printing-offices, one weekly newspaper; two schools, 61 scholars. Pop. 397.

Marion, p. t., Wayne co., N.Y., 201 m. W. by N. Albany, 355 W. Drained by a branch of Mud creek. It contains a Presbyterian and a Baptist church, three stores, two grist-mills, three saw-mills, one tannery; one academy, 32 students; 12 schools, 333 scholars. Pop. 1903.

Marion, v., capital of Marion dist., S.C., 146 m. E. Columbia, 223 W. Situated on the E. side of Catfish creek, a branch of Great Pedee river. It contains a handsome brick courthouse, a jail, an academy, 30 dwellings, and about 100 inhabitants.

Marion, p. t., capital of Marion co., O., 44 m. N. Columbus, 416 W. Watered by Little Scioto river and its branches. It contains 13 stores, one flouring-mill, three grist-mills, five saw-mills, two tanneries, one distillery; eight schools, 330 scholars. Pop. 1639. The village contains an elegant brick courthouse, 66 by 45 feet, a jail, two churches, a Presbyterian and Methodist, 12 stores, a printing-office, issuing a weekly newspaper, 100 dwelling, and 570 inhabitants.

Marion, t., Athens co., O. Watered by Federal and Wolf creeks. It contains three stores; six schools, 128 scholars. Pop. 1019.

Marion, t., Hocking co., O. Pop. 940.

Marion, t., Putnam co., Ia. It has two stores, one grist-mill, two saw-mills; five schools, 451 scholars. Pop. 1030.

Marion, p. v., capital of Smyth co., Va., 275 m. W. by S. Richmond, 343 W. Situated on the middle fork of Holston river. It contains a courthouse, jail, and several stores and dwellings. Nett proceeds of the postoffice, \$193.

Marion, p. v., capital of Twiggs co., Ga., 41 m. S.W. Milledgeville, 659 W. Situated 8 m. E. of Ocmulgee river. It contains a courthouse, jail, six stores, 90 dwellings, and about 125 inhabitants.

Marion, v., capital of Grant co., Ia., 73 m. N.N.E. Indianapolis, 569 W. Situated on Mississippi river, about 35 m. from its entrance into Wabash river. It contains a courthouse, jail, a store, and several dwellings. Nett proceeds of the postoffice, \$698.

Marion, p. v., capital of Perry co., Ala., 58 m. S. Tuscaloosa, 634 W. It contains three churches, two female academies, one male lyceum with a preparatory school, three weekly newspapers, and about 1000 inhabitants.

Marion, p. v., capital of Lauderdale co., Miss., 110 m. E. Jackson, 991 W. It contains a courthouse, jail, and several stores and dwellings. Nett proceeds of the postoffice, \$809.

Marion, p. v., capital of Linn co., Iowa. Situated 4 m. E. of Cedar river. It contains three stores, a saw-mill, and several neat dwellings.

MARION CITY, p. v., Marion co., Mo., situated on the W. bank of Mississippi river, and may be regarded as the port of Palmyra, the capital of the county. It extends for a mile and a half along the river, and has two large steam saw-mills, three other steam-mills, 70 dwellings, and about 400 inhabitants. Most of the merchandise of the county is landed here.

MARION COLLEGE, p. v., Marion co., Mo., 134 m. N.N.W. Jefferson city, 938 W. Situated 12 m. W. of Palmyra, the capital of the county. Marion college was founded in 1831, and its manual labour institution, for which 5080 acres of the best land have been purchased, and improvements have been made on them to the amount of \$70,000. The president, professors, and students, are supported from the products of the soil. Including the preparatory department, it has a president, six professors or other instructors, 116 students, 43 in the college proper, and 3300 volumes in its libraries. The commencement is on the last Thursday in September. It has a theological department.

MARKET-BOSWORTH. See BOSWORTH (MARKET).
MARKET-DRAYTON, a market town and par. of England, partly in N. Bradford hund., co. Salop, and partly in N. Firehill hund., co. Stafford, on the Tern, a tribute of the

MARKET-HARBOROUGH.

Severn, 18 m. N.E. Shrewsbury, and 135 m. N.W. London. Area of par., 13,000 acres. Pop. in 1831, 4619. The town, which stands on the W. side of the river, and in the county Salop, having been recently much improved, is now clean and well built, with tolerably wide streets. The church, originally erected in the reign of Stephen, was all but rebuilt in 1787. There are also places of worship for Roman Catholics, Wesleyan Methodists, and Independents, with attached Sunday schools. The charitable institutions comprise a free school, founded in the reign of Queen Mary, a national school, and a set of almshouses and dispensary, with a few small money bequests. Drayton was formerly a place of more consequence than at present; its market having been among the largest in England, till the formation of the Liverpool and Birmingham Junction canal gave superior advantages to Stone, in Staffordshire. There are two paper-mills and two horse-hair manufactories close to the town; but most of the inhabitants are engaged either in retail trade or farming pursuits.

Drayton is a borough by prescription, governed by a mayor and two constables, chosen at a court-leet by the lord of the manor; and petty sessions are held here for the Drayton division of Salop. Markets on Wednesdays, chiefly for corn; fairs, for horses and farming-stock, Wednesday before Palm-Sunday, September 19, and October 24.

About one mile from Drayton, on Blore-heath, a battle was fought between the partisans of the houses of York and Lancaster, on the 23d of September 1459. Lord Audley, the Lancastrian general, was slain in the engagement; the spot where he fell being marked by a stone, close to Newcastle road.

MARKET HARBOROUGH. See HARBOROUGH (MARKET).

MARKET-JEW. See MARAZION.

MARKET-RASIN, a small market town and par. of England, Lindsey div., co. Lincoln. wap. Walshcroft, on the river of its own name, a tributary of the Ancholme, 134 m. N.E. Lincoln, and 130 m. N. London. Area of par., 1290 acres. Pop. in 1831, 1428. This town deserves notice, chiefly on account of its large cattle and sheep fairs, which are attended by persons from almost all parts of the county. The church, an ancient structure, with an embattled tower, has peculiar windows, resembling those of the church at Louth. The living is a vicarage in the gift of the lord chancellor. The Roman Catholics and Wesleyan Methodists have also their respective places of worship; and its only charities are a free school (now incorporated with the national school), and a set of almshouses. Markets on Tuesdays; and fairs on alternate Tuesdays, between Palm Sunday and September 23. About 14 m. W. Market Rasen is the village of Middle Rasen, remarkable for a small church presenting a most beautiful specimen of early Norman architecture.

MARKSVILLE, p. v., capital of Ascovilles par., La., 325 m. N.W. by W. New-Orleans, 1918 W. It contains a courthouse, jail, and several stores and dwellings. Nett proceeds of the postoffice, \$308.

MARLBOROUGH, a parl. and mun. bor. and market town of England, co. Wilts. hund. Selkley, on the Kennet, 27 m. E. Bath, and 70 m. W. London. Area of parl. bor. (which includes, with the old bor., the par. of Freshute), 4399 acres. Pop. in 1831, 4188. The town consists of one broad main street, crossed by others of inferior dimensions. The houses are irregularly built, and apparently of great antiquity, having high and curiously carved gables; a portion of the High-street also has a kind of colonnade projecting from the houses. The guildhall is supported on pillars, the lower part being open for the accommodation of the people frequenting the market; above are the council-chamber, session-hall, and assembly-rooms. There is also a handsome market-house, the upper part of which is used as a national school. The prison, which serves as a bridge-well and house of correction, was built in 1787; but it is too small to admit either of separate confinement or proper classification, and there is no provision for hard labour. There is also a very large hotel, partly built with the materials of the old castle, which once stood at the S. end of High-street. The old church of St. Mary the Virgin, near the guildhall, is of early Norman architecture, with a low square tower; the living is a vicarage, in the gift of the Dean of Salisbury. The other church, which stands at the W. end of High-street, is of more modern construction, and distinguished by its light spinnaced tower; the living is a rectory, in the patronage of the Bishop of Salisbury. The Independents, Wesleyan and Calvinist Methodists have likewise their respective places of worship, with attached Sunday-schools. The national school furnishes gratuitous instruction to 100 boys and the same number of girls; besides which, there are two church Sunday-schools. It has also a free grammar school, founded by Edward VI. and endowed with estates producing about £70 a year: the instruction is almost exclusively classical; and the school

MARLOW.

has the privilege of sending an exhibitor, on the Somerset foundation, to Brasenose college, Oxford.

Marlborough has little trade, and derives its chief importance from being on the great road between London and Bath; but it will soon lose this advantage, as the Great Western railway runs through a line of country considerably N. of the town. Malt and rope-making are extensively pursued. Large quantities of corn and cheese are sent to London and Bristol; their carriage being greatly facilitated by the Kennet and Avon canal, which commences at Newbury, and joins the Avon near Bath, having an entire length of 57 m. "The town has likewise several excellent inns and shops, possesses a large market for the agricultural district, and may be considered in a prosperous state, and highly respectable." (*Ann. Board. Rep.*, p. 2, *Marlboro'.*)

The borough, which received its first charter from King John, in 1203, and a subsequent one, in 1577, from Elizabeth, is governed, under the Municipal Reform Act, by a mayor, three other aldermen, and 18 councillors; but it has no separate commission of the peace. Corporation revenue, in 1839, £239 (exc. of £358, accruing from the sale of property). Marlborough has sent two members to the House of Commons since 94 Edw. I.; the right of election, down to the Reform Act, being vested in the mayor and burgesses; but it was, in fact, a mere nomination borough, belonging to the Marquis of Aylesbury. Registered electors, in 1839-40, 389. Markets on Saturday; large fairs, July 18, Aug. 1, and Nov. 23. (*Mun. Corp. Rep.*; *Parl. B. Rep.*, part vi.; *Oxford Calendar*; *Priv. Inform.*)

MARLBOROUGH, district, S.C., situated in the N.E. part of the state, and contains 480 sq. m. Bounded S.W. by Great Pedee river, and drained by its tributaries. It contained in 1840, 9374 neat cattle, 3993 sheep, 15,915 swine; and produced 9276 bushels of wheat, 1417 of rye, 375,990 of Indian corn, 22,161 of oats, 39,547 of potatoes, 2,446,068 pounds of cotton. It had 17 stores, one cotton factory with 9000 spindles, six flouring-mills, 91 grist-mills, 30 saw-mills; three academies, 104 students; 13 schools, 329 scholars. Pop.: whites, 4188; slaves, 4118; free coloured, 103; total, 9408. Capital, Bennettsville.

MARLBOROUGH, p. t., Cheshire co., N.H., 53 m. S.W. Concord, 439 W. Drained by branches of Ashuelot river. Incorporated in 1776. It has one store, one grist-mill, five saw-mills; six schools, 301 scholars. Pop. 831.

MARLBOROUGH, p. t., Windham co., Vt., 120 m. S. Montpelier, 431 W. Chartered in 1761. Drained by the W. branch of West river, by Green river, and by Whetstone brook. It contains three churches, a Congregational, Baptist, and Universalist; one store, two grist-mills, eight saw-mills, one paper-mill; 13 schools, 377 scholars. Pop. 1067.

MARLBOROUGH, p. t., Middlesex co., Mass., 37 m. W. Boston, 414 W. A branch of Concord river affords water-power. It contains four churches, a Congregational, Methodist, Restorationist, and Universalist; six stores, five grist-mills, five saw-mills, two tanneries; one academy, 75 students; 10 schools, 750 scholars. Pop. 2101.

MARLBOROUGH, p. t., Hartford co., Ct., 16 m. S.E. Hartford, 340 W. Chartered in 1803. It contains a Congregational church, two stores, one cotton-factory with 1200 spindles, one grist-mill, four saw-mills; five schools, 185 scholars. Pop. 713.

MARLBOROUGH, p. t., Ulster co., N.Y., 30 m. E. Kingston, 84 m. S.S.W. Albany, 294 W. Bounded E. by Hudson river. Drained by Old Man's kill. It contains three churches, a Presbyterian, Methodist, and Friends'; eight stores, two woollen-factories, one paper-mill; seven schools, 31 scholars. Pop. 2523.

MARLBOROUGH, t., Montgomery co., Pa. Drained by Perkiomer and Swamp creeks. It contains iron ore, and has five stores, one furnace, one forge, one woollen-factory, 74 grist-mills, three saw-mills, 10 powder-mills, one printing-office, one weekly newspaper. Pop. 1140.

MARLBOROUGH, p. t., Stark co., O., 135 m. N.E. Columbus, 312 W. Pop. 1671.

MARLBOROUGH, t., Delaware co., O. It has five schools, 150 scholars. Pop. 1182.

MARLOW (GREAT), a parl. bor., market-town, and par. of England, co. Bucks, hund. Desborough, on the N. bank of the Thames (here crossed by a handsome suspension-bridge), 29 m. W. London. Area of parl. bor., which includes the several pars. of Great Marlow, Little Marlow, Medmenham, and Bisham (the last being in Berks), 14,916 acres. Pop. in 1831, 6175. The town, formed by several streets, meeting in a large open market-place, is irregularly built; but is well paved and lighted, and contains many substantial houses, and a good town-hall. The parish church, opened in 1835, is a handsome structure, surmounted by a spire. The living is a vicarage, in the gift of the dean and chapter of Gloucester. There are, also, places of worship for Wesleyan Methodists and Baptists, with attached Sunday-schools. A charity school, for 24 boys and

MARMANDE.

12 girls, a national school, for children of both sexes, and a set of almshouses, are the principal benevolent foundations. Great Marlow has little trade, except what results from its position, in the midst of a rich and productive country, inhabited by wealthy land-owners. On the London, however, are several paper-mills; and, "on the whole the town is slowly recovering from a state of great depression, consequent to the removal, some years ago, of the military college." (*Parl. Bound. Rep.*) The borough has returned two members to the House of Commons, with some interruptions, since 98 Edw. I.; the right of election being vested, down to the Reform Act, in householders, paying scot and lot. The Boundary Act extended the limits of the parliamentary borough, by including with the old bor. three out-parishes. Registered electors, in 1830-40, 397. Market, well attended, on Saturdays; fairs, for cattle and farming produce, May 1-3 and Oct. 29. (*Parl. Pap.*, &c.)

MARLOW, 1, Cheshire co., N. H. Drained by Ashuelot river and its branches. It has four saws, one fulling-mill, one grist-mill, four saw-mills: one academy, 19 students; six schools, 150 scholars. Pop. 636.

MARMANDE, a town of France, dep. Lot-et-Garonne, cap. arrond., on the Garonne, here crossed by a bridge of one arch, 30 m. N.W. Agen. Population (1836), ex. com., 4968. It is regularly laid out, well built, and clean; has several good public edifices, and is nearly surrounded by an esplanade, planted with trees. It has a small port, suitable for steamboats, which ascend the Garonne as high as Marmande. It is the seat of courts of original jurisdiction and commerce; and has manufactures of woollen and linen fabrics, cordage and sailcloth, and several brandy distilleries. (*Hugo, art. Lot-et-Garonne, &c.*)

MARNE, a dep. of France, reg. N.E., formerly included in the prov. of Champagne, chief between lat. 46° 30' and 49° 30' N., and long. 3° 30' and 5° E., having N. Ardennes and Aisne, W. the latter department and Seine-et-Marne, S. Aube, and E. Haute-Marne and Meuse. Length, E. to W., about 70 m.; greatest breadth, nearly as much. Area, 817,037 hectares. Population (1836), 345,945. The hills in this department do not rise to more than 1300 feet above the sea; its general slope is from S.E. to N.W., in which direction nearly all its rivers flow. It derives its name from the Marne, which divides it into two nearly equal parts. This river rises in the department of Haute-Marne, about 3 m. S. Langres; it flows, at first N.W. and afterward generally W., through the departments of Haute-Marne, Marne, Aisne, Seine-et-Marne, Seine-et-Oise, and Seine; and falls into the Seine at Charenton, about 1 m. S.E. Paris, after a course of about 300 m., for 215 of which it is navigable. It has some considerable affluents; and Vitry, Châlons, Châtillon-Thierry, and Meaux are on its banks. About two thirds of this department, including all its central portion, has an arid, barren soil, composed principally of chalk, covered with a thin layer of vegetable mould. But on the borders of this sterile tract are the vineyards which produce the celebrated champagne wine; and surrounding it is a country with a deep and rich alluvial soil. In 1834 the cultivated land was estimated at 614,285 hectares, pastures at 38,454 ditto, vineyards, 18,495 ditto, woods, 78,901 ditto, and heaths, wastes, &c., 16,951 ditto. Considerably more corn is grown than is required for home consumption. Its average annual amount has been estimated at 3,000,000 hectol.; but, according to the official tables, 4,570,000 hectol. were harvested in 1835, chiefly wheat, oats, and rye. The culture of the vine is, however, by far the most important branch of industry. The department is supposed to furnish annually from 650,000 to 700,000 hectol. Of this quantity, however, the finest growths, produced in the arrondis. of Epernay and Reims, make but a small portion. The red wines "se distinguent par beaucoup de finesse, de délicatesse, et d'agrément; ils occupent un rang distingué parmi les meilleurs vins fins du royaume." (*Jullien*, 21) But the white wines, which include the finest varieties of champagne, are by far the most celebrated. They are of three sorts, *still, mousseux, and grand mousseux*. The *vrais gourmets* prefer the first, or still wines, of whichillery (which see) is the best; but the greater number of amateurs prefer the mousseux, being that variety of the sparkling wine which merely creams on the surface; the *grand mousseux*, or full frothing wines, are less esteemed. The wine of Ay, the best of the mousseux variety, is an exquisite liquor, worthy, according to the President De Thou, of being called *Pinum Dei*! The best of the red wines are those of Verzy, Verzenay, Mailly, Bouzy, St. Basle, Clos-Thierry, &c. The vineyards round Epernay are valued at from 4000 to 10,000, and even 20,000 francs the arpent; and about 5400 *pieces* of vines of the finest growths are produced annually in its arrond. and that of Rheims, about a half of which is exported to foreign countries. Rheims, Epernay, and Azy are the chief seats of the wine trade. Epernay has extensive vaults, excavated in tufa, and admirably fitted for the preservation of wines. (*See EPERNAY.*)

MAROS-VASARHELY.

Agriculture, according to Hugo, is in a tolerably advanced state. Near St. Manebould orchards are numerous. More cattle are reared than in any of the adjacent departments, the number, in 1830, being about 190,000. In the same year the department was estimated to have 304,000 sheep, the breeds of which have been much improved by crossing with merinos and English varieties. In 1833, of 179,316 properties subject to the *contribution foncière*, 98,583 were assessed at less than 5 francs, and 94,897 at from 5 to 10 francs; 134 were assessed at 1000 fr. and upward. *Il y a de l'aisance dans le pays, mais il n'y a pas de grandes fortunes. On n'y voit point le cultivateur affligé de l'extrême opulence et de la misère; la mendicité n'y règne point.* (*Hugo*). Marne has but one iron mine; but it furnishes excellent mill-stones, potter's clay, &c. Manufactures of various kinds of woollen fabrics, woollen yarn, &c., are established at Rheims; and hats, silk goods, paper, glass, earthenware, cordage, leather, candles, and soap are made in different places. Marne is divided into five arrondis.; chief towns, Châlons-sur-Marne the cap., Epernay, Rheims, St. Menould, and Vitry-le-François. It sends six members to the chamber of deputies. Number of electors (1838-39), 9308. Total public revenue (1831), 13,299,636 francs; expenditure, 16,688,985 francs. (*Hugo, art. Marne; Official Tables; Jullien, Topographie des Vignobles; Henderson on Wine*, p. 153, &c., *MAIRY* (HAUTE), a dep. of France, reg. N.E., between lat. 47° 20' and 49° 40' N., and long. 4° 40' and 6° E., having N. the depts. of Marne and Meuse, E. Vosges and Haute-Saône, S. the latter and Cote d'Or, and W. Cote d'Or and Aube. Length, N.N.W. to S.S.E., 90 m.; average breadth, about 30 m. Area, 625,043 hectares. Population (1836), 240,287. The plateau of Langres and the Faucilles mountains traverse the S. and E. parts of this department, covering the greater part of its surface with their ramifications. They, however, nowhere rise to any great elevation; Mont-sigri, the highest point in Haute-Marne, being only 1630 feet above the sea. The chief rivers are the Marne, which intersects the department lengthwise; its affluents the Ornain, Blaise, Meuse, and Aube, rise in this department, and have, more or less, a N. course. Surface mostly stony or calcareous; there not being more than 11,000 hectares of rich soil. In 1834, however, the arable land was supposed to comprise 335,611 hectares; pasture land, 35,526 do.; vineyards, 13,136 do.; woods, 174,975 do.; and heaths, wastes, &c., 97,989 do. The farmers devote their attention to the growing of corn, the culture of the vine, and the rearing of live stock. The produce of corn exceeds the demand for home consumption; the annual supply is estimated at nearly 1,800,000 hectolitres, chiefly wheat and oats. The produce of wine amounts to between 400,000 and 500,000 hectol. a year; but the quality is very inferior to that of the wines of Marne. Cherries and walnuts are grown in considerable quantities. The pasture lands are excellent; and, in 1830, there were 84,000 head of cattle, and 921,000 sheep in the department; the annual produce of wool is estimated at 100,000 kilograms. In some castons of the arrond. Vassy a good many turkeys are reared. Bees are numerous, and wax and honey are valuable products. This is one of the best wooded departments in France, and St. Dizier has a considerable trade in timber, sent in large quantities to Paris by the Marne. Iron is the only metal found in the department, but the working of the iron mines, and the manufacture of their produce, hold a high rank among the occupations of the people. The department has upward of 50 smelting furnaces (*hauts-fourneaux*), and 100 ordinary forges. Iron plates, rasps, files, and hardware of all kinds are manufactured; and the cutlery of Langres has long enjoyed a high reputation. Chaumont has manufactures of gloves and haberdashery. Linen and cotton thread, wax, candles, leather, brandy, and vinegar are the other chief articles made in the department. In 1835, of 124,714 properties, subject to the *contribution foncière*, 72,694 were assessed at less than 5 francs, and 16,700 at from 5 to 10 francs. Haute-Marne is divided into three arrondis.; chief towns, Chaumont the cap., Langres, and Vassy. It sends four members to the chamber of deputies. Number of electors (1838-9), 1004. Total public revenue (1831), 6,798,503 francs. (*Hugo, art. Haute-Marne; Official Tables, &c.*)

MAROS-VASARHELY, or SEKELY-VARSARHELY (Germ. *Neumarkt. Wallach. Ockerof*), a royal free town of Transylvania, the cap. of the Szekler-land, and of the *Stabla*, or presidency, of Maros; on the Maros, 33 m. N.N.E. Hermanstadt. Pop. 7000. "Although there is nothing very imposing in the wide streets and small houses of which Maros-Vasarhely is mostly composed, it is rather an important place; and, in winter, many of the gentry in the neighbourhood take up their residence within it. Moreover, both Protestants and Catholics have colleges here: the Protestant has 800, and the Catholic 300, scholars; and these institutions give something of a literary air to its society. Maros-Vasarhely is also the seat of the highest legal tribunal in Transylvania, the Royal Table; and it is, in com-

MARQUETTE.

sequence, the great law-school of the country. Almost all the young nobles who desire to take any part in public business, as well as all the lawyers, after having finished their regular course of study, think it necessary, under the name of *Jurates*, to pass a year or two here in reading law, and attending the court.

"The great pride of the town is the fine library of the Teleki, founded by the Chancellor Teleki, and left to his family, on the condition of its being always open to the public. It contains about 80,000 volumes, which are placed in a very handsome building, and kept in excellent order. It is most rich in choice editions of the Latin and Greek classics." (*Paget's Hungary and Transylvania*, ii., p. 393, 394.) The town has a Roman Catholic gymnasium and seminary, a reformed college, with a library and printing-office, two convents, a flourishing casino, or literary club, and considerable trade in agricultural produce, particularly tobacco, which is grown in large quantities in this vicinity. (*Paget; Berghaus; Oesterr.; Nat. Encyc.*)

MARQUETTE, county, Wis. Situated in the N. part of the settled portion of the territory. Bounded N.W. by Fox river, which runs through Puckaway lake. It is very little settled, and had, in 1840, 45 neat cattle, 20 swine, and only 18 inhabitants. Capital, Marquette, on the S. side of Nunah river.

MARSALA (an. *Lilybeum*), a city and seaport of Sicily, at its W. extremity, adjacent to Cape Boeo (the *Promontorium Lilybeum*), in the intend. of Trapani, 16 m. S.S.W. Trapani; lat. 37° 48' 10" N.; long. 29° 25' 10" E. Pop., in 1831, 23,368. It is of a square form, and is surrounded by an old wall, flanked at the angles with bastions, but destitute of a glacis. It might be easily rendered a strong military post; but at present, it is without ordnance, quarters, or bomb-proof stores. The town, which is pretty well built, is bisected by a broad and regular street, called the Casarso, on one side of which is the cathedral, a large edifice, ornamented with 16 fine marble columns of the Corinthian order. It has 16 churches, numerous convents, a *retiro*, or place of retirement under monastic regulations, three abbeys, a gymnasium, a seminary, a hospital, with 70 beds, a *monte-di-pieta*, barracks for cavalry, an old castle, &c. Among its curiosities is a bell tower, which vibrates perceptibly when the bell is rung.

Lilybeum was famous for its port; but, though secure, and well adapted for the use of the gallees of the ancients, it would not have accommodated the larger ships of modern times. Captain Smyth says, that where deepest, the ancient port could not have had more than 14 ft. water. The Romans, in their struggles with the Carthaginians, attempted over and over again to fill up the port, but uniformly without success. This, however, was effected, 1570, by Don John of Austria, who, to prevent the Barbary corsairs from taking refuge here, filled up the port with rubbish. The modern is not, therefore, identical with the ancient harbour, but is about 1 m. S. from the town. It has a mole, constructed by Mr. Woodhouse, for the convenience of the shipment of his wine: large ships anchor S.W. from the city, about 2 m. off shore, in from 8 to 11 fathoms water. The entrance to the port is a good deal encumbered with rocks and reefs; the knowledge of which is as indispensable to the modern as it was to the ancient mariners. (*Smyth's Sicily*, p. 233.)

Marsala is indebted for its importance in modern times to its wine trade; which has grown up, within the last half century, through the skill and intelligence of the Messrs. Woodhouse, Englishmen, who began business here in 1789. The wine, however, did not begin to come into much repute till 1803, when it was supplied, by order of Lord Nelson, to the Mediterranean fleet. It is a dry wine, the best qualities closely resembling the lighter sorts of Madeira; but the extensive demand for it in this country is, no doubt, ascribable more to its cheapness than its quality. It is, however, in all respects, superior to Cape Madeira, with which it principally comes into competition. The success of the Messrs. Woodhouse has led others to embark in the business; and Mr. Ingham and Mr. George Wood have also very large establishments at Marsala. The entire produce of the district is estimated at about 30,000 pipes, of which from 18,000 to 20,000 are exported, partly to the U. States and the W. Indies, as well as to England. In 1823 the entries of Marsala for home consumption in the United Kingdom amounted to 79,696 gallons; whereas, in 1839, they amounted to 369,417 gallons; but, for some years past, the consumption has been pretty stationary.

Besides wine, Marsala exports corn, cattle, oil, salt and soda; but in no great quantities. In 1839, 37 British and nine American ships, of the aggregate burden of 6508 tons, cleared out from Marsala. (*Macgregor's Report on the Commercial Statistics of the Two Sicilies*, passim; *Commercial Dict.; Official Accounts*, &c.)

Lilybeum, from its proximity to Carthage, and the excellence of its port, was, for a lengthened period, the capital of the Carthaginian possessions in Sicily. It was a place of

MARSEILLES.

great strength; being fortified by strong walls and a deep ditch, into which the sea appears to have flowed (*Polybius*, lib. i., cap. 48); indeed a portion of the ancient ditches still exist in tolerable preservation. (*Heuri's Classical Tour*, ii., 73.) The size of the city may be inferred from the fact of its requiring a garrison of 10,000 men, exclusive of the citizens, for its defence. The successful resistance it opposed to Pyrrhus, by whom it was attacked with great fury, and its defence against the Romans, sufficiently evince its strength and importance. After having ineffectually attempted to carry it by assault, the Romans converted the siege into a blockade; and the city only surrendered at the end of five years, when the defeat of Hannu made further resistance unavailing. (*Ancient Universal History*, xvi., 531, &c., 8vo. ed.) Under the Romans it was the residence of a questor, and is called by Cicero, *civitas splendidissima*. (*In Verrem*, v., cap. 5.) Very few remains now exist of its ancient grandeur; vases, coins, &c., are, however, occasionally dug up; and in the town-hall is a group of two lions destroying a bull, said to be worthy the best period of Grecian art.

MARSEILLES (Fr. *Marseille*, an. *Massilia*), a large commercial city and seaport of France, dep. Bouches-du-Rhône, of which it is the cap., on the E. side of a bay of the gulf of Lyons, 30 m. W.N.W. Toulon, about 170 m. S.S.E. Lyons, and 490 m. S.E. Paris; lat. 43° 17' 48" N., long. 5° 52' 15" E. Pop. of the city, ex. suburbs, in 1836, 190,455; and inc. suburbs, 146,239: but this official statement is said to be under the mark, and it is alleged that, including strangers, the pop. is now (1840) at least 170,000. (*Conducteur dans Marseille*.)

"The situation of Marseilles," says Mr. MacLaren, "is one of the most beautiful I ever saw. It occupies the centre of a basin about 6 m. or 7 m. broad, bounded by lofty precipitous hills. The whole space from the city, back to the hills, is adorned with villas and hamlets; for every merchant or respectable shopkeeper here has his *maison de campagne*. These buildings are showy, sometimes large and splendid. They are called *Bastides*, and I learn that their number is not less than 5,000." (*Notes on France and Italy*, p. 28.) The country around is, however, extremely arid; and the wind called the *mistral* is blighting and noxious in the extreme. The city is somewhat of a horse-shoe shape, and built round its port. It is divided into two parts:—The first, or old town, occupying the site of the ancient Greek city, on rising ground, on the N. side the harbour, is confined, ill-built, with narrow dark streets, or rather lanes, not half ventilated, and inconceivably filthy. The second, or new town, constructed in the modern style, with regular streets, and handsome squares and houses, stands on the S. and E. sides of the port; being separated from the old town by a magnificent street, which extends in a right line from the Porte d'Aix to the Porte de Rome, traversing the city in its entire length N. to S. The middle part of this street, called the *Cours*, is sheltered by trees; the houses on either side are good; it has some handsome fountains, and is one of the chief places of public resort: but the favourite public promenade is the *Rue Casabian*; a fine broad street, running at a right angle from the far-going to the inner extremity of the harbour, and completing the line of demarcation between the old and new town. Marseilles has been fortified at different periods; but its walls were finally destroyed in 1800; and their place is occupied by boulevards planted with trees, beyond which the city rapidly extending, particularly towards the E. and S. It still, no doubt, is defended by the fort of *Notre Dame de la Garde*, on a steep eminence to the S.; but it is more remarkable for the beauty of its situation than for its strength: the harbour (see port) is protected by a fort on either side its entrance, by the Château d'If, on the island of the same name, and by some additional works on the islands of *Ratoneau*, *Pomone*, &c., nearly opposite its mouth.

Marseilles has numerous public edifices, but none merit any detailed notice. The cathedral occupies the site of an ancient temple of Diana; it is extensive but heavy-looking. Its interior is a mixture of various orders; and in ornament, which are mostly of the 11th and 12th centuries, are in bad taste. In fact none of the churches within the city have any considerable claims to notice. The church of *S. Madeleine* (formerly *des Chartreux*), in the suburbs, an edifice constructed in the 17th century, is far superior to any one else; it has a handsome façade, and 2 steeples (*campaniles*), remarkable for their light appearance. There are in all about 30 Rom. Cath. churches, several chapels, two Greek churches, a Protestant church, and a synagogue. The Prefecture is the finest of the public buildings. The town-hall, on the N. quay, is a heavy edifice, composed of two separate piles of building, connected by a light and elegant arcade on the first story. Its ground floor is appropriated to the exchange. There are numerous hospitals, and other charitable institutions. The Hôtel Dieu, one of the first established hospitals in France, was founded in 1185; it has usually from 500 to 800, and is capable of accommodating 750 patients. The

MARSEILLES.

Hôpital de la Charité, founded in 1640, an asylum for aged persons, and for orphans, foundlings, &c., has usually from 600 to 850 inmates. The *Lazaretto*, one of the largest and most perfect establishments of the kind in Europe, is situated to the N. of the city, and is surrounded by a triple wall. Ships may clear from it while in quarantine. Marseilles has also a lying-in hospital, a *berceau de bienfaisance*, asylums for poor children, a *mont-de-piété*, and a savings' bank. One of the largest public edifices, formerly a Bernardine convent, accommodates the Royal college which has between 300 and 400 students; the Royal society of science, literature and art; the public library of 50,000 printed vols., and 1300 MSS., with cabinets of natural history, medals, and antiquities, &c., and a gallery of paintings, comprising works by Carracci, Salvator Rosa, Rubens, Vandyk, Jordane, and other artists of the Italian and Flemish schools. The observatory, on the highest point of the old town, has apartments appropriated to schools of navigation, geometry, &c. The Grand theatre, built after the plan of the Odeon in Paris, is spacious and handsome. It has six tiers of boxes; but is in general ill-attended. The *Théâtre Français*, a small building, open on Sundays for vaudevilles, and on other days for occasional concerts, is more frequented. The other chief public buildings and establishments are the hall of justice, the new prison, the custom-house, arsenal, barracks, mint, bishop's palace, various public halls, the fish market, &c. Marseilles has a botanic garden, and some excellent public walks. It is well supplied with water from fountains and public wells, but it is not introduced into the houses. At the extremity of the Rue d'Aix is an unfinished triumphal arch, the Corinthian order, originally erected in honour of the Duc d'Angoulême, after his invasion of Spain in 1823; but it is not intended to commemorate the revolution of 1830, one of the effects of which was to strip the Duc d'Angoulême from the kingdom: Marseilles has but few remains of antiquity. Except a fountain, with an inscription in Greek, an obelisk, and the remains of an aqueduct, none is worthy of mention. It is doubtful, indeed, whether Marseilles possessed any grand or remarkable edifices in antiquity; and if she did, the corroding influence of the sea air, which proves detrimental to the modern buildings, has been a powerful agent in their destruction. But the Marseillais, for a lengthened period, took little interest in the preservation of the relics of past ages; and, says Hugo, "lorsque l'esprit de conversation entra dans les mœurs, il n'y avait plus rien à conserver."

Marseilles is the see of a bishop, suffragan under Aix; the seat of tribunals of primary jurisdiction and commerce; a chamber of commerce; the residence of a commissary-general and a treasurer of marine; and the head-quarters of the 8th military division of the kingdom. Consuls from all the principal states of Europe and America are resident in it. Besides the public institutions before noticed, it has a diocesan seminary, a royal society of medicine, societies of agriculture and *belles lettres*, a statistical society, an atheum, and several commercial and other clubs. Three newspapers (two of them daily), and several literary journals are published in the city; the principal of the former are the *Scènes de Marseille*, and the *Gazette du Midi*.

The port, to which Marseilles is wholly indebted for her early and long continued prosperity, is a fine basin, stretching from W. to E. about 1,000 yards, into the very centre of the city. It has from 16 to 19 ft. water at its entrance, and from 19 to 24 ft. within; so that it is extremely well fitted for moderate-sized merchantmen, of which it will accommodate from 1000 to 1300. The ships come close to the quays, by which it is surrounded on all sides, except at its entrance, which is defended on its N. side by the tower of St. John, a work of the 15th century, and on its S. side by fort St. Nicholas, constructed by Louis XIV. The careening basin, on the right side of the harbour, occupies the site of the ancient necropolis.

Unluckily, this fine basin becomes, from its position, the common sewer, as it were, or receptacle for all the filth of the city; and, as it is not agitated by tides, which are here hardly perceptible, nor by storms, from which it is screened on all sides, nor swept by any current, the water is completely stagnant; and, unless the mud were removed by dredging-machines, it would in no very long time be entirely filled up. But in hot weather the stench arising from this torpid reservoir, and from the detestably filthy streets of the old town, is absolutely intolerable, at least to those not habituated to it; and has doubtless been the cause of Marseilles having suffered so dreadfully on various occasions from the plague, and more recently from the cholera. Such a state of things is a disgrace to a civilized country. And we agree with Mr. Maclean in thinking that, next to the enforcing of proper sanitary regulations in the old town, the best thing that could be done to improve the city would be to cut a canal from the *Anse de Joliette*, on the coast, to the harbour, which would at once create a current, and freshen and agitate the water in the latter. In its present state, Marseilles has been

truly described as a "vast cloaca." We doubt, indeed, whether there be a single water-closet in the city.

There is excellent anchorage ground for men of war and other large ships, about 3 m. W.S.W., between the isles of Ratoneau and Pomegues; which have been connected by a mound. Ships from the Levant perform quarantine at Pomegues; and on Ratoneau island is a hospital for those whose health is dubious. A lighthouse, with a revolving light, 131 ft. in height, is erected on the Isle de Planier, about 10 m. from the city, and there is another in Fort St. Jean. Ships having got within a quarter of half a mile of the Isle d'If, usually heave to for a pilot. The charge for pilotage is four sous per ton, and two sous per do. out, for French vessels and vessels belonging to powers having reciprocity treaties with France. With the exception of the above pilotage charges, and the charges on vessels performing quarantine, there are no port charges on ships entering or clearing out from Marseilles.

The trade of Marseilles is very extensive, and is rapidly increasing. She is the grand emporium of the S. of France, and the centre of nine tenths of her commerce with the countries bordering on the Mediterranean. The exports consist principally of silk stuffs, wines, brandies, and liqueurs; woollens and linens; madder, oil, soap, refined sugar, perfumery, stationery, verdigris, gloves, and all sorts of colonial products. Among the principal imports are sugar, coffee, and other colonial products; dye stuffs; corn, from the Black sea and the N. coast of Africa; cotton, from Egypt and America; coal, linen thread, and various descriptions of manufactured goods, from England; hides, wool, tallow, timber, &c. Marseilles engrosses almost the whole trade between France and Algiers. She is now also the principal station for the intercourse carried on by steamers with Malta, Alexandria, and Constantinople; and, besides the steamers employed by the government as packets, she had, in 1859, 19 steam-packets belonging to private companies. Mr. Maclean says that most of the private steamers have English-made engines, and English engineers; and that they burn English coal, sold here for about 30s. a ton.

The following details set the importance of the trade of Marseilles in a still more striking point of view:

	Ships.	Tons.
In 1837 there entered the port—		
French ships from foreign ports	1,188	146,120
" from French colonies	121	30,925
" coasters from the Atlantic to the Medi-		
" terranean	404	57,967
" coasters in the Mediterranean trade	8,454	174,705
" cod and other fisheries	64	11,518
Total of French ships	10,231	421,230
Foreign ships from foreign ports	1,602	231,285
Total entries of ships of all sorts	6,384	669,507

We subjoin an

Account of the Ships arrived at Marseilles from the Levant, during the Four Years ending with 1837; specifying the Ships, and their Tonnage, from each Country.

In this account, the ships from Syria and Candia are included under Egypt. The total value of the imports into Marseilles may be estimated at about 900,000,000 francs, or £3,000,000; and that of the exports at about as much.

The customs' revenue of Marseilles is greater than that of Havre, or any other French port: it amounted in 1836 to 29,808,346, and in 1837 to 30,324,013 francs. A joint stock bank, established here in 1835, is said to have been eminently successful.

Though principally distinguished by its commerce, Marseilles has several important manufacturing establishments. Its soap-works, which are numerous and extensive, employ about 700 workpeople, and consume large quantities of olive oil; but, though soap be exported, by far the greater portion of that produced here is destined for home consumption. The artists of Marseilles prepare and fashion coral into a great variety of articles. Among its other manufactures are woollen stockings and caps, *façons de Tulle*; hats, of which from 30,000 to 50,000 fine, and from 10,000 to 15,000 coarse, are annually exported; morocco and other leather (but the tanneries have fallen off), and sail cloth. Marseilles has likewise refineries for sugar, sulphur, wax, and borax, with breweries, oil-works, glass-works, brick and tile works, &c.

MARSHALL.

and furnishes large quantities of vinegar and *liqueurs*. Another branch of industry is the salting and curing of meat, and the pickling and preparing of capers, olives, and other fruits, and of anchovies and other fish. It has, also, a great variety of trades connected with the building and fitting out of ships, steamers, &c.; and is, in fact, a very prosperous and rapidly increasing town.

There are but few great capitalists in Marseilles. "Here, as in Paris," says Mr. MacLaren, "it is the custom to retire altogether from business as soon as a trader has realized a competency. I was told that there are not a hundred men in Marseilles worth £30,000 each; but there are a great many worth half that sum. The people generally seem stout and well-fed. I went into the *Place Royal* when it was filled with 400 or 500 of the middle classes, meeting for business. I thought them the tallest, stoutest men I had ever seen. The millers, porters, and carters, are more tanned than at Paris; but the shopkeepers are not sensibly darker than in the capital. Black eyes, however, are more common; a change invariably observed as we approach the equator. The houses and mode of living resemble those of Paris; but in the new streets, houses with front-doors like our own are common; while in Paris they adhere to the old plan of vast townships, with a grand gate and open court in the centre."

Marseilles is very ancient, having, according to the best authorities, been founded by a colony from Phocæa, a city of Ionia, about 600 years B. C. The Marseillians, as the inhabitants were then called, speedily distinguished themselves by their skill as seamen, and the extent of their commerce; and were celebrated for the wisdom of their political institutions, and their civilization. They became, at an early period, allies of Rome; but having espoused the party of Pompey, their city was besieged, and, after an obstinate resistance, taken by Cæsar. But though Marseilles lost her liberty, she preserved her commerce and superior civilization under the Romans; and was highly distinguished as a school of *belles lettres* and philosophy. She is spoken of by Cicero in the highest terms of eulogy. (*Oratio pro L. Flacco*, cap. 36.) At a later period, Agricola was sent thither to be educated; and Tacitus calls her *sedes ac magistra studiorum*. (*Vit. Agricola*, cap. 4.) After the fall of the Roman empire, she underwent many vicissitudes. In the 10th century she was taken and sacked by the Saracens. She was afterwards governed by dukes and counts, and sometimes by her own magistrates, and more recently by the counts of Provence. She was finally united to the crown of France in 1483. During the middle ages she rivalled Venice and Genoa in her trade with the Levant. In 1793 she suffered dreadfully from the plague, which is said to have destroyed from 40,000 to 50,000 of the inhabitants; she also suffered considerably from the revolutionary frenzy and the anti-commercial policy of Napoleon; but, as already seen, she has risen superior to all these disasters, and is now more populous and flourishing than ever.

Marseilles has given birth to many very distinguished individuals, among whom may be specified Pytheas, one of the most illustrious navigators and astronomers of antiquity who flourished in the 4th century B. C., and Petronius Arbitrator, *Auctor peritissima imperitatis*. Among its modern citizens have been Dumas, the grammarians, Mascaron the celebrated preacher, Peyssonnel, the author of a treatise on the commerce of the Black sea and of several other works on the Levant, and Puget, celebrated as a sculptor, painter, and architect.

The famous revolutionary song and air, called the Marseillaise, did not originate in Marseilles, as might be inferred from the name; this was derived from the tune having been played by a body of troops from Marseilles, on their entry into Paris, in 1791. (Besides the authorities already referred to, we have consulted *Hugo*, art. *Bouches du Rhone*; *Julesm*, *Essai sur le Commerce de Marseille*; *Dictionnaire du Commerce*; and *Private Information*.)

MARSHALL, p. v., La Salle co., Ill., 141 m. N.N.E. Springfield, 776 W. Situated at the N. side of Illinois river, at the Grand Rapids, which afford a great water-power. It has several mills, and exports lumber and flour. The Wabash and Erie canal passes through it.

MARSHALL, county, Va. Situated in the N. part of the state, and contains 350 sq. m. Bounded W. by Ohio river. Watered by Grave, Fish, and Wheeling creeks. It contained, in 1840, 4640 neat cattle, 7173 sheep, 9091 swine; and produced 93,890 bushels of wheat, 2098 of rye, 145,922 of Indian corn, 3500 of buckwheat, 103,195 of oats, 90,672 of potatoes, 3936 pounds of sugar. It had six stores, 16 grist-mills, six saw-mills, two tanneries; three schools, 70 scholars. Pop.: whites, 6654; slaves, 46; free coloured, 37; total, 6937. Capital, Elizabethtown.

MARSHALL, county, Tenn. Situated S. of the centre of the state, and contains 900 sq. m. Watered by Duck river and its branches. It contained, in 1840, 14,933 neat cattle, 16,604 sheep, 67,739 swine; and produced 89,922 bushels

MARSHPEE.

of wheat, 3465 of rye, 1,019,863 of Indian corn, 121,881 of oats, 16,071 of potatoes, 119,165 pounds of tobacco, 499,931 of cotton. It had 17 stores, nine tanneries, 92 distilleries; 21 schools, 743 scholars. Pop.: whites, 11,469; slaves, 3075; free coloured, 19; total, 14,553. Capital, Lewisburg.

MARSHALL, county, Ala. Situated toward the N.E. part of the state, and contains 600 sq. m. Watered by Tennessee river and its tributaries. It contained, in 1840, 9417 neat cattle, 2408 sheep, 96,390 swine; and produced 8896 bushels of wheat, 384,969 of Indian corn, 23,324 of oats, 16,696 of potatoes, 17,918 pounds of tobacco, 4,385,967 of cotton. It had 13 stores, 13 grist-mills, 16 saw-mills, five tanneries, 15 distilleries; 16 schools, 436 scholars. Pop.: whites, 6688; slaves, 641; free coloured, 94; total, 7533. Capital, Warrenton.

MARSHALL, county, Miss. Situated in the N. part of the state, and contains 800 sq. m. Watered by Tallahatchee and Coldwater rivers and their branches. It contained, in 1840, 14,681 neat cattle, 6944 sheep, 51,376 swine; and produced 19,113 bushels of wheat, 733,514 of Indian corn, 33,540 of oats, 50,550 of potatoes, 9336 pounds of tobacco, 1,064,465 of cotton. It had 96 stores, two flouring-mills, 19 grist-mills, 18 saw-mills, four tanneries, two printing-offices, two weekly newspapers; nine academies, 563 students; 26 schools, 553 scholars. Pop.: whites, 9268; slaves, 6280; free coloured, 8; total, 17,556. Capital, Holly Springs.

MARSHALL, county, Ia. Situated toward the N. part of the state, and contains 440 sq. m. Watered by Yellow and Tipppecanoe rivers. It contained, in 1840, 2127 neat cattle, 893 sheep, 5378 swine; and produced 5540 bushels of wheat, 37,570 of Indian corn, 16,198 of oats, 13,840 of potatoes, 13,655 pounds of sugar. It had two stores; three schools, 40 scholars. Pop. 1651.

MARSHALL, county, Ill. Situated a little N. of the centre of the state, and contains 364 sq. m. Watered by Illinois river. It contained, in 1840, 9493 neat cattle, 1806 sheep, 6495 swine; and produced 31,869 bushels of wheat, 96,669 of Indian corn, 81,485 of oats, 11,900 of potatoes. It had eight stores, one flouring-mill, three grist-mills, eight saw-mills; one academy, 50 students; three schools, 100 scholars. Pop. 1940. Capital, Lacon.

MARSHALL, p. t., Oneida co., N. Y., 19 m. S.W. Utica, 23 m. W.N.W. Albany, 379 W. Drained by Oriskany cr. The Chenango canal passes through it. It contains three stores, three fulling-mills, one woolen factory, one furnace, one forge, five grist-mills, 10 saw-mills, three tanneries, one distillery; 16 schools, 740 scholars. Pop. 2351.

MARSHALL, p. t., capital of Calhoun co., Mich., 165 m. W. Detroit, 570 W. Watered by Kalamazoo river. It contains 14 stores, two lumber-yards, one furnace, three flouring-mills, one grist-mill, three saw-mills, two printing-offices, two weekly newspapers, and one periodical; one academy, 68 students; eight schools, 328 scholars. Pop. 1763. The village is pleasantly situated on Kalamazoo river, at the confluence of Rice creek. It contains a courthouse, jail, four churches (the Presbyterian a handsome edifice of stone), a bank, 14 stores, several fine hotels, one of which cost from \$30,000 to \$35,000; was founded in 1831, and is one of the finest villages in the state. It is the seat of Marshall college, recently instituted, which has a president and one professor, 62 students, and 3700 volumes in its libraries. The Detroit and St. Joseph railroad is designed to pass through the v.

MARSHALL, p. v., capital of Clark co.; Ill., 193 m. R.R.E. Springfield, 601 W. Pleasantly situated on the National road, and contains a courthouse, jail, and several stores and dwellings. Nett proceeds of the postoffice, \$302.

MARSHALL, p. v., capital of Saline co., Mo., 87 m. N.W. Jefferson city, 1001 W. It contains a courthouse, a church, four stores, and 150 inhabitants.

MARSHFIELD, p. t., Washington co., Vt., 15 m. N.E. Montpelier, 598 W. Watered by Onion or Winouski river. It has one store, two grist-mills, one saw-mill; 13 schools, 284 scholars. Pop. 1156.

MARSHFIELD, p. t., Plymouth co., Mass., 31 m. S.E. Boston, 453 W. Chartered in 1840. Bounded N.E. by Massachusetts bay, and it has a tolerable harbour, and some shipping. Bounded N. by North river, by which, and by South river, it is watered. It contains six churches, three Congregational, a Methodist, Episcopal, and Baptist, six stores, one furnace, six grist-mills, five saw-mills; eight schools, 450 scholars. Pop. 1761.

MARSHPEE, t., Barnstable co., Mass., 12 m. S.E. Barnstable, 65 m. S.E. Boston. This is an ancient Indian settlement, still inhabited chiefly by their descendants, of a mixed blood. It contains about 18 sq. m., or 10,500 acres. It has a church which has had a succession of preachers, some of them Indians, from the earliest times. The land is secured to the Indians in perpetuity, and is held in common, except so much as each one can cultivate. It is bounded S. by the Atlantic, and watered by several inlets and ponds. The inhabitants are agriculturalists or fishermen, and in the

MARS HILL.

Other employment are particularly expert. They are a quiet and orderly people. It has two schools, 60 scholars. Pop. 350.

MARS HILL, an isolated mountain in Me., near the eastern boundary of the United States. It has two peaks, one 1366 feet high, and the other 1363 feet above the waters of St. John's river. The British commissioners, before the late treaty, fixed on it as the commencement of the high-lands described in the treaty of 1763. But this claim is now set aside, and Mars Hill will be regarded as of less importance than heretofore. It is an isolated mountain, other than part of a chain of high lands.

MARTABAN, a town of the Birman empire, cap. of the prov. Martaban, on the Tha-wang (Salsen) river, near its mouth, 10 m. N.W. Manimain, and 98 m. E.S.E. Rangoon; lat. 16° 35' N., long. 97° 30' E. Population uncertain: in 1838, it was estimated at 9000; but many of the inhabitants were then preparing to emigrate into the British territories, and Mr. Crawford (*Embassy to Siam*, ii., 328) estimates the ordinary population at only 1500. It stands on the E. declivity of a high hill, is more than a mile in length, consisting of two long streets, and is surrounded by a stockade, which separates it from some suburbs. The houses are of wood; it has several conspicuous temples, one of which is upwards of 150 ft. in height. Martaban has an imposing appearance from the water, facing which is a battery on a rocky mound, and a deep wall of masonry with embrasures for cannon, &c., behind the stockade. It was formerly a place of considerable trade; but, early in the course of the century, its navigation was injured by the sinking of vessels in the river by the Birman in their wars with Pegu; and Manimain (which see) is at present the emporium of all the adjacent provs. Martaban was taken by the British in 1824. (*Crawford's Embassy*; *Hamilton's E. I. Gaz.*; *Mod. Trav.*, ii., 179-181.)

MARTHA, or **MARTA (SANTA)**, a seaport town of Colombia, New Granada, dep. Magdalena, cap. prov. Santa Martha, on the Caribbean sea, 105 m. N.E. Cartagena, and 173 m. W.N.W. Maracaybo. Lat. 11° 15' N., long. 74° 18' W. Population estimated at 6000. It has some good houses, a cathedral, which is a conspicuous object in approaching it, both by land and sea, some convents, &c.; but it suffered much from the attacks of the Indians during the revolutionary war, and does not appear to have regained its previous importance. Its harbour, which is one of the best on this coast, having sufficient depth of water and good holding-ground, is defended by several batteries, and by a castle on an insulated rock, commanding both the town and the harbour. Santa Martha was founded in 1525, and made an episcopal city four years afterward. Before the revolution it had risen to considerable importance as a commercial city, and was the port into which manufactured goods for Bogota were almost exclusively imported. (*Cochran's Modern Trav.*, xvii., 297, 298; *Shaw's American Coast Pilot*.)

MARTHA'S VINEYARD, island, off the S. shore of Massachusetts, S. of Falmouth on the main land, and W.N.W. of Nantucket island. It is 21 m. long, and from 2 to 5 m. broad, and is divided into three towns, Chilmark on the W., Tisbury in the centre, and Edgartown in the E. part of the island. With several small islands in the vicinity, it constitutes Duke's county, which contains 150 sq. m. The capital is Edgartown. In the W. part of Chilmark is a lighthouse, on a promontory called Gay Head. In the war with Great Britain the inhabitants have been chiefly without protection. An Indian church was formed here in 1668. The government of the island was at first independent of the other provinces, but in 1664 it was united to New-York, and in 1692 to Massachusetts.

MARTIE, t., Lancaster co., Pa., 10 m. S. Lancaster. Drained by Beaver, Muddy, and Pocongo creeks, which afford water-power. Bounded S.W. by Susquehanna river, across which is a ferry. It has five stores, six flouring-mills, six grist-mills, four saw mills, two tanneries, one distillery; nine schools, 350 scholars. Pop. 2453.

MARTIGUES (LES), a maritime town of France, dep. Bouches-du-Rhône, on an island in the channel between the lagoon of Berre and the Mediterranean, on either bank of which channel are its suburbs of Ferrières and Jonquières, 29 m. W.N.W. Marseilles. Population (1836), including its suburbs, 7299. Its situation, amid pools and canals, has made it be called the Venice of Provence. It is well built, and has several good streets and quays, and handsome buildings; but it is ill supplied with water. Its port is much resorted to by fishing-boats. Merchant vessels are built here; and it has an active trade in olive oil, fish, wine, and salt. (*Hugo's art. Bouches-du-Rhône*, &c.)

MARTIN, county, N. C. Situated toward the E. part of the state, and contains 481 sq. m. Bounded N.E. by Roanoke river. It contained, in 1840, 4333 neat cattle, 4862 sheep, 17,764 swine; and produced 5158 bushels of wheat, 254,463 of Indian corn, 7475 of oats, 39,690 of potatoes, 37,457 pounds of rice, 291,660 of cotton. It had seven stores, 12 grist-mills,

MARTINIQUE.

nine saw-mills; six schools, 130 scholars. Pop.: whites, 4438; slaves, 2516; free coloured, 363; total, 7337. Capital, Williamson.

MARTIN, county, La. Situated in the S.W. part of the state, and contains 300 sq. m. Watered by the E. fork of White river and its branches. It contained, in 1840, 4169 neat cattle, 2261 sheep, 11,046 swine; and produced 9684 bushels of wheat, 87,032 of Indian corn, 19,164 of oats, 7433 of potatoes, 15,267 pounds of sugar. It had six stores, nine grist-mills, 10 saw-mills, three tanneries, three distilleries; three schools, 96 scholars. Pop. 3875. Capital, Mount Pleasant.

MARTIN (ST.), one of the Virgin islands, in the W. Indies, belonging partly to the French and partly to the Dutch; about lat. 18° 4' N., and long. 63° 5' W.; between Anguilla and St. Bartholomew, and 12 m. N.W. the latter, and 75 m. N.N.W. Barbuda. Area estimated at 30 sq. m. Though hilly, it has no eminence 9000 ft. in height. It is watered by numerous rivulets; and in the S. are numerous lagoons, from which great quantities of salt are obtained by the Dutch. The coasts, which are deeply indented, afford several good roadsteads, of which Philipsburg and Marigot are the best. The soil is light, strong, and frequently arid; but it is tolerably healthy. The northern, and larger portion of the island belongs to France, forming a commune of the colony of Guadeloupe; and having an area of 5371 hectares, of which 1841 are cultivated, 341 in pasture, 674 in woods, and 3616 unproductive. The annual produce of sugar averages about 900,000 kilogs., syrup about 11,000 kilogs., and rum about 50,000 gallons: a good many cattle are also reared. Population of the French division about 3000, five sixths of whom are slaves. The southern, or Dutch division of the island is less fertile and richly wooded than the French, but more profitable, on account of the salt it produces, which is sent to the neighbouring islands, and to N. America: it is also estimated to yield annually about 25,000 cwt. of sugar, and 130,000 gallons of rum. (*Stein's Handbook*, iii., 329.) The Dutch portion is said to be about as populous as the French. Nearly all the white population of St. Martin are of English descent. The Spaniards first colonized this island, but abandoned it in 1650; after which it became a subject of contention between the French and Dutch, who subsequently divided it between them. It has been frequently taken by the English. (*Hugo*, iii., 300; *Notices Statist. sur les Colonies Françaises*; *Stein*, &c.)

MARTINIQUE, one of the Windward islands in the W. Indies, belonging to France; between lat. 14° 23' 43" and 14° 53' 47" N., and long. 60° 48' and 65° 15' W., about 25 m. S.E. Dominica, and 20 m. N. St. Lucia; length, N.W. to S.E., 38 m.; average breadth, about 10 m. Area estimated at 92,788 hectares. Population in 1836, 117,508 of whom 40,000 were white, or free-coloured, and 77,500 slaves. The surface gradually rises on proceeding inland, and mountain-ranges occupy the centre of the country. Their loftiest summits are the *Montagne Pelée*, towards the N. extremity of the island, and the *Piton du Carbet*; the former rises to 4429 ft., the latter to 3960 ft. above the sea. These, and other mountains, are evidently extinct volcanoes, having their characteristic conical form, and abounding with lava, and other volcanic products. The flanks of the mountains are mostly covered with a dense and luxuriant forest vegetation, and are in many parts under culture to an elevation of 1200 ft. About a third part of the island consists of pretty level land. It is watered by numerous rivulets; but of these only three or four, which disengage on the W. coast, are navigable in any part of their extent. At the S. extremity of the island is a small salt-lake. The coasts present many bays and inlets, but the harbours on its E. side are difficult of access, being obstructed by numerous islets, and extensive banks of madrepore. On the S. side is the bay of Maria; and the harbour in the Antilles: in the N.W. is the roadstead of St. Pierre, where ships ride safely, except during W. winds. The mean annual temp. in the coasts is about 81° the maximum in the shade being 95°, and the minimum 69° Fah.; but the heat is tempered by sea breezes during the day, and land-breezes at night. The moisture of the atmosphere is excessive; and it is estimated that at the level of the sea 85 inches of rain fall annually. Most of this rain descends from July to Oct., a period of the year termed the *tiempo*; when the hurricanes, from which the island has often suffered severely, are most frequent. The weather for the remaining nine months is generally fine; but Martinique, like the neighbouring island of St. Lucia, is very unhealthy. Mineral springs are abundant, of a chalybeate, saline, or siliceous nature, and useful in cutaneous and liver complaints. The surface consists chiefly of disintegrated pumice-stone, intermixed with vegetable mould, forming a light and very fertile soil. In 1835, it was estimated that 38,390 hectares were under culture; that savannahs and pasture lands occupied 21,779 do.; woods and forests, 93,367 do.; and unproductive lands, 15,363 do. The following official account has

MARTINIQUE.

been given of the distribution of the cultivated lands, their produce, &c., in 1836:—

Articles.	Hectares cultivated.	Slaves employed in culture.	Produce.
Sugar-cane	52,777	24,940	Raw sugar . . . kil. 33,980,500 Do. 184,785 Syrup & molasses 6,259,130 Rum 1,668,520 Coffee kil. 682,807 Cotton Do. 18,705 Cocoa Do. 125,610 Corns, &c. 12,706 Mulberry 4 Various 3,807 Total 60,117 65,421

Of late years, agriculture has made considerable progress in Martinique. The plough has come more into use, and manuring is more extensively practised; and the culture of the sugar cane, to which the colonists have turned their chief attention since 1830, has been greatly improved. The cane is of two kinds; the Otaheitan variety, and the yellow cane of Batavia. It was first naturalized about 1650. The coffee plant was introduced in 1723; but its culture, like that of most other products, is diminishing in favour of sugar. A few cloves, and some other spices, are grown; and the government has attempted, though hitherto with little success, to introduce the culture of indigo. Martinique formerly produced a pretty large supply of tobacco, but it is now quite insignificant. Manioc, bananas, sweet potatoes, maize, &c., are the principal farinaceous vegetables. The island has about 40,000 head of live stock, of all sorts; about 18,000 being black cattle, and 9000 sheep. In 1836, there were three earthenware and tile factories, and 10 lime-kilns, employing 352 slaves; these are, however, the only manufacturing establishments in Martinique. Carpenters, masons, and such-like workmen are pretty numerous; but there are few of any other description. Most part of the skilled workmen belong to the free coloured class, and only work when they have expended their wages, and are in want of necessities. A number of hands, both free and slaves, are employed in fishing; and between 400 and 500 are occupied in navigation and the coasting trade. Subjoined is an

Account of the Quantities and Values of the principal Articles exported from Martinique in 1836.

Articles.	Quantities.	Value.
Raw Sugar	kilog. 22,994,754	18,796,552

Coin, gold and silver		415,190
Other articles		232,290
Total		16,423,422

The imports consist chiefly of salted meat, butter, and fish, corn, flour, pulse, oils, timber; cotton, linen, and other manufactured goods; wines, soap, candles, hardware, jewellery, apparel, &c.; chiefly from France and the French colonies. In 1836, the value of the imports amounted to 19,460,598 fr. In the same year, 358 French vessels, of the aggregate burden of 48,861 tons, entered, and 353 left, the ports of the island: in addition to which, 495 foreign vessels entered, and 487 cleared out.

The government is vested in a governor, assisted by a privy council, composed of the military commandant, the three principal civil officers of the colony, and three privy councillors nominated by the king; and in a colonial council of 30 members elected for five years. Every individual of French descent, 25 years of age, born or having resided two years in the colony, and paying taxes to the extent of 300 fr. a year, or having property worth 30,000 fr., may be an elector; and inhabitants paying taxes, or possessing property of double the above amount, are eligible to the colonial council. In 1836, there were 819 electors, and 507 individuals eligible to the council. Martinique is divided into the arronds. of Fort Royal and St. Pierre, four cantons, and 36 communes. Justice is administered by a royal court at Fort Royal, courts of assize and primary jurisdiction in each arrond., a justice of the peace in each canton, and a functionary, uniting both the civil and military jurisdiction, in most of the communes. The military force amounts to 2030 men, besides which there is a militia of 4103 men. There are three schools of mutual instruction, two in the capital, and one in St. Pierre; and primary schools in almost every commune. At St. Pierre is a superior female seminary. There are orphan asylums, and various other charities, in the two principal towns; and two newspapers are published, both at St. Pierre. The total expenditure of

MARYBOROUGH.

the colony, in 1837, was estimated at 4,387,886 fr., the total receipts to meet which amounted to only 2,365,711 fr.

Martinique has only three towns worthy of mention. Fort Royal, the capital, and seat of government, on the N. shore of the bay of same name, in the S.W. part of the island; Pop., inc. com., about 11,500. It is well built, its chief public edifices being the parish church, government offices, naval storehouses, arsenal, barracks, hospital, two prisons, and the residence of the *préfet apostolique*, the superior ecclesiastic of the island. It is defended on the N. by Fort Bourbon, and on the S. by Fort Louis, on a small peninsula, by which it is shut off from its port; but it communicates with the harbour, by a canal, cut within a few years. Near Fort Royal are numerous pleasant country residences. St. Pierre (which see), also on the W. coast, is the largest town in the French W. Indies. La Trinité, on the bay of same name, on the E. side of the island, has a population of about 4000, large warehouses, a prison, some barracks, a hospital, and a handsome church. Its roadstead and harbour are secure; the latter has good holding-ground, but it is difficult of access. Its entrance was formerly protected by a fort, now in ruins.

This island was discovered by the Spaniards in 1493. In 1635 it was settled by the French. In 1763 the English took it from the latter, but restored it in the succeeding year. In 1794 it was again taken by the English, who gave it back in 1803; it came a third time into our possession in 1809, and was finally restored to France in 1815. The Viscount Beaulieu, and his wife Josephine, subsequently espoused by Napoleon, were natives of Martinique. (*Notice sur les Colonies Françaises*, l. 27-134; *Official Tables*; *Hugo*, art. *Martinique*.)

MARTINSBURG, p. t., capital of Lewis co., N.Y., 194 m. N.W. Albany, 433 W. Drained by Martin's and Wheelstone creeks, flowing into Black r., which bounds it on the N.E. It contains seven stores, one fulling-mill, two grist-mills, nine saw-mills, two tanneries, one printing-office, one weekly newspaper; 17 schools, 733 scholars. Pop. 332. The village situated on elevated ground, contains a courthouse and jail in the same building, three churches, a Presbyterian and two Methodist, the Lewis county bank, several stores, mills and manufactures, 75 dwellings and about 300 inhabitants.

MARTINSBURG, p. v., capital of Berkeley co., Va., 21 m. N. Harper's Ferry, 160 m. N. by W. Richmond, 77 W. It contains a courthouse, jail, county offices, two academies, an almshouse, four churches, an Episcopal, Presbyterian, Lutheran and Roman Catholic, 19 stores, one bakery, one flouring-mill, two grist-mills, three tanneries, one printing-office, one weekly newspaper, 350 dwellings, many of them of brick and neat, and about 1700 inhabitants.

MARTINSBURG, p. v., Clay t., Knox co., O., 57 m. N.N.E. Columbus, 366 W. It contains two churches, a Methodist, and Presbyterian, seven stores, two high schools, one for males and one for females, a steam saw-mill, 75 dwellings, and about 450 inhabitants.

MARTINSVILLE, p. v., capital of Henry co., Va., 194 m. S.W. Richmond, 369 W. Situated on Smith's r., a tributary of Dan r. It contains a courthouse, jail, two stores, a tannery, and about 100 inhabitants.

MARTINSVILLE, p. v., capital of Morgan co., Ia., 36 m. S.W. Indianapolis, 590 W. Situated half a mile E. of the E. branch of White r., on a beautiful plain. It contains a courthouse, jail, three stores, and about 125 inhabitants.

MARWAR, a native state of Hindostan. See *Jonpore*.

MARYBOROUGH, an inland town of Ireland, Queen's co., of which it is the cap.; prov. Leinster, on a branch of the Barrow, 46 m. S.W. Dublin. Pop., in 1821, 267; in 1831, 3930. "It is a town of very little importance or wealth, possessing a very inconsiderable market, compared to Mount Melick and other towns in the co.; but within the last few years the quantities of grain brought to market have increased." (*Wes. Bunsd. Report*.) It is struggling and meanly built. The new co. prison has 75 cells and 50 other prisoners' rooms. The district lunatic asylum has accommodation for 104 patients. It has three schools, one for boys, another for girls, and one for both, partly supported by and connected with the Educational Board, which, in 1830, were attended by 743 children. When the barony of Leix was made shire-ground, at the close of the reign of Philip and Mary, this place, previously a border town, was fixed on as the assize town, and named from the reigning queen. It changed masters several times during the war of 1641. It has several good public buildings, among which are the parish church, a Roman Catholic chapel, a convent, Presbyterian and Methodist meeting-houses, the infirmary for the co., the district lunatic asylum lately erected for King's and Queen's coes., Westmeath, and Longford, the new co. courthouse and prison, with barracks, schools, &c. It is a constabulary station. The corporation, under a charter of Elizabeth, in 1570, consists of a burgomaster, two bailiffs, and an indefinite number of burgesses and freemen.

MARYLAND.

It returned two members to the Irish House of Commons till the season, when it was disfranchised. The assizes for the co. are held here: and general sessions in April and October, and petty sessions weekly. Markets on Thursdays; fair, Jan. 1, Feb. 24, March 25, May 12, July 5, Sept. 4, Oct. 26, and Dec. 12. Postoffice revenue, in 1830, £284; in 1835, £437. Rathleague, the seat of Sir Henry Parnell, and Ballyfin, the seat of Sir Charles Coote, are in the immediate vicinity of the town.

MARYLAND, the most southern of the middle United States is bounded N. by Pennsylvania; E. by Delaware and the Atlantic; S. and W. by Virginia. It is separated from Virginia by Potomac river, which pursues a winding course, along its S.E. border. It is between 36° and 39° 44' N. lat. and between 75° 10' and 79° 30' W. long. and between 90° 31' W. and 10° 58' E. long. from W. Its shape is very irregular, and may be considered as 196 m. long and 190 m. broad, which is not its average breadth, containing 13,950 sq. m., or 8,933,760 acres, of which one fifth part is water. The Chesapeake bay runs nearly through the state from S. to N., dividing it into two parts. East of Chesapeake bay, it is called the *Eastern shore*, and W. of it, the *Western shore*.

The population in 1790, was 219,798; in 1800, 345,924; in 1810, 500,546; in 1820, 607,350; in 1830, 646,913; in 1840, 680,523, of whom 80,495 were slaves. Of the free population 138,636 were white males; 150,081 do. females; 99,173 were colored males; 33,947 do. females. Employed in agriculture, 60,851; in commerce, 39,949; in manufactures and trades, 31,335; in navigating the ocean, 791; do. canals, rivers, &c., 1519; in the learned professions, 1647.

The state is divided into 20 counties, which with their population in 1840, were as follows:

<i>Western Shore.</i>			
Alleghany	15,690	Frederick	36,405
Anne Arundel	29,538	Harford	17,190
Baltimore	124,379	Montgomery	14,669
Calvert	9,939	Prince George	19,530
Carroll	17,341	St. Mary	13,294
Charles	16,083	Washington	96,550
<i>Eastern Shore.</i>			
Caroline	7,806	Queen Anne's	13,633
Cecil	17,322	Somerset	19,508
Dorchester	18,843	Talbot	12,090
Kent	10,942	Worcester	18,377

Annapolis, on Severn r., which enters on the W. side of Chesapeake bay, is the seat of government; though Baltimore is much the largest town.

The land on the eastern shore, with the exception of a small tract at the N., is generally level and low, and in many places, covered with stagnant waters, in the summer and fall, which occasion agues and intermittent fevers, and many of the inhabitants have a sickly appearance. The soil is tolerably fertile, and produces a beautiful white wheat, said to be peculiar to this region, Indian corn, sweet potatoes, and tobacco. Above the falls in the N.W., the country gradually becomes uneven, and in the western part of the state, it is mountainous. Several branches of the Alleghany chain cross it from Pennsylvania and Virginia. The principal of these are South mountain, North mountain, Snelling hill, Warrior's, Evi's, Willis's, and Alleghany mountains. Between these ranges of mountains are many fertile valleys. Wheat and tobacco are the staple productions, cotton of an inferior quality is raised, chiefly for domestic use, and S. of Baltimore a bright tobacco, denominated *bits-foot*. The soil of the state is generally a red clay or loam, and much of it is excellent. Hemp and flax are raised. There are fine orchards, and apples, pears, peaches, plums, and cherries are abundant. The forests abound in nut-bearing trees, which feed great numbers of swine. Beef and mutton are plentiful. The climate in the western part of the state is particularly salubrious.

There were in the state, in 1840, 92,990 horses or mules, 25,714 neat cattle, 257,993 sheep, 416,943 swine; poultry raised to the value of \$918,765. There were produced 345,789 bushels of wheat, 733,577 of rye, 8,333,086 of Indian corn, 73,606 of buckwheat, 3594 of barley, 3,534,911 of fl., 1,826,423 of potatoes, 488,301 pounds of wool, 94,816,019 of tobacco, 5673 of cotton, 3674 of wax, 2357 of hops, 2390 of silk cocoons, 36,306 of sugar, 106,687 tons of hay. The value of the dairy amounted to \$457,486, of the orchard, \$185,740, of lumber, to \$266,977; and 7585 gallons of wine were made.

Iron ore is found in various parts of the state; the bog ore found in the E. part of the Eastern shore, and is extensively wrought. Bituminous coal abounds between the mountain ranges in the western part of the state, particularly at Cumberland. The Cumberland coal field, extending to Willis' cr. to the head branch of the Potomac, is 66 m. sq. and from five to seven miles wide, and from 3 to 15 ft. thick, and covers an area of 400 sq. m., and is of an excel-

lent quality. The Baltimore and Ohio railroad, completed to Cumberland, will make this coal extensively available. Beyond the main ridge of the Alleghany mountains, the Youghiogheny coal field has beds of 30 ft. in thickness. Sulphuret of copper is found in the Monocacy valley, and is easy of reduction. Porcelain clay occurs in the N.E. corner, and excellent clays for stone ware pottery, &c., are extensively found. Red and yellow ochre and chrome ore, alum-earth, and copperas ore are found, in the eastern part of the state.

The state carries on an extensive trade with the other states, the West Indies, and with Europe, principally from Baltimore. The exports consist of flour, tobacco, iron, lumber, Indian corn, pork, flaxseed, beans and fish, particularly shell-fish, with the latter of which Chesapeake bay abounds.

Potomac r., which divides this state from Virginia is 500 m. long, and navigable about 295 miles from the mouth of Chesapeake bay to Washington city. It is 7½ miles wide at its mouth in Chesapeake bay, and 14 m. at Alexandria. Susquehanna r. enters the head of Chesapeake bay in this state, is 14 m. wide at its mouth, and navigable only 5 m.; above which, it is obstructed by falls and rapids. The Patuxent, though a small r., is navigable 14 m. for large ships to Baltimore, and affords above much water-power. The Patuxent is 110 m. long, and navigable for 50 miles for vessels of 250 tons burthen. The other rivers are Elk, Sassafras, Chester, Choptank, Nanticoke, and Pocomoke which flow by broad mouths into the E. side of Chesapeake bay.

Baltimore is much the largest place in the state, and according to the census of 1840, the third in population in the United States. The other principal places are Frederick, Hagerstown, and Annapolis, the capital.

The exports of this state in 1840 amounted to \$5,768,768, and the imports to \$4,910,746. There were in the state 70 commercial and 117 commission houses in foreign trade, with a capital of \$4,414,000; 3563 retail stores, with a capital of \$9,546,170; 1320 persons engaged in the lumber trade with a capital of \$307,300; 103 persons employed in internal transportation, who with 911 butchers, packers, &c., employed a capital of \$98,836; 7814 persons employed in the fisheries, with a capital of \$98,047.

Of the principal manufactures, home-made or family articles amounted to \$176,050; 39 fulling-mills and 99 woollen manufactures employed 386 persons, produced articles to the amount of \$325,900, with a capital of \$117,630; 21 cotton manufactures, with 41,183 spindles, employing 9384 persons, produced articles to the amount of \$1,150,550, with a capital of \$1,304,400; 13 rope-walks employed 198 persons, and produced cordage to the amount of \$141,050; 19 furnaces produced 8876 tons of cast iron, and 17 forges, &c., produced 7900 tons of bar iron, the whole employing 1789 persons, and a capital of \$795,650; 17 paper mills produced to the amount of £195,100, and other manufactures of paper to the amount of \$3000, the whole employing 171 persons, and a capital of \$95,400; 93 persons produced 1,865,340 pounds of soap, 731,446 pounds of tallow candles, and 35,000 of wax or spermaceti candles, and employing a capital of \$98,000; 73 distilleries produced 366,313 gallons, and 11 breweries produced 828,140 gallons, the whole employing 199 persons, and a capital of \$185,790; hats and caps were manufactured to the amount of \$153,456, and straw bonnets to the amount of \$13,900, the whole employing 905 persons and a capital of \$76,620; 161 tanneries employed 1035 persons, and a capital of \$713,655; 408 saddleries, and other manufactures of leather, produced articles to the amount of \$1,050,975, with a capital of \$434,137; one glass-house employed 37 persons, produced articles to the amount of \$40,000 with a capital of \$20,000; 23 potteries employed 90 persons, produced to the amount of \$60,940, with a capital of \$26,129; 33 persons produced drugs and paints to the amount of \$60,100, with a capital of \$65,100; 15 powder-mills employed 47 persons, and produced 609,135 pounds of gunpowder, with a capital of \$46,000; six sugar refineries produced to the amount of \$176,000; 103 persons produced confectionary to the amount of \$73,450; 378 persons manufactured tobacco to the amount of \$332,000, with a capital of \$125,100; 947 persons manufactured granite and marble to the amount of \$152,750; 1049 persons produced bricks and lime to the amount of \$409,456; 723 persons produced machinery to the amount of \$348,165; 36 persons manufactured hardware and cutlery to the amount of \$15,670; 600 persons produced carriages and wagons to the amount of \$257,693, with a capital of \$154,935; 180 flouring-mills produced 446,708 barrels of flour, and with other mills employed 886 persons, producing articles to the amount of \$2,567,950, and employed a capital of \$4,069,671; ships were built to the amount of \$279,771; 834 persons manufactured furniture to the amount of \$305,380, with a capital of \$330,336; 389 brick or stone houses, and 593 wooden houses were built, and employing 9036 persons, at a cost of \$1,078,770; 48 printing offices, 15 binderies, seven daily, seven semi-weekly and 98 weekly newspapers, and seven

MARYLAND.

periodicals, employed 736 persons, and a capital of \$159,109. The total amount of capital employed in manufactures in the state, amounted to \$6,450,394.

St. John's college at Annapolis was founded in 1784. St. Mary's college at Baltimore was founded by the Roman Catholics in 1799. Baltimore Medical school was founded in 1807; and in 1812, there were added to it the faculties of general science, law and divinity, and it received the name of the University of Maryland. Mount St. Mary's college was established near Emmetsburg in 1830, by the Roman Catholics. These institutions had in 1840, 460 students. There were in the state 137 academies or grammar schools, with 4173 students, and 567 common and primary schools, with 16,963 scholars. In the state there were 11,605 white persons over 20 years of age, who could neither read nor write.

The first settlers of this state were Roman Catholics, and they are still numerous. They have an archbishop, who is metropolitan of the United States, and 66 churches. The Episcopalian have 77 ministers. The Presbyterians have 25 ministers. The Baltimore Methodist conference, which extends into neighbouring states, has 173 travelling preachers. The Baptists have 30 ministers. The German Reformed have nine ministers. There are some Lutherans, Friends, Unitarians, &c.

There were in the state in 1840, 13 banks with an aggregate capital of \$6,106,031, and a circulation of \$2,322,555. At the close of 1841, the state debt amounted to \$15,914,761.

The constitution was formed in 1776, but has been frequently amended, since that time. The state is divided into three districts, the Eastern, Southern, and North Western. The governor is elected for three years, by the people from the districts alternately, so that each district is represented in the gubernatorial chair for one term, in each period of nine years. He must have resided in the district for which he is elected for three years next preceding the election. The senate consists of 21 members elected for six years, by the people; one third of the number being elected every two years; and the senators must have resided in the city or county for which they are chosen for three years, next preceding the election. The house of delegates consists of 79 members elected by the people, and must have resided in the county for which they are chosen for one year next preceding the election. All judges are appointed by the governor, with advice and consent of the senate, and hold their offices during good behaviour. Every white male citizen over 21 years of age, who has resided in the state one year next preceding an election, and for six months in the city or county where he offers his vote, enjoys the right of suffrage. The legislature meets annually at Annapolis, on the last Monday of December.

Two of the greatest works of internal improvement in the United States have been projected and commenced in Maryland; the first is the Chesapeake and Ohio canal, which commences at Georgetown, Dist. Columbia, and is designed to extend 341½ m. to Pittsburgh. This is the work of a joint stock company, chartered by the states of Maryland, Virginia, and Pennsylvania, and sanctioned by Congress. It was commenced in 1828 and is completed to Hancock, 136 miles. Considerable work has been done between this and Cumberland, where a spacious basin is in process of erection. It is extended 7½ m. to Alexandria, in the S. part. A completion to Cumberland will open a vast and rich coal region. The Baltimore and Ohio railroad is designed to extend from Baltimore to the Ohio r. at Wheeling, 300 miles, and is the second great work. It was incorporated by the legislatures of Maryland, Virginia and Pennsylvania in 1827, and commenced July 4th, 1828. It is completed from Baltimore to Cumberland. There is a side cut, over 24 m. to Frederick. A railroad extends across the state, passing through Baltimore, and which forms part of the great chain from New-York and Philadelphia to Washington. This road proceeds on the Baltimore and Ohio railroad, 8 m. from the former place. The Baltimore and Susquehanna railroad extends 56 m., from Baltimore, Md., to York, Pa. A railroad 19½ m. long extends from the Baltimore and Washington railroad, to Annapolis. A railroad extends from Frenchtown to New-Castle, Del., connecting the Delaware and Chesapeake bays. The same is effected by a canal, extending from Back cr., a tributary of Elk r., to Delaware city on the Delaware, 42 m., below Philadelphia. It is 66 feet wide at top and 10 feet deep, and affords a passage to vessels requiring that depth of water, completed in 1839, at an expense of \$2,750,000.

Maryland was considered as included in the petent of the South Virginia company, until June 30th, 1632, when it was granted to Cecilius Calvert, lord of Baltimore in Ireland, and it received the name of Maryland, in honour of Henrietta Maria, queen of Charles I., of England. The proprietor offered 50 acres of land in fee to every emigrant, and gave equal privileges to all denominations of Christians. In 1634 the first colony, consisting of 300 Roman Catholics, started itself on the N. side of Potomac r., at a place called

MASON.

ed St. Mary's. In 1639 the first legislature was summoned at St. Mary's, which divided the territory into hundred and manors, and passed a variety of laws. The next year the legislature passed a law establishing a house of assembly. In 1645 Claiborne, who was the head of a colony, invited the Indians against the colony of Calvert, and drove him from the province. In 1659 the constitution of Maryland was settled, the legislature was divided into two houses, and the province included three counties. In 1682 parliament violently assumed the government, and imposed it on commissioners. In 1693 the government reverted to Lord Baltimore, who assumed the administration. Annapolis was made the seat of government in 1699, and has ever since retained it. In 1775 the people were forward to resist the encroachments of parliament, and took an active part in the Revolution. The constitution was formed in August, 1776, but they did not join the confederation till 1781. In convention, April 26th, 1788, they adopted the constitution of the United States, yeas 63, nays 13; majority 51.

MARYLAND, p. t., Otsego co., N.Y. 193, by E. Consperson, 66 W. by N. Albany, 302 W. Drained by Schenectady cr. and its branches, which flows into Sasquehanna r. It contains a Presbyterian church, six stores, one fulling-mill, three grist-mills, 17 saw-mills, one tannery, one distillery; 18 schools, 763 scholars. Pop. 3065.

MARYPORT, a seaport town of England, co. Cumberland, par. of Crook Canonby, Altherdale Ward, on the Fawcett frith, close to the mouth of the Ellen, 25 m. S.W. Carlisle. Pop., in 1841, 5311. It is neat and well-built, and from its salubrity, is much frequented by summer visitors. A modern-built townhall, chapel of ease, and five places of worship for dissenters, are its chief public edifices. A national school furnishes instruction for about 150 scholars, of both sexes, and there is a school of industry for 20 girls. The present importance of Maryport, which, in 1734, was a mere hamlet, is attributable to the rise of an extensive coal-trade with Ireland and Scotland. It has also three ship-building yards; and sail-cloth, ropes, blocks, &c., as made on a pretty extensive scale. A pier has recently been erected, and there are commodious quays and stables; but the harbour dries at low water, and has only 12 ft. at high water springs, and 8 ft. at neaps.

MARYSVILLE, p. v., Paris t., capital of Union co. O. Situated on the W. side of Mill cr., a branch of Scioto r. It contains a courthouse of brick, a jail, three stores, 60 dwellings, and 360 inhabitants.

MARYVILLE, p. v., capital of Blount co., Tenn., 18 S.W. Knoxville 183 S.E.E. Nashville, 293 W. Founded in 1796. Situated on the great stage road leading from Knoxville to Huntsville, and contains a courthouse, jail, three churches, five stores, three grist-mills, one carding machine, one printing office, various mechanic shops, and about 700 inhabitants. It is the seat of the South Western Theological Seminary, founded by the Presbyterians in 1821, which has two professors, 34 students, 90 have completed their education, and 60000 vols in its libraries.

MASCAL, a town of Sicily, intend. Catania, capital of canton, at the E. base of Mount Ætna, on a small river about 2 m. from the sea, and 10 m. S.W. Taormina. Pop. in 1831, 3063. Its district is exceedingly fertile, and the town was formerly flourishing, but it is now rapidly decaying, while several of its dependent villages are proportionally thriving and increasing, particularly Giarrè and Riposto.

MASSA-CARRARA (DUCHY OF). See Modena.

MASON, county, Va. Situated in the W. part of the state, and contains 875 sq. m. Bounded W. and N. by Ohio river. Watered by Great Kanawha river and its tributaries. Salt water is found by digging near Kanawha r. It contained in 1840, 7899 neat cattle, 9993 sheep, 17,169 swine; and produced 69,503 bushels of wheat 1914 of rye; 906,798 of Indian corn, 30,316 of potatoes, 9478 pounds of tobacco, 22,168 of sugar. It had 11 stores, one flouring-mill, four grist-mills, five saw-mills, four tanneries; 11 schools, 241 scholars. Pop. whites, 5923; slaves, 806; free coloured 46; total, 6777. Capital, Point Pleasant.

Mason, county, Ky. Situated toward the N.E. part of state, and contains 980 sq. m. Bounded N. by Ohio river. Drained by North Lick cr., a branch of Licking river. It contained in 1840, 11,315 neat cattle, 21,240 sheep; 29,354 swine; and produced 320,783 bushels of wheat, 34,250 of rye, 666,536 of Indian corn, 91,804 of oats, 29,630 of potatoes. 1065 tons of hemp or flax, 1,122,740 pounds of tobacco. It had 11 commission houses in foreign trade, 63 stores, two woolen factories, one cotton factory with 1100 spindles, 18 flouring-mills, 19 grist-mills, four saw-mills, eight tanneries, six distilleries, one brewery, three potteries, four rope-walks, two printing-offices, three weekly and one semi-weekly newspapers; one academy, 70 students; 35 schools, 1068 scholars. Pop. whites, 11,132; slaves, 4309; free coloured, 572; total, 15,719. Capital, Washington.

Mason, p. t., Hillsborough co., N.H., 44 m. S.S.W. Concord, 450 W. Chartered in 1793, first settled in 1751. Dis-

MASONVILLE.

ed by Susquehanna river, and branches of Nashua river. It has three churches, a Congregational, Baptist, and Christian, three stores, one woollen factory, one cotton factory with 9068 spindles, two grist-mills, and two saw-mills; 10 schools, 257 scholars. Pop. 1275.

MASONVILLE, p. t., Delaware co., N.Y., 111 m. S.W. Albany, 313 W. Drained by small branches of Susquehanna river, and of the W. branch of Delaware river. It contains two churches, a Presbyterian and Methodist, two stores, one saw-mill, one grist-mill, 15 saw-mills; 11 schools, 455 scholars. Pop. 1499.

MASSACHUSETTS, one of the eastern United States, is bounded N. by Vermont and New-Hampshire; E. by the Atlantic; S. by the Atlantic, Rhode Island and Connecticut; and W. by New-York. It lies between 41° 23' and 49° 38' N. lat., and between 69° 50' and 73° 30' W. long. It is about 190 miles long, with an average breadth of 90 miles, and contains about 7500 square miles, or 4,800,000 acres. The population in 1790 was 368,797; in 1800, 422,845; in 1810, 472,940; in 1820, 523,287; in 1830, 610,408; in 1840, 737,690. Of these 360,679 were white males; 392,351 were white females; 4654 were coloured males; 4015 do. females. Employed in agriculture 87,837; in commerce 8063; in Manufactures and trades, 85,176; in navigating the ocean, 37,153; do. rivers and canals, 372; in mining 469; in the learned professions, 3904.

The state is divided into 14 counties, which with their population in 1840, were as follows:

Berkshire . . .	95,773	Berkshire . . .	41,745
Bristol . . .	94,987	Bristol . . .	60,164
Dorchester . . .	106,611	Dorchester . . .	47,373
Essex . . .	95,313	Essex . . .	32,548
Hampshire . . .	30,897	Hampshire . . .	3,958
Hampden . . .	37,366	Hampden . . .	9,012
Franklin . . .	93,819	Franklin . . .	53,140

The capital is Boston, the metropolis of New-England, situated on a peninsula in Massachusetts bay.

The face of the country is diversified. The southeastern part is mostly level. There are also level districts of small extent, in the vicinity of Merrimack river in the N.E. Salt marshes are numerous, but not very extensive in the maritime parts. Most of that part bordering on the sea and extending into the interior as far as the county of Worcester may be regarded as level, with slight undulations, but no high hills. Worcester county, which extends across the state, and the three counties west of it present an elevated and various surface diversified with gentle swells with plains and valleys, and with several mountain ranges, and a strong soil, adapted to grazing and most of the purposes of agriculture, and well watered with clear and beautiful streams. Through Berkshire the western county pass two mountain ranges, the Tugthanak, on the western border of the state; and between the Housatonic and Connecticut rivers, the Green mountain range, here called Hoosick mountains. To the east of Connecticut are several mountains with elevated summits. Mount Holyoke near Northampton is more than 1900 feet above the level of the sea, and Wachusett mountain in Princeton is an isolated summit, from 3000 to 3000 feet high. Saddle mountain, in the Tugthanak range, in the N.W. corner of the state, is 4000 feet high, and Mount Washington in the same range, in the S.W. corner of the state is about 3000 feet high. The valleys of the Connecticut are fertile, as are those of the Housatonic. In no state of the Union has agriculture been more improved than in Massachusetts. The principal productions are grass, Indian corn, rye, wheat, oats and potatoes. Beef, pork, butter and cheese, of an excellent quality, are produced. Apples are found in great abundance, and pears, peaches, plums and cherries are cultivated with success. Marble is produced in various parts of Berkshire county, granite in Chelmsford and Quincy, and iron ore in the S.E. parts of the state. In 1840, there were in the state, 61 684 horses or mules, 393,574 neat cattle, 378,226 sheep, 143,221 swine; poultry was produced to the amount of \$178,157; there were produced 157,983 bushels of wheat, 536,914 of rye, 1,909,193 of Indian corn, 87,000 of buckwheat, 165,319 of barley, 1,319,680 of oats, 3,355,653 of potatoes, 941,906 pounds of wool, 254,795 of hops, 509,395 tons of hay, 2433 of hemp or flax, 1741 pounds of silk cocoons, 593,327 of sugar. The products of the dairy were valued at \$23,273 299; of the orchard at \$59,177, and of lumber, at \$344,845.

Massachusetts is extensively engaged in the fisheries. There were produced in 1840, 389,715 quintals of dried or salted fish, 194,755 barrels of pickled fish, 3,300,972 gallons of spermaceti oil, 3,394,725 gallons of whale or other fish oil. In the shipping Massachusetts is the second state in the Union, being 1 inferior only to New-York.

The climate is favourable to health; the extremes of temperature at Cambridge in 1843, were 94° above and 70° below zero of Fahrenheit; but such extremes are of short continuance.

MASSACHUSETTS.

The principal rivers are the Connecticut, a noble stream, winding for 50 miles across the state, receiving Deerfield and Westfield rivers from the west, and Miller's and Chickapee rivers from the east; Housatonic, which rises in Berkshire county, and flows through the west part of the state; and Merrimack, which rises in New-Hampshire, and has a course of 50 m. in the N.E. part of the state, and enters the ocean below Newbury port. It is navigable for large vessels 15 miles to Haverhill. Besides these, there are Nashua, Concord, Ipswich, Charles, Taunton, and Blackstone rivers.

Massachusetts bay, that gives name to the state, which was formerly called the Bay State, extends from Cape Ann on the N., 40 m. to Cape Cod on the S., and includes Boston and Cape Cod bays. Buzzard's bay on the S. shore, is 30 m. in length. Boston harbour is one of the finest in the world, capacious, safe, easy of entrance and easily defended. New-Bedford on Buzzard's bay, has a fine harbour. The other commercial towns are Salem, Newburyport, Gloucester, and Nantucket. The other principal towns are Lowell, Plymouth, Worcester, Springfield, Pittsfield, and Northampton.

There are several important islands off the S. shore of Massachusetts, belonging to the state. The largest is Nantucket, 15 m. long, and 11 broad, and which constitutes a county of its own name. Martha's vineyard lies W. of Nantucket, is 30 m. long and from 2 to 10 broad, and with other small islands, constitutes Duke's county.

The exports of the state in 1840, amounted to \$10,186,261, and the imports to \$16,513,558. There were 241 commercial and 123 commission houses engaged in foreign trade, with a capital of \$13,881,517; 3925 retail dry goods and other stores, with a capital of \$12,705,038; the lumber trade employed 3433 persons, and a capital of \$1,029,360; internal transportation employed 799 persons, and with 480 butchers, packers, &c., employed a capital of \$407,850; the fisheries employed 16,000 persons, and a capital of \$11,725,850.

The manufactures of Massachusetts are equally distinguished with its commerce. Home-made or family goods were produced to the amount of \$231,942; there were 27 fulling-mills and 144 woollen manufactories which employed 5076 persons, producing articles to the amount of \$7,082,298, with a capital of \$4,179,850; 378 cotton factories, with 665,095 spindles, employing 30,928 persons, producing articles to the amount of \$16,533,423, and employing a capital of \$17,414,009; 48 furnaces produced 9332 tons of cast iron, and 67 forges, rolling-mills, &c., produced 6604 tons of bar iron, the whole employing 1097 persons, and a capital of \$1,322,875; 82 paper-mills employed 967 persons, producing to the amount of \$1,659,930, 82 other manufactories of paper produced to the amount of 50,700, and the whole employed a capital of \$1,088,800; 483 persons produced salt to the amount of 376,596 bushels, with a capital of \$502,959; hats and caps were manufactured to the amount of \$918,438, and straw bonnets to the amount of \$21,646, the whole employing 6656 persons, and a capital of \$602,292; 355 tanneries employed 2446 persons, and a capital of \$1,084,009; paints and drugs were produced to the amount of \$405,735, and turpentine and varnish to the amount of \$25,880; 1532 saddleries, and other manufactories of leather produced various articles to the amount of \$10,553,938, and employed a capital of \$3,318,544; four glass houses employed 372 persons, producing articles to the amount of \$471,000, with a capital of \$277,000; 90 potteries employed 71 persons, produced articles to the amount of \$44,450, with a capital of \$27,975; two sugar refineries produced articles to the amount of \$1,025,000; chocolate was manufactured to the amount of \$31,500; confectionery was made to the amount of \$137,300; 14 powder-mills employed 60 persons, and produced 2,315,215 pounds of gunpowder, with a capital of \$955,000; 913 persons produced machinery to the amount of \$928,973; 1109 persons produced hardware and cutlery to the amount of \$1,881,163; 37 distilleries produced 3,177,910 gallons, and seven breweries produced 429,800 gallons, employing 154 persons, and a capital of \$963,100; 377 persons produced 30 cannon and 32,652 small arms; 1402 persons produced carriages and wagons to the amount of \$903,999, with a capital of \$324,060; 24 persons produced granite and marble to the amount of \$217,180; 758 persons manufactured bricks and lime to the amount of \$310,796; mills of various kinds, flouring, grist and saw, employed 1808 persons, manufactured to the amount of \$1,771,185, with a capital of \$1,440,153; ships were built to the amount of \$1,349,994; 51 ropewalks employed 673 persons, producing cordage to the amount of \$653,900, with a capital of \$555,100; 2424 persons manufactured furniture to the amount of \$1,000,008; 246 persons manufactured musical instruments to the amount of \$943,760, with a capital of \$555,100; 924 brick or stone houses, and 2940 wooden houses were built, employed 2947 persons, and cost \$2,767,134; 104 printing offices, 72 binderies, 10 daily, 67 weekly, and 14 semi-

MASSACHUSETTS.

weekly newspapers, and 14 periodicals, employed 923 persons, and a capital of \$416,900. The total amount of capital employed in manufactures was \$41,774,446.

Massachusetts has three colleges and two theological seminaries. Harvard university at Cambridge, is the oldest and best endowed seminary in the country, founded in 1638, about 18 years after the first landing on the Rock of Plymouth; Williams college at Williamstown, in the N.W. corner of the state, was founded in 1793 and is flourishing; Amherst college at Amherst, was founded in 1831, and has had an unexampled growth, ranking with the first colleges in New-England. The theological seminary at Andover, under the direction of the Congregationalists, has been munificently endowed by a few individuals, and is one of the oldest and most respectable institutions of the kind in the United States. It was opened for students in the autumn of 1808. The Baptists have a flourishing theological institution at Newtown, founded in 1825. All these institutions had in 1840, 769 students. There were 251 academies and grammar schools in the state, with 16,746 students, and 3362 common and primary schools, with 160,257 scholars. There were 4446 white persons, over 20 years of age who could neither read nor write. These, as in most cases in the states, are principally made up of foreign immigrants.

The principal religious denominations are Congregationalists, of whom some are Unitarians, Baptists, Methodists, Episcopalians and Universalists. In 1836, the Orthodox Congregationalists had about 323 churches, 291 ministers, and 46,950 communicants; the Unitarians had about 190 ministers; the Baptists had 159 churches, 160 ministers, and 90,900 communicants; the Methodists had 87 ministers; the Episcopalians had one Bishop and 37 ministers; the Universalists had 169 congregations and 44 ministers; the Friends had 18 societies; the Roman Catholics had one bishop, and 11 ministers. Besides these there are a few Presbyterians, Christians, Swedenborgians or New Jerusalem, and Shakers.

At the commencement of 1843, the state had 118 banks with an aggregate capital of \$31,390,000, and a circulation of about \$7,573,332. There is a state penitentiary at Charlestown, substantially on the Auburn plan, and the income more than pays the expenses.

Massachusetts has not been behind her sister states, on works of internal improvement. The Middlesex canal, connecting the Merrimac river, two miles above Lowell, with Boston harbour at Charlestown, is 27 m. long, was completed in 1828, at a cost of \$528,000; and it is the first canal of any length, constructed in the U. States. Hampshire and Hampden canal continues the Farmington canal from the N. line of Connecticut, 22 m. to Northampton, making the whole length of the canal from Northampton to New-Haven Ct., 76 m. Blackstone canal, 45 m. long, connects Worcester with Providence, R. I., and was completed in 1826, at a cost of \$600,000. Montague canal, around Montague falls in Connecticut river, is three miles long, and overcomes, by eight locks, a fall of 75 feet. South Hadley canal along South Hadley falls in Connecticut river, is two miles long, and has five locks. The railroads are more numerous and important than the canals. Quincy railroad was completed in 1827, from the granite quarry, three miles to Neponset river, and deserves to be mentioned as the first work of the kind built in the United States. The Western railroad commences at the termination of the Boston and Worcester railroad, and extends to the western boundary of the state, 156 m., and is continued to Albany. It cost \$7,595,791. A branch of this railroad extends to Hudson, N. Y. Boston and Lowell railroad connects the two places, is 26 m. long, and cost \$1,978,936. Boston and Maine railroad, which is continued, after leaving the state to Portland, Me., cost, in the Massachusetts part, \$1,900,925. Boston and Providence railroad connects the two places, is 43 m. long, and cost \$1,892,531. Boston and Worcester railroad between the two places is 44 m. long, and cost \$2,764,396. The Charlestown branch of this road, six miles long, cost \$223,145. The Eastern railroad extends to the line of New-Hampshire, 53 m., and cost \$2,321,069. The Norwich and Worcester railroad between the two places is 59 m. long, and cost \$2,158,562. A steamboat line connects this road with New-York city. Nashua and Lowell railroad is 14 m. long, and cost \$360,000. New-Bedford and Taunton railroad is 21 m. long, and cost \$426,192. The Taunton branch of this road is 11 m. long. Most of these railroads yield a dividend of from six to eight per cent. At the close of 1840, the debt of the state amounted to \$5,149,137.

The government of Massachusetts consists of a governor, lieutenant governor, senate and house of representatives. They are elected annually by the people. The governor must have resided seven years in the state and be worth a freehold of 1000 pounds and declare his belief of the Christian religion. The lieutenant governor must possess the

MASSAT.

same qualifications. A council of nine persons besides the lieutenant governor are elected annually by the joint ballot of the legislature, and not more than two can be chosen in one congressional district. They rank next to the lieutenant governor. The senate contains 48 members, who must possess a freehold of 300 pounds, and a personal estate of 600 pounds, and must have resided in the state for five years immediately preceding the election. The house of representatives contains 336 members, who must possess a freehold of 100 pounds in the town for which he is chosen, or rateable estate to the value of 200 pounds. The judges and various other officers, as attorney general, &c., are appointed by the governor with the advice and consent of the council. The judges hold their offices during good behaviour. The secretary, treasurer, and receiver-general are appointed annually, by the joint ballot of both houses of the legislature. Every male citizen over 21 years of age, (excepting paupers, and persons under guardianship,) who has resided in the state one year, and in the town or district in which he may claim to vote six months next preceding an election, and shall have paid a tax in the Commonwealth within two years, or shall have been exempted from taxation, enjoys the right of suffrage.

Plymouth colony was settled by the Puritans, a part of Mr. Robinson's congregation under Carver and Bradford, Dec. 22nd, 1620. In 1630 the foundation of the Massachusetts colony was laid, and Salem and Charlestown were settled, and Boston in 1630. In 1634 the charter of Plymouth colony was surrendered to the crown, and an attempt was made the same year, and again in 1638 to procure the surrender of the charter of Massachusetts without effect. The patent of the Plymouth colony was, in 1641, transferred to the freemen. In 1643 the four colonies of Massachusetts, Plymouth, Connecticut and New-Haven entered into articles of union, styling themselves the *United Colonies of New-England*. Rhode Island petitioned to be admitted to the confederacy, but was refused. In 1675 the colony engaged in Philip's war, which issued after much suffering, in the defeat and extermination of the hostile tribe of the Pequods. In 1645 the troops of Massachusetts, Connecticut and New-Hampshire sailed for Cape Breton, and captured Louisbourg from the French. In 1765 the colony proposed a general congress, which met at New-York to resist the encroachments of parliament, and sent letters to all the provinces in 1768 to excite them to insist on a redress of grievances. In 1692 the colonies of Plymouth, Massachusetts and Maine were united, by a charter, under the name of Massachusetts. In 1773 the destruction of tea in the harbour of Boston occurred, which was followed the next year, by the shutting up of the port of Boston. The Revolution opened by the battle of Lexington, April 19th, 1775: and of Breed's hill, generally called Bunker hill, June 17th, 1775. Boston was the cradle of American independence, and Massachusetts bore an honourable part in securing it. On the 17th of March, 1776, the British were compelled to evacuate Boston. In 1780, a convention of delegates formed a state constitution. In 1780 Shay's rebellion occurred in the western counties, and was quelled the following year. The state voted in convention, Feb. 6th, 1788 to adopt the constitution of the United States—yeas, 187, nays 163, majority, 19.

MASSA-DUCALE, or DI-CARRARA, a town of N. Italy, belonging to the Modenese dom., cap. duchy of the same name, on the road between Genoa and Leghorn, 3 m. from the Mediterranean, and 98 m. N.W. Lucca. Pop. estimated by Rampoaldi at 7000. It is distinguished by the beauty and salubrity of its situation, and is clean and well built, but has few remarkable edifices. Its ancient cathedral was pulled down by Eliza Baccocchi, sister of Napoleon, when queen of Etruria, on account of its being too near the royal palace. It has an academy of sculpture and architecture, a seminary, college, hospital, public library, and an old castle now used as a prison. It is the see of a bishop; and has manufactures of silk stuffs, and some trade in wool, oil, and other agricultural products, and the fine marble of its vicinity, as to which see CARRARA in this Diet. (Vol. I, p. 539).

MASSAFRA, a town of the Neapolitan dom., province Otranto, cap. canton, on the road from Bari to Taranto, 10 m. N.W. the last-named city. Pop. about 7000. "Massafra is prettily situated on the slope of a hill interspersed with tufts of trees and shrubs; but when near it, it assumes a most singular appearance. The rock on which it stands is perforated and worked into a thousand fantastic shapes. The houses stand on the brink of a narrow valley, or rather chasm, worked through the rock by the action of running water." (*Burgess's Greece*, &c., I., 22.) The town is walled, and is conjectured by some authors to occupy the site of the *Messapia* of antiquity; but others contend that Messagna, between Oria and Brindisi, is the modern representative of that ancient city.

MASSAT, a town of France, dep. Ariège, cap. cant., in a fertile valley, 14 m. W.S.W. Foix. Pop., in 1838, 759.

MASSERNE.

There are in its vicinity numerous iron mines, the working of which employs a considerable portion of the people.

MASSERNA, p. l., St. Lawrence co., N. Y., 947 m. N. N. W. Albany, 594 W. Bounded N. by St. Lawrence river. Watered by Grass and Racket rivers. It contains several considerable islands in St. Lawrence river, and has a sulphur spring of some celebrity, which emits sulphuretted hydrogen gas, and contains carbonates of soda, lime, magnesia, and sulphur. It contains a Baptist church, nine stores, one fulling-mill, two grist-mills, four saw-mills; 17 schools, 740 scholars. Pop. 5736.

MASSERNE, mountains, sometimes improperly called the Ozark mountains, rise 70 m. S. W. of St. Louis, Mo., and run in a S. W. direction through Missouri and Arkansas into Texas. They are crossed by the Arkansas and Red rivers. It derives its name from mount Cerne, one of its most elevated summits.

MASSILON, p. v., Perry l., Stark co., O., 116 m. N. E. Columbus, 8 m. W. Canton, 100 m. W. Pittsburg, 92 m. E. Wooster, 450 W. Laid out in 1836 on the Ohio canal, on the E. side of Muskingum river. It contains two churches, an Episcopal and Baptist, a bank, 29 stores, 15 warehouses, one flouring-mill, one woolen-factory, two tanneries, one printing-office, one weekly newspaper, 250 dwellings, and about 3000 inhabitants. Goods are, to some extent, sold here by wholesale. The exports are estimated at over 600,000 annually, and the imports of merchandise amount to over 1,000,000 pounds. Bituminous coal is found in the vicinity, and is exported. In the vicinity are several large flouring-mills.

MASUAH, the principal seaport of Abyssinia, on the Red sea, on an island separated from the continent by the narrow but deep channel of Adowa, 250 m. N. E. Gondar, and 420 m. S. by E. Djidda: lat. $15^{\circ} 26' 45''$ N., long. $39^{\circ} 24'$ E. Pop. 9000. The island in which Masuah stands is only about half a mile in length, and a quarter of a mile in breadth, one third of its extent being occupied by houses. The town has several stone houses, two stories high; but most of them are in ruins. The other dwellings are mere huts, built, as in Arabia, with poles and bent grass. The only public buildings are four mosques, of small size and rude architecture. Owing to the total absence of springs, water is very scarce, and is collected in large public tanks, that occupy nearly a third part of the island. The harbour, though having a narrow entrance, can accommodate about 60 vessels; and is safe, deep, and easily accessible. The trade carried on between Masuah and the ports of Arabia is of considerable importance. From Djidda are brought many articles of European manufacture, embroidered velvets, arms, glass-ware, silks, and satins; while Mocha furnishes Indian fabrics of every quality, from the finest muslins to the coarse Surat cloth, used as articles of dress in a great part of Africa. The exports comprise a considerable number of slaves, gold-dust, ivory, rhinoceros' horns, and corn, brought from the interior by a large caravan, which arrives in February. The naybe demands 10 per cent. *ad valorem*, on all exports and imports, and the same amount of duty is levied by the imâm. (*Valentia's Travels*, ii., 44-48.)

MASULIPATAM. See **CIRCARS** (NORTHERN).

MASULIPATAM, a fortress and town of British India, presid.

MATANZAS.

Madras, capital of the above district, on the Coromandel coast, 230 m. N. N. E. Madras; lat. $16^{\circ} 15'$ N., long. $81^{\circ} 14'$ E. The fort is of an oblong figure, 800 yds. by 600, in the midst of a salt morass, and close to a canal communicating with the Krishna. By means of this canal the surrounding country may be entirely inundated, a circumstance constituting the chief strength of the place. The *pettah*, or native town, is about $\frac{1}{2}$ m. to the N. W.; it is very extensive, and, for a Hindoo town, tolerably well built. Masulipatam stands on the only part of the Coromandel coast which is not beat with a heavy surf. Its port receives vessels of 300 tons; and it was for a lengthened period a place of considerable trade with Bengal, China, Birmah, Persia, and Arabia. Its commerce is now, however, greatly fallen off, and scarcely extends beyond Calcutta on one side, and Bussorah on the other. Its chief exports are piece-goods and tobacco. The chintzes of Masulipatam, though not equal to those of Europe, have been long, and deservedly, celebrated, and are very generally worn in some parts, especially in Persia. This town is the residence of the district collector and judge. It was conquered by the Bhamanee sovereigns of the Decca, in 1480, ceded to the French in 1751, and taken by the British in 1759.

MATANZAS, a sea-port town of Cuba, ranking next to Havannah, in commercial importance, on the N. coast of the island, at the bottom of a deep bay, 52 m. E. Havannah; lat. $23^{\circ} 2' 38''$ N., long. $81^{\circ} 37' 44''$ W. Pop., in 1857 (including garrison and strangers, estimated at 3000), 14,341: of the resident population, 6333 were whites, 1141 free people of colour, and 3067 slaves; but, at present (1841), the population is probably not under 20,000. It is pretty well built, has some good streets, and about one third part of its houses are of stone. It has a large hospital, a good parish church, barracks, theatre, two market-places, two printing-offices, a bathing establishment, &c.; and in the neighbourhood is a considerable sugar-refinery, belonging to an English firm. The bay of Matanzas, defended by the castle of San Severino, is extensive, and is exposed only to the N. E. wind. The harbour, in front of the city, is protected by a ledge of rock, 4 ft. below the surface, which serves as a natural breakwater, to defend the vessels at anchor within it from the swell. There are two channels by which to enter, the one by the N., the other by the S. end of the ledge; but the S. channel is fit only for coasting vessels. There are two rivers, one on each side of the town, which deposit so much mud at their mouths as greatly to diminish the extent of the anchorage ground, and render it necessary to load and discharge the shipping by lighters and launches. (*Turnbull's Cuba*, 217-219; *Cuba's Dict.*, &c., *passim*.)

Matanzas, though situated in one of the most fertile districts of this noble island, was an inconsiderable place till within the last 30 years. Under the old colonial government, it was merely a subsidiary port to the Havannah, and was not allowed to carry on any direct intercourse with foreign countries; but this impolitic restriction being removed in 1809, Matanzas immediately became the centre of a considerable trade; and the town and its commerce have since continued to increase, with the rapidly increasing cultivation of sugar and coffee, and other colonial staples in the adjoining districts. The great importance of the trade of Matanzas will be seen from the subjoined

ACCOUNT of the Sugar and Coffee exported from the Havannah and Matanzas, in 1836 and 1839.

MATARO (an. *Maro*), a seaport town of Spain, in Catalonia, 30 m. N. E. Barcelona. Lat. $41^{\circ} 33'$ N., long. $3^{\circ} 30'$ E. Pop., according to Mifano, 12,949. The more ancient or Moorish portion of the town stands on a slight eminence, at a short distance from the shore, and is surrounded by walls: its streets are narrow and crooked, with the exception of the Riera, which is wide and straight, lined with rows of trees, and forming an agreeable promenade. The new town, which stretches eastward along the seashore, is much larger and more regularly built, with wide streets, and respectable houses. A parish church and a general hospital, with two or three large buildings, formerly used as

monasteries, are the only public edifices. The town is celebrated for the excellence of its red wine and brandy, much of which is exported to the United States. Its cloth fabrics, which were favourably noticed by Townsend (i., 109), have much declined; and, since the emancipation of the colonies, its exports of cotton-print, ribbands, and lace, have become quite inconsiderable. The port has a ship-building yard; and there is good anchorage for merchant-ships close in shore. "The neighbourhood is very picturesque, and the country-houses and cottages have an air of greater neatness and comfort; the windows are glazed, and the inmates of the dwellings display a good stock of furniture. No beggars

MATHURA.

and fewer ragged people are seen; industry is evidently active; the ground is better cleared, fences (made of the American aloes) are more general and more neatly constructed; nobody is seen basking in the sun. In short, there is altogether a new order of things, quite different from that seen in any other part of Spain." (*Anglia*, ii., 304.)

MATHURA, or **MUTTRA**, a celebrated town and place of pilgrimage in Hindostan, prov. Agra, on the Jumna, 30 m. N.W. Agra; lat. 27° 31' N., long. 77° 33' E. It is highly venerated by the Hindoos, from its being the birthplace of their deity Krishna, and consists chiefly of one continued street of temples and ghauts, which, though they do not exhibit the architectural magnificence of similar structures in S. India, have, nevertheless, considerable elegance and richness. Mathura was taken in 1019 by Mahmoud of Ghiznee, who despoiled it of an immense quantity of gold, silver, and gems, threw down many of its temples, and desecrated others by converting them into mosques. Under Achar and his successors, however, the Hindoos were permitted to rebuild and improve the city; and a temple, erected about that period, is said to have cost 60 lacs of rupees. But this splendid edifice was destroyed by Aurunzebe, who built on the spot a mosque with the materials. Another large mosque, built by a Mohammedan governor, is now in a state of decay. Some extensive cantonments are separated from the town by an interval of broken ground covered with ruins. Mathura has a fort, in which is an observatory, founded by the rajah Jye-Singh of Jyepoor. At the end of the last century it was the head-quarters of the commander of Scindia's infantry: it was, however, taken, without opposition, by the British in 1803. (*Hamilton's E. I. Gaz.*)

MATLOCK, a village and parish of England, celebrated for its mineral waters, hund. Wirksworth, co. Derby, on the Derwent, 14 m. N. by W. Derby, and 125 m. N.N.W. London. Area of parish, 3660 acres. Pop., in 1841, 3782. The town is beautifully situated, partly in a valley and partly on the slope of a hill rising E. from the Derwent, here crossed by a neat stone bridge: the houses are chiefly of stone. The church, picturesquely situated on the brow of a rock, rising perpendicularly above the river, and embosomed in trees, is a small edifice, in the perpendicular English style, with a square tower at its W. end: the living is a rectory (annual value £330), in the gift of the Dean of Lincoln. There are also four places of worship for Wesleyan Methodists, Independents, and other dissenters, with attached Sunday-schools, providing religious instruction for between 400 and 500 children of both sexes. There is also an endowed school, for clothing and educating 30 boys. In 1839, a cotton-mill employed about 300 hands: it has, also, a large paper-mill; and the lead-mines in the neighbouring hills employ about 150 hands. A museum of mineralogy, established here a few years ago, contains a great many valuable specimens of ore, &c., peculiar to this district. Visitors purchase considerable quantities of Derbyshire spar. But the chief dependence of the inhabitants is on the supply of those who come here during summer, to use the mineral waters; which are considered beneficial in cases of glandular affections, scrofula, bilious disorders, pulmonary complaints, and diabetes. The springs, which first attracted notice, for their medicinal qualities, in 1668, when the first, or old bath, was built, are about 1½ m. S. of Matlock, on the W. bank of the river; and here are the hotels, libraries, and lodging-houses, to which the visitors chiefly resort. Other two springs have been discovered, each of which is now enclosed, with a handsome edifice, conveniently fitted up with baths and pump-rooms. The waters have a temperature of about 66° or 68° Fahrenheit, and hold in solution only a small quantity of carbonate of lime, their specific gravity being less than that of ordinary water: it would hence appear, though having a lower temperature, greatly to resemble the Buxton and Bristol waters.

The scenery of Matlock-dale is peculiarly picturesque and romantic, diversified with rugged, beetling crags, strongly contrasted with the fine verdure of the valley: the most prominent objects being the high Tor and Masson hill. The former rises almost perpendicularly about 300 ft., the upper half of which is a broad mass of naked brown rock, from which fragments often fall into the river which flows immediately below, obstructing the channel, and greatly increasing the impetuosity of the stream after heavy rains. Opposite the high Tor, but of a less bold, though loftier, character, is Masson hill; on the summit of which are the heights of Abraham, rising about 750 ft. above the river, and not only overlooking the whole dale, but commanding an extensive prospect over a considerable part of Derbyshire. Willemsley castle, the seat of Mr. Arkwright, son of the great founder of the cotton manufacture, stands on a commanding eminence E. of the Derwent. (*Parl. Rep.; Priv. Inform.*)

MATTAPONY, r., Va., rises by several branches in Spottsylvania county, and in the S.E. part of King William county, unites with Pamunky river, to form York river.

MAULMAIN.

MATTEAWAN, p. v., Flehkill t., Dutchess co., N.Y., situated on Flahkill creek, a mile and a half from the landing on Hudson river. It contains a flourishing boarding school for boys, two churches, a Presbyterian and Episcopal, two cotton-factories with 6000 spindles, an iron foundry and machine shop, which produces every kind of machinery for cotton and woollen manufactures, 200 dwellings, and about 1800 inhabitants. No intoxicating liquors are allowed to be sold to the workmen. The creek has here a fall of 40 feet, affording an extensive water-power.

MATTHEWS, county, Va., situated in the S.E. part of the state, and contains 80 sq. m. It consists of a peninsula between Planktank and Mobjaek bays. Bounded E. by Chesapeake bay. It contained in 1840, 4181 neat cattle, 2336 sheep, 9214 swine; and produced 8875 bushels of wheat, 171,280 of Indian corn, 54,100 of oats, 17,070 of potatoes, 24,580 pounds of cotton. It had 30 stores, 15 grist-mills, two tanneries; two academies, 92 students; 13 schools, 257 scholars. Pop.: whites, 3969; slaves, 330; free coloured, 164; total, 7442. Capital, Matthews C.H.

MATTHEWS, C.H., p. v., capital of Matthews co., Va., 103 m. E. by S. Richmond, 187 W. It contains a court-house, jail, and several stores and dwellings. Net proceeds of the postoffice, \$250.

MAUCHLINE, a neat village of Scotland, co. Ayr, on an eminence 1 m. N. from the river Ayr, 37 m. S. by W. Glasgow. Pop., in 1831, 1364. The only public buildings are the parish church, and a chapel belonging to the Associate Synod. It has a woollen-mill, which employs about 25 hands; and hand-loom weaving and tambouring for the Glasgow manufactures employ about 200 hands. It has also a manufacture of beautifully jointed and varnished wooden snuff-boxes, similar to those made at Cumnock and Laurence kirk. There are four schools in the town, of which three are endowed: two subscription libraries, and a savings' bank. The village of Catrine (l., 563), is 3 m. S.E. from the town.

This place, trifling as it is, has been "married to immortal verse." Burns lived for nearly nine years at the farm of Mossiel, half a mile N. of the village; and Mauchline was the birthplace of "bonnie Jean," and is the scene of two of his inimitable poems, "The Jolly Beggar," and "The Holy Fair."

MAUCH CHUNK, p. t., capital of Carbon co., Pa., 98½ N.E. by E. Harrisburg, 280 W. The township belongs chiefly to the Lehigh navigation and coal company. Drained by Beaver, Mauch Chunk, Nesquehoning, and Kettle creeks, and Room run. It contains several villages connected with the coal business, which are Mauch Chunk, Coalville, Lousanne, and Nesquehoning. The village of Mauch Chunk is situated on the W. bank of Lehigh river, in a deep and romantic ravine, between rocky mountains, which rise precipitously 800 or 1000 feet above the level of the stream. It contains five churches, a Presbyterian, Methodist, Episcopal, Dutch Reformed, and Roman Catholic, seven stores, 300 dwellings, and about 1800 inhabitants. About 1200 of the inhabitants are employed in mining and shipping coal, and there is little attention paid to agriculture in the vicinity, the provisions being brought from an average distance of 30 miles. An inclined plane 700 feet long, rising 200 feet at that distance, and a railway 9 m. long, extends to the great coal mine. About 30 acres have been worked from this single vein, and have produced more than 1,200,000 tons. Here is located the village of Coalville, containing about 40 dwellings, inhabited chiefly by miners. The township contains seven stores, three lumber-yards, a furnace, an iron foundry, one grist-mill, four saw-mills, one printing-office, one weekly newspaper; six schools, 363 scholars. Pop. 3193.

MAULMAIN, or **MOULMEIN**, a seaport town of India beyond the Ganges, cap. British prov. Martaban, at the mouth of the great river Than-leung, having N. the Birme town of Martaban, on the opposite side of the river, and W. the island of Balu, which serves as a natural breakwater to defend the port from the heavy seas that would otherwise be thrown in from the W. 100 m. S.S.E. Rangoon, 97 m. N.N.E. Amherst; lat. 16° 30' N., long. 97° 30' E. It was founded so late as 1825, when the site was selected by Sir A. Campbell, as eligible as well for a commercial as a military station. It is about 800 ft. above the level of the river, and extensive and fertile plains stretch eastward from it towards the mountains. The port is good, and, from its extensive command of internal navigation, it promises to become a considerable emporium. The principal articles of export are teak, timber, and rice; but there is also a considerable export of tobacco, stic-lac, betel-nut, ivory, catch, cocca-nut, &c. The imports consist principally of European cotton goods, and marine stores. The principal trade of the place has hitherto been carried on with Calcutta, Madras, Rangoon, and Pinang; but, in 1837, a direct trade was commenced with London. Ship-building is carried on to a considerable extent. We have no recent accounts of

MAUMEE.

the population; but, probably, it is not under 8000 or 10,000. An English newspaper (the *Moulmein Chronicle*), from

MAURA (SANTA).

which we borrow the following details, is published once a week:—

	Imports.		
	1836.	1837.	Increase.
	<i>Reals.</i>	<i>Reals.</i>	<i>Reals.</i>
Calcutta	5,56,819	9,38,681	3,82,072
Madras	77,802	1,39,476	61,674
Straits	51,632	91,137	39,515
Rangoon	1,00,874	1,97,539	95,658
Tenasserim coast	43,730	52,174	8,444
Other ports	34,510	41,455	9,945
Total	8,65,357	14,60,665	5,95,308

	Exports.		
	1836.	1837.	Increase.
	<i>Reals.</i>	<i>Reals.</i>	<i>Reals.</i>
Calcutta	94,944	2,08,011	1,13,767
Madras	26,900	1,23,935	97,735
Straits	49,300	56,998	7,698
Mauritius		84,305	84,305
Rangoon	2,04,457	1,48,081	
Tenasserim coast	32,614	18,471	
Other ports	18,000	98,609	10,519
Total	4,94,995	6,68,410	2,43,415

"In order to exhibit, at one view, the decided increase of our trade in 1837 over the preceding year, we place the totals to and from each port in juxtaposition.

"From this it will appear, that the imports have increased nearly six lacs of rupees, and the exports two lacs and a half. Among the imports, the increase is found chiefly under the head of marine stores, spirituous liquors, and articles of European and Birmese manufacture. Among the exports, it is found in the staple productions of the country, rice and timber. Under the head of imports, we may notice that five lacs of rupees were received during the year into the government treasury; to which may be added, what does not appear in our statement, about half a lac of rupees, perhaps, from the Mauritius, for the purchase of cargoes of rice and timber. Under the head of exports, also, it would not, we think, be improper to include the estimated value of the vessels built and launched during the year at the several dock-yards. The following is a very rough estimate:

	No.	Tonnage.	Estimated Value.
Vessels launched	9	2,500	<i>Reals.</i>
Cost fitted for sea			250,000
Total			15,000
			575,000

"We are not aware that the mode in which our statements are drawn up requires any particular explanation. The word ' sundries ' may be, perhaps, thought too comprehensive; but we have divided it among articles of European, Indian, Chinese, and Birmese produce of manufacture.

"The following is a statement of the imports into Moulmein from the neighbouring Shan states during 1837:

	No.	Value.
Elephants	68	<i>Reals.</i>
Pine	16	15,000
Opium	40	17,500
Buffaloes	30	900
Cows and buffaloes	8,600	45,000
Sundries		4,500
Total		81,610

"Of the exports to those states, we can procure no detailed statement. Little else, however, is taken to them from hence but piece goods, either European or native, the value of which may, perhaps, be estimated at about 60,000 rupees.

"Taking, then, into consideration the various items above alluded to, and which are not brought into our statements, we shall have the following as the amount of imports and exports for the year 1837: Imports, 30,92,975 reals; exports, 11,03,410 reals.

MAUMEE, r. O., rises in the N.E. part of Indiana, and is formed by the junction of Little St. Joseph, St. Mary's, and Great and Little Auglaize rivers. It is about 160 m. long, and its average width for 50 m. from its mouth is 70 rods. It enters the W. part of lake Erie, in Maumee bay, and is navigable at all seasons, 18 m. from the lake to Perryburg, for schooners and steamboats. It is bountiful in spring and fall 18 m. above Perryburg to Fort Wayne; but this will be in a great measure superseded by the Wabash and Erie canal, now completed along its borders; and the Maumee canal will extend from it to Cincinnati. It waters a fertile country.

MAUMEE CITY, p. v., Lucas co., O., 124 m. N.N.W. Columbus 455 W. Situated on the W. side of Maumee river, at the foot of the rapids, at the head of navigation for small craft from lake Erie. A side cut here connects the Wabash and Erie canal with the river, and affords extensive water-power. It is extensively laid out, has several stores and warehouses, a considerable number of dwellings, and about 1000 inhabitants. It is in contemplation to remove obstructions in the river, so as to make it accessible to steamboats.

MAURA (SANTA) (an. *Leucas*), one of the Ionian islands, off the W. coast of Greece, and separated from it only by a channel about 100 yards broad, and so shallow, as in some places to be fordable; 48 m. S.E. Corfu and 7

m. N. Cephalonia, its cap. Amasichi being in lat. 39° 50' 15" N., long. 20° 43' E. Length 23 m.; average breadth, 8 m. Area, about 180 sq. m. Pop., including troops in 1836, 17,385. It is intersected by a chain of mountains, running N. and S. through its whole extent, and rising in some places to the height of 3000 feet, whence secondary ridges branch off in various directions, forming a few small valleys admitting cultivation; but most of the produce is raised on a narrow strip of land, stretching about 20 m. along the N.W. side of the island, and comprising the residences of the greater part of the population. The soil is generally very scanty; and many parts of the surface exhibit nothing but bare rock, interspersed with small patches of verdure: indeed, only about 1-8th part of the surface is capable of cultivation. In the valleys, the soil is either alluvial, or a red loamy earth, tenacious of moisture. There are no rivers; and, though numerous torrents flow from the mountains during the winter months, their channels are quite dry in the summer. There is a winter lake, if we may so call it, about 6 m. S. of Amasichi, in the bottom of a valley, surrounded by lofty mountains, which dries in summer, and produces rich crops. At the S. end of the island, is a shallow lagoon called the Venetian harbour, now rapidly filling up by the accumulation of sand and mud, the banks of which are said to be exceedingly unhealthy. The temperature of Santa Maura, like that of the other islands, is extremely variable; the thermometer in autumn often rising or falling 20° in 24 hours. In the valleys it seldom falls to the freezing point; but occasionally there is snow on the hills. The quantity of rain, and the seasons in which it falls, are much the same as in the adjacent islands. The low grounds are very unhealthy; and fever usually prevails at Amasichi during summer, attended with a mortality in some years of 1 in 19 of the population: indeed, most of the natives, except those living on the mountains, present a very sickly appearance. (*Major Tullock's Reports.*) The quantity of corn raised in the island is barely sufficient for half the consumption of its inhabitants; but wine, olive oil, and several varieties of fruit, are produced in great abundance. The sides of the hills afford excellent pasture, and are grazed by large numbers of sheep and goats. Game is plentiful, and bees form an object of rural economy. The salt-pans near Amasichi produce annually from 5000 to 6000 tons of basalt, which, as well as wine, oil, and cotton, are the chief articles of export. The inhabitants are of Greek origin, and belong to the Greek church. Many of them are employed as fishermen and sailors; while others, especially at harvest-season, cross to the neighbouring continent in quest of agricultural employment.

It has several good ports, and some towas; but none is of any importance, except the capital AMASICHI (which see).

The ancient Leucas once formed a part of the continent; for Homer expressly terms it *Ἀγρίν Χαλκίδα*, in opposition to Ithaca and Cephalonia. So late as the time of Thucydides, the Peloponnesian fleet was more than once conveyed across the isthmus; and Livy informs us, that it had its peninsula shape even in the Macedonian war. *Leucadia, nunc insula et vadoso freta quod perossam manu est, ab Aecarnania divisa, tum peninsula erat occidentis regione arctis faucibus coherens Aecarnania. Quingentes ferme passus longa fauces erant; lata haud amplius centum et viginti. In his angustis Leucas posita est, coll applicata versus in orientem et Aecarnaniam.* (*Hist. lib. xxxiii., 17.*) The cut here mentioned, called Dioryctus, was three stadia in length, and, in Strabo's time, was crossed by a bridge. The famous Leucadian promontory (now *Caps Ducato*) is a low ridge of white marble rocks, projecting 8, about 2 m., terminating in a precipice 200 feet high. It was surmounted by a temple of Apollo, and Virgil represents it as an object of dread to mariners:

*Mors et Leucatae sinibus cacumina montis,
Et formidatus nautes aperitur Apollo.* *Æn.* iii., 774.

but it is wholly indebted for its immortality of renown to its being

The Lover's refuge, and the Lesbian's grave,

MAURICE.

—the spot whence Sappho precipitated herself into the ocean, resolved either to recover the affections of Phaon, or to die in the attempt. (See *Ovidii Epist. Sappho Phaoni*, lln. 163, &c.)

Not far from the promontory stood the very ancient town of Neritum, mentioned by Homer as *νεριτων πολισ*, "a well-built city," and of which there are still some small vestiges. The position of the ancient Leucæa is fixed by Livy in the above passage close to the narrow strait which divides the island from Acarnania; and Dr. Holland mentions the ruins of an ancient town about 2 m. S. of Amaschi, exhibiting the remains of massive old Greek walls, ascending a narrow ridge near the sea, and of numerous sepulchres, which appear among the vineyards covering its declivity. (*Travels in Greece*, p. 63.) The modern history of Santa Maura is closely connected with that of the IONIAN ISLANDS generally; and to that article the reader is referred. (*Holland*, ii., 34; see also *Dodwell's Greece*, i., 62, &c.)

MAURICE, T., N. J., rises in Depford and Franklin townships, and flows into Delaware bay. It is navigable for 20 m. from its mouth, for vessels of 80 or 100 tons burthen. In its upper parts, it affords good water-power. There are fine embanked meadows on its borders, and fine oysters are taken at its mouth.

MAURICE RIVER, L. Cumberland co., N. J., 20 m. S.E. Bridgeton. Bounded W. by Maurice river. Drained by Tuckahoe and Tarkill creeks. It contains six stores, two glass houses, seven grist-mills, four saw-mills; eight schools, 260 scholars. Pop. 2143. It has several villages on the E. bank of Maurice river.

MAURICETOWN, p. v., Downe t., Cumberland co., N. J., 75 m. S. by W. Trenton, 187 W. Situated on the W. side of Maurice river, 10 or 12 m. from its entrance into Delaware bay. It contains a Methodist church, an academy, a store, and about 30 dwellings, some of them of brick, and neat.

MAURITIUS (THE), or ISLE OF FRANCE, an island in the Indian ocean, belonging to Great Britain, situated between 19° 58' and 20° 32' S. lat., and 57° 17' and 57° 46' E. long., from 70 to 80 m. N.E. the Isle de Bourbon, and 500 m. E. Madagascar. It is an irregular oval; length, N.E. to S.W., about 36 m.; breadth varying from 18 to 27 m. Area estimated at nearly 500,000 acres. Pop., in 1836, 92,147, of whom 29,812 were whites and free people of colour, 61,045 apprenticed labourers (blacks), now also free, and 1490 strangers. "From whatever quarter it is approached, the aspect is singularly abrupt and picturesque. The land rises rapidly from the coast to the interior, where it forms three chains of mountains, from 1800 to 2000 feet in height, intersecting the country in different directions. Except towards the summit, these are generally covered with wood, and in many parts cleft into deep ravines, through which numerous rivulets find their way to the low grounds, and terminate in about 90 small rivers, by which the whole line of coast is well watered, from the foot of the mountains to the sea. Though, from its mountainous and rugged character, a great part of the interior is not available for any useful purpose, yet extensive plains, several leagues in circumference, are to be found in the high lands; and in the valleys, as well as along the coast, most of the ground is well adapted either for the ordinary purposes of agriculture, or for raising any description of tropical produce. Extensive forests still cover a considerable portion of the districts of Mahébourg, the Savanna and Flaco, and in the centre of the island are several small lakes. The soil, in many parts, is exceedingly rich, consisting either of a black vegetable mould, or a bed of stiff clay of considerable depth; occasionally the clay is found mixed with iron ore and the debris of volcanic rock. In the neighbourhood of port Louis, and generally in the immediate vicinity of the sea, there is but a scanty covering of light friable soil over a rocky surface of coralline formation. The whole coast is surrounded by reefs of coral, with the exception of a few openings, through which vessels can approach the shore; and at these points the different military posts for the defence of the island have been established. There is a marked difference in the climate of this island in different situations; the windward (or S.E.) side enjoying a lower temperature by several degrees than the leeward (N.W.), owing to the cooling influence of the S.E. breeze, which prevails during most part of the year.

In so far as regards temperature, rain, physical aspect, and diversity of climate, this island exhibits a very striking resemblance to Jamaica; though, being S. of the line, the seasons are reversed; summer extending from Oct. to April, and winter during the rest of the year. The principal rainy season is from the end of December to the beginning of April, but showers are frequent at all times. Hurricanes are of frequent occurrence, and create great devastation, with much loss of life: they principally occur in January, February, and March. "So far as can be ascertained from

MAURITIUS.

the statistical returns of the island, the climate does not exert any prejudicial influence on the health of the white resident population, though it is by no means favourable to the negro race." (*Tulloch's Report on the Sicknes, &c., of the Troops in W. Africa*, &c., p. 3, 4, c.)

Previously to 1825, the sugar and other articles imported from the Mauritius into Great Britain were charged with the same duties that were laid on such articles when imported from India. But, at the epoch now alluded to, the produce of the Mauritius was admitted into our markets at the same duties as W. Indian produce, which were then materially lower than those imposed on the produce of our Eastern possessions. This alteration of the duties gave a great stimulus to cultivation in the Mauritius, particularly to that of sugar, which has since been raised, to the almost total exclusion of coffee, cotton, and indigo, that were previously produced in considerable quantities, the coffee especially being of excellent quality. Wheat and maize are raised in small quantities, with yams, manioc (introduced by the French), potatoes, bananas, and other vegetables. But the island is almost wholly indebted for its supplies of provisions to Hindostan, the Cape of Good Hope, Madagascar, the Isle de Bourbon, &c. Next to sugar, blackwood, or ebony, of which there is an immense supply, and tortoise shell, are the principal articles of export.

The exports of sugar from the Mauritius amounted, in 1812, to less than one million lbs. In 1814 they amounted to 1,034,264 lbs.; and, in 1818, to 7,908,399 lbs. Since then, but especially since the modification of the duties in 1825, there has been a most extraordinary increase in the export of sugar from the island. It amounted in

	1820	to	1835	to	1836	to	1837	to	1838
	15,294,753		64,854,515		21,730,766		63,357,317		67,998,692
	1825		1830		1835		1837		1838
	42,439,416		63,478,874						
	1830		67,998,692						

But the exports of other things are comparatively trifling; having amounted, in 1836, to only 15,819 galls. rum, 23,238 lbs. cloves, and 664,309 lbs. ebony.

In 1837, the total value of the imports amounted to £1,033,793, of which cotton manufactures and other articles from Great Britain made £245,744. The total value of the exports (including £77,793 for imports re-exported) during the same year, amounted to £231,050, of which, sugar produced no less than £739,973; of the total export of sugar that year, amounting to 63,478,874 lbs., 57,158,488 lbs. were shipped for Great Britain, 7,565,197 lbs. for New South Wales, 4,896,788 lbs. for the Cape of Good Hope, and some small quantities for other places. Among the imports were 54,005,000 lbs. of rice, and nearly 5,000,000 lbs. of wheat, from India; with considerable, though far less extensive, supplies from the Cape and Madagascar. During the same year, 433 British ships, of the aggregate burden of 95,831 tons, and 65 foreign ships, of the burden of 14,692 tons, entered the ports of the island.

Nine tenths of the sugar produced in the island, comes to England. Vessels have been above the distribution of the shipments in 1837; and it appears from the customs' returns, that we imported, in 1838, 67,874,128 lbs.; and, in 1839, 68,284,960 lbs., from the Mauritius. We believe, however, that the culture of sugar in the Mauritius has attained to a maximum. Indeed, the fair presumption seems to be that, in future, it will decline rather than increase. We found this opinion partly and principally on the greater natural facilities enjoyed by India for the culture of the cane, and partly, also, on the influence of the abolition of slavery, in lessening the supply of labour in the island.

The emancipation of the slaves in the Mauritius does not appear to have been so prejudicial to agriculture as in the W. Indies. By way of supplying the demand for labour, a considerable number of hill coolies have been brought from Hindostan; but it has been contended, and was believed truly, that, despite the regulations under which the coolies were introduced, they would be, in fact, little else than slaves; and their introduction has, in consequence, been stopped. Chinese settlers have also been introduced, but not in any considerable numbers.

The government is vested in a governor, with a salary of £7000 a year, and a colonial legislative council, subordinate to the orders of the sovereign in council. The governor is aided in his duties by an executive council, composed of the military officer second in command, the colonial secretary, and the advocate-general. The legislative council is composed of 15 members, seven of whom hold no official situation. Justice is administered in a supreme civil and criminal court, with three judges, a petty court, from which there is no appeal, and such other minor courts as the governor may see fit. Several provisions of the old French law continue in force. The troops employed in this com-

* These are French lbs., and are about 9 per cent. heavier than English lbs.

MAURITIUS.

mand have consisted either of two complete, or the service-companies of three, regiments of the line, with one company of sappers and miners, and half a company of artillery. The service-companies of two corps, with the head-quarters of the artillery and sappers and miners, are generally at Port Louis: those of the other corps are distributed between the different stations on the windward side of the island, having their head quarters at Mahébourg. The public revenue, in 1825, amounted to £187,780, and the internal colonial expenditure to £177,740, leaving a surplus of about £10,000, which was to be paid over in aid of the expenditure incurred in Great Britain, in the same year, on account of the colony, amounting to £78,384. (*Parl. Paper*, No. 632, Sess. 1840.) The greater portion of the revenue is derived from the customs' duties received at Port Louis.

Port Louis, or N.W. port, the capital and seat of government, is on the N.W. side of the island, in lat. 30° 8' S., long. 57° 38' 41" E. Pop. 26,000. It is situated at the bottom of a triangular bay, the entrance to which is rather difficult. Every vessel approaching the harbour must hoist her flag and fire two guns; if in the night, a light must be shown, when a pilot comes on board, and steers the ship to the entrance of the port. It is a very convenient port for coaling and repairing, but provisions of all sorts are dear. In the hurricane months the anchorage of Port Louis is not good, and it can then only accommodate a few vessels. The streets are tolerably regular; but the houses are low, and are principally built of wood. It has extensive, but generally very filthy suburbs. It suffered severely from fire in 1816, and from the cholera in 1819. The town and harbour are pretty strongly fortified. At the W. extremity of the town are some extensive and commodious barracks; and about 3 m. distant is the hospital, on a peninsula of coral rock, jutting into the sea. Mahébourg, in a healthy situation on the E.E. coast, with an excellent harbour, was opened to ships from distant countries in 1836.

The Mauritius has numerous small dependencies between lat. 30° and 30° S., and long. 50° and 70° E. The chief of these are the Seychelles Islands, between lat. 4° and 5°, about 930 m. N. from the Mauritius; one of which, Mahé, is 16 m. long, by from 3 to 4 m. broad; fertile, well-watered, very healthy, and having a population of about 7000. Mahé, its chief town, has on its N.E. side about 100 wooden houses, and a garrison of 30 men.

The Mauritius was discovered, in 1505, by the Portuguese. The Dutch took possession of it in 1598, and named it Mauritius, in honour of Prince Maurice. They made a settlement in it in 1644, which, however, they abandoned early in the next century. The French having, in 1637, expelled Bourbon, sent occasional settlers to the Mauritius, and, on its evacuation by the Dutch, they established a regular colony in the island in 1715, of which, however, they did not take formal possession till 1791. But the real founder of this important settlement was the justly celebrated M. de la Bourdonnaye, appointed governor in 1734. The Isle de France had hitherto been neglected for that of Bourbon, and was, at the arrival of the new governor, in the most impoverished and disordered state imaginable. But M. de la Bourdonnaye immediately perceived the importance of the island, which its two excellent harbours rendered of the greatest consequence to any European power having, or wishing to have, possessions in India; and he set about its improvement with a zeal, sagacity, and success that have rarely been equalled, and never surpassed. Besides extending the culture of the sugar cane, coffee, cotton, and indigo, he introduced the manioc from S. America, and cinnamon, cloves, pepper, &c., from the Dutch Islands; though the latter, with the exception of cloves, have not answered his expectations. He fixed the seat of government at Port Louis, which he may be said to have created as well as fortified; and constructed numerous roads, aqueducts, and other useful public works. His administration continued only for 11 years; and in that short space he contrived to change the whole aspect of the country, and rendered it a most prosperous and valuable colony. Even after the possessions of France in India had all fallen into our hands, the Mauritius continued to be of importance to her, and proved how justly M. de la Bourdonnaye had appreciated its capabilities as a naval station. It was estimated that, during the first 10 years of last war, the value of the British ships captured by privateers and other cruisers from the Mauritius amounted to £2,500,000. At length, a formidable armament being sent against it in 1810, it surrendered to our arms, and was definitely ceded to us in 1815.

Every body knows that this island is the scene of St.

The signal services rendered by M. de la Bourdonnaye here and in India met with a most ungrateful return. On his return to France, in 1748, he was thrown into the Bastille, where he was imprisoned for more than three years, without, as it turned out, there being the smallest foundation for any one of the charges made against him! He died, the victim of this disgraceful treatment, in 1788. (*See Biographie Universelle*, art. *M. de la Bourdonnaye*.)

MAYENNE.

Pierre's inimitable tale of Paul and Virginia. The wreck of the St. Geran, so striking and affecting an incident in the story, is a real event, which took place on the 18th of August, 1744. (*See Almanac de l'Isle Maurice pour 1837; and Parl. papers.*)

MAURY, county, Tenn., situated a little S.W. of the centre of the state, and contains 750 sq. m. Erected in 1807. Watered by Duck river and its tributaries. It contained in 1840, 23,614 neat cattle, 27,391 sheep, 105,175 swine; and produced 131,037 bushels of wheat, 13,649 of rye, 2,543,842 of Indian corn, 118,858 of oats, 24,616 of potatoes, 51,376 pounds of tobacco, 2,001,676 of cotton. It had 34 stores, two cotton factories with 796 spindles, 23 grist-mills, 20 saw-mills, 10 tanneries, 33 distilleries, two printing-offices, two weekly newspapers; one college, 85 students; 7 academies, 336 students; 98 schools, 763 scholars. Pop.: whites, 17,090; slaves, 11,093; free colored, 94; total, 38,186. Capital, Columbia.

MAXATAWNY, t., Berks co. Pa. 74 m. N.E. Harrisburg, 165 W. Drained by Maiden creek, and its tributary, Sacony creek, which afford water power. It contains two churches, one Lutheran, and one common to Lutherans and Presbyterians, three stores, one grist-mill, one tannery. Population, 1897.

MAY, cape, N. J. situated at the N.E. side of Delaware bay, in 39° 36' N. lat., and 74° 39' W. lon. It has a light-house on the point. It received its name from Cornelius Jacobus Meyr, a distinguished Dutch navigator, who visited the Delaware in 1693.

MAYBOLE, a bor. of barony and market-town of Scotland, co. Ayr, distr. Carrick, of which it is the cap., on the slope of a hill with a S. exposure, 8 m. S. Ayr, and 39 m. S. by W. Glasgow. Pop., in 1837, 4,000. The town contains mainly of an antique well-built street, interspersed with numerous modern buildings. The superiority of the old houses is owing to Maybole having been, in ancient times, the town residence of the aristocracy of Carrick; and the remains of no fewer than 38 baronial mansions are still more or less entire. Of these, the most imposing is "the Castle," once occupied by the Earl of Cassilis, the principal part of which is still standing. The only modern building is the parish church, erected in 1808. There is also a dissenting chapel. Hand-loom weaving, in connection with the Glasgow cotton manufactures, is extensively carried on, employing from 600 to 800 hands. The weavers are mostly Irish; boys and females also engage in the work, and perpetuate the poverty inseparable from the business. A weekly market is held in the town; and it has a bank, and a savings' bank. The parish school and the other schools bear a good character. There are two subscription, and two circulating, libraries. Poor-rates have not been introduced; but, when occasion requires, the inhabitants and land owners submit to a voluntary contribution to meet the case.

Maybole, being the capital of the bailiery of Carrick, was the seat of the courts of the district previously to the abolition of hereditary jurisdictions in 1747. The remains of Cromaragel abbey are situated close to the town, on the W. A celebrated disputation, which lasted three days, between Quintin Kennedy, one of its abbots, and John Knox took place, in 1561, in a house in Maybole, now "the Red Lion Inn;" it is needless to add, that it ended, as is universally the case with such disputes, in a drawn battle, each party claiming the victory, and conceiving that he had demolished his antagonist. (*M' Crie's John Knox*, p. 941. ed. 1839; *New Statistical Account of Scotland*, q. *Ayrshire*, p. 348.)

MAYENNE, a dep. of France, reg. N.W., formerly comprised in the prov. of Maine; between lat. 47° 45' and 49° 34' N., and long. 0° 5' and 10° 20' W., having N. Manche and Orne, E. Sarthe, S. Maine-et-Loire, and W. Ille-et-Vilaine. Length, N. to S., 55 m.; average breadth about 30 m. Area, 514,668 hectares. Pop. (1836), 332,598. A mountain chain, though of no great height, bounds Mayenne to the N., from which two ranges strike off to the S., one forming the E., and the other a part of the W. boundary of the department. It slopes generally from N. to S., in which direction it is intersected near its centre by its principal river, the Mayenne. The latter rises in the department of Orne, about 12 m. W. Alençon, running at first S.W., and afterwards generally S., through the departments of Mayenne and Maine-et-Loire; in the last of which, after receiving the Sarthe and Loire, it assumes the name of the Maine, and falls into the Loire, after an entire course of nearly 130 m. (*See also* MAINE-ET-LOIRE.) Mayenne, Laval, Château-Gontier, and Angers, are on its banks. There are numerous small lakes in this department. In 1834, it was supposed to comprise 354,998 hectares of arable land; 66,338 do. pasture; 26,379 do. woods; and 24,429 do. heaths, wastes, &c. More corn is grown than is required for home consumption. In 1835, the total produce was reckoned at upwards of 3,000,000 hectolitres, chiefly

MAYFIELD.

wheat, oats, and rye. The annual produce of cider is said by Hugo to be about 600,000 hectolitres. Some inferior wine is produced, but in small quantities only. Flax, hemp, chestnuts, and some other fruits, are the other principal products. Property is very much subdivided; and many of the farms, or rather patches called *cleuses*, are so very small that they do not admit of the use of the plough, and are cultivated by the spade only! In 1835, of 86,563 properties subject to the *contribution foncière*, 27,137 were assessed at less than 5 fr., 13,009 at from 5 to 10 fr., and 13,231 at from 10 to 20 fr., and only 17 were assessed at 1,000 fr. or upwards. We need not, therefore, be surprised to learn that the occupiers are generally destitute of either capital or enterprise, and strongly attached to routine practices. In 1830, there were about 214,000 head of cattle, and 144,000 sheep, in the department; the produce of wool being estimated at 175,000 kilogr. a year. The woods yield excellent timber, a good deal of which is appropriated to ship-building. Some extensive manufactures of linen stuffs and yarn were formerly established at Laval and Château-Gontier. But though these have fallen off the linen and cotton fabrics, including printed handkerchiefs, &c., of the department, still enjoy a high reputation. The iron trade of Mayenne is of considerable importance; and it also furnishes superior paper. It is divided into three arrondissements; chief towns, Laval the capital, Mayenne, and Château-Gontier. It sends five members to the chamber of deputies: number of electors (1839), 1716. Total public revenue (1831), 6686, 211 fr.; and expenditure, in the same year, 3,791,930 fr. (*Hugo*, art. *Mayenne*; *Official Tables*.)

MAYENNE, a town of France, in the above dep., cap. arrond., on both sides the Mayenne, 18 m. N.N.E. Laval. Pop. (1836), 8790. The town proper stands on the right, or W., bank of the river; the portion on the opposite bank, though comprising a third of the entire population, being only a suburb. They are connected by a bridge. This is an ill-built town; its streets are steep, irregular, and inconvenient, and its houses old and odd-looking. The castle of Mayenne, founded in the eighth century, made some figure in the wars between England and France; having sustained several sieges, especially one in 1434, when it capitulated to the earl of Salisbury, after resisting four successive assaults. It is now in ruins, and is separated by a planted promenade from the linen-hall of the town.

Mayenne has two parish churches, two hospitals, a good town-hall, &c.; and manufactures of linen and cotton fabrics; the former of which has, however, greatly declined of late years, while the latter has increased. (*Hugo*, art. *Mayenne*; *Guide du Voyageur*.)

MAYFIELD, p. t. Fulton co., N. Y., 8 m. N.E. Johnstown, 58 m. N.W. Albany, 429 W. Watered by Stoney creek, and other branches of Sacandaga river. It contains a church, four stores, two fulling-mills, two cotton factories, four grist-mills, 18 saw-mills, two paper-mills, two tanneries; 13 schools, 536 scholars. Pop. 9615.

MAYFIELD, p. v., capital of Graves co., Ky., 275 m. W.S.W. Frankfort, 808 W. Situated on a head branch of Mayfield's river. It contains a courthouse and jail, of brick, two churches, a Presbyterian and Methodist, three stores, 25 dwellings, and about 150 inhabitants. Nett proceeds of the postoffice, \$118.

MAYFIELD, p. t., Cuyahoga co., O., 161 m. N.N.E. Columbus, 389 W. Watered by Chagrine river, on which is situated the village of Gates' Mills. It contains two stores, one fulling-mill, one woollen factory, two grist-mills, four saw-mills, two tanneries; six schools, 280 scholars. Pop. 851.

MAYN, or MAIN, a river of central Germany, which has its source in Bavaria. It is formed by the union, about 24 m. N.W. Bayreuth, of the White and Red Mayn; the former rising in the Fichtelberg, and the latter in the Frankenjura, about 8 m. S.E.E. Bayreuth. The resulting river flows, with a gentle current, generally W., but with a very tortuous course; first traversing the circles of Upper and Lower Franconia, in Bavaria, then dividing Hesse-Cassel and Nassau, on the N., from Hesse-Darmstadt, on the S., and intersecting the territory of Frankfurt; till it ultimately falls into the Rhine, nearly opposite Ments, after an entire course of about 230 m. Though shallow, it is of equal depth, and is navigable throughout seven eighths of its extent, as far as the confluence of the Regnitz, near Bamberg. The Mayn is of considerable importance as a means of traffic; and Frankfurt, especially, owes all its consequence, as a commercial city, to this river. But few rivers, at least in civilized countries, presenting such facilities for improvement, have been more neglected; and, in addition to other inconveniences, the number and amount of the tolls levied on the Mayn oppose serious obstacles to its navigation. A vessel, in passing from the Rhine to Wertheim, in Baden, has to pay tolls amounting to 23 kreutzers per cwt., or 14s. a ton, besides fees, &c. A commission has, however, been recently appointed, for

MAYNOOTH.

examining the state of the river, and introducing some improvements. The Mayn will, probably, at no distant period, form a part of the line connecting the Rhine and the Danube; a canal having been already commenced, which is to run from Meitfirth, on the Altmain, to Bamberg, on the Regnitz. Besides the Regnitz, the Tauber, Mümmling, and Gersprenz are its chief affluents from the S., and the Rodach, Saale, Kitzig, and Nidda from the N. Bayreuth, Bamberg, Würzburg, Aichshaffenburg, Hanau, Offenbach, and Frankfurt, are either on, or immediately adjacent to, the banks of the Mayn. (*Dict. Géog.*; *Barthes*; *Private Inform.*, &c.)

MAYNOOTH, an inland town of Ireland, prov. Leinster, co. Kildare, on the Liffy Water, an affluent of the Liffy, 14 m. W. Dublin. Pop., in 1831, 2,653. It is without trade, and depends principally for its support on the contiguous college. It has a parish church, a Roman Catholic chapel, and the ruins of a large castle, once occupied by the family of Kildare.

The Royal college of St. Patrick, Maynooth, was founded in 1795, for the education of persons designed for the Roman Catholic ministry in Ireland. It is placed under the direction of a board of trustees, of whom the Roman Catholic archbishops are members *ex officio*, the remainder being selected from the Catholic hierarchy and nobility, in the proportion of seven of the former to six of the latter. An additional board of control was appointed by parliament in 1800, consisting of the lord-chancellor of Ireland, the chief justices of the Queen's Bench, Common Pleas, and Exchequer, the four Roman Catholic archbishops, and the earl of Pingall. This board holds triennial, or, if necessary, more frequent visitations, and has power to examine into all matters connected with the college. The chief functionaries of the establishment are the president, vice-president, and two deans; besides whom, there are three professors of divinity, and five others, giving instruction in various branches of literature and science. The number of students, on the first opening of the classes, in 1795, amounted only to 50; but it has since progressively increased to 450, at which it is limited, by the inadequacy of its funds to admit of further augmentation. The funds consist principally of an annual parliamentary grant of 8,928*l.*, and 3,000*l.* a year are derived from donations and bequests. The income is applied to the maintenance of an order of senior students, nominated from the four ecclesiastical provinces, who not only pursue the higher courses of study, but are also required to take part in the business of instruction. Their number is limited to 50, each of whom has an allowance of 60*l.* a year, half being deducted for board, and other collegiate expenses. Thirty bursaries have likewise been founded, of different annual amounts, from 30*l.* downwards. Two other orders of students have been formed, under the name of pensioners and half-pensioners, the former paying 21*l.* a year, and the latter half that sum, for board, &c. Each free student pays an entrance-fee of eight guineas, but the pensioners pay only four guineas. The free students, of whom there are 200, are appointed, after examination, by the bishops of the several dioceses, and are supplied gratuitously with lodging, commons, and instruction during the course, which ordinarily occupy seven years. The students belong, with but few exceptions, to the middle and lower classes of Roman Catholic farmers and occupiers. Public examinations are held twice a year. The site of this establishment is a tract of 54 acres, adjoining the town; and the buildings, which form three sides of a quadrangle, comprise the chapel, refectory, library, lecture-rooms, dormitories, and professors' residences. The library contains about 14,000 volumes, chiefly on theological subjects.

"There is much room for doubt, whether the advantages anticipated by government from this institution, have been realized; or, if realized, whether they are not more than counterbalanced by corresponding disadvantages. There seems to be a very general opinion, among those who have the best means of judging, that the Catholic clergy educated at Maynooth are less intelligent, less liberal, and less gentlemanly, in their manners, than their predecessors; and we should be inclined, on general grounds, to think that this must be the case. The Catholic clergy educated abroad were generally of a superior class to those educated at Maynooth; the scholastic instruction they received at the foreign seminaries was not, perhaps, better than what they now receive at home; but it is pretty certain that their scientific and general education was incomparably superior, and that they were less imbued with sectarian prejudices. The pupils at foreign seminaries mixed much more with the world, especially with the upper classes, than those educated at Maynooth; their opportunities for observation were consequently much greater, and their minds were necessarily liberalised by their familiarity with tastes, habits, and modes of thinking, widely different from their own.

"The students now at Maynooth belong, with but few

MAYO.

exceptions to the middle and lower classes of Catholic farmers and occupiers. The discipline to which they are subjected appears, judging from its effects, to be well fitted for forming skilful controversial divines, and zealous Catholics; but, in all that tends to expand and liberalise the mind, it is exceedingly defective; and the society of the student during the period of vacation, provided he be allowed to leave the college, is better calculated to increase than to lessen the deficiency. It is difficult to see how this unfavourable state of things is to be amended. Some have proposed opening the general classes of Trinity college to Roman Catholics as well as Protestants; and others have suggested the formation of a new establishment, where clergymen of both sects might be educated, the literary and scientific classes being common to all the students; and there being, at the same time, separate courses of theology by Catholic and Protestant professors, for the students of each persuasion. Either of these plans would, no doubt, materially weaken prejudices, and introduce greater liberality of opinion; but both the one and the other are opposed by great and we fear, all but insurmountable obstacles." (*Statistical Account of British Empire*, vol. ii., p. 385-386.)

MAYO, a marit. co. of Ireland, prov. Connaught, of which it occupies the N.W. portion; having N. and W. the Atlantic, E. Sligo and Roscommon, and S. Galway. Area, 1,355,048 acres; of which 425,124 are unimproved mountain and bog, and 57,940 water, consisting principally of loughs Mask, Conn, Carr, &c. The coast-line is extremely irregular, from its being more deeply indented with bays and arms of the sea than any other part of Ireland. On the W. it is fenced with numerous islands, and it has several fine harbours, of which, however, very little use is made. It has every variety of surface, rising, in parts, into high mountains and rugged wastes; but comprising, also, a large extent of comparatively flat and fertile land. The substratum is generally limestone; and, from the thinness of the soil and the humidity and mildness of the climate, it is better suited for grazing than for tillage. Property in a few hands. There were formerly some very extensive grazing farms in this county, but their number and size have been very greatly diminished within the last half century. Land being here indispensable to existence, the competition for small patches is quite intense; and it is said that any amount of rent that may be asked is sure to be promised! It was formerly usual to let land on the village, or partnership system; but of late years this practice has, luckily, been getting into disuse. (Unfortunately, however, the *cess* system seems to be rapidly extending; and this is, if possible, worse than the other. (See *ent*, p. 34.) Hence, notwithstanding the increase of cultivation, the condition of the great bulk of the occupiers of land has deteriorated, and is, at present, as bad as possible. Average rent of land, 6s. 6d. per imperial acre; but the best grazing lands fetch above 40s. per Irish acre. Iron used to be made in this county; the works have, however, been long abandoned, on account of the want of fuel. It has, also, some valuable slate quarries; but its mineral riches have been but very imperfectly explored. The linen manufacture, which had been pretty widely diffused, has materially declined, and its place has not been occupied by any other department of industry. Principal rivers, Moy, Guishden, Deel, Owenmore, and Robe. Principal towns, Castlebar, Ballina, and Westport. Mayo is divided into nine baronies and 66 parishes. It sends two members to the House of Commons, both for the county. Registered electors, in 1830-40, 2,185. In 1831, Mayo had 62,367 inhabited houses, 65,907 families, and 366,299 inhabitants, of whom, 179,595 were males, and 186,733 females.

MAY'S LANDING, p. v., Hamilton t., capital of Atlantic co., N. J., 73 m. S. Trenton, 183 W. Situated at the head of sloop navigation, on both sides of Great Egg Harbor river, 16 m. from the ocean. It contains a courthouse, all, Methodist church, four stores, and about 30 dwellings. It has considerable trade in cord-wood and lumber, and has some ship-building.

MAYSVILLE, p. v., capital of Buckingham co., Va., 9 m. W. Richmond, 158 W. Situated on the S.E. side of State river, which flows into James river. It contains a courthouse, jail, five stores, and about 300 inhabitants.

MATVILLE, Morgan co., O. It has two grist-mills, four saw-mills; six schools, 175 scholars. Pop. 1,150.

MATVILLE, city, Mason co., Ky., 81 m. N.E. by E. 'narkort, 461 W. Situated on the S. side of Ohio river, just below the entrance of Limestone creek. It was in early times called Limestone. It has a fine harbour for boats, situated on a narrow bottom, between the Ohio and the high hills in its rear. It has three streets running parallel with the river, and four others which cross them at right angles. It contains three churches, and about 500 dwellings; and is the dépot for most of the goods and merchandise for the E. part of Kentucky. It contained in 1840, nine commission houses in foreign trade, capital,

MAZANDERAN.

\$111,600, 29 retail stores, capital, \$133,000, two lumber yards, capital, \$10,500, one cotton factory, 1100 spindles, one flouring-mill, one saw-mill, one tannery, one brewery, two printing-offices, three weekly and one semi-weekly newspapers; one academy, 70 students, three schools, 300 scholars. Pop., 9741.

MAYVILLE, p. v., Chautauque t., capital of Chautauque co., N. Y., 21 m. N.W. Jamestown, 334 m. W. by S. Albany, 339 W. Situated on elevated ground at the N. end of Chautauque lake. The buildings are mostly on one broad street and a public square, with a delightful water prospect down the lake. It contains a fine courthouse, which cost \$9000, a jail, a fire-proof county clerk's office, all of brick or stone, four churches, a Baptist, Presbyterian, Methodist, and Episcopal, an academy, eight stores, 90 dwellings, and 600 inhabitants. A steamboat plies on the lake, between this place and Jamestown.

MAZAMET, a town of France, dep. Tarn, cap. cant. on the Arnette, a tributary of the Tarn, 32 m. S.E.E. Albi. Pop., 1836, 4438. Its population and prosperity are increasing: it has some manufactures of woollen cloth; several dyeing establishments and paper-mills, and considerable annual fairs for cattle, wool, &c.

MAZANDERAN, a prov. in the N. of Persia (an. a part of *Hyrcania*), separated from Irak-Adjem by the lofty ridge of Elburg, and bounded N. by the Caspian Sea, E. by Khorassan, and W. by Ghilan. Length from W. to E., 200 m.; average breadth, 50 m.; area, 10,000 sq. m. Pop., 150,000 (exclusive of the nomad tribes of Kadjars, Kodjavehs, and Modanlus). The S. parts of the province are mountainous, abounding with oak-timber, and full of swamps; but the valleys are fertile, producing the finest rice in vast quantities. Besides many smaller streams, the Mazanderan has two principal rivers, both having their sources in the Elburg mountains, and falling into the Caspian sea. With respect to temperature, the province may be divided into a warm and a cold climate, the former being that of the flat country near the sea, and the latter that of the mountain region: in all parts, however, the climate is extremely variable with respect both to temperature and moisture. (*Foxes's Caspian Sea*, p. 48.) Winter and spring are the healthiest seasons; for during the summer and autumnal heats, such exhalations arise from the fens and marshes overpreeding this part of Persia, as to render the air most insalubrious. Agues and dropsies, rheumatism and eye-diseases, are the prevalent disorders, and the natives have generally a sallow and bloated appearance. Heavy rains fall in October, November, and December: snow also falls, but never lies long on the ground; and in spring, the rivers almost invariably overflow. The cultivation of rice is the most important branch of agriculture. Cotton and sugar, also, are raised; but the canes are small, and the produce is dark, moist, and of very inferior quality. Tobacco does not succeed, nor is opium much cultivated, though the poppy grows abundantly. Barley is sown occasionally in spring as a green crop for horses and cattle: it is cut about the middle of May, after which the ground is ploughed, and planted with rice. Wheat is little cultivated, and is of bad quality; but excellent flour is imported from Astrakhan. Unhusked rice is used as dry food for horses and mules. Silk was formerly raised only in small quantities; but it appears that since the government monopoly ceased some few years ago, more attention has been paid to it, and its price has fallen. The trade of the province is chiefly with Russia, in rice, silk, and cotton, which it exchanges for silk, cotton, and woollen fabrics, corn, tobacco, cutlery, &c.

The inhabitants are described as "vain, ignorant, and arrogant, considering themselves as persons of mighty importance, superior to all strangers. Their ignorance of everything beyond their own province, is profound, to a degree hardly credible. Their bigotry in religious matters is excessive, though chiefly confined to forms; for there are few who do not transgress every article of inhibition: all of them drink strong liquors and eat opium." In their appearance and dress, they greatly resemble other Persians, but swarthy and almost black men are of more frequent occurrence than elsewhere. The natives are regarded as the most warlike of the Persians; and, in the time of Timour Bec, they defended their retreats and castles with so much courage and ability, as to secure their independence. This province is also said to have been the grand seat of the war between the Sefeed Deeve (or White Demon) and Rustom, prince of Zablestan; and the relief of his sovereign, who had been besieged in the city of Mazanderan, is one of the most glorious exploits recorded in the life of the Persian hero. The chief cities are Sari, Balfrosh, Ferrabad, and Amul. Most of the towns and villages are open, well-built, and delightfully situated either on verdant hills, or in fertile and well-watered valleys. Among the numerous public works of Shah Abbas the Great, is a magnificent causeway of great length, run-

MAZZARA.

ning nearly parallel to the Cuspian. The pavement, even now, is perfect in many places, though it has hardly ever been repaired. In some places it is above 20 yards wide, with ditches on each side; and on it are many bridges, under which the water is conveyed to the rice-fields. (*Fraser's Travels on the Shores of the Caspian; Kinmar, &c.*)

MAZZARA (an. *Emperium*, or *Mazara*), a seaport town of Sicily, on its W. coast, intend. Trapani, cap. distr., on the Salemi (an. *Mazara*), at its mouth, 11 m. S.E. Mazara, lat. 37° 30' N.; long. 15° 24' E. Population, in 1831, 5205. It is surrounded by an old wall of Saracenic construction, flanked by small square towers, and has an old ruinous castle at its S.W. angle. The domes of its churches give Mazzara as imposing aspect from the sea; but the contrast, on entering the town, is no less striking. The streets are narrow, unpaved, filthy, and swarm with pigs; the public buildings, for civil purposes, are large, heavy, and mean; and those for ecclesiastical purposes, being very numerous, we need not wonder that it should have become a common saying, "that every house in Mazzara has a priest and a pig;" the latter being by far the more useful animal of the two. The principal square has a singular appearance, from the antiquated style of its architecture; probably of the 11th century, from its having an equestrian statue of Count Roger destroying a Saracen, over the cathedral gate. Besides the cathedral, an edifice, remarkable for its fine cupola, the principal buildings in this square are the bishop's palace, the senate-house, and the residence of Count Gazzi. "In the cathedral porch are preserved three sarcophagi; the first of them bears a bas-relief, representing the battle of the Amazons; the second, the rape of Proserpine; the third, and most inferior, the Calydon hunt. At the convent of St. Michael is a Roman tomb, and some marble inscriptions; these, with a small collection of Punic, Saracenic, and Roman coins, are nearly the sum of the antique remains. Nor are there any modern specimens of the fine art." (*Smythe's Sicily*, 236.) Mazzara has a hospital, a college, and a theatre. Its port, which now, as in antiquity, is formed by the mouth of the river Salemi, is convenient enough for boats and small craft, but larger vessels are obliged to anchor in an exposed roadstead, in from eight to 10 fathoms water. The entrance of the port is ornamented by a statue of St. Vitus, the tutelary saint of the town, in whose honour a festival is held here in August. Notwithstanding the badness of its port, Mazzara enjoys a considerable trade. It has a *carricatore*, for the warehousing of corn, of which it exports considerable quantities; and it also exports pulse, wine, fruit, fish, barilla, madder, oil, and soap. (*Smythe's Sicily*, 234-238, &c.)

Mazzara, or Emperium, was taken by storm by Hannibal, previously to his commencing the siege of Selinus; but it does not appear to have been a place of much importance in antiquity. There can, however, be no doubt, were Sicily subject to a vigorous and enlightened government, capable of developing its gigantic resources, that Mazzara would rise to very considerable distinction as a shipping port. It was here that the Saracens landed when they invaded and conquered Sicily. (*Smythe, ubi supra; Ancient Universal History*, xvii. 360. 8vo. ed.; *Hoar's Classical Tour*, &c., i. 75-77.)

An extraordinary phenomenon, called the *Maròbes*, being a violent agitation of the sea, is witnessed on this part of the Sicilian coast. "Its approach is announced by a stillness in the atmosphere, and a lurid sky; when suddenly the water rises nearly two feet above its usual level, and rushes into the creeks with amazing rapidity; but, in a few minutes, recedes again with equal velocity, disturbing the mud, and occasioning a noisome effluvia: during its continuance, the fish float quite helpless on the turbid surface, and are easily taken. These rapid changes generally continue from half an hour to upwards of two hours, and are succeeded by a breeze from the S., which quickly increases to heavy gusts." Captain Smyth by some speculations as to the cause of this singular phenomenon, for which we beg to refer to his work. (*Smythe's Sicily*, pp. 234-238.)

MEAD, county, Ky. Situated in the N. part of the state, and contains 360 sq. m. Bounded N. and N.W. by Ohio river, and watered by small creeks flowing into it. It contained in 1840, 5714 neat cattle, 7045 sheep, 12,586 swine; and produced 41,597 bushels of wheat, 3906 of rye, 199,223 of Indian corn, 73,529 of oats, 9199 of potatoes, 170,464 pounds of tobacco. It had 17 stores, one fulling-mill, two woollen factories, one cotton factory with 1370 spindles, five flouring-mills, four grist-mills, five saw-mills, two tanneries, three distilleries; 10 schools, 257 scholars. Pop.: whites, 4366; slaves, 1409, free coloured 5; total, 5780 Capital, Brandenburg.

MEADVILLE, p. b., capital of Crawford co., Pa., 234 N.W. by W. Harrisburg, 87 m. S. Erie on lake Erie, 94 m. N.W. Franklin on Alleghany river, 307 W. Situated on the E. side of French creek. The township gradually rises from the creek to its centre, where is a handsome public

MEAUX.

square of five acres, on the E. side of which is an elegant courthouse of brick and cut stone, ornamented with a handsome cupola. It contains seven churches, two Presbyterians, a Methodist, Baptist, Episcopal, Cumberland Presbyterian, and Unitarian, an academy, a stone arsenal, 14 stores, one fulling-mill, one grist-mill, one saw-mill, two furnaces, four tanneries, two printing-offices, two weekly newspapers, three schools, 163 scholars. Pop. 1219.

It is the seat of Alleghany college, founded in 1815, which has a president, four professors or other instructors, 160 students, and 6860 volumes in its libraries, chiefly the donation of distinguished gentlemen in Massachusetts. The library contains many rare and valuable works. A portion of the students adopt the manual labour system. The institution is under the direction of the Methodists.

MEADVILLE, p. v., capital of Franklin co., Minn., 89 m. S.W. Jackson, 1698 W. Situated on the W. side of Bemidjito river. It contains a courthouse, and several stores and dwellings. Net proceeds of the postoffice, \$113.

MEATH, a marit. co. of Ireland, on its E. coast, prov. Leinster, having N. the counties of Louth, Monaghan, and Cavan, W. Westmeath, S. King's county and Kildare, and E. Dublin and the Irish sea. Area, 567,127 acres, of which only about 5800 are said to be unimproved or waste. Surface mostly flat, or only slightly undulating; soil, clay or loam, on limestone or gravel, and generally very fertile. Grazing used formerly to be the principal occupation; but, since the close of the American war, tillage has been gradually extending, and is now spread over more than four-fifths of the county. Notwithstanding the richness of the soil, and the favourable situation of Meath, the state of agriculture, and of the great bulk of the occupiers, are alike bad. A rotation of crops is only beginning to be introduced; corn frequently follows corn for a long series of years; when fallows do occur, they are in general wastefully executed, so that the land is in general foul and in bad order. Later, however, a better system has begun to make its way into the county, and the stock and implements of husbandry have been a good deal ameliorated. Even the better sort of farmers are, for the most part, very badly lodged; and the cabins of the cottiers and labourers are in the last degree filthy and wretched. Potatoes constitute three-fourths of the food of the bulk of the people; oatmeal and churned milk are sometimes added, but they rarely taste butchers'-meat, the pig being usually sold to assist in paying the rent. There are some large estates; but property is better divided than in most Irish counties. Tillage farms vary from five to 50, and some few extend to 100 acres. Average rent of land, 18s. an acre, which is higher than that of any other Irish county, except Dublin. Minerals and manufactures of no importance. Irish language pretty generally spoken. Principal river, the Boyne. Principal towns, Navan and Kells. Meath is divided into 12 baronies and 147 parishes. In 1831, it had 95,798 inhabited houses, 31,633 families, and 176,836 inhabitants, of whom 68,993 were males, and 87,833 females.

MEAUX (an. *Jetinum*, afterwards *Meldi*), a town of France, dep. Seine-et-Marne, cap. arrond., on both sides the Marne, which is here crossed by an old stone bridge. 24 m. E. N.E. Paris. Population, in 1836, 7774. It is pleasantly situated, and is tolerably well built. Its ramparts have been laid out in public walks; and it has some good promenades along the river, and a spacious public square. The cathedral, one of the most remarkable Gothic edifice in France, was begun in 1392, but not finished till the 16th century: it is 329 feet in length, 137 feet in breadth; the height of its vault being 150 feet, and that of its tower 213 feet. Its choir and sanctuary are extremely elegant; but it derives its chief interest from its containing the remains and monument of Bossuet; who, having been raised to the bishopric of Meaux in 1681, continued in possession of the see till his death, in 1704. The controversial writings of this great glory of the Gallican church display extraordinary learning and acuteness; but it is to his *Discours sur l'Histoire Universelle*, and his *Oraisons Funèbres* that he is mainly indebted for his imperishable renown. Extensive of the cathedral, the public buildings comprise the episcopal palace, in which is the writing-table of Bossuet, a public library, with 14,000 volumes, the college, town-hall, theatre, two asylums, a Protestant and two parish churches, and cavalry barracks. Meaux has manufactures of cotton stuff, earthenware, and glue. Numerous flour-mills are constructed on the Marne, the produce of which is sent to Paris, and the town has a good deal of trade in fish and other articles of farm produce: its traffic is greatly facilitated by the canals of Ourcy and Cornillon. Meaux is very ancient: it was made a bishopric in 375; was twice seized by the Normans in the ninth century; and was annexed to the French crown by Philippe-le-Bel. The French Protestants first preached publicly in this town, and it was the first to abandon the league, and submit to Henry IV. (*Hist. art. Seine-et-Marne*, &c.)

MECCA.

MECCA, one of the most famous cities of the eastern world, the birth-place of Mohammed, and the great centre of attraction to all the pilgrims or *Hajjis* of the Mohammedan faith, in Arabia, prov. El-Hedjaz, 51 m. E. from the port of Djidda (which see), on the Red sea, and 370 m. S. of E. Medina; lat. 21° 36' 17" N., long. 40° 15' E. Population 30,000. This celebrated city, which, being forbidden round to Christians, was known to Europeans only through direct and suspicious information from Mohammedans or African renegades, was a few years ago visited, in disguise, by Burckhardt; who has given a very full though rather desiccated description of the localities, climate, inhabitants, ornaments, religious ceremonies, and pilgrim visitors, not only of this city, but also of Medina (which see). Mecca literally meaning "the place of assembly," but pompously styled by the Arabs *Om-el-Kere*, "mother of towns," and *Islet-el-Ameq*, "region of the faithful," stands in a long, arrow, barren, sandy valley, running N. and S., called in the Koran "the valley without seeds." It is a straggling town, nearly 2 m. in length, but nowhere more than about 80 paces in breadth; the streets, which are irregular, paved, and dusty, are generally wider than those of other eastern cities. The handsome entrance is from Djidda, by S.W. quarters comprising some of the best houses; but on the other side of the great mosque, which is the nucleus of Mecca, there are three or four other good streets; the rest of which, perhaps, is the Mecca, the great resort of the Turkish pilgrims, and the noisiest, as well as most frequented, part of the town. "Indeed," says Burckhardt, "the Mecca resembles a Constantinopolitan bazaar. Many shops are kept by Turks from Europe and Asia Minor, for sale of swords, watches, copies of the Koran, and second-hand Turkish dresses; and there are numerous modern shops of ples, sweetmeats, &c. Here, too, are numerous *harem*-houses, crowded during the Hajj from three in the morning till 11 at night; barbers' shops, auction rooms, &c. The Mecca branches off a street called Soucyga, or the little Market, which though narrow, is the neatest street in Mecca, being regularly cleaned and sprinkled with water. Here the rich India merchants offer for sale their pieces of Cashmere shawls, muslins, perfumes, Mecca balsam, rose-wood, civet, &c., strings of coral, necklaces of carnelians, *al-rings*, and various kinds of China ware, and Abyssinian area. In fact, the Soucyga, being the coolest spot in the town during mid-day, is on that account the most frequented; and here all the gentlemen-hajjis take their morning and evening lounge, smoke their pipes, and hear the news." (Burckhardt's *Arabia*, i. 219-220.)

The quarter called Shamye is likewise well built, being chiefly inhabited by merchants or *olemas* (clergy) attached to the mosque, and frequented at the pilgrim time by merchants from Damascus; in whose shops are found silks, umbrellas, gold and silver thread, handkerchiefs, carpets, dried fruits, pistachios, &c. Near those last mentioned, also, another respectably-built quarter, called Gerara, inhabited by some of the wealthiest native merchants. These are certainly the best parts of the town, comprising lofty stone houses, often three stories high, surmounted by handsome minarets, and (what is unusual in eastern towns) having rows of windows fronting the streets. The town, however, not lighted, is scantily supplied with water, and contains many quarters, which, in filth and closeness, might vie with the dirtiest parts of Constantinople. Though once walled on three sides, Mecca is at present entirely open; but the neighbouring mountains are sufficiently high to form a tolerably strong barrier against an enemy; and on the rising ground S. of the city stands the great castle, a massive square structure, with thick walls and solid towers, containing a bomb-proof magazine, a reservoir for water, and accommodation for 1000 men. With this exception, Mecca is said to be almost destitute of public buildings; for the houses belonging to the sherifs, though handsome, are rarely private, and not large dwellings, and the *medreses*, or colleges, are now converted either into storehouses or dwellings for pilgrims. This circumstance is, no doubt, attributable to the veneration of the people for their holy zone, and this feeling prevents them from erecting any structure which might seem to rival the great object of their affection.

The *Beitallah*, otherwise called *El Haram*, the chief of Mecca, and the resort of every pious Mussulman*

who regards the injunction of the Koran, is a building by no means remarkable either for size or beauty; standing on low ground, in an oblong enclosure about 350 feet in length and 300 feet in breadth, formed by colonnades, roofed with numerous small plastered cupolas, supported by 450 pillars, about 90 feet in height, of marble, or Mecca stone. The temple has been so often ruined and repaired, that it has no traces of remote antiquity. The walls, arches, and minarets at the angles of the buildings are gaudily painted in stripes of yellow, red, and blue; but paintings of flowers in the usual Mussulman style are nowhere seen, and the colonnades are very clumsily paved. The Kaaba, or Holy House, which occupies the centre of the enclosure, and is the great attraction for all pilgrims, lays claim to a far more remote origin than that of Mohammedanism; and, though we may safely doubt the alleged fact of its having been built by Abraham and Ishmael, assisted by the angel Gabriel!† there can be no question that its genuine antiquity ascends beyond the Christian era. In all probability, the Kaaba is alluded to by Diodorus Siculus, when speaking of a temple held in superior sanctity by all Arabians. In the second century Maximus Tyrius attributes to the Arabs the worship of a stone; and this, if not identical with, is, at any rate, analogous to the "black stone" of Mecca, which, as Gibbon justly remarks, is deeply tainted with the reproach of an idolatrous origin. (Gibbon, ix. 247.) The Kaaba, which was all but rebuilt in 1697, after having suffered great damage from fire, is an oblong massive structure, 18 paces in length, 14 do. in breadth, and from 35 to 40 feet in height; its door being coated with silver, and embellished with gold ornaments. At the N.E. corner, near the door, is the "Black Stone" previously alluded to, obligingly brought by the angel Gabriel as his contribution to the building: it forms part of the sharp angle of the structure, four or five feet above the ground; being oval-shaped, seven inches in diameter, of a dark brown colour, somewhat resembling lava; and surrounded by a border of cement and silver, to prevent its being worn away by the kisses and touches of the pilgrims. Round the building is a broad marble pavement; and at the S.E. corner is another stone, much revered by all visitors, but of a less noble origin, and less holy than the other. The four sides of the Kaaba are covered with a curtain of embroidered black silk stuff, called the *keccema*, annually brought from Cairo at the time of the Hajj, and renewed with some not very decorous ceremonies. The holy fountain of Zem-zem, (said to be that so opportunely found by Hagar, when her son Ishmael was dying of thirst,) which supplies the town with water for drinking or *ablution* (its use for other purposes being forbidden), is enclosed in a substantial square building, having a handsome marble-faced entrance, with marble basins for *ablution*, and a room appropriated to the pilgrims, who come here in crowds to taste the miraculous fountain. From before dawn till near midnight, the well-room is constantly filled with visitors; all of whom, if not disposed to buy the services of the attendant, may themselves draw freely from the well. Various stories are afloat respecting the origin and virtues of this sacred spring, which, of course, are all believed by orthodox visitors, few of whom leave Mecca without carrying away some of the water in copper or tin bottles, to give away to their friends, and for their own use during illness, and their *ablution* after death. These are the chief buildings within the enclosure; but some of them can be considered as consecrated, except during the hour of prayer; for at other times, barbers, and all kinds of retail vendors, porters, idlers, &c., are to be met with at every turn. (Burckhardt, vol. i. p. 278.) In several parts of the colonnade, public schools are held for the instruction of young children; while, in other parts, a few professors deliver theological lectures, which meet, however, with little patronage from the pilgrims, who, with all their anxiety to visit the holy house, are, like all Turks, too much attached to the *dolce far niente* to trouble themselves with the doctrines either of the theologians or men of science. The exterior of the mosque is adorned with seven quadrangular minarets, from the summits of which a view is obtained of the busy scene around. There are 19 gates, distributed without any order or symmetry; and the outside walls are formed by the surrounding houses, which during the pilgrimage are let, at enormous rents, to the wealthiest hajjis, with whom it is a grand object to be as near as possible to the holy house. The windows of these houses overlook the enclosure; and hence their occupants are enabled to join in many of the mosque services without stirring from home. The service of the mosque occupies a vast number of people, as the imams, muftis, officers of the Zem-zem, muaddins, *olemas*, lamp-lighters, and menial servants, all of whom receive regular pay, besides sharing

* "They who shall disbelieve and obstruct the way of God, and hinder us from visiting the holy temple of Mecca, which we have appointed for place of worship unto all men,—the inhabitant thereof and the stranger to us equal right to visit it,—and whosoever shall seek implicitly to prevent us from coming thither, shall be a grievous sinner. Call to mind, when we sit, we will come thither to taste a grievous torment. Call to mind, when we give the site of the house of the Kaaba for an abode unto Abraham, say: 'Do not associate any thing with me; and cleanse my house for those to worship it, and who stand up and bow down to worship. And promise unto the people a solemn pilgrimage, then come unto them on foot, on every least road, arriving from every distant road, that they may be named of the advantages which accrue to them from the visiting, and may named the name of God on the appointed days.' *Sole's Koran*, ch. 22.

† The curious reader is referred for a very full account of the traditionally ascribed antiquity of the Mohammedan temple respecting the origin and antiquity of the Kaaba, to Burckhardt's extracts from Arabic works of well-known authority. (*Travels in Arabia*, i. 298-311.)

MEDINA.

the presents made by the pilgrims. The revenues of the mosque were formerly very extensive; but its wealth has greatly declined, nor does it now possess any treasures except a few golden lamps, the establishment being kept up almost wholly at the expense of the sultan. The first officer of the mosque is the *Nayib el Haram*, or warden, who keeps the key of the Kaaba, receives the pilgrims' contributions, and directs the repairs of the building. Next to him is the Aga of the eunuchs, a body of about 40 negroes who perform the duty of police officers in the temple; preventing disorders, and washing and sweeping the pavement round the Kaaba. In the time of the Ramadan, or great festival, the mosque is particularly brilliant; not only from the number of pilgrims of every age, rank, and nation within the enclosure, but also from the thousands of lamps which illuminate the colonnades. On the termination of the Hadj, however, the temple assumes a very different appearance. Disease and mortality, caused by fatigue, unhealthy lodgings, bad fare, and, in some cases, by absolute destitution, fill the mosque with the sick and dying; all of whom are anxious to have the satisfaction of expiring in view of the Kaaba, of receiving the finihm's prayers, and of being sprinkled with the sacred water of Zem-zem. Whoever enters Mecca, whether pilgrim or not, is enjoined by the law to visit the temple immediately, and not to attend to any worldly concern before he has discharged that solemn duty. Certain religious rites, such as walking seven times round the Kaaba, and reciting certain prayers, are performed in the interior of the mosque; then comes the ceremony of walking seven times between the hill of Safa and Merona; and, lastly, the pilgrims must submit to have their heads shaved by the barbers of the mosque. All these ceremonies must be repeated by every Mussulman, who enters Mecca from a journey farther than two days' distance; and they must be again more particularly performed at the time of the pilgrimage to Arafat, a hill about 15 m. E. of Mecca, to which Mohammed used to retire to pray, and which, on this account, is esteemed particularly sacred by all Mohammedans.

The concourse of pilgrims to the holy mount is often immense: Burchardt says he counted about 3,000 tents dispersed over the surrounding plain; but the greater number of the pilgrims were without tents: between 30,000 and 25,000 camels were to be seen scattered among the pilgrims, whose numbers, he concludes, must have exceeded 70,000. The camp was from three to four miles long, and between one and two miles in breadth. But we suspect that these returns are very decidedly beyond the mark; and the taste for pilgrimages is now rapidly declining throughout the Mohammedan world. A visit to Arafat is indispensable to the pilgrims; none by any chance omit it; nor can the title of Hadji be assumed except by those who have been present at the ceremony. Mecca, like Jerusalem, boasts of many places rendered sacred by tradition. The birth-places of Mohammed and his daughter Fatima, the tomb of his wife Hadia, and the cell where the prophet wrote the Koran, are shown to the pilgrims, who are expected to make contributions for their maintenance. But a visit to these places forms no item of religious duty; and but few depart in any way from the prescribed routine, as such acts would interfere with their profits either as merchants or beggars, and thus frustrate a very important, if not chief, object of the expedition.

The inhabitants of Mecca are, with the exception of a few Hedjaz Bedouins, either foreigners or the offspring of foreigners. The ancient tribe of Koreyah, to which Mohammed belonged, is almost extinct; and there are now in Mecca only three or four Koreyah families, the head of one of which is the Nayib, or keeper of the great mosque. The neighbourhood, however, of the great mart of Djidda, the annual arrival of immense caravans, and the holy house, attract thither vast multitudes of strangers; a portion of whom remain behind, and settle permanently in the city, adopting Arabian habits, and intermarrying with the native population. The most numerous are the descendants of Arabs from Yemen and Hadramaut; next to them in numbers are those of Hindoo, Egyptian, Syrian, African, and Turkish origin; besides whom there are Persians, Afghans, Kurds, and people, in short, of almost every Mohammedan nation, all of whom are careful in preserving a traditional knowledge of their original country. The inhabitants, however, though differing so much, nationally considered, wear the same sort of dress, have the same customs, and care much less for national costume and manners than in any other part of the east. Their colour is a yellowish brown; and in features they closely resemble the Bedouins: the lower classes are generally stout, with muscular limbs, while the higher orders are distinguished by their meagre emaciated forms and black piercing eyes. All classes are fond of dress, and the earnings of the poor are mostly spent on clothes. The women wear Indian silk gowns, with large blue striped trousers reaching to the ankles, and a white

kind of hood to cover the face. There are few families in moderate circumstances that do not keep slaves, most of whom are Nubians and Abyssinians, brought thither from the port of Soakin: many African females are kept as concubines; and, in case of their having issue, the masters usually legitimate the offspring by marrying them. The sale of concubines is confined to the middle and lower classes; the more wealthy regarded the practice as disgraceful. The inhabitants of Mecca, as also of Djidda and Medina, are far more lively and communicative than either the Syrians or Egyptians, and in this respect they resemble the Bedouins. Indeed, vivacity of temper, acute intellect, sagacity, and suavity of manner, are characteristics of almost all the native inhabitants; while, at the same time, their proud, independent spirit, for which they are equally remarkable, is infinitely preferable to the cringing servility of the Turks of Anatolia and Syria. Religion exercises little control over them; and, though they are proud of asping the manners recorded of Mohammed, and thoroughly versed in the Koran, few Mussulmen are so insistent to the moral duties inculcated by the Prophet. For the most part, indeed, they exhibit great profligacy of character. Drunkenness, gambling, cheating, false-swearing, and the grossest sensuality, are of everyday occurrence; and it is a common saying among the people, "Forbidden things abound in the city forbidden to infidels." Learning and science, which once flourished in Mecca, are now almost wholly neglected. The many *medrasas*, or colleges, for which the city was formerly renowned, are turned either into con-spiracies or lodging-houses for pilgrims; its large libraries have disappeared; the great mosque is at present the only place where teachers of eastern learning are to be found; and the Meccaways themselves, who wish to improve in science, go to Damascus or Cairo.

The employments of the people are in trade and the service of the Beitullah; but there are few employed in the mosque who do not clandestinely at least, engage in commercial affairs. There are but few artisans, and those much inferior in skill to the same class in Egypt; a few potteries and dye-works are the only manufactures; and the town is wholly dependent on other countries for its necessary supplies. Hence there is a large foreign trade; and the holy city is crowded, during the month of Dhu-hijja (the latter end of June and beginning of July), not only with zealous devotees, but opulent merchants, who thus make use of the permission granted them by the prophet: "It shall be no crime in you, if you seek an increase from your Lord by trading during the pilgrimage." (*Sala's Koran*, ch. ii.) During the whole twelve days that the pilgrims are allowed to remain, a fair or market is held in Mecca and its vicinity; and though the number of pilgrims has greatly declined of late years, it is still a crowded and bustling scene. "Few pilgrims," says Burchardt, "except the mendicants (a very numerous class), arrive without bringing some productions of their respective countries for sale; and this remark is applicable as well to the merchants, with whom commercial pursuits are the main object, as to those who are actuated by religious zeal; for to the latter the profits derived from selling a few articles at Mecca diminish in some degree the heavy expenses of the journey. The Mogrebins (pilgrims from Morocco and North Africa) bring their red bonnets and woollen cloaks; the European Turks, shoes and slippers, hardware, embroidered stuffs, sweetmeats, amber, trinkets, &c.; the Turks of Anatolia bring carpets, silks, and Angora shawls; the Persians, Cashmere shawls and haps silk handkerchiefs; the Afghans, tooth-brushes made of the spongy boughs of a tree growing in Bokhara, beads of yellow soap-stone, and plain coarse shawls manufactured in their own country; the Indians furnish the numerous productions of their rich and extensive region; the people of Yemen, snakes for Persian pipes, sandals, and various other works in leather; and the Africans bring various articles adapted to the slave trade. The pilgrims are, however, frequently disappointed in their expectation of gain, for want of money often obliges them to accept very low prices." The most respectable of the mendicant pilgrims are negroes (called here *Tekwarys*), and these apply themselves to labour immediately on their arrival at Mecca: some serve as porters, for the transport of goods and corn from the ships to the warehouses; some hire themselves to clean the court-yards, fetch wood, carry water, &c.; while others manufacture small baskets and mats of date leaves, or prepare the intoxicating drink called *Assa*. The pilgrims are accommodated in lodgings, for which the inhabitants charge a most exorbitant rent; and all, except those of the highest and lowest ranks, live together in a state of freedom and equality, keeping but few servants, and generally dividing among themselves the various duties of housekeeping. The two principal caravans which rendezvous at Mecca are those of Damascus and Cairo; both of which always arrive at fixed periods, generally a day or two before the departure of the Hadj for Arafat. The ser-

MECHLIN.

ner of these is very large, and is, at the same time, very well regulated. The caravan of Cairo is much smaller, and a route, along the Red Sea, is more dangerous and fatiguing; but many of the Egyptian and African merchants now come by sea from Suez, Cosmeir, and Suakin to Djidda, and thus avoid the weariness of a long land journey. The Persian caravan sets out from Bagdad, and crosses the desert; at it is now of little importance, as all but the poorest Persian pilgrims come round by sea from Bussorah, between which place and Djidda there is a large and steadily increasing trade.

The climate of Mecca is sultry and unwholesome; especially in August, September, and October, when a hot suffocating wind prevails. The wet season is in December; at the rains are not so continuous as in other tropical countries. Intermitting and inflammatory fevers, dysentery, elephantiasis, and more, are common diseases; and, with respect to the general health of the town, Burckhardt says, "I seldom enjoyed perfect health while in Mecca: I was twice attacked by fever, attributable chiefly to bad water; and, even on those days when I was free from disease, I felt great lassitude, depression of spirits, and total want of appetite." (Vol. i. p. 450.)

The territories of Mecca, Tayf, Gofade, and Yembo, were, previously to the Wahabee and Egyptian conquests, under the command of the sheriff of Mecca, who held his authority from the grand seignor; but when the Porte was obliged to secure large armies with the Hadj caravans, to secure her power in the Hedjaz, the sheriffs became independent. The Wahabees (who are to the Mohammedan religion what the Protestant churches are to Christianity) took possession of Mecca in 1802, and retained it till 1813, when Mehemet Ali restored the holy cities to the nominal protection of the Porte, while at the same time he placed them effectually under his own control. (Burckhardt's *Travels*, i. 171., *ed. facsim.*, and li. 1-98.)

MECHLIN (Fr. *Mulines*), a city of Belgium, prov. Antwerp, cap. arrond., on the Dyle, a tributary of the Scheldt, ad on the road between Antwerp and Brussels, 14 m. S.E. the former, and 14 m. N.N.E. the latter. Pop. in 1836, 32,800. The Dyle divides Mechlin into two parts. It is regularly laid out with broad, well paved, and clean streets. Houses grotesque, antiquated, and frequently of a large size; but, being painted in front, they look clean and cheerful. The fortifications were demolished by the French in 1804. The most remarkable public building is the cathedral, a Gothic edifice, commenced in the twelfth century. The body of this building is by no means commensurate with the present altitude of the morisco tower attached to it, and still less with the height to which it was originally intended to be carried. This massive tower, with its truncated steeple, begun in 1458, is 370 feet above ground, being the height of the cross of St. Paul's, London; and, had it been completed according to the original design, it would have been 640 feet high. The Last Supper, the altar-piece, by Rubens: the heads of the apostles and style of drapery re said to be in his best manner; but the Christ is a failure, and the picture is mildeyed. The church of the Beata has the famous picture of the Crucifixion, by Van der Meulen. "This," says Sir Joshua Reynolds, "is, perhaps, the most capital of all his works, in respect of the variety and extensiveness of the design, and the judicious disposition of the whole. It may be considered as one of the first pictures in the world, and gives the highest idea of Van der Meulen's powers." (Reynolds's *Works*, li. 373. ed. 1819.) Here are pictures by Rubens in the cathedral, and some of the other churches, of which the Adoration of the Magi in the church of St. John, is probably, the best. After the churches, the bishop's palace, town-hall, arsenal and canon foundry, the Franciscan convent, and the *Beguinage*, a large asylum for 800 widows, or aged women, are the principal public buildings. Mechlin is the see of an archbishop, who is primate of Belgium, and has a revenue of about 8000, a year. It is the seat of a tribunal of primary jurisdiction, and the residence of a military commandant. It is an ecclesiastical seminary, a college, an academy of eloquence, a society of twelve arts, and a *mont-de-piété*. It has been long celebrated for the manufacture of lace, of a coarser and stouter kind than that of Brussels; but this industry has, to a considerable extent, superseded by the Nottingham lace, and it is said that only eight houses are now engaged in the business. Among its other fabrics are some of cashmere shawls, and gilt leather chairs: the latter were at one time an article of export, and it is said that upwards of 400 workmen are still engaged in their manufacture.

Mechlin furnishes a peculiar species of beer, of a light sky, which acquires, by keeping, a vinous flavour and quality. Another delicacy peculiar to this city is the "*Dischiner de Mulines*," a dish much admired by travellers as

MECKLENBURG.

well as natives, into which pigs' feet and ears enter as important constituents.

Mechlin has an extensive trade in flax, corn, and oil. The tide ascends the Dyle to a league above the city, which is accessible for vessels of considerable burden from the Scheldt. Mechlin is connected with Louvain by a canal navigable by vessels of 160 tons: it would also, but for the absurd opposition of its magistrates, have been the central depot of the Belgian railways; but this has been fixed without its boundary, a circumstance which those by whom it was occasioned now deeply regret.

As early as the sixth century, Mechlin appears to have been a place of importance, and the capital of a lordship. It suffered severely from war, plague, and fire in the middle ages; and in modern times has been repeatedly taken by the Spaniards, Dutch, English, and French. (*De Cloet*; *Hausching*; *Belgium*, by Emerson Tennent, Esq. M. P.; *Murray's Handbook for N. Germany*, &c., passim.)

MECHANIC, t., Holmes co., O. Watered by Doughty's fork of Killbuck creek. It has four grist-mills, four saw-mills. Pop. 1,403.

MECHANICSBURG, p. b., Cumberland co., Pa., 9 m. E. Carlisle, 6 m. S.W. Harrisburg, 105 W. Incorporated in 1838. It contains a church, four stores, nine flouring-mills, six saw-mills, one tannery, three distilleries, one printing-office, one weekly newspaper; four schools, 300 scholars. Pop. 670.

MECHISSES, p. t., Washington co., Me., 157 E. by N. Augusta, 743 m. W. Watered by E. Machias river. It contains Washington academy, which has an edifice 50 by 38 feet, two stories high, a library and philosophical apparatus, and a productive fund of \$14,000, 13 stores, one fulling-mill, two grist-mills, 14 saw-mills; one academy above stated, 161 students; eight schools, 400 scholars. Pop. 1,393.

MECKLENBURG, a territory in N. Germany, between lat. 53° and 54° 30' N., and long. 10° 33' and 13° 57' E.; having N. the Baltic, E. and S. the Prussian dom., and W. Hanover, Denmark, and Lubeck. Area, 5,343 sq. m. Pop. about 572,500. It is divided into

1. **MECKLENBURG-SCHWERIN** (GRAND DUCHY OF), a state of N. Germany, between lat. 53° 27' and 54° 30' N., and long. 10° 37' and 13° 15' E.; having E. Pomerania and Mecklenburg-Strelitz, S. Brandenburg, W. the Hanoverian and Danish provs. of Luneburg and Lauenburg, the principality of Ratzeburg, belonging to M. Strelitz, and the territory of Lubeck, and N. the Baltic. Length, E. to W., about 110 m.; average breadth nearly 45 m. Area, 4,533 sq. m. Pop., in 1840, 482,925. Mecklenburg belongs to the great plain of N. Germany; it is not, however, a dead level, but has an undulating surface, interspersed with some ranges of low hills, one of which, the Rühneburg, rises to nearly 600 feet above the level of the Baltic. It has several rivers of some size, as the Recknitz, constituting its N.E. boundary, the Warnow, Stepenitz, &c., flowing to the Baltic, the Elbe, a tributary of the Elbe, and others; and a great number of lakes, that of Murtz, which has an area of more than 50 square miles, and is elevated 216 Rhinish feet above the sea, being by far the largest lake in N. Germany; next to it is the lake of Schwerin, having the capital of the duchy on its banks. Notwithstanding its high latitude, this grand duchy has a milder climate than most parts of Germany. The mean temperature of Germany being taken at 51° Fahr. (50° 5° F.), that of Mecklenburg will be about 52° 5° F. (50° R.). But the winter is severe, the average temperature of that season being little above the freezing point; the atmosphere, also, is particularly humid, which, added to the moisture of the soil, renders catarrhs and consumptions frequent. The surface and soil are very various. On either border of the principal range of hills a poor sandy tract extends, covered with heath; and few parts of Germany are worse cultivated or more thinly inhabited than that between Schwerin and Güstrow, a distance of nearly 40 miles. To the south of this district the soil is somewhat better; and beyond Güstrow, towards what was formerly Swedish Pomerania, the sand gradually changes into a fertile loam, well adapted to the growth of rye and wheat. Near the Baltic the soil is, for the most part, a meagre sand, intermixed with stripes of loam. With the exception of the sandy heaths, the face of the country is cheerful and pleasing; the land is mostly enclosed; the woods, which are extensive, are scattered over the country, and on the borders of the lakes good meadow lands occasionally present themselves. Mecklenburg is essentially an agricultural country. It is generally divided into large estates. The demesnes of the sovereign comprise four tenths of the land, and those of the nobility, knights, &c., nearly five tenths; leaving about one tenth in the possession of the municipalities and a few monastic institutions. Farms are generally very extensive; they vary from 300 to 1,000 or 1,200 acres. About one fourth part of the province is cultivated by proprietors resident on their own estates, and who are fre-

* This is Sir Joshua Reynolds's statement. Mr. Murray, on the contrary, says that this is the altar-piece of the cathedral! *Non nobis*, &c.

MECKLENBURG.

quently very intelligent and well-informed; about a half is occupied by farmers, and a quarter by peasants or boors. The severity of the winter makes it necessary to have farm buildings sufficient to accommodate the live stock, in addition to the corn, hay, &c.; and hence a gentleman's house has near it, besides labourers' cottages, more than five times the extent of barns, stables, cow and sheep houses, &c., that would be required in England for the same extent of land. Farms, when let, are usually held by tenants on leases, varying from seven to 21 years. The rent varies, of course, according to the quality of the soil, situation, &c. It is uniformly almost paid in money, and the rotation of crops prescribed in the lease must be strictly adhered to. The best farms brought, in 1827, according to Mr. Jacob, about 13s. an acre; the medium lands from 6s. 4d. up to 8s. 4d., and the sandy districts in the south from 2s. to 3s. 2d. an acre; but he thinks that the larger portion of land in the grand duchy did not then produce more than 5s. an acre. Taxes are lower than in most parts of the continent. The various taxes and other out-goings borne by the proprietor may be estimated at about 1d. an acre. The stock on the larger farms usually belongs to the tenants; but that on the smaller farms, held by peasants, usually belongs to the landlords.

The cultivation of wheat (especially the red variety) has increased greatly of late years, and Mecklenburg is now one of the principal countries of Germany for the export of wheat. Rostock wheat is, however, inferior to either English or Dantzic wheat; so much so, that while wheat is being shipped from Rostock at 18s. a quarter, it will fetch 27s. or 28s. at Dantzic. Next to corn, peas, beans, potatoes, and turnips are principally grown. Hemp and flax are reared, but in no great quantities, and the culture of tobacco has very much diminished. Of late years horses, instead of oxen, have been employed in field labour. The system of cultivation corresponds with that of Holstein and Sleswick. After a year's fallow, three corn crops, usually rye, barley, and oats, are taken in succession, the land being sown down with grass seeds; along with the third corn crop, a crop of hay is taken in the fifth year, and the sixth and seventh years the fields are in pasture. (*Jacob's Second Report*.) The climate is too cold for the vine, though lately it has been raised to some extent at Crevitz, and some bad wine has been produced. The horses and horned cattle, which are both numerous and excellent, find a ready sale in every part of Germany, and are a source of great profit to the landed proprietors. The breed of horses has been much improved, by means of the grand ducal stud at Roden and several private studs. Sheep have been a good deal increased of late: the stock in the grand duchy is now estimated at about 1,300,000, and wool has become a principal article of export. Herds of hogs and flocks of geese are met with in every part of Mecklenburg. The former wander, nearly wild, through the forests, feeding on acorns and roots, and the geese literally cover the banks of the lakes and rivers. The latter supply a considerable part of Europe with quills; and their breasts, smoked and cured like bacon, are much esteemed as a delicacy.

The population has increased very rapidly within the last 26 years, a consequence partly of the breaking up of the old feudal system, and partly of the introduction of the potato, &c. The number of inhabitants, in 1812, was 377,954, whereas, in 1837, it was 476,492, being an increase of 96 per cent. During the 10 years previous to 1836, the deaths amounted to 10,080, and the births to 16,070 a year. Mecklenburg is still, however, the least populous portion of Germany; there being only 99 inhabitants to the English sq. m. Till within the last 20 years the peasants were in a state of mitigated slavery. They could acquire, enjoy, and transmit property, but they were *adscripti glebe*, and bound to the soil, so as to be sold or let with it. The government took measures on the restoration of peace, to abolish this relic of the feudal ages; and about 1830, all the peasants who still remained in the condition of *serfs* (for many of the proprietors had previously emancipated those on their estates) were declared free, though their actual manumission did not take place till about 1825. They are now, however, quite free, and may labour where and under whatever conditions they please to stipulate with their employers. Previously to the emancipation of the peasantry, a man was estimated to cost during harvest 1s. 4d., during hay-making, 1s. 1d., and at other periods from 6d. to 1s. a day. Probably but few changes have yet taken place, either in the condition or appearance of the peasantry. The country, at a passing view, seems, from the magnitude of the farms-buildings and the number of enclosures and woods, to be more prosperous than, on a closer examination, is found to be the case. "On a nearer approach, it is scarcely possible to avoid feeling disgust at the miserable filthiness and apparent poverty of the peasants' dwellings and of their clothing; though a difference may be discerned on the several properties, according to the greater or less degree of

prudence and kindness of the various proprietors." (*Jacob's Rep. on Agric.*)

The condition of the peasants, of whom a large proportion are noble, appears, in fact, to be much depressed. The author of *Germany and the Germans*, in 1835-36, says, "The landman, unlike his neighbour in Holstein, is poor. I sought in vain for the appearance of comfort and plenty which had delighted me in Holstein; and yet, like the latter, Mecklenburg is one of the most fertile provinces in the N. of Germany, and exports provisions in large quantities to Prussia and Hamburg, while the natives are obliged to content themselves with potatoes, horse-beans, and *sauer-kraut*. During my tour through the more remote villages, I found it impossible to procure a comfortable dinner. Fresh meat was entirely out of the question; the general bill of fare at the inns consisted of potatoes, bread, butter, and eggs, and those of a superior class added bacon and *sauer-kraut*. My drink was confined to wretched beer or schnapps; and, when I demanded wine, they looked at me as if my intellects were deranged. My bed was not unfrequently a straw palliase, and the only covering a feather bed, enveloped in a grey-coloured cotton cover; the whole supported on a bedstead, 5 feet long, composed of deal boards nailed together, in form not unlike a packing-box. These miserable arrangements are common to all the remote districts of Mecklenburg, Pomerania, and Prussia.

"As Germany supplies Europe with princes and princesses, it would appear as if Mecklenburg alone were sufficient to furnish it with nobles; for it is reckoned that the nobility include the half of the population, the possessions of 8,936 of these dignified persons being limited to their genealogical trees. During my progress through the country, I met with a *herr* (baron) who exercised the profession of relieving men's chins of what is sometimes considered an embarrassment; and at one of the inns I found a *herr graf* (count) for a landlord, a *fräulein gräfin* (countess) for a landlady; the young *herren gräfin* filled the places of ostler, waiter, and boots, while the fair young *fräulein gräfinen* were the cooks and chambermaids. I was informed that, in one village, the whole of the inhabitants were noble except *hans*, and these were married to noble *fräuleins*." (*Germany, &c.*, l. 43, 44.)

In Mecklenburg the general principle is, that every *plac* shall provide for its own poor, either separately or in common with others. All proprietors are bound to provide for the poor on their estates; and, in furtherance of this object, are entitled to levy a sum of about 8d. a year from the day-labourers, and 4d. from the maid-servants, &c., on the estate, though but few avail themselves of this privilege. When crown lands are let, there is always a clause in the contract, regulating what the farmer, the dairy farmer, the smith, and the shepherd are to pay for behoof of the poor. The higher classes, public officers, &c., should pay one per cent. of their income to the poor's funds. All poor persons have a legal claim to assistance, and such work must be found them as they can perform.

About 80,000 cwts. of salt are obtained annually; but, with the exception of lime, minerals are of little importance, and mining is quite neglected. Manufactures are not very considerable. The principal are those of woollen and linen fabrics; but the former employed, in 1834, only 1122 hands, who produced goods of the value of about 271,000 *thaler*, about 1-5th part of which was exported. Mecklenburg is famous, even in Germany, for the distillation of *rum*. Every one may carry on the business of distiller without any restriction of any kind; and this facility has, no doubt, tended to increase it, as it is for ardent spirits which, unhappily, distinguishes the peasantry. A few cotton, paper, glass, tobacco, soap, and wax-light factories, with breweries and tanneries, complete the list of manufacturing establishments. The government is, however, devoting a good deal of attention to the improvement and diffusion of manufactures, and at least one school of arts and trades is now established in every town. Mecklenburg has an extensive trade in farm produce, which is facilitated by the proximity of the Elbe and the Baltic, especially the former, the principal part of the foreign commerce of the duchy being carried on through Hamburg. The value of the exports is estimated, at an average, at about 4,000,000 *dollars* a year, of which, corn, pulses, &c., furnish 2,300,000, wool 800,000, butter and cheese 400,000, and cattle 250,000 *dollars*. The import trade is also considerable; but no accurate statement can be made, either of the exports or imports, from the want of custom-house accounts. The commercial policy of Mecklenburg is as liberal as can be desired; she has no duties on imports, except a trifling excise at her ports; nor any frontier-duties beyond a trifle in the shape of a road-toll, which does not, however, appear to be strictly enforced. The only commercial towns and ports of any consequence are Rostock and Wismar. The other towns have merely a retail trade, a large part of which is in the hands of Jews. In the S. Prussian money and measures are current: but the Han-

MECKLENBURG.

long measures of length and the Lübeck measures of capacity are in use, in most parts of the grand duchy. The Mecklenburg rod is larger than the Rhenish, in the proportion of 1 to 1.08; the *mergen* varies from 300 to 400 square rods. The pond is to that of Hamburg as 401 to 406: the *oster* = 9 *heep*land = 119 lb.; but in Rostock the *heep* has 16 lb.

The government is intimately connected with that of Mecklenburg-Strelitz. Each grand duchy has its separate states, which, also, meet separately; but the states of both grand duchies assemble once a year, alternately at Parchim and Malchin. The joint assembly has the right, in conjunction with the grand duke of Mecklenburg-Schwerin, to make laws for and impose taxes on the whole of Mecklenburg; it consists of the landed proprietors among the nobility, and of deputies from towns, &c., in all amounting to between 300 and 600 members. When the states are not assembled, a committee sits at Rostock. The executive power is entrusted to a *directorium*, consisting of eight grand-ducal councillors, three heads of noble families (*Erb-Landmarschall*), and a deputy from the town of Rostock, which is itself a sort of little republic, or *imperium in imperio*. The grand duchy is divided into five principal districts—the duchy of Schwerin, or circ. of Mecklenburg; the duchy of Gommow, or circ. of Wenden; the district of Rostock; the principality of Schwerin, and the lordship of Wismar; besides which, there is a small extent of territory, which sends no representatives to the states, and over which three conventional establishments have jurisdiction.

Justice is administered in primary courts in the towns and villages, in patrimonial courts on the estates of the nobility, with courts of secondary jurisdiction at Schwerin, Gommow, and Rostock, and a high court of appeal at Parchim, which is the supreme legal tribunal for both grand duchies. With the exception of between 3000 and 4000 Jews, the inhabitants are nearly all Lutherans. There are upwards of 1000 primary schools, about 40 superior public schools (*Bürger-schulen*), five gymnasia, and the university of Rostock, with several ecclesiastical and other special seminaries. Previously to 1826, there was but one book-selling establishment in the grand duchy; but, since that period, the diffusion of education and the cultivation of literature has led to the establishment of 11 others, besides 13 printing-offices. (*Berg-haus*.)

The public revenues of the grand duchy amount to 4,000,000 fr. per annum, and the public debt to 18,000,000 fr. The dukes of Mecklenburg had formerly five votes in the college of princes, in the diet of the empire. Since 1815, Mecklenburg-Schwerin has held, with Mecklenburg-Strelitz, the 14th rank in the Germanic confederation. They have conjointly two votes in the general assemblies, but only one in the committee of the diet. Mecklenburg-Schwerin furnishes a contingent of 3380 men to the army of the confederation.

Schwerin is the political capital; but Ludwigslust, a town with a population of about 5000, 14 m. S.W. Parchim, is the usual summer residence of the grand duke. The palace, which is a large fine edifice, has a cabinet of pictures and a collection of Slavonic antiquities; the surrounding grounds so well laid out; but the neighbourhood is dull and not very healthy.

MECKLENBURG-STRELITZ (GRAND DUCHY or), a state of N. Germany, consisting of two separate territorial divisions; the first and largest, or the duchy of Stargard, lying between lat. 53° 9' and 53° 47' N. and long. 12° 40' and 13° 57' E. having W. Mecklenburg-Schwerin, and surrounded on all other sides by the Prussian territories; and the second, or principality of Ratzeburg, between lat. 53° 40' and 53° 54' N. and long. 10° 39' and 11° E. United area, 907 sq. m. Pop., in 1840, 69,338. The general features of the country are the same as those described in the above article; in mean elevation is, however, somewhat less than that of Mecklenburg-Schwerin, though the Heiligerberg, near Waiditz, rises to 640 feet above the sea. The chief river is Stargard in the Havel, and in Ratzeburg the Stepenitz. The land is divided among the sovereign, the nobility, and the towns, in the proportions of about 7-10ths to the first, 3-10ths to the nobles, and 1-10th to the municipalities. Nearly 1-4th part of the grand ducal property consists of forest lands. Agriculture and cattle-breeding are the chief branches of industry here, as in Mecklenburg-Schwerin. The manufactures are even more insignificant than the latter grand duchy, and almost confined to leather, beer, and spirits, with copper wares in Ratzeburg. There is a brick-works in rural production. New Brandenburg is, next to Gussow, the largest wool-market, and Old Strelitz the largest mart for horses, in Mecklenburg. Fürstenburg has some trade in timber and butter.

The government is a limited monarchy, as in Mecklenburg-Schwerin. Justice is administered in eight courts of primary jurisdiction, the superior courts of Recksticht and Ansbarg, and the court of chancery in New Strelitz, from

MEDINA.

which appeal lies to the supreme tribunal at Parchim. The principal public schools are, the *Gymnasium Carolinum* at New Strelitz, the high schools at New Brandenburg, Friedland, and Ratzeburg, and the school of arts (*Bildungsschule*), at Mirow. New Strelitz is the capital and residence of the grand duke. The other chief towns are New Brandenburg, Friedland, and Old Strelitz, Mecklenburg-Strelitz holds, with Mecklenburg-Schwerin, the 14th place in the German confederation, and has also, with it, one vote in the committee, having in the full diet one vote independently. It furnishes 718 men to the army of the confederation.

Mecklenburg has been several times conquered and disposed of by foreign powers; as by Henry the Lion, in the 13th century by Ferdinand II., who gave it to Wallenstein, and by Napoleon; but it has always reverted to its original dynasty. The reigning family is the only sovereign house of Slavonian origin, and is one of the most ancient in Europe, with all the principal reigning families of which it has been allied. The separation of Mecklenburg into two states took place in 1791, and both were recognised as grand duchies in 1815. (*Berg-haus, Allg. Länder, &c.*, iv. 395-411; *Stein, Handbuch der Geog.*; *Jacob's Second Report on Agriculture, Part. Papers*, 1836; *Almanach de Gotha*, 1841; *Germany and the Germans, &c.*, *passim*.)

MECKLENBURG, county, Va. Situated on the S. part of the state, and contains 640 sq. m. Watered by Roanoke river, formed in the W. part of this county by the union of Staunton and Dan rivers. Bounded N. by Meherria river. It contained in 1840, 13,938 neat cattle, 14,109 sheep, 31,998 swine; and produced 77,444 bushels of wheat, 478,345 of Indian corn, 324,107 of oats, 35,107 of potatoes, 4,194,131 pounds of tobacco, 19,054 of cotton. It had 30 stores, one furnace, 17 flouring-mills, 32 grist-mills, 19 saw-mills, four tanneries; one college, 80 students; seven academies, 186 students; 15 schools, 334 scholars. Pop.: whites, 7754; slaves, 11,915; free coloured, 1055; total, 20,724. Capital, Boydton.

MECKLENBURG, county, N. C. Situated towards the S. part of the state, and contains 900 sq. m. Bounded W. by Catawba river, by branches of which it is watered. It contains several rich gold mines. It had in 1840, 18,541 neat cattle, 19,519 sheep, 33,065 swine; and produced 78,315 bushels of wheat, 3005 of rye, 586,928 of Indian corn, 61,407 of oats, 14,443 of potatoes, 1,595,397 pounds of cotton. It had 32 stores, two smelting houses for gold, 11 flouring-mills, 23 grist-mills, 39 saw-mills, nine tanneries, 15 distilleries, one printing-office, one blundery, one weekly newspaper; one college, 81 students; five academies, 181 students; 25 schools, 475 scholars. Pop.: whites, 11,250; slaves, 6322; free coloured, 101; total, 18,773. Capital, Charlotte.

MEDFIELD, p. t., Norfolk co., Mass., 31 m. S.S.W. Boston, 425 W. Bounded W. by Charles river. It contains, one mile E. of the central village, one of the oldest houses in New-England, which was known to be standing in 1676, when the town was burned by the Indians. It has three churches, a Congregational, Unitarian, and Baptist, two stores, six grist-mills, five saw-mills; three schools, 190 scholars. Pop. 683.

MEDFORD, p. t., Middlesex co., Mass., 5 m. N.W. Boston, 445 W. Watered by Mysis river, which is navigable to this place. Vessels are built here, and floated down the river, without being loaded. The Middlesex canal and the Lowell railroad pass through the town. It contains four churches, a Congregational, Unitarian, Methodist, and Baptist; nine stores, two lumber-yards, capital \$35,000, one grist-mill, two saw-mills, one oil-mill, one tannery, one distillery, one pottery; one academy, 48 students; eight schools, 579 scholars. Pop. 2478.

MEDINA, or MEDINET-EL-NABI, "the town of the prophet," one of the sacred cities of Arabia, the burial-place of Mohammed, and next to Mecca, the great centre of attraction to Mohammedan pilgrims, in the prov. el-Hedjaz, 100 m. N.E. its port of Yembo on the Red sea, and 960 m. N. Mecca. Lat. 25° 13' N. long. 40° 3' 15" E. Pop. of town and suburbs, according to Burckhardt, 18,000. This celebrated city stands in a plain, close to a chain of hills which bounds the great desert westward. It is not open, like Mecca, but surrounded by a wall about 40 feet high, and flanked by 30 towers; it was additionally fortified with a ditch by the Wahabees; but this is in most places nearly filled up. It is entered by three fine gates; one of which, towards the S., called Bab-el-Masry, is said by Burckhardt to rank second only to the noble gates of Cairo; a fourth gate, in the S. wall, was closed by the Wahabees, and has not since been re-opened. The houses are well built, of a dark gray stone; but it has a desolate appearance, owing to the lessened resort of pilgrims. Ruined houses and tottering walls are seen in every part of the town; and "Medina presents the same disheartening view as most of the eastern towns, which now afford but faint images of their ancient splendor." (*Burckhardt's Arabia*, II., 150.) The principal street, in

MEDINA.

which are most of the shops, leads from the Cairo gate to the great mosque; another, of respectable size and breadth, runs from the mosque to the Syrian gate; but many of its houses are in ruins, and there are few shops. No shops or bazars, however, are found in other parts of the town; and, in this respect, Medina differs from Mecca, which is one continued market. The suburbs cover more ground than the city itself, from which they are separated by an open space, narrow on the S., but widening on the W., before the Cairo gate, where it forms a large public place called *Mawāṭṭā*, always crowded with camels and Bedouins. Provisions are sold here in sheds erected for the purpose, and the numerous coffee-huts are beset the whole day with visitors. The greater part of the suburbs consist of large court-yards, built round with low houses, tenanted chiefly by the humbler classes. Each *hauṣ*, or court-yard, contains 30 or 40 families; the cattle belonging to the little community occupy the centre of each; and the only gate of entrance is regularly closed at night. Opposite, however, to the gate of Cairo are several regular and well built streets, with houses similar to those within the town; one of these, called El-Amḥary, comprises some of the handsomest residences in Medina, besides two rather large mosques, all now remaining, except the great temple, out of 14 mentioned by the Arabian historians. The town is supplied with good water, both from wells and open streams.

The glory of Medina, and that which places it as a sacred city, almost on a level with Mecca, is the possession of the tomb containing the remains of the prophet. The tomb, with the tombs of Abou-Beker and Omar, the friends and immediate successors of the prophet, are inclosed within the great mosque, situated at the E. end of the town. Though smaller than the mosque at Mecca, it is built upon the same plan, with minarets at the angles, and forms an open square, surrounded on all sides by covered colonnades. The tombs are enclosed within a curtain, in a square building of black stone, detached from the walls of the mosque, and surrounded by a close iron railing. People of rank are admitted gratis within the sacred precinct, called *El Hadjra*; and any one, indeed, who has money to spare, finds but little difficulty in being admitted. The ridiculous stories, long current in Europe, as to Mohammed's coffin being suspended in the air by a loadstone, are unknown in the East; and most part of the statements that have been put forth, as to the richness and magnificence of the tombs and the great mosque, have been absurdly exaggerated. The tomb of Fatima, the favourite daughter of the prophet, and the wife of Ali, is also within the great mosque; but it is doubtful whether it really encloses her remains. The lofty dome, which rises above the tombs, is seen at a great distance from town. The ceremonies observed by persons visiting Medina are somewhat different from those customary at Mecca; nor is it absolutely required of the *hadjis* to visit the prophet's tomb; hence it is that the enjoined religious duties are considerably less tedious. The building lighted at night with lamps and candles, sent either from Cairo or Constantinople. The mosque has four gates, of which the principal, by which the pilgrims first enter, called Bab Merouān, is certainly very superior in beauty to any of the gates at Mecca. The police, cleansing and lighting of the mosque, are entrusted to about 40 eunuchs, somewhat similar to those of the Beitullah at Mecca, supported, like them, by salaries from Constantinople, and by fees and presents from the *hadjis*. Besides these, and the *Imāns*, *Muḥaddins*, and *Olema*, who are as indispensable here as at Mecca, there are upwards of 500 inferior servants. The mosque, founded by Mohammed himself, immediately after his flight from Mecca, on the spot where his camel first rested in the town, was enlarged by Omar after the prophet's entombment, and surrounded with walls by Othman. Subsequent caliphs and nobles of Arabia greatly embellished it; but the whole edifice was burned down A.D. 1508; and so complete was the destruction, that only the interior of the tomb was spared. The present building was erected, in 1514, by Kayd Beg, then king of Egypt; since whose time only a few immaterial improvements have been made by the Othman emperors of Constantinople. (*Burckhardt's Arabia*, ii., 161-305.) The burial ground of Medina, called *El Bekya*, is another object of extreme veneration, in consequence of its containing the tombs of Ibrahim, Othman, Abbas, the aunts of Mohammed, &c. Another place of pilgrim-resort is Djebel-Ohod, about 2 m. from the town; the scene of a conflict between the small army of Mohammed, and a very numerous band of idolatrous Koreysh, under Abu Sofyan. The prophet's uncle, Hamza, fell in the engagement, with 75 others, all of whom are buried in this mountain, the exact spot being marked by a mosque.

The people of Medina, like those of Mecca, are chiefly either foreigners or of foreign extraction, drawn thither by the prophet's tomb, and the gains which it ensures to its neighbours. The number of sherifs, indeed, descended from Hassan, the prophet's grandson, is very considerable;

MEDINO DEL CAMPO.

but most of them come from Mecca, or elsewhere, and nearly all are *olemas*, or clergymen. The population presents, therefore, as motley a race as that of Mecca; and Arabians of every district, Egyptians, Africans, Syrians, and Turks of Anatolia, are found here, more or less characterized by intermarriage; those long settled being characterized, as at Mecca, by the Arab face, expressive cast of features, and stout thick-set person.

With respect to commerce, Medina widely differs from Mecca; for, while the latter is enriched by a transit trade scarcely inferior to that of any great city in the east, the trade of the former is merely for the consumption of the town and its neighbourhood, the articles being chiefly received from Egypt, by way of Yembo. The provision trade is a lucrative branch of traffic; and the richer merchants often realise enormous profits when the caravans stay for any considerable time, and exhaust the stores of the smaller dealers. The Bedouins supply the town with sheep, butter, honey, and charcoal, taking in return corn and clothing; but the trade is subject to great fluctuations, in consequence of continual enmities between the tribes. The date and lotus fruit are produced in large quantities in the neighbouring gardens, the former of these being the prime article of food, and brought thither from all the surrounding country. As respects native industry, Medina is as ill situated as Mecca; wanting the commonest mechanica, and not even possessing a pottery. Weaving, dyeing, and tanning are arts wholly unknown, nor is there a single person in the whole city capable of making either a nail or a horse-shoe, unless it be at pilgrim-time, when many of the poorest *hadjis* endeavour by hard labour to earn the money necessary for their journey homewards.

The climate of Medina is, during the winter, much colder than at Mecca. Rain falls irregularly at that season; often in violent storms, lasting for two or three days, but in some years so sparingly as to cause a general dearth, from the want of proper irrigation. The summer heat is alleged to be greater than in any other part of the Hedjaz; and the salt-marshes, stagnant pools, and exhalations from the neighbouring date-groves, are powerful agents in producing those intermittent fevers, which are so common, and often fatal, in the city, especially to visitors. The deaths, indeed, are reckoned by Burckhardt (though, no doubt, very vaguely) at 1500 annually; which, assuming the population at 16,000, is one in 15; and if this be near the truth, it is clear it must long ago have been depopulated, but for the continued supply of inhabitants from other countries!

Medina, though, probably, not entitled to rank as one of the cities of what, by the best authorities, is considered the Hedjaz, has always, since the establishment of Mohammedanism, been considered as a separate principality, and is dependent even of Mecca. The governor has, till recently, been appointed by the grand seignor; but, in the absence of precise information, it is believed that Mehmet Ali now exercises supreme power over both the holy cities of the Mohammedan world. (*Burckhardt*, vol. ii., 145-222; *Med. Trav.*, &c.)

MEDINA, county, O. Situated in the N. part of the state, and contains 450 sq. m. Drained by head branches of Black and Rocky rivers. It contained in 1840, 19,365 neat cattle, 31,450 sheep, 30,980 swine; and produced 219,433 bushels of wheat, 5339 of rye, 128,460 of Indian corn, 5339 of buckwheat, 3175 of barley, 133,563 of oats, 113,064 of potatoes, 325,501 of sugar. It had 31 stores, one furnace, eight fulling-mills, one woolen factory, 14 grist-mills, 51 saw-mills, 17 tanneries, two printing-offices, two weekly newspapers; two academies, 90 students; 97 schools, 370 scholars. Pop. 18,352. Capital, Medina.

MEDINA, p. t., capital of Medina co., O., 117 m. N.E. by N. Columbus, 351 W. The village is situated on elevated ground, and contains a handsome brick courthouse, in which the county offices are kept, a brick jail, two churches, 10 stores, one fulling-mill, three grist-mills, four saw-mills, one distillery; two schools, 147 scholars. Pop. 675. The township, exclusive of the village contains one store, two fulling-mills, one woolen factory; five schools, 199 scholars. Pop. 806.

MEDINA, p. t., Lenawee co., Mich., 81 m. S.W. Detroit, 510 W. It has three stores, two grist-mills, four saw-mills; six schools, 165 scholars. Pop. 760.

MEDINO DEL CAMPO, a town of Spain, kingdom of Leon, prov. Valladolid, on the Zapardiel, a trib. of the Douro, 37 m. S.S.W. Valladolid, and 83 m. N.W. Madrid. Pop. 3000. The town on both sides the river (crossed here by a stone bridge), has a neat square, with a handsome sculptured fountain in its centre. The houses are mostly very old, and many of them quite in ruins. A collegiate and six other churches, several monasteries (now uninhabited), and two hospitals, one of which has considerable architectural merit, are its chief public buildings; but most of them show, by their dilapidated appearance, the degraded condition of the place. The inhabitants are chiefly em-

MEDINA DE RIO SECO.

ployed in agriculture. It has two weekly markets, and a fair in February, well attended by traders from Toledo, Segovia, Cuenca, &c.

Medina del Campo occupies the site of the ancient *Mithras Compostia*, and was formerly a place of considerable importance; but in the 17th century, after the discovery of America, a large part of its population emigrated, and its decay has since been hastened by the internal troubles of the country (*Méjane*).

MEDINA DE RIO SECO, a town of Spain, kingdom of Leon, prov. Valladolid, on the Sequillo, a trib. of the Douro, 52 m. S.E. Leon, and 123 m. N.W. Madrid. Pop. 4700. It stands in an open plain, W. of the river, crossed here by three bridges, and has narrow, badly-paved streets, and shabby decaying houses; there are three churches, four monasteries, two hospitals, and a castle; but, with the single exception of the church of St. Maria, all the public buildings are in a ruinous condition. The inhabitants were once so celebrated for their industry and the variety of manufactured goods exhibited at its fairs in April and September, that the district acquired the name of *India chica* (the Little Indies); but every trace of its former prosperity has now disappeared, and the population ranks at present among the most degraded and least industrious in Spain. (*Méjane*.)

MEDINA SIDONIA, a town of Spain, in Andalusia, prov. Cadix, 29 m. E. by S. Cadix, and 65 m. S. Seville. Pop., according to Méjane, 9337. It is an old walled town, beautifully situated on the brow of a rocky eminence, looking eastward over a fine champagne country. A castle, two parish churches, six monasteries (now unoccupied), and two hospitals, are the only public buildings. The chief employment of the inhabitants is the manufacture of earthenware, which is conducted on a large scale, furnishing the principal supply for Cadix, Seville, and, indeed, the whole of Andalusia. The neighbourhood is celebrated for its fine pastures; and the rearing of cattle forms the chief occupation of the rural population.

MEDITERRANEAN SEA (the *Mare Internum* of the ancients, and more recently, the *Mare Mediterraneum*), a large and very important inland sea, bounded N. by Europe, E. by Asia, and S. by Africa, communicating at its W. extremity, by the straits of Gibraltar, with the N. Atlantic ocean, and at its N.E. extremity, by the Dardanelles and Bosphorus, with the Black or Euxine sea. It extends, in a general sense, from lat. 30° to nearly 46° N., and from long. 50° 54' W. to 36° 8' E. Greatest length, 3300 m.; do. breadth, from Venice to the bay of Sidra, 1900 m.; estimated area (according to Stieler), nearly 690,000 sq. m. It is of an oblong, but very irregular shape, especially on its N. side, into which project southward the two large peninsulas of Italy and Greece, which thus divide the Mediterranean into three basins, the most westerly of which is included between the straits of Gibraltar and the passage, only 73 n. broad, between C. Boeo in Sicily and C. Bon in Africa; the central part extending eastward from the last-mentioned points to the meridian of C. Matapan in the Morea; while the E. basin, called the Levant, comprises the Grecian Archipelago and the sea that washes the coasts of Karamania, Syria, and Egypt. The principal inlets of the W. basin are the bays of Lyons, Genoa, and Naples; it contains, also, the three large islands of Corsica, Sardinia, and Sicily; the Lipari, and other islands on the W. side of Italy; and the Balearic group, off the coast of Spain. The central basin has a large arm projecting N. under the name of the Adriatic sea; its smaller inlets being the gulfs of Taranto in Italy, Lepanto in Greece, and Cabea and Sidra an. the two *Syrtes* in Africa; Malta, the Ionian Isles, and the numerous rocky islets skirting the shores of Dalmatia, are its chief islands. The portion of the E. basin or Levant, which stretches N. from the Isle of Candia to the coast of Macedonia, is called the Archipelago, and is remarkable, not only for the extreme irregularity of its coastline, but for the numerous clusters of volcanic islands and rocks that stud its surface; its chief gulfs are those of Egina, Salonika, Canea, and Smyrna; and its largest islands are Lemnos, Mytilene, Thasos, Scio, and Naxos. The great sand of Cyprus lies in the angle between the coasts of Asia Minor and Syria.

The coast of the Mediterranean is as remarkable for difference of altitude as for variety of outline. Its N. shores, might be inferred from their jagged outline, are generally steep and bold; but in parts, as in Spain and France, near the mouths of the Ebro and the Rhone, and in Lucca, Tuscany, the Papal states, and Naples, as far S. as C. Camanella, the shores are low and gently shelving, varied only by a few bold rocky headlands. On the S. side of Sicily and the W. shores of the Adriatic, are, also, with a few exceptions, flat and sandy; but in Istria, Dalmatia, and, in short, along the E. side of the Adriatic, the coast is bold, broken, and irregular, often presenting cliffs rising between 30 and 700 feet in perpendicular height, with deep sound-

MEDITERRANEAN SEA.

ings close to the shore. The shores of the Archipelago partake, more or less, of the same bold character, except in a few bays, where rivers, by the constant deposition of alluvial soil at their mouths, have formed low beaches, extending considerably beyond the high rocks usual to this coast.

The S. coast of Anatolia, which has a less indented line of shore, though by no means low, is much less craggy and precipitous; extremely high promontories here and there stretch out into the deep sea; but beaches, more or less shelving, of shingle, gravel, or sand, are by far the most common on this coast. The cliffs about Iskenderoon are of great height, running round the bay, and furnishing complete security for shipping, except from the E., or land, breezes, which are both violent and dangerous. The shores of Syria are mountainous between Tripoli and Tyre, but present, in many places, a large extent of low and flat coast, especially towards the S. extremity.

Near the mouth of the Nile the country presents a low uninteresting flat, with rocky reefs and shoals, projecting from 5 to 7 m. from the shore; and this continues as far W. as long. 97° E., beyond which a series of not very high cliffs, varied here and there by sandy bays (the largest being those of Sidra and Cabea), marks the whole African coast as far as C. Spartel. Submarine rocks and projecting shoals of mud and sand, not less than the roving piratical habits of the Moors, render the navigation of these shores both difficult and dangerous; and, in this respect, the S. side of this sea presents a striking contrast to the N., where, generally speaking, deep soundings may be had close in shore; while, in parts, particularly between Nice and Genoa, and near Gibraltar, no soundings can be found under 1000 fathoms and upward. The in-shore navigation presents some difficulties, in consequence of a few hidden rocks; but the chief skill of the mariner is required in the Archipelago, where, though there be few hidden dangers, it requires first-rate experience of its shifting winds and currents to guide him safely through its many intricate channels. (*Purdy's Sailing Dir. for the Med.*, part II., p. 61; *Lyell's Geology*, i., 347.)

It is a curious fact, that, though the Mediterranean generally be so deep that soundings, even where possible, are of no practical utility, except in some of its bays and harbours, the depth of the channel between Sicily and Tunis, according to Sonnin and Smythe, nowhere exceeds 30 fathoms, the average not being greater than the depth of the straits of Dover between England and France. (*Smyth's Hydr. Maps of Sicily and Africa, and Memoir*.) The temperature of its waters is, at an average, from 75° to 78°, or 54° Fah. higher than the W. part of the Atlantic ocean; but it does not appear, from the experiments of Marcet and Woolaston, that its density exceeds that of many ordinary samples of sea-water. (*Lyell's Geology*, ii., 17.) The chief feeders of the Mediterranean are the Ebro, Rhone, Po, and Nile, with the various waters brought from the Black sea by the strong current that sets W. through the Dardanelles. But, notwithstanding this vast supply, the evaporation is so rapid, that water constantly passes in through the straits of Gibraltar, to restore the equilibrium. The Mediterranean has long been considered a tideless sea; but this is not strictly true: for, in the Adriatic, as well as between that sea and the coast of Africa, tides rise from 5 to 7 feet, and their influence is felt, more or less, along the shores of Sicily, and on the W. side of the Morea. The existence of this tide, indeed, may suggest an explanation of the loss of so many vessels in that region of mist and terror, the gulf of Sidra, where there is always a lofty swell and accumulation of waters during the prevalence of N.W. winds. A tide of 8 or 9 feet also ebbs and flows at pretty regular intervals in the smaller gulf of Cabea, on the same coast. In the straits of Messina and Bonifacio, at Naples, in the narrow channel of the Euripus, and on both shores of the straits of Gibraltar, there is an ebb and flow amounting to 3 feet and upward; but whether these movements are to be attributed to lunar influence, or to other causes, has not been determined. (*Purdy*, part II., p. 9; *Lyell*, i., 375.) The currents peculiar to this great inland sea vary in its different parts: a current sets E. along the African shores, which is turned northward along the coast of Syria, and then westward along that of Cyprus and Karamania; the current in the Archipelago sets almost continually to the S., being increased or retarded, according to the winds; in the Adriatic, the current runs N.W. up the coast of Albania, and S.E. down the Italian shores, bringing with it the waters of the Po. A strong current runs through the Faro of Messina (the Scylla and Charybdis of antiquity), and, by meeting a lateral current, causes numerous eddies and whirlpools. (*See SCYLLA and CHARYBDIS*.)

But this strait, notwithstanding the statements in the classics, presents no real danger; and, in the late war, it was traversed by the fleet under Lord Nelson. (*Smyth's Sicily*, p. 110-113.) In the straits of Gibraltar, the main

current sets eastward, at a rate varying from 3 to 6 m. an hour: it is true that an under-current has long been supposed to run in an opposite direction; but the fallacy of this hypothesis has been fully shown by Mr. Lyell; and it seems that the only outlet for the superfluous water is by the lateral current, which runs westward close to the African shore. (*Geology*, ii., 19.) With respect to the winds of the Mediterranean, it may be observed that the prevalent winds, except during spring, vary between N.W. and N.E., while those in spring are from S.E. to S.W. But the winds are extremely variable, and it is said that three or four vessels may occasionally be seen carrying different, and sometimes opposite, winds at the same time. The *Bora*, a violent N.E. wind in the Adriatic, the *Etesias*, or N.E. winds (called also *Tramontane*), which blow for several months together in the archipelago, and the *sirocco*, or *solano*, are peculiar to this sea. The last of these is described by Capt. Smythe as being extremely troublesome, and producing great dejection and lassitude. "At its commencement," he observes, "the air is dense and hazy, with long white clouds floating just above, and parallel to, the horizon. The thermometer rises to 90° or 95°, sometimes 100°, and the barometer gradually sinks to about 29.60". It generally continues during three or four days; during which period, such is its influence, that wine cannot be fined, or most effectually salted: oil-paint laid on during its continuance will seldom harden. But, though blighting in its general effects during summer, it is favourable to the growth of many useful plants in winter, when, indeed, it has few disagreeable qualities." (*Sicily*, p. 6.)

Waterpouts are of very common occurrence, especially on the coast of Asia-Minor, where as many as sixteen have been seen at one time. Many volcanic phenomena have also been observed in this sea; among which may be mentioned the sudden appearance, in 1831, of an island, about 30 m. S.W. of Sicilaca in Sicily, and its equally sudden disappearance, three years afterwards. These movements may result from the close proximity of the large igneous region of Italy and Sicily. The presence of electric fluid in the atmosphere is also proved by the play of flame round the mast-heads, called by sailors "the fire of St. Elmo." Several springs of fresh water rise in different parts of the Mediterranean: the largest of these is in the port of Tarranto, near the mouth of the Gaius, where the fresh water ascends in such a volume, and with such impetuosity, that it may be taken up at the surface without the least impregnation of salt; but the most celebrated of these fountains is that of Arethusa, in the harbour of Syracuse. (*See ARETHUSA*, i., 146.)

The Mediterranean abounds with fish of many different varieties, as well as with mollusca. The tunny and anchovy fisheries are a source of great profit on the coasts of Italy and Sicily: the sword-fish is very common; and the *marx perpuræ* supplies the fine Tyrian dye, now, as anciently, celebrated for the brightness of its red colour. Coral is found on many parts of the Barbary coast, and in some of the bays of Corsica and Sardinia. The chief fishery, however, is in the straits of Messina, where there is a coral-ground upward of 6 m. in length.

In the Scriptures, the Mediterranean is called "the Great sea" (*Nam. xxiv.*, 6). Herodotus calls it (i., 185.), "the Sea;" and Strabo, "the Sea within the Columns" (*Σάραρα ἡ τῶν στῆλῶν*). It is probable that it witnessed the first rude attempts at navigation. "Having," as Dr. Smith has justly observed, "no (perceptible) tides, nor, consequently, any waves, except such as are caused by the wind only, the Mediterranean was, by the smoothness of its surface, as well as by the multitude of its islands, and the proximity of its neighbouring shores, extremely favourable to the infant navigation of the world; when, from their ignorance of the compass, men were afraid to quit the view of the coast, and, from the imperfection of the art of ship-building, to abandon themselves to the boisterous waves of the ocean." (*Wealth of Nations*, book i., cap. 3.) At all events it was navigated, and its islands occupied, in the remotest antiquity: it subsequently was traversed in all directions by the ships of the Phœnicians, and their descendants, the Carthaginians; and, at a later period, by those of the Greeks and Romans. During the middle ages, and down to the discovery of America, it was the grand centre of the commerce and navigation of the old world; and the Venetians and Genoese, by whom its trade was for awhile principally engrossed, attained, in consequence, to great wealth and consideration. The discovery of America, and of a route to India by the cape of Good Hope, opened new and far more extensive channels for maritime enterprise. But we incline to think that the depression of the Mediterranean trade, in the 16th, 17th, and 18th centuries, was principally owing to the circumstance of the countries round the Black sea, the Levant, and the whole N. shore of Africa, having been shortly before subjugated by the Turks, the implacable foes of art, civilization, and refine-

ment. Happily, however, their empire has been, to a considerable extent, dismembered; and, within the course of the present century, the trade of the Mediterranean has begun to resume something like its former importance. The opening of the Black sea, and the rise of Odessa and other towns on its shores, the renewed intercourse with India by Alexandria, the occupation of Malta by the English, and of Algiers by the French, the independence of Greece, and the establishment of steamers between the principal ports of the sea, have prodigiously extended its commerce and navigation. And when the old, worn out, imbecile despotism of the Turkish government has been overthrown, and the fine and fertile countries, now under its degrading yoke, have been emancipated, a vast additional stimulus will be given to its commerce; so that the fair presumption seems to be, that the ancient importance of the Mediterranean, as a field for the successful prosecution of commercial navigation, is destined, at no very distant period, to be again equalled, and, most probably, surpassed.

The Mediterranean has on its shores the capital cities of Naples, Palermo, Athens, Tripoli, Tunis, and Algiers. Among its principal emporiums may be specified Marseilles, Genoa, Leghorn, Civita-Vecchia, Venice, Trieste, Smyrna, Alexandria, Malaga, and Barcelona. Its most important naval stations are those of Malta and Toulon: Gibraltar is, as it were, the key of the sea.

To the scholar and classical traveller the Mediterranean has the most powerful attractions. Her shores were the earliest seats of art, science, and civilization. She has been surrounded and occupied by the most renowned nations of antiquity; and her coast and islands have still to boast the ruins of some of the noblest and most splendid cities of the ancient world. In short, to use the language of Dr. Johnson, "the grand object of all travelling is to see the shores of the Mediterranean." On those shores were the four great empires of the world; the Assyrian, the Persian, the Grecian, and the Roman. All our religion, almost all our law, almost all our arts, almost all that we owe to our above savages, has come to us from the shores of the Mediterranean: (*Partly and Notion's Sailing Directions: Smyth's, Sicily, and Hydro. Charts; Beauport's Koronisia, and Chierici; Dict. Geog.* &c.)

MEDWAY, an important river of England, which has its embouchure in the estuary of the Thames. It rises in the S.E. corner of Surrey between the N. and S. chalk ranges; being joined at Fenshurst-place by streams from the S. of Sussex. Its course is thence N.E. to Maidstone, and then N. to Rochester and Chatham, about two miles below which it turns nearly E., expanding at the same time into a wide estuary. Interspersed with islands. After prosecuting an easterly course for 8 or 10 m., it turns once more to the N., uniting with the estuary of the Thames at Sheerness. The tide is interrupted by locks, otherwise it would flow up the river to Maidstone. In consequence of works begun in the reign of Charles II., and resumed at different periods, it has been rendered navigable as far as Tonbridge; affording a channel of communication of much importance to the surrounding country. From Sheerness to Chatham there is water to float the largest ships; and the ground being soft, and the reaches short, it forms an admirable harbour for men-of-war, many of which are usually laid up here when out of commission. (*See CHATHAM*, i., 605.) The Medway was called by the ancient Britons *Faga*, to which the Saxons prefixed the prefixable *Med*, signifying mid or middle, because it ran through the middle of the kingdom of Kent: hence it came to be called Medweg, and latterly Medway. Considering the shortness of its course, the Medway is one of the deepest of European rivers. (*Hasted's Kent*, i., 278, 6vo ed.; *Statistical Account*, &c., i., 33.)

MEDWAY, p. t., Norfolk county, Mass. 28 m. S.W. Boston, 418 W. Watered by Charles river. It contains four churches, two Congregational, a Unitarian, and Baptist, eight stores, six cotton factories with 2859 spindles, four grist-mills, eight saw-mills; three academies, 150 students, eight schools, 498 scholars. Pop. 2043.

MEERUT, a district of British India, presid. Agra (Ben gal), chiefly between lat. 29° 30' and 29° 30' N., and long. 77° and 78° E., having N. the collectorate of Mozaffargarh, E. that of Moradabad, S. Roolundshahur, and W. Paniput, &c. Area, 2250 square miles. Land revenue, in 1822, 14,04,316 rup. The chief towns are Meerut, Sirhind, Kauli, and Hunsinapur.

MEERUT, a town of British India, presid. Agra, cap. of the above district. In an extensive grassy plain, 30 m. N.E. Delhi. This, which, like Cawnpore, is a military station, is a much more agreeable residence than the latter. The town is surrounded by a dilapidated brick wall, and has a ruined fort or citadel. The streets are narrow and mean, and the houses mostly of mud; but it has some good architectural remains of mosques and pagodas; and without the

MEHERRIN.

walls are various Mohammedan tombs, built of red stone. A small stream, which swells into a river during the rainy season, is here crossed by a handsome bridge. The cantonnments are at some distance N. of the town, from which they are separated by a long and busy bazaar. The barracks are one story in height, and disposed in regular ranges, at intervals along a space about two miles in length: the hangars of the officers are surrounded with gardens, enclosed by tall hedge-rows. The church of Meerut is probably the largest in British India, being 150 feet in length, by 84 feet in breadth, and capable of accommodating 3000 people. There is a good free school here, with about 100 native pupils. Meerut was a city of some consequence before the Mohammedan invasion of India. It was taken by Mahmood, of Ghaznee, in 1018, and by Timour in 1399. It was occupied, with its district, by the British in 1803, and is now the residence of a revenue collector and a judge, and the head-quarters of a force of about 20,000 men, of whom about 3300 are Europeans. (*Hamilton's E. I. Gaz.*, *Modern Trav.*, i., 5, 2. *Farr. Reports*, &c.)

MEHERRIN river, Va., rises in Charlotte county and enters N. C., and unites with Nottaway river, to form Chowan river.

MEIGS, county, O. Situated in the S.E. part of the state, and contains 425 sq. m. Organized in 1810. Watered by Shade and Licking creeks. Bounded E. and S.E. by Ohio river. It contained in 1840, 9747 neat cattle, 14,860 sheep, 12,497 swine; and produced 95,595 bushels of wheat, 192,367 of Indian corn, 75,050 of oats, 24,906 of potatoes. It had 25 stores, one fulling-mill, two flouring-mills, 21 grist-mills, 39 saw-mills, nine tanneries, one distillery; 82 schools, 3691 scholars. Pop. 11,493. Capital, Chester.

Meigs, county, Tenn. Situated in the S.E. part of the state, and contains 215 sq. m. Bounded N.W. by Tennessee river. It contained in 1840, 5163 neat cattle, 4942 sheep, 17,141 swine; and produced 98,985 bushels of wheat, 2103 of rye, 207,739 of Indian corn, 51,393 of oats, 4093 of potatoes, 18,565 pounds of tobacco, 10,776 of cotton. It had 13 stores, one forge, 15 grist-mills, nine saw-mills, seven tanneries, 39 distilleries; 14 schools, 945 scholars. Pop. whites, 4493; slaves, 294; free coloured, 12; total, 4794. Capital, Decatur.

Meigs, T., Adams co., O. Watered by Brush creek. It has five stores, one furnace, one flouring-mill, two grist-mills; one school, 94 scholars. Pop. 1064.

Meigs, T., Muskingum co., O. It has nine schools, 270 scholars. Pop. 1333.

MEIGSBVILLE, T. Morgan co., O. It has six schools, 175 scholars. Pop. 1150.

MEININGEN (SAXE), or SAXE-MEININGEN-HILD-RUGSHAUSEN (DUCHY OF), an indep. state of Central Germany, consisting of a crescent-shaped territory, between the 50th and 51st degs. of lat., and long. 10° 10' and 11° 45' E.; enclosed on the S. by the territories of Cobourg and Bavaria, on the other sides by the dominions of Cobourg, Schwartzburg, Prussia, Hesse-Cassel, and Weimar. Area, 986 sq. m. Pop. (1840), 148,078. This duchy comprises a portion of the Thuringian forest mountains; one of which, the Dollinar, rises to 2376 feet above the sea. The remainder of Saxe-Meiningen is chiefly comprised in the vale of the river Werra, by which it is traversed in a N.W. direction. This last portion of the duchy, though one of the most fertile districts in Germany, does not, however, produce enough of corn for the consumption of its inhabitants. The tobacco, turnips, and fruit are staple products; and the forests and cattle of the duchy are among its most important sources of wealth. Mining is pretty actively pursued; iron, a little copper, coal, alum, vitriol, &c., being produced: it has also marble quarries, and furnishes about 120,000 cwt. of salt a year. The manufacture of hardware and the weaving of flannels and woollens are the chief remaining branches of industry; but a number of hands are also employed in making various wooden articles, toys, &c.

The government is a limited monarchy, and, in nearly all respects, similar to that of Saxe-Weimar (which see). The high court of appeal in Jena is the supreme tribunal for this duchy. The inhabitants, who are nearly all Lutherans, are quite as well educated as those of the rest of Saxony. Primary schools are numerous; there are superior schools, or colleges, in all the towns, and the state has a considerable share in the direction and patronage of the university of Jena and of the Prussian gymnasium at Schlensingen, near Erfurt. Public revenue, in 1840, 1,147,000 florins, which was about equal to the expenditure. The public debt, at the same time, amounted to 5,000,000 florins. Saxe-Meiningen has one vote in the full council of the German confederation, and a vote in the committee, conjointly with Saxe-Weimar, Cobourg, and Altenburg, together with which it holds the 14th place in the diet. It furnishes 1150 men to the army of the Confederation. Adelaide, queen dowager of Great Britain, relict of

MELFORD.

William IV., is a sister of the present sovereign of Saxe-Meiningen.

MEININGEN, a town of Central Germany, capital of the above duchy, on the Werra, here crossed by two stone bridges, 31 m. N.E. Fulda. Pop. about 6000. It is encircled by wooded hills, is well built and laid out, and surrounded with ramparts and ditches. In the palace, which has been the residence of the dukes since 1831, are collections of paintings, engravings, natural curiosities, the archives of Meiningen and Weimar, and a library of 24,000 volumes. The house of assembly for the states of the duchy, the *berathendium*, or gymnasium, the female seminary, riding-school, theatre, and hospital, are the other principal edifices. It has some manufactures of woollens, lins, and mixed fabrics, with tanneries, breweries, &c., and has some of the best public gardens in Germany. (*Bergkass. Allg. Lander*, &c., iv., 361-9; *Stein's Handb. der Geogr.*, *Alm. de Gotha*, 1841.)

MEISEN, a town of the kingdom of Saxony, prov. Meissen, on the Elbe, here crossed by a handsome bridge, 14½ m. N.W. Dresden. Pop., in 1837, 7858. "The castle, the Gothic church, and the lofty houses, perched high upon a rocky eminence, have a most imposing effect as you approach Meissen; but the streets are narrow, and the town has internally a gloomy appearance, which is considerably increased by the smoke constantly issuing from the porcelain manufactory." This establishment occupies the castle, built it is said, by the emperor Henry I. "The beautiful pottery ware that goes by the name of Dresden china, is all manufactured here; and though the Meissen potteries are now rivalled by those of Berlin and Vienna, they were at one time the first, and may still be considered the most celebrated, in Europe." (*Strang's Germany* in 1831, i., 84, 85.) The Gothic cathedral is remarkable for the fine open-work of its spire and the elegance of its interior. In it are several antique monuments of the Saxon princes, and some fine old paintings by Albert Durer and Cranach: the latter has introduced into the altar-piece the portraits of Luther, his wife, and his friend, the Elector of Saxony. The neighbouring convent of Agra has been converted into a royal school. The chapter-house, three hospitals, and the orphan asylum, are the other chief public establishments. Besides the porcelain factory, founded by a chemist named Böttcher, in 1710, Meissen has manufactures of hats, stockings, leather, colours, &c., though none is very considerable. (*Bergkass.*; *Stein*, &c.)

MELCOMBE REGIS. See WIMBORNE.

MELFI, a town of the Neapolitan dom., prov. Basilicata, on a lofty and remarkable volcanic mountain, overlooking the plain of Capitanata, 34 m. S. Foggia. Pop. about 7000. Like most other towns in an elevated situation, Melfi loses somewhat on a nearer approach. It is encircled by old ruined walls. The streets are narrow, ill-paved, and dirty; and most of them, as the town is built on the side of a steep acclivity, are impracticable for carriages. Many of the houses, however, have a respectable appearance; which they owe more to the solidity of their masonry than to their magnitude. The principal object is its castle; which, though partly fallen to decay, and partly restored in very bad taste, retains a venerable and imposing aspect. It stands at the higher extremity of the town, from which it is separated by a kind of platform, commanding a view of the opposite slopes of mount Volturne. Considerable historical interest is attached to it from its being the principal, and probably the first fortress built by the Normans after their conquest of this portion of the kingdom. The large hall in which the meetings of the Norman confederates were held, and which afterwards accommodated the council of prelates, held here in 1059, and the parliament summoned by Frederick of Swabia, has been converted into a theatre. One only of its towers remains entire; but it affords, in height and solidity, a good specimen of the general structure.

The cathedral has attached to it a high tower, erected in 1151; which, like most of our English belltowers, has small Saxon arches for windows. There are eight other churches, with numerous convents, a magnificent bishop's palace, some excellent public cisterns, and a good private collection of the minerals of the neighbourhood. The atmosphere is damp, and the town is said to be at times unhealthy. "The population appears lively, industrious, and active; though there are no particular manufactures. Many of the inhabitants deal in cattle and wine, which last is somewhat less sweet and heavy than the produce of the surrounding towns: it constitutes an abundant article of commerce with the whole of the adjoining province of Capitanata, where, under the name of *Vino di Melfi*, it is sold, and held in general use." (*Crozza's Abruzzi*, &c., ii., 204; *Switzerland*, i., 409.)

MELFORD, LONG, a market town and par. of England, co. Suffolk, hund. Babergh, 17½ m. W. Ipswich, and 51 m. N.E. London. Area of par., 4290 acres. Pop., in 1841,

MELKSHAM.

2807. The town is very pleasantly situated in a picturesque and well wooded country, and consists chiefly of one main street, nearly one mile in length. A handsome Gothic church, two places of worship for dissenters, and an almshouse (founded in 1573) for 12 poor men and two women, are the only public buildings. Spinning, woollen weaving, and retail trade, are the chief occupations of the inhabitants. The weekly market once held here has been discontinued for some years. Cattle and sheep fairs, Tuesday, Wednesday, and Thursday, in Whitsun-week.

MELKSHAM, a market town and par. of England, co. Wilts, hund. its own name, 26 m. N.W. Salisbury, and 66 m. W. London. Area of par., 8090 acres. Pop., in 1841, 6236. The town, formerly much more important than at present, on an acclivity rising from the Avon, consists principally of one long street, with stone houses. The church is a large, old, embattled building, with a central tower and two transepts, both on the S. side: the living is a vicarage, in the gift of the dean and chapter of Salisbury. There are, also, places of worship for Independents, Baptists, and the society of Friends. Two mineral springs, one a strong chalybeate and the other a saline aperient, have been discovered about half a mile from the town; but though they are reported to be as efficacious as those of Cheltenham, they have not led to any great accession of visitors. The staple business of Melksham is the manufacture of woollen cloth; but it has greatly declined, in consequence of the superior facilities enjoyed by the clothing district of Yorkshire. In 1830, two woollen-mills employed 162 hands; besides which there are about 80 handloom weavers, whose weekly wages vary from 8s. 2d. to 14s. (*Hand-loom Weaver's Rep.*) Petty sessions for the hundred are held here. Markets for cattle, &c., on alternate Thursdays; fair for horses, cattle, and farming stock, July 7. (*Parl. Papers*, &c.)

MELROSE, a village of Scotland, co. Roxburgh, beautifully situated at the N. foot of the Eildon Hills, on the Tweed, 31 m. S.E. Edinburgh. The village has only about 700 inhabitants, and would be unworthy notice, were it not for its possessing the finest monastic ruin in Scotland. The abbey of Melrose, originally founded by David I., in 1136, for Cistercian monks, was destroyed by the English forces, under Edward II., in 1322. The structure, of which the mutilated remains still attest the grandeur and magnificence, was founded by Robert Bruce, the hero of Bannockburn, in 1236. It was finally completed, in the perpendicular Gothic style, in the reign of James IV.; and must, when entire, have been one of the noblest structures of the kind in the kingdom. This splendid edifice was well nigh demolished by the barbarous zeal of the early reformers. In fact, with the exception of a part of the cloister walls, the abbey has been wholly destroyed; but fortunately a considerable part of the church has been preserved. The great altar or eastern window, 36 feet in height by 16 feet in width, is unrivalled for its fine proportions, the richness of its tracery, and the beauty and delicacy of its workmanship. It has been admirably described by Scott:

The moon on the east oriel shone,
Through slender shafts of shapely stone,
By fang'd tracery comb'd;—
Then would'st have thought some fairy hand
Twist poplars straight the airy wand,
In many a freakish knot had twist'd;
Then fain'd a spell when the work was done,
And chang'd the willow-branch to stone.

Minstrel, canto ii., st. 11.

The south transept window and door is, perhaps, the most perfect part of the ruin. It is in the decorated style, with crockets and creeping foliage. The compartment of the nave, from the screen work to the cross, was roofed over, and fitted up, in 1618, for the parish church. But this roof does not harmonise with the rest of the fabric; and it is obvious that the stones of which it consists had been quarried from other parts of the building! A great tower rose from the centre of the cross, of which a portion, 84 feet in height, still remains; but the spire by which it was surmounted is entirely gone. The decorated work and masonry of the building have been most admirably executed; the mouldings are still as sharp as if they were fresh from the chisel.

In the centre of the village is a cross, said to be coeval with the abbey: a small property in the village is held on condition of the proprietor keeping up this fabric. The abbey is no longer used as the parish church, a handsome new edifice having been constructed for that purpose some years ago. Abbotsford, the seat and creation of Scott, is situated about three miles W. from Melrose; and Dryburgh abbey, where the great minstrel is buried, is about three miles E. from the village. (*See Monastic Annals of Tiviotdale*, a learned and able work; *Border Antiquities of Scotland*, &c.)

MELTON-MOWBRAY, a market town and par. of England, co. Leicester, hund. Framland, on the Wreak (a trib.

MEMEL.

of the Boar), crossed here by three stone bridges, 14 m. N.E. Leicester, and 92 m. N. by W. London. Area of par., 3570 acres. Pop., in 1841, 3037. The town has of late years been much improved and enlarged; the houses are generally well built, the streets are well paved, watched, and lighted, and there are some excellent hotels. The church is a large and somewhat striking cruciform Gothic building, with a highly ornamented pinnacled tower, rising at the intersection of the nave and transepts: the living is a vicarage, in private patronage. There are places of worship, also, for Wesleyan-Methodists and Independents. Three Sunday schools give religious instruction to upwards of 500 children; and two free schools, supported from the town's estate, are attended by about 400 children of both sexes. (*Educ. Rep.*, 1836.) Melton-Mowbray enjoys a small share of the hosiery and bobbin-net trade, which furnishes employment to many thousands in the county; but the chief business and celebrity of the town is attributable to its situation in the centre of a fine hunting country, and to its being, as it were, the hunting metropolis. The hunting season lasts from the beginning of November to the end of March; and during this time the town is frequented by the leading sportsmen of England, who resort thither from all parts of the country, and a few even from the continent. The stabling is excellently arranged, as well as very extensive, there being accommodation for upwards of 800 horses, with their grooms, helpers, &c. The town supports a good subscription library and news-room; and there is a temporary theatre, in which performances are held during the hunting season. Melton has water-communication with Leicester by the Wreak and Boar, and with Oakham by a canal. Petty sessions are held here; and this town is one of the polling places for the N. division of the county. It is likewise the chief place of a poor-law union, comprising 14 parishes and has a very large and well-arranged workhouse. Markets, well attended, for cattle and provisions, on Tuesday, horse fairs, Monday and Tuesday after Jan. 17; cattle fair, March 13, Holy Thursday. Whit Tuesday, Aug. 24, and Sept. 7. (*Parl. Papers*; *Sporting Review*, 1840, &c.)

MELUN (an. *Melodunum*), a town of France, dep. Seine-et-Marne, of which it is the cap.; on an island in, and on both sides the Marne, 25 m. S.E. Paris. Pop., in 1836, 6538. It is badly laid out, but is tolerably well built; and, being pleasantly situated, has a prepossessing appearance from without. The different parts of the town are connected by two bridges, one of which admits of the passage of boats. The part of the town built on the island is the most ancient; it has a large central prison for five departments, the most conspicuous edifice in the town; and on its E. side are the remains of a palace, inhabited by several of the French kings. The portion on the right or N. bank of the Marne, called St. Aspais, is the most extensive: it is built on the declivity of a hill, and has a spacious square, an old Gothic parish church, with some fine stained glass, the prefecture, formerly a Benedictine abbey, a theatre, some vapour-baths, and the remains of the abbey of St. Pierre, founded under the Merovingian dynasty. The portion on the left bank of the river is less than either of the others; it comprises the cavalry barracks. Melun has a communal college, a public library, with 10,000 volumes, a society of agriculture, arts, and sciences, a school of drawing, &c., with manufactures of woollen cloths, printed cotton and linen goods, and glass, and some trade in corn and other products destined for the Paris markets. Melun is mentioned by Caesar in his Commentaries: it was taken by his lieutenant Labienus. In the middle ages, it was several times captured by the Normans and English, and was held by the latter from 1419 to 1430. (*Hist. art. Seine-et-Marne*, &c.)

MEMEL, a fortified seaport town of the Prussian dom., being the most northerly of any size in the kingdom, and one of the principal shipping ports on the Baltic, prov. Prussia, gov. Königsberg, on the N.E. side of the entrance to the great salt lake, or lagoon called the Kurische Haß, but within the bar, 30 m. N.W. Tilsit, and 74 m. N.N.E. Königsberg; lat. 55° 42' N., long. 21° 8' 14" E. Pop., in 1838, 9034. It consists of the portion called the Old town, New town, and Frederick's town, and has several suburbs. It was surrounded by walls in the time of the Teutonic knights, and has a citadel, founded in 1280, now partly used as a prison. It has four churches (two Lutheran, one Calvinist, and one Roman Catholic), a synagogue, arsenal, exchange, theatre, high school, school of industry, female seminary, school for neglected children, a hospital, and various charitable institutions. It is the seat of a council for the circle (Landraths-amt), of judicial tribunals for the circle and town, a board of taxation, police commission, &c.; and it has manufactures of woollen cloth and soap, with docks for ship-building, sawing works, distilleries, &c. The harbour is large and safe, with deep water; but the bar, at the mouth of the Kurische Haß, has seldom more than 17 feet water, and

MEMMINGEN.

sometimes not more than 12 or 14 feet; so that ships drawing more than 15 or 16 feet water are frequently obliged to load and unload a part of their cargoes in the roads, where the anchorage is but indifferent, particularly when the wind is at N. or N.W. A lighthouse, originally 75 feet, but now 100 feet high, has been erected on the N.E. side of the entrance to the harbour. The light, which is fixed and powerful, may be distinguished, in clear weather, at more than 30 m. distance. Timber, particularly oak-plank and fir, of the very finest quality, is the great article of export from Memel; but corn, staves, flax and hemp, linseed for washing, hides, bones, bristles, wool, &c., are also largely exported. Timber, hemp and flax, and most other articles shipped from this, and, indeed, from most Baltic ports, are *bracketed*; that is, they are inspected, and assorted into three qualities, according to their degrees of goodness, by persons appointed by government for the purpose. (See art. *Pirassova*, in this Dict.) Despite the serious difficulties which our corn laws and timber duties throw in the way of the trade with Russia, we have a pretty considerable intercourse with Memel, especially when there is a demand for colonial produce, cotton stuffs and yarn, and cutlery, and considerable quantities of coal, which, however, is reckoned merely as ballast. The trade of ship-building has recently been carried on to a considerable extent at Memel; and, in 1839, 64 vessels, of the aggregate burden of 13,773 tons, of 4000 lbs. each belonged to the port. The present average export of timber is reckoned at about from 75,000 to 80,000 loads of timber, 5,000 loads of oak timber and plank, 700 mill-oak pipe-staves, and about 600,000 ft. planks. The exports of other articles are so very fluctuating as hardly to admit of their being reduced to an average. In 1837, of 609 vessels which cleared out from the port, 103 were laden with corn, 59 with linseed, eight with flax and hemp, five with bones, &c., the rest being laden with timber, or ballast. Of these ships 136 belonged to England. In 1838, 901 English ships cleared out from the port. (*Zeitung, der Preussische Staat; Boering's Report on the Prussian Commercial League, &c.*)

MEMMINGEN, a town of Bavaria, and formerly a free city of the empire, circ. Swabia, cap. distr. on a tributary of the Iller, 40 m. S.W. Augsburg. Population, 7,000. It is walled, and has a handsome town-hall, an arsenal, barracks, a lyceum, an academy of instrumental and vocal music, &c. It has manufactures of woollen, cotton and linen stuffs, stockings, ribbons, oil-cloths, copper and iron wares, &c., with tanneries, linen and cotton printing and dyeing establishments; and an active trade in the products of these, and in salt, wool, corn, hops, &c., which it sends to Switzerland and Italy. (*Berghaus, Allg. Länder, iv. 158.*)

MEMPHIS, v., Shelby co., Tenn., 230 m. W.S.W. Nashville, 915 ft., situated on an elevated bluff on the Mississippi, immediately below the mouth of Wolf river. It is built on the site of Old Fort Pickering, and is regularly laid out. It contains four churches, a Presbyterian, Methodist, Episcopal, and Roman Catholic, an academy; 53 stores, three printing offices, each issuing a weekly newspaper, 550 dwellings, and 3300 inhabitants. Its commerce is extensive, being equal to that of any town between St. Louis and New-Orleans. Its growth has been exceedingly rapid. A railroad is in operation to Lagrange, intended to be a part of the Charleston and Memphis rail road.

MEMPHREMAGOG, lake, Vt., is from 30 to 40 m. long, and from two to three broad, and lies mostly in Canada. About seven or eight m. of the S. part extend into Vt. It contains about 15 sq. m. in Vt., and receives Clyde, Barton and Black rivers. It discharges its waters through St. Francis river into lake St. Peter, an expansion of St. Lawrence river, 15 m. below the mouth of Richelieu river. On an island, on W. side, at the mouth of Fitch's bay, 3 m. N. of the Canada line, is a quarry of *novaculite*, known by the name of "Mago's oil stone," which have been prepared and vended in various parts of the United States, and is considered not inferior to the Turkey oil stone.

MENALLEN, p. t., Adams co., Pa., 48 m. S. W. Harrisburg, 60 W. It contains six stores, one fulling-mill, eight flouring-mills, eight grist-mills, 23 saw-mills, one oil-mill, one distillery; 11 schools, 440 scholars. Pop. 3269.

MENARD, county, Ill., situated a little N.W. of the centre of the state, and contains 290 sq. m. Watered by Sangamon river and its branches. It contained in 1840, 7,096 neat cattle, 6244 sheep, 23 swine; and produced 21,671 bushels of wheat, 399,990 of Indian corn, 35,150 of oats, 13,339 of potatoes, 2,190 pounds of tobacco. It had six stores, two woolen factories, three flouring-mills, seven grist-mills, 10 saw-mills, three distilleries; 17 schools, 407 scholars. Population, 4,431. Capital, Petersburg.

MENAI STRAIT, a strait or channel of N. Wales, separating the island of Anglesea from Caernarvon: it runs N. E. and S.W. about 14 m., varying in width from about 200 yards to about 2 m. Parliament having contributed a sum

MENTZ.

of money to assist in improving its navigation, the dangerous rocks, by which it was formerly encumbered, have been removed, so that vessels of moderate burden are able to pass without difficulty through the strait, when it would not be possible for them to double Holyhead. But the Menai Straits is now principally celebrated for the magnificent hanging bridge by which it has been recently crossed. Holyhead being the nearest port to Ireland, and the most convenient place at which to ship and receive the Dublin mails, it became of great public importance that the access to it should be rendered as safe and expeditious as possible. The usual ferry across the strait was in the vicinity of Bangor; and this being frequently attended with both danger and delay, it was resolved to erect, nearly at the same place, a chain bridge, elevated sufficiently above the water to allow ships to pass freely underneath. This great undertaking was begun in 1819, and completed in 1825. There are seven stone arches, each of 524 feet span; and the length of the catenary, or chain part, 579 feet. The bridge cost in all £311,797. Its elegance and solidity reflect great credit on the engineer, Mr. Telford; but it is to the parliamentary commissioners for the Holyhead road, or rather their chairman, Sir Henry Parnell, that the public is mainly indebted for this signal improvement.

MEÑDE, a town of France, dep. Lozère, of which it is the cap., on the Lot, 48 m. E.N.E. Rodez. Population, in 1838, 5100. It is badly built and laid out, but is well supplied with water by numerous public fountains, and surrounded by a boulevard, forming a public promenade. The cathedral, a Gothic building, had two light spires. The old episcopal palace, now the prefecture has a gallery and hall, enriched with many paintings by Benard, an artist of the French school. It has also a public library of 6,600 volumes, a communal college, a court of primary jurisdiction, a society of agriculture, science and arts, a chamber of manufactures, &c. Its inhabitants fabricate coarse woollen cloths, called *serges de Mende*, which are sent into Spain, Italy, and Germany.

Mende is a town of considerable antiquity. For at least 600 years its bishops possessed the privilege of coining money, and other rights of sovereignty, which, however, they began to share with the French kings in 1306. (*Hugo, art. Lozère.*)

MENDHAM, p. t., Morris co., N. J., 56 m. N. Trenton, 230 W. Drained by branches of the N. branch of Raritan river and of Whippany river. It contains a Presbyterian church, four stores, one fulling-mill, one woollen factory, one cotton factory with 308 spindles, two grist-mills, one saw-mill, two tanneries, four distilleries; three academies, 95 students; five schools, 183 scholars. Population 1378.

MENDON, p. t., Worcester co., Mass., 33 m. S.W. Boston, 406 W. Watered by Blackstone and Mill rivers. Blackstone canal crosses the S.W. part. It contains nine churches, three Congregational, two Restorationist, one Free-will Baptist, two Friends, one unoccupied; 10 stores, five fulling-mills, four woollen factories, six cotton factories with 19,008 spindles, five grist-mills, six saw-mills, one printing office, one weekly newspaper; two academies, 58 students, 10 schools, 915 scholars. Pop. 3594.

MENDON, p. t., Monroe co., N. Y., 12 m. S. Rochester, 210 W. by N. Albany, 356 W. Drained by Homeoye and Ironsquoit creeks. It contains two churches, a Presbyterian and Baptist; seven stores, one fulling-mill, two woollen factories, one furnace, one grist-mill, six saw-mills, two tanneries; two academies, 309 students, 22 schools; 1178 scholars. Pop. 3435.

MENIN (Flemish *Meenen*), a town of Belgium, prov. W. Flanders, cap. cant. on the Lys, immediately within the Belgian frontier, and 64 m. S.W. Courtrai. Population, in 1826, 7,394. It is well fortified, and tolerably well built; is the residence of a military commandant; and has manufactures of woollen yarn, and table and other linen cloths, lace, soap, linseed and other oils, &c., with tanneries, breweries, and large bleaching grounds. It has also a considerable trade in horses, cattle, and agricultural produce, and two large annual fairs. (*Vandermaelen, Dict. Geog.*)

MENTOR, p. t., Lake co., O., 169 m. N.E. Columbus, 355 W. Bounded N. by lake Erie. First settled in 1797. It has two saw-mills; 13 schools, 556 scholars. Population 1,945.

MENOMONEE, r., Mich., has a course of 100 m. and enters Green Bay, bounding the upper peninsula of Michigan on the S.

MENTZ, or MAINZ (Fr. *Mayence* an. *Moguntiacum*), a strongly fortified city of Germany, the bulwark of the German Confed. towards the W., in the grand duchy of Hesse-Darmstadt, prov. Rhenish Hesse, of which it is the cap., on the left or W. bank of the Rhine, nearly opposite its junction with the Mayn, 18 m. W.S.W. Frankfurt, and 39 m. S.E. Coblenz; lat. 50° 0' 3" N., long. 8° 16' 41" E. Pop., estimated at 40,560, including its garrison of about 6,000 men. It is built

MENTZ.

partly on level ground, and partly on the declivity of a hill, in the form of a semi-circle, the Rhine forming the basis of the arch. It is surrounded by strongly-built bastioned walls; and is further defended by extensive outworks, including a citadel, lunettes, and six forts. A bridge of boats across the Rhine, 1,666 Rhenish feet in length, protected by a *Ute de pont*, connects Ments with its fortified suburb of Castel, a town of 2,900 inhabitants, near which is an island in the river, that is also strongly fortified. A garrison of 30,000 men would be required for the proper defence of the various works. The city is entered by 10 gates, five on the land side, and five along the river; all which, except on special occasions, are closed at 10 P. M. It has several good streets and squares, which present various indications of improvement; generally, however, it is in most parts irregular, and the streets, which are narrow and dirty, are rendered darker by the loftiness of the houses, many of which have strongly-stanchioned windows: the appearance of the town is, in fact, that of an ancient city, converted into a modern fortress; but it is, notwithstanding, interesting from its antiquity, and its numerous public edifices. The cathedral, built in the massive round-arched Gothic style, was commenced in the 10th, and finished in the 13th, century. Like the cathedral of Worms and Spiers, it has a double choir, and a high altar at both the E. and W. extremities. It was nearly destroyed by fire in 1190, and suffered greatly during the siege of the town by the Prussians, in 1793; but, of late years, extensive repairs have been made upon it, by the aid of voluntary contributions; the nave has been newly roofed with slate, and the great E. tower has been surmounted with an iron cupola, 70 feet in height. The interior has numerous monuments of the former archbishops of Ments, who were sovereign princes, and electors of the empire. It has also monuments of various other historical personages. The side chapels abound in fine old carvings; the doors of solid brass and great height, opening to the market-place, were cast by the founder of the cathedral, and have engraved on them the charter given to the city by Archbishop Adalbert, in 1135. There are six other Roman Catholic parish churches, several conventual churches, and a Calvinist church, most of which deserve notice. On the quay beside the river are two large red buildings: one of which, the ancient electoral palace, has been converted into the custom-house; and the other, the Teutonic-house, once occupied by Napoleon, is now the residence of the military governor. The former palace of the Prince Dalberg, nearly destroyed by fire in 1793, is used for the courts of justice. The arsenal, on the bank of the Rhine, the theatre, a new and handsome edifice, and the episcopal and vice-governor's palaces, are among the remaining principal public buildings. But Ments derives its principal celebrity from its having been the residence of Gutenberg, and the cradle of the art of printing. The house in which Gutenberg lived has been taken down, and its site is occupied by a casino, belonging to a literary club. In an adjacent court is a statue of Gutenberg, in bronze, from a model by Thorwaldsen; but this work is said (by Chambers) to be clumsy, gigantic, and tasteless; and it is proposed to raise a monument more commensurate with the signal merits of the individual in whose honour it is to be erected. Ments has a gymnasium, an ecclesiastical seminary, schools of medicine and veterinary surgery, a public library of 90,000 volumes, in which are preserved some of the earliest extant specimens of printing; a museum of natural history, antiquities, coins, &c. Outside the walls are some fine gardens along the bank of the river.

Ments, formerly the first ecclesiastical city of the empire, is now of importance chiefly as its strongest fortress and principal military post. A mighty revolution has taken place since the visit of Dr. Moore, towards the end of last century, when the abbess, with their handsome equipages, lorded it over the well-behaved troops. "The chapter and the grenadiers have now precisely changed places. You see the meagre occupants of the stalls skulking to mass in threadbare *soutanes*, their looks preclaiming them no longer the monopolisers of the old hock of the neighbourhood; while the Austrian and Prussian soldiers are parading about in the insolence of military superiority. The cafes, the billiard-rooms, the promenades, are thronged with these smoking and swaggering guests, who impart a sort of unhallowed vivacity to the gloomy haunts of superstition and monachism. The university building is converted into barracks, and hospitals and guard-rooms strike one at every corner." (*Autumn on the Rhine*, p. 5.) Ments is garrisoned by a nearly equal number of Prussian and Austrian troops, and is commanded by a governor, elected alternately every five years from either nation. It is the seat of a military tribunal, and the high court of justice for Rhenish Hesse; its civil authorities being appointed by the government of Hesse-Darmstadt. The town is so environed, on the river side, by its fortifications and other erections, that the Rhine is but little available for commercial purposes, and the ac-

MERCER.

commodation for craft is very inferior. Nevertheless, Ments is the chief commercial town in the grand duchy (see also HESSE-DARMSTADT, l. 1089.), and, next to Cologne, the chief mart for Rhenish produce in Germany. It has a considerable trade in corn, wine, timber, &c.; and manufactures of leather, soap, hats, glue, vinegar, tobacco, musical instruments, &c.; steam-communications with Mannheim and Holland, and a steam-navigation insurance company.

Though Ments abounds in historical associations, its existing vestiges of antiquity are very few. Agrippa, the general of Augustus, established an entrenched camp on the site where Drusus Germanicus, about anno 10 B.C., erected a fort called *Moguntiacum*. Drusus afterwards founded a second fort (*Castellum*) on the opposite bank of the Rhine; and the two were at a subsequent period connected by a Roman bridge, portions of some of the piers of which may still be seen when the water is low. (*Schreiber*.) In the citadel is the Eichelstein, a stone tower, alleged to have been erected by Drusus. At Zahnbach, not far from Ments, are the remains of an ancient aqueduct; and, between the two, a Roman cemetery has been discovered. The city, which was almost wholly destroyed in the wars at the fall of the Roman empire, was restored by Charlemagne, who erected a church, and rebuilt the bridge with timber. In the 13th and 14th centuries Ments was a place of some note for literature and the arts. In 1631, it was taken by the Swedes; in 1644, 1693, and 1793, by the French; it was bombarded and taken by the Prussians in 1793; but, being re-taken by the French in 1797, it became during their ascendancy, the cap. of the *dept. of Mont-Tonnerre*. (*Schreiber, Guide du Rhin*, p. 136-137; *Autumn near the Rhine*, p. 1-13; *Berghaus, Allg. Länder, &c.*, iv. 358, 359; *Chambers's Tour*, &c.)

MENTS, l. Cayuga co., N. Y., 8 m. N.N.W. Auburn, 156 m. W. Albany. Watered by Owaseo inlet, and Seneca river, which bounds it on the W. and N.E. The Erie canal passes through its centre, crossing Owaseo inlet by a stone aqueduct. Montezuma salt works, lie a little N. of the canal, and are connected with it by a side cut. It contains two commission houses in foreign trade, 35 retail stores, four fulling-mills, two woolen factories, three grist-mills, 10 saw mills, two hatteries, one distillery; 30 schools, 1,336 scholars. Pop. 4,915.

MEQUINEZ, a large city of Morocco, and one of the residences of the emperor, 70 m. E. Salee, and 235 m. N.N.E. Morocco; lat. 33° 56' N., long. 5° 59' W. Population, differently estimated, at from 50,000 to above 100,000. It stands in a beautiful, well-watered, and very fruitful valley; and is surrounded by a wall about six feet high, built for a defence against the marauding Berberes. It owes its present extent and consequence to the late sultan, Muley Ismael; who, after having secured to himself the undisputed sovereignty of the kingdoms now forming the empire of Morocco, made Mequinez one of the capitals, considerably enlarged it, and erected a fine palace, which, owing to its having only one story, is of great apparent extent. In the centre of the enclosure, which contains several well laid-out gardens, is the emperor's harem, formed by a four-sided colonnade, above which are various apartments for the women, eunuchs, and female attendants. The rooms are each about 20 feet long, by 19 feet broad, and 16 feet high: the walls are inlaid with red and blue tiles, and the light is communicated by means of two large folding-doors. Between the chief apartments are paved courts of chiseled marble, in the centre of most of which is a fine marble fountain. The houses of Mequinez are better than those of Morocco; but the streets are not paved; and hence in rains they are infested with mud, and in dry weather with dust. The millah, or Jews' quarter, is walled round, extensive, and in good repair; but the Negroes' quarter is now a mere ruin. About a century ago a convent was formed here by the king of Spain, for the relief and spiritual comfort of Roman Catholic captives and Christian travellers; but it was deserted by the monks, previously to the accession of the late emperor, Muley Soliman. The inhabitants are described as being more courteous than those more to the S.; they are hospitable to strangers, invite them to their gardens, and entertain them sumptuously. The women are beautiful, and have fair complexions, with black eyes, white teeth, and dark hair; and have a suavity of manners rarely to be met with even in the most polished nations of Europe. (*Jackson's Morocco*, p. 136-139; *Geog. Journ.*, vol. 1.)

MERCER, county, N. J., situated in the W. part of the state, and contains 900 sq. m. Bounded S.W. by Delaware river. Watered by Assumpkin creek, and a head branch of Millstone river. It contained in 1840, 8096 neat cattle, 8,643 sheep, 12,758 swine; and produced 43,446 bushels of wheat, 46,306 of rye, 179,730 of Indian corn, 32,852 of buckwheat, 1,767 of barley, 216,888 of oats, 57,581 of potatoes. It had 106 stores, eight lumber yards, three furnaces, five fulling-mills, four woolen factories, seven cotton factories

MERCERSBURG.

with 6580 spindles, four dyeing and printing works, nine flouring-mills, 98 grist-mills, 93 saw-mills, three oil-mills, three paper-mills, one rope-walk, 13 tanneries, 11 distilleries, one brewery, six printing-offices, four breweries, three weekly and one semi-weekly newspapers; eight academies, 269 students; 69 schools, 1478 scholars. Pop. 21,502. Capital, Trenton.

MERCER, county, Pa., situated in the W. part of the state, and contains 850 sq. m. Watered by Shemango, Nesbanneck, and Wolf creeks. It contained in 1840, 33,296 neat cattle, 63,367 sheep, 47,006 swine; and produced 310,015 bushels of wheat, 89,877 of rye, 254,218 of Indian corn, 112,817 of buckwheat, 1294 of barley, 442,885 of oats, 331,655 of potatoes, 121,214 pounds of sugar. It had 95 stores, 19 fulling-mills, five woolen factories, one flouring-mill, 73 grist-mills, 198 saw-mills, 35 tanneries, 19 distilleries, three potteries, three printing-offices, three weekly newspapers; two academies, 150 students; 207 schools, 1,746 scholars. Pop. 22,872. Capital, Mercer.

MERCER, county, Va., situated toward the S.W. part of the state, and contains 549 sq. m. Bounded E. by New river and drained by its branches. It contained in 1840, 2989 neat cattle, 3625 sheep, 5166 swine; and produced 12,529 bushels of wheat, 4711 of rye, 55,254 of Indian corn, 1173 of buckwheat, 98,265 of oats, 7901 of potatoes, 3373 pounds of tobacco, 2943 of sugar. It had one store, 13 grist-mills; one school, 94 scholars. Population, whites, 2,127; slaves, 96; free coloured, eight; total, 2,233. Capital, Princeton.

MERCER, county, Ky., situated centrally toward the E. part of the state, and contains 350 sq. m. Bounded N.E. by Kentucky river, E. by Dicks river. Drained by branches of Salt river. It contained in 1840, 16,778 neat cattle, 29,052 sheep, 49,032 swine; and produced 99,265 bushels of wheat, 34,421 of rye, 3,397,406 of Indian corn, 181,039 of oats, 22,531 of potatoes, 54,747 pounds of tobacco, 12,314 of sugar. It had 35 stores, one fulling-mill, one woolen factory, three cotton factories with 1040 spindles, nine flouring-mills, 49 grist-mills, 21 saw-mills, one powder-mill, nine tanneries, six distilleries, one printing-office, one weekly newspaper; two colleges, 94 students; three academies, 140 students; 30 schools, 736 scholars. Population, whites, 13,061; slaves, 3296; free coloured, 373; total, 18,720. Capital, Harrodsburg.

MERCER, county, O., situated in the W. part of the state, and contains 576 sq. m. Drained by St. Mary's and Wabash rivers, and their tributaries. It contained in 1840, 4943 neat cattle, 1440 sheep, 6907 swine; and produced 12,596 bushels of wheat, 154,698 of Indian corn, 31,937 of oats, 11,948 of potatoes. It had 94 stores, one woolen factory, two grist-mills, six saw-mills, two tanneries; 12 schools, 409 scholars. Pop. 3977. Capital, Celina.

MERCER, county, Ill., situated toward the N.W. part of the state, and contains 559 sq. m. Bounded W. by Mississippi river. Drained by Edwards, and Pope rivers, and the N. fork of Henderson's river. It contained in 1840, 3072 neat cattle, 1698 sheep, 9339 swine; and produced 27,163 bushels of wheat, 1701 of rye, 111,439 of Indian corn, 20,506 of oats, 11,852 of potatoes, 1735 pounds of sugar. It had 10 stores, two woolen factories, two grist-mills, 11 saw-mills, one distillery; 15 schools, 320 scholars. Pop. 2322. Capital, Millersburg.

MERCER, p. t., Somerset co., Me., 34 m. N.N.W. Augusta, 627 W. Watered by Sandy river. It has two stores, two grist-mills, three saw-mills; 11 schools, 616 scholars. Pop. 1432.

MERCER, p. b., Springfield t., capital of Mercer co., Pa., 57 m. N. by W. Pittsburg, 234 m. W.N.W. Harrisburg, 277 W. Incorporated in 1814. It contains a courthouse, jail, four churches, a Presbyterian, Methodist, Associate Reformed, and a Union, 18 stores, two tanneries, one pottery, two printing-offices, two weekly newspapers; one academy, 109 students, four schools, 138 scholars. Pop. 761.

MERCER, t., Butler co., Pa. It has six stores, one woolen factory, four grist-mills, two saw-mills, two tanneries, two distilleries, one pottery; eight schools, 406 scholars. Pop. 1233.

MERCERSBURG, p. b., Montgomery t., Franklin co., Pa., 15 m. S.W. Chambersburg, 62 m. S.W. Harrisburg, 85 W. Situated on a branch of Conococheague creek. It has four churches, a Presbyterian, Methodist, German Reformed, Associate Reformed, six stores, 200 dwellings and 1143 inhabitants. It is the seat of Marshall college, founded in 1836, which has four professors or other instructors, and 49 students. The commencement is on the last Wednesday in August. The b. has one academy, 54 students, seven schools, 307 scholars.

MERDIN (an. *Merde*), a city of Asiatic Turkey, at the N.W. extremity of the pach. of Bagdad, 50 m. S.E. Diarbekir, lat. 37° 19' N., long. 40° 20' E. Population about 11,000, of whom 1500 are Armenians, and 300 Jews. It is situated on the slope of the Karadja-dagh, or ancient

MERIDA.

Mount Maria, and overlooks a very extensive and fertile tract of country. It is commanded by a castle, crowning the summit of a rock, and is very difficult of access, the best road to it leading up a steep about 1½ m. in length. The houses are all built of hewn stone, and iron to be very old; the windows are small, grated with iron, the streets narrow, and the buildings, being on an acclivity, seem to rise one on the top of the other. The walls are kept in tolerable repair, and a few old pieces of cannon are mounted on the towers of the castle. Meridia is the frontier town of the pachalia towards Constantinople, and the residence of a mutsallim appointed by the pachas. The industry of the inhabitants is confined to the manufacture of cotton fabrics and Turkey leather; but it has little external trade, in consequence of not being on any of the great caravan-routes. The neighbourhood produces an abundance of cotton, grain, and fruits, which find a ready sale in the market of Merdin. (*Olivier*, tom. iv., p. 242-245; *Kincaid* p. 265.)

MERE, a small market town and par. of England, co. Wilts, hund. its own name, 30 m. W. Salisbury, and 96 m. W. by S. London. Area of par., 7400 acres. Population in 1831, 2708, of whom 1493 belong to the town-tything. The town is very indifferently built, having in its centre an ancient cross, the interior of which serves as a market-house. The church is large, with a square tower at its W. end: the living is a vicarage in the gift of the dean of Salisbury. The Wesleyan-Methodists, also, support a place of worship and attached Sunday-school. A silk-mill has recently been erected, and, in 1839, employed 71 hands. Dowling, also, and bed-ticking, are made here on a small scale; but the town (formerly of considerable importance, having a castle on an adjacent eminence) is now in a miserably decayed condition.

MEREDITH, t., Belknap co., N. H., 99 m. N. Concord. Bounded E. by Winnepesaukee lake. A part of Great South Bay of the lake, extends into its S. part. It contains two Congregational, two Baptist, and several Free-will Baptist churches, 20 stores, one grist-mill, three saw-mills, three tanneries; 12 schools, 787 scholars. Pop. 3351.

MEREDITH, p. t., Delaware co., N. Y., 6 m. N. Delhi, 70 m. W.S.W. Albany, 345 W. Drained by Outcort creek, flowing into Susquehanna river, and branches of the W. branch of Delaware river. It contains three churches, two Baptist and a Presbyterian, three stores, one fulling-mill, two grist-mills, three saw-mills; 14 schools, 530 scholars. Pop. 1640.

MERGUL, a town of the Tenasserim coast, in India-beyond-the-Brahmaputra, capital of the British province of Mergul, on the river Tenasserim, at its mouth, in lat. 12° 12' N., long. 96° 25' E. Population probably from 6000 to 7000, including natives and British residents, with Chinese, Siamese, Peguans, and descendants of Portuguese. It is built along the declivity and skirts of a steep hill, and, when taken by the British, was surrounded by a wooden stockade. But it is not a place of any strength, being accessible to ships, and commanded by a high island in front. The streets are wide, but badly paved; and they would be much filthier than they are but for the situation of the town on a slope, which facilitates their being cleaned by the rain. The houses are nearly all of bamboo, reeds, matting, and other fragile materials. A mean brick gateway stands at the entrance to the town from the river side, which, with some bastions at the angles of the works, a few small pagodas, and some houses erected by Europeans, are the only structures of any solidity. The harbour is safe for small vessels, having 12 feet water over the bar at low water, with 18 feet rise at springs. The climate is mild and salubrious: European invalids, sent thither from Rangoon during the war, speedily recovered their health. Mergul was taken by storm by the British in 1824. (*Low Hist. &c. in Journ. of the Royal Asiatic Soc.* ii. 256-259; *Hamilton's E. I. Gat.*)

MERGUL ARCHIPELAGO. See TENASSERIM PROVINCES. MERIDA (an. *Augusta Emerita*), a town of Spain, in Estremadura, on the N. bank of the Gadiana, 29 m. E. Badajoz, and 176 m. N.E. Madrid. Pop., according to Mifano, 4890. It is situated close to the river, on a slight eminence, in the midst of an open and gently undulating country, naturally very fertile, but almost uncultivated, and unhealthy in summer. Its chief public buildings are two parish churches, eight ruined monasteries, two hospitals, and a prison: it is, in fact, one of the most decayed towns in the peninsula, and is wholly unimportant, except for its antiquities. But the remains of the power and magnificence of its Roman masters render it an object of great interest. These are scattered in all directions: in the walls, the houses, the churches, and even in the pavements of the streets are discovered fragments of columns, bases, capitals, friezes, statues, and inscriptions. Similar vestiges, and in a more perfect condition, are to be seen in the suburbs. The principal ruins comprise an amphitheatre (used also as a

MERIDEN.

naumachia), circus, theatre, triumphal arch, baths, &c. The seats of the amphitheatre appear quite perfect; the vaulted dens for the beasts are uninjured; and the conduits by which the arena was filled with water are still distinctly visible. In one of the streets may be seen a large triumphal arch, 150 feet high, but without any inscription or sculptures. The baths are surprisingly perfect, but not large; and round the top of the bathing-rooms runs a cornice of most curious and delicate workmanship, almost as perfect as if it had recently been executed. The bridge over the Guadiana is of stone, and portions of it may be of Roman architecture; but the greater part of the Roman bridge was swept away by a flood in 1610, and the present bridge has been constructed since. Two arches of this structure were blown up, in 1812, by the British troops under the Duke of Wellington. There are likewise two aqueducts, one of Roman, and the other of Moorish architecture, of brick and granite, the former having three, and the latter two tiers of arches.

Augustus Emerita was founded by order of Augustus, *anno* 25 B.C., who planted in it some of his veterans, called *emeriti*, whence its ancient and modern names. Though its ancient magnitude appears to have been greatly exaggerated, it was, no doubt, one of the largest Roman cities in the peninsula, and became the metropolis of Lusitania. From the Romans it passed, in 713, to the Moors, who destroyed and altered many of its old buildings. In 1228 it opened its gates to Alphonso IX., after his signal victory over the Moors in the contiguous plain of Matanzas; and from this period downwards it has been attached to the kingdom of Castile and Leon. (*Recollections of the Peninsula*, p. 178-181; *Cook's Spain*, l. 143-144; *Milano's Ancient Universal History*, xlii. 492, 8vo. ed.)

MERIDA, a town of S. America, rep. Venezuela, dep. Zulia, cap. the prov. Merida, on the Chama, 330 n. S.W. Caracas, and 325 m. N.E. Bogota. Previously to 1812, when it was destroyed by an earthquake, this was the largest city in Venezuela, and had a population of 12,000. It continued, for some years, to be little better than a heap of ruins; but it has been again rebuilt, and is now, probably, become more populous than before. It has a cathedral, several chapels, convents, &c., an ecclesiastical seminary, a college for philosophy, civil law, &c. The inhabitants are said to be, for the most part, in good circumstances. The coloured races dye wool and manufacture carpets and other woollen and cotton fabrics. (*Geog. Account*, &c., 270-74; *Mod. Trav.* xvii.)

MERIDEN, p. t., New Haven co., Ct., 16 m. S. by W. Hartford, 331 W. Incorporated from Wallingford in 1806. Watered by Quinnipiacer r. and its branches. It contains three churches, a Congregational, Episcopal, and Baptist; a bank, eight stores, two fulling-mills, two woollen factories, two grist-mills, nine saw-mills, two paper-mills, one tannery, one distillery; two academies, 50 students; 12 schools, 367 scholars. Pop., 1880.

MERIONETH, or MERIONYDD, a marit. co. of N. Wales, having N. the cos. of Caernarvon and Denbigh, E. and S. those of Montgomery and Cardigan, and W. St. George's Channel. It is of a triangular shape, and contains 494,390 acres. This, next to Caernarvon, is the most mountainous county in the principality. Among the principal summits are those of Arran-Fowdy, Cader-Idris, and Arneig; respectively 2,955, 2,914, and 2,909 feet above the sea. It has, however, some fine vales, especially that of Festiniog, celebrated for its romantic scenery. There are some considerable tracts of low swampy land along the sea-coast; and in parts considerable tracts have been gained by embankments. The soil is very various; but, generally speaking, it is poor, and suited only for pasturage. Oats is the grala principally cultivated; but wheat and barley are also raised, though in no great quantities. Agriculture is in a very backward state; little or no attention is paid to a rotation of crops, and it is a frequent practice here, as well as in Denbigh, to burn the ashes for manure. In some parts of the county potatoes are pretty extensively cultivated. The principal dependence of the farmer is, however, on his cattle and sheep, of which great numbers are fed on the mountains, and in the valleys not fitted for husbandry. The small native Welsh ponies, called *Merfins*, are now rare. They are sure-footed and exceedingly hardy. Dairy farming is carried on to a considerable extent. Farms usually small; and being mostly held at will, without any conditions as to management, the low state of agriculture need not be wondered at. Average rent of land, in 1810, 3s. 11d. an acre. Speaking generally, the cottages are wretched in the extreme; though happily they have been a good deal improved in some parts of the county. The minerals seem to be of less consequence than might have been supposed: lead and copper are raised, though in small quantities; large quantities of lime are produced at Corwen, and slates are quarried in different places. The manufactures, which also are unimportant, consist principally of coarse flannels, produced

MERSEBURG.

on the domestic system, at Dolgelly, Towyn, and a few other places. The Dee has its source in this county; and it is also watered by the Dyff, Maw, Dwyfnwy, &c., flowing W. Baia, the largest lake in the principality (*see* Bala), is in this county. Harlech is the county town. Merioneth is divided into six hundreds and 37 parishes. It sends one member to the House of Commons for the county. Regt. electors, in 1830-40, 1389. In 1831, the county had 6063 inhabited houses, 7358 families, and 35,315 inhabitants, of whom 17,184 were males, and 18,121 females. Sum expended for the relief of the poor, in 1838-39, 13,107l.

MERMENTAU, r., La., drains the extensive prairies of south western Louisiana. After a southerly course of 900 miles, it enters the gulf of Mexico, 900 m. W. of Mississippi river. It passes through a lake of the same name, and has not more than four feet of water on the bar at its mouth. Live oak is found on its borders.

MERRIMAC, r., N. H., is among the large rivers of New-England. Its longest branch is Penicewasmet river, which rises near the Notch of the White Mountains. After running S. about 70 m., it receives Winnipisceog river, in Franklin township, the outlet through Great bay of Winnipisceog lake, and below that it takes the name of Merrimac river. It then flows S. by E. until it enters Massachusetts; it then turns E. and N.E. for 50 m., until it enters the Atlantic, a little below Newburyport. It is navigable for vessels of 300 tons to Haverhill. By means of the Middlesex canal from Chelmsford to Boston harbour, and canals and locks around the falls in the river, a boatable communication is opened from Boston to Concord, N. H. *Below* canal, a few miles below Concord, with four locks, overcoming a fall of 35 feet, was completed in 1812, and cost \$65,000; 6 m. further down, *Hockett* canal, with three locks, overcoming a fall of 17 feet, cost \$15,000; 8 m. below Hockett is *Amoskeag* canal, with nine locks, overcoming a fall of 45 feet, and cost \$50,000. It is the greatest work of the kind on the river. Below Amoskeag canal, the river, for 9 m., is converted into the *Union* canal, overcoming six distinct falls, with slack-water navigation, and seven locks, and cost \$50,000; 5 m. below are *Crowell's* falls, made passable by a canal, the expense of which is included in Union canal; 15 m. below, in Massachusetts, *Wicasset* canal cost \$14,000, 3 m. below which is the entrance of the Middlesex canal. A number of bridges cross Merrimac river. Its principal tributaries on the W. side are Contoocook, Piscataqua, Souhegan, and Nashua rivers; and on the E. side are Soucook, Suncook, and Beaver rivers. It has several important places on its banks, the principal of which are Newburyport, Haverhill, and Lowell, in Massachusetts, and Concord in New-Hampshire.

MERRIMAC, co., N. H. Centrally situated toward the S. part of the state, and contains 816 sq. m. Organized in 1823. Watered by Merrimac r. and its branches. It contained, in 1840, 35,911 neat cattle, 89,508 sheep, 12,385 swine; and produced 60,612 bushels of wheat, 46,706 of rye, 181,394 of Indian corn, 6868 of buckwheat, 5351 of barley, 173,328 of oats, 685,370 of potatoes, 63,940 lbs. of sugar. It had 113 stores, 12 fulling-mills, three woollen factories, 3 cotton factories, with 11,768 spindles, one glass factory, 43 grist-mills, 105 saw-mills, one oil-mill, five paper-mills, 35 tanneries, two distilleries, three potteries, 10 printing offices, six disteries, six weekly newspapers, and one periodical; 10 academies, 1694 students; 573 schools, 10,369 scholars. Pop. 36,353. Capital, Concord.

MERRIMAC, p. t., Hillsborough co., N. H., 29 m. S. Concord, 453 W. Bounded E. by Merrimac river. Watered by Souhegan river and its branches, which afford extensive water-power. Incorporated in 1763. It contains a Congregational church, four stores, six grist-mills, six saw-mills; nine schools, 351 scholars. Pop. 1111.

MERRIMAC, t., St. Louis co., Mo. Pop. 1722.

MERRIMAC, t., Crawford co., Mo. Pop. 1111.

MERRIWETHER, co., Ga. Situated in the W. part of the state, and contains 490 sq. m. Bounded E. by Flint river, and drained by its branches, and by branches of Chattahoochee river; it contained, in 1840, 18,393 neat cattle, 9121 sheep, 41,544 swine; and produced 85,480 bushels of wheat, 1040 of rye, 354,115 of Indian corn, 53,779 of oats, 94,370 of grist-mills, 5,860,328 lbs. of cotton. It had 11 stores, nine grist-mills, five saw-mills, three tanneries; four academies, 155 students; nine schools, 265 scholars. Pop.: whites 8,795; slaves 5,291; free coloured 16; total, 14,132. Capital, Greenville.

MERSEBURG, a town of the Prussian dom. prov. Saxony, cap. reg. Merseburg, on the Saale, 56 m. S.E. Magdeburg; lat. 51° 23' 1" N., long. 12° 0' 35" E. Pop., in 1837, 9413. It is walled, and is old and irregularly built. It has several suburbs, a cathedral, a castle, a gymnasium, a hospital, and various other public institutions. Merseburg is the seat of government for the regency of the council and court of justice for the circle and town, a board of forests, &c.; and has manufactures of woollen and linen

MERSEY.

cloth, paper, tobacco, and vinegar. The beer of Merseburg is celebrated as the best in Saxony. (*Von Zedler, Der Preussische Staat*, iii. 323; *Bergkass*, &c.)

MERSEY, a river of England, which has its embouchure on the W. coast of the island, in the Irish sea. Though not large, the Mersey has, from its flowing through the principal manufacturing district of the empire, and giving its name to the gulf or estuary between Lancashire and Cheshire, become, in point of commercial importance, second only to the Thames. It has its sources in the great central ridge, or Pennine chain, on the confines of Yorkshire, Cheshire, and Derbyshire. After receiving the Goyt from the S., and flowing W. through Stockport, it is joined by its important affluent the Irwell. The latter, which has its source in the Lancashire moors, near Haslingden, flows S. through Bury to Manchester, where, being joined by two smaller streams, it takes a westerly course, till its confluence with the Mersey. After being still further increased by the Boleas from Macclesfield, the Mersey passes Warrington, a little below which it expands into a magnificent estuary, having the great commercial port of Liverpool on its N. side, near its junction with the Irish sea. The Mersey and Irwell have been rendered navigable from Sankey bridge to Manchester; and projects are now on foot for improving and deepening the navigation. (*See MANCHESTER*.)

MERTHYR-TYDVIL, a parl. bor., market-town, and par. of S. Wales, co. Glamorgan, hund. Caeaphilly, on the Taff, 19 m. N. by W. Cardiff, and 140 m. W. by N. London. Pop. of parl. bor., which includes nearly all the par. of Merthyr-Tydvil, and the entire par. of Aberdare, with a small portion of the par. of Vainor, 37,460 in 1831, but in 1841, 34,577. "The town lies on the E. side of the valley, down which the Taff descends to Cardiff, scattered in detached masses about the valleys and on the hills, sending forth branches in different directions; and fresh groups are continually rising in the neighbourhood of the great iron-works, so that it is somewhat difficult to point out where any collection of houses ends or begins." (*Bond. Rep.*) The houses, generally speaking, are mean-looking, comprising "labourers' cottages, or small ale-houses, beer-shops, or retail shops;" but in the centre of the town there are three tolerably respectable streets, forming a triangle, at one point of which is the parish church, a modern and well-built structure: the living is in the gift of the marquis of Bute. There is, also, a chapel-of-ease, besides several places of worship for dissenters; and the various Sunday schools of the town give religious instruction to nearly 6,000 children of both sexes. National, Lancastrian, and other subscription schools have likewise been formed, and are well attended. A philosophical society and several book-clubs have been established; and there is abundant proof that education is advancing among all classes. A theatre has been built within these few years, and there are two good hotels. In the environs are many handsome seats, belonging to the wealthy iron-masters; and three miles N. of the town, on an insulated hill, stand the ruins of Morlais castle, a very ancient building, demolished during the late civil wars.

The rise of Merthyr has been rapid, almost beyond belief. Towards the middle of last century it was an insignificant village: in proof of this, it is sufficient to state, that, in 1755, the lands and mines for several miles round the village, the seat of the great works now erected, were let for 99 years for 200*l.* a year. It is wholly indebted for its prosperity to its rich mines of coal, iron-ore, and limestone. The stratum of coal, which is of excellent quality, is accompanied by parallel veins of argillaceous iron, penetrating to a great depth, and yielding, at an average, about 35 per cent. of metal. The iron works are on a vast scale; those of Sir John Guest and Co. at Dowla's, of the Messrs. Crawshaw at Cyfarthfa and Hirwaia, having actually raised up very populous townships; the Pen-y-darran and Plymouth iron-works are also very extensive. In all, about 150,000 tons of iron a year are produced in the immediate vicinity of the town. Of this, a large proportion goes through the various processes of refinement and rolling into bars, previous to being shipped at Cardiff. The furnaces, reboeries, and rolling-mills employ a great many persons; the wages for men ranging from 1*sh.* to 6*sh.*; of women, from 6*s.* to 10*s.*; and boys, 7*s.* to 11*s.* per week. The trade is of a very fluctuating character, and great numbers of workmen are often thrown out of employment by the stoppage even of two or three furnaces. Distress, however, is less permanent here than in many other districts, as "the work is one requiring less experience than many other manufactures; so that a demand for labour is readily met by a supply; while, on the other hand the labourers feel no great reluctance to transfer themselves to fresh employments." (*Bond. Rep.*) It is said by Mr. Nicholson, in the last edition of the *Cambrian Guide*, that "there is a marked improvement in the houses of the workmen; most of them have good oak chests of drawers, bright as silver; cupboards, with a display of family china cups and glasses; some of the younger women

MESSINA.

have a veneered work-box; and all these little things die play an attention to the lesser comforts and luxuries of life, of which, a few years ago, they had no idea. On the whole, there is a decided improvement in the general condition and circumstances of our workmen." (P. 431.)

But, notwithstanding their comparatively comfortable condition, and the great increase of temperance societies, it would seem that Chartist doctrines have made a very considerable progress among the labourers in this district, a circumstance for which it is not very easy to account. A large portion of the Chartists engaged in the outbreak at Newport, on the 4th of November, 1839, were understood to be from Merthyr and the adjoining iron-works. It is to be hoped that the severe, but wholesome, chastigation they received on that occasion may not have been thrown away; and that it may help to disabuse them of their prejudices, and hinder them from again becoming the dupes of designing demagogues.

The communication with Cardiff is effected by means of the Glamorgan and Cardiff canal (completed in 1794), which commences at Merthyr, and ends, after a course of 25 m., in the tideway of the Taff, near its entrance into Penarth harbour, the entire descent being 611 ft. (*See CARDIFF*, i. 552.) In 1836, 118,000 tons of iron were sent down this canal. The late improvements of the marquis of Bute in the port of Cardiff have also been of essential advantage to the export trade of Merthyr-Tydvil. The Taff-vale railway, for which the act of parliament was procured in 1836, and which is intended to connect the mining district of Merthyr with Cardiff, was opened as far as Newbridge, 14 m. N. Cardiff, in October, 1840; and it is stated that the traffic, as well as the number of passengers, already exceeds the original estimate. This railway, when completed, will, with its various branches, have a length of 25 m.: the capital is estimated at 620,000*l.*

The Reform Act created Merthyr a parliamentary borough, with the privilege of sending one member to the House of Commons; the electoral limits comprising the parish of Merthyr-Tydvil, except parts of the hamlets of Forest and Taff and Cynon, the entire parish of Aberdare, and the hamlet of Cefn-Coed-y-Cunner, in the parish of Vainor. Registered electors, in 1839-40, 592. Merthyr is also one of the polling-places at elections for the county. Petty sessions are held here for the upper division of hundred Caeaphilly; and a court of requests sits monthly for the recovery of debts not exceeding 5*l.* An act was passed in 1830 for the better security of life and property in this district; and the three parishes of Merthyr-Tydvil, Aberdare, and Gellygare are under the superintendence of a stipendiary police magistrate, having a salary of 600*l.* a year, half of which is levied on the furnaces within the limits of his jurisdiction, and half on the inhabitants of Merthyr alone. Markets on Wednesday and Friday; cattle fairs May 14, the first Monday in July, and the first Monday in August.

MESAGNE, or **MESSAGNA**, a town of the Neapolitan dom., prov. Otranto, cap. tant., 8 m. S.W. Brindisi. Pop. 5,000? It has several convents, an hospital, and a fine palace, belonging to the Francavilla family. It manufactures kitchen utensils; and has some trade in oil and grain, considerable quantities of which are grown in its vicinity. Messagne is supposed by many Italian authors to be the representative of the ancient town of *Messapia*, but this is doubtful.

MESHED, a city of Persia, the cap. of Persian Khorassan, and esteemed as "holy" from its containing a very superb sepulchre, enclosing the remains of Imam Reza and the caliph Haroun al Raschid, 455 m. E. by N. Tcheran; lat. 36° 17' 40" N., long. 50° 35' E. Pop., according to Kliner, 50,000. It stands in a rich and well-watered plain, is surrounded with a strong wall, and is divided into 12 quarters, of which five are in ruins. The houses are meanly built of sun-dried bricks, and the ark or palace is unworthy of its name. There were formerly 16 medressas or colleges; but most of them are either deserted or in ruins. Indeed, the city has now little worth notice, except its fine and well-supplied bazaar, and the mausoleum of Imam Reza, the magnificence of which, with its silver gates, jewelled doors, rails once of solid gold, glittering domes and minarets, and handsome arcades, is almost unequalled in Persia. It has, however, been often plundered; and its resources are said by Mr. Fraser to be greatly reduced. Meshed carries on a considerable trade with Bokhara, Balkh, Candahar, Yezd, and Herat; and many of the inhabitants are employed in weaving velvet and making fine pelisses, both of which are much esteemed throughout Persia. (*Kinner's Persia; Fraser's Khorassan*, &c.)

MESSINA (an. *Zancle* and *Messana*), a celebrated city and seaport of Sicily, ca.p. Intendency, near the N.E. extremity of the island, on the strait of its own name, 8 m. N.W. Reggio, 564 m. N.N.E. Catania, and 190 m. E. by N. Palermo; lat. (of its lighthouse) 38° 11' 30" N., long. 15° 34' 40" E.

MESSINA.

E. Pop. in 1831, including that of its canton, 83,772.* The city has a most imposing appearance from the sea, forming a fine circular sweep, about 3 m. in length, on the W. shore of its magnificent harbour, from which it rises in the form of an amphitheatre; and being built of white stone, it strikingly contrasts with the dark forests that cover the mountains in the background. Prior to 1783, the harbour was fronted by a magnificent terrace of lofty houses, called the *Pallastata*, having in front a broad quay decorated with statues and fountains. But the great earthquake of that year laid the city almost entirely in ruins; and though the terrace still exists, it is shorn of its former grandeur. The quay in its front, called the *Merina*, has now, as formerly, numerous fountains, and is the favourite promenade. Ruined buildings, and other vestiges of the earthquake, occupy a considerable portion of the city; and few houses have now more than two stories. Swinburne, who visited Messina before 1783, complained that its interior was dirty, with narrow streets, gloomy houses, little bustle of trade, and still less show of luxury. According to Smyth, however, the modern city is regularly built, well paved with square blocks of lava, and several of its streets are wide and handsome, ornamented with numerous churches, convents, statues and fountains. The square in front of the cathedral, and that of *San Giovanni di Malta*, are both well built and handsome. The fountain in the centre of the former ranks with the finest in Sicily. The cathedral, erected soon after the conquest of Sicily by the Normans, has been repeatedly damaged by earthquakes. It is a Gothic building, with a heavy and gloomy exterior: the interior, though devoid of taste, is richly ornamented. The principal entrance is handsome; and the nave is supported by immense granite columns taken from the ruins of a temple of Neptune. The great altar and the roof of the choir are set off with mosaics and precious stones: the carved work of the pulpit is said to be a *chef d'œuvre* of the Sicilian sculptor Gagini. The church of Monte Virgine has some good paintings in fresco, and that of St. Giorgio is very rich in marbles and inlaid work, and has some tolerable pictures. Adjacent to the viceroy's palace, a noble building at the S. extremity of the city, is a large open space planted and laid out in public walks. The other public buildings include a large hospital, several asylums of various kinds, two theatres, town-hall, exchange, bank, college, &c. Messina is surrounded by an old irregular wall, finished by Charles V. The citadel, a pentagonal fortress, erected on the S. side of the harbour, is constructed according to the principles of Vauban; but though well provided with bomb-proof quarters and stores, it is badly situated and commanded in almost every part. Two strong and well-built forts have, however, been constructed on eminences above the town, that would greatly annoy and harass an enemy during any operation against the citadel. The town is further defended by a fort placed so as to command the mouths of the *Flumara*, which are the only places where an enemy could land with cannon. The port, to which Messina is wholly indebted for her prosperity, and even existence, is formed by a lengthened curved tongue of land, that might almost be supposed to be an artificial circular mole, projecting first N. E. from the main land, and then bending round to the W. in the form of a sickle.† The entrance on the N., about 700 yards across, is defended on the W., or main-land side, by the bastion of Porto Reale, and at the extremity of the curved promontory by Fort Salvatore. A lighthouse has been constructed on the extreme E. verge of the promontory. The noble basin thus enclosed is about 4 m. in circuit, and, having deep water throughout, is capable of accommodating the largest fleets: it is, in fact, not only the finest harbour in the Mediterranean, but one of the finest of which we have any certain knowledge. Men-of-war moor in the centre of the basin in about 35 fathoms; but merchantmen lie alongside the quay, and have every facility for loading and unloading. The practice-office, the fish-market, and the custom-house, are all on the Marina. The lazaretto, the best establishment of the kind in Sicily, is in the E. angle of the harbour. The situation of Messina, on the strait between Italy and Sicily, and her admirable port, give her great advantages as a commercial entrepôt; and were Sicily and Naples subject to an enlightened government, able and willing to put down abuses, and to call into activity their long dormant energies, Messina would certainly be one of the greatest emporiums of the Mediterranean. Even as it is, her trade is very considerable. Her exports consist principally of oranges and lemons, olive oil, silk, linned, wines and spirits, shumac, liquorice, rags, corn, salted fish, &c. Almost all the silk exported from Sicily is shipped here. The imports consist of colonial produce, and cotton and woolen fabrics, hides, hardware, &c. (*Macgregor's Re-*

METHUEN.

ports on Sicily; Smyth's Sicily, p. 113-123; *Russell's Sicily*, p. 280-281, &c.) We subjoin an

Account of the quantities and value of the principal articles exported from Messina in 1830.

Articles.	Quantities.	Total Value.
Argols and cream of tartar	cwt.	494 6,900
Barilla	ditto	5,000 8,842
Bromstone	ditto	3,100 3,650
Castor-oil	cwt.	96 1,044
Corn, grain, and pulse	qrs.	4,500 9,375
Cotton wool	cwt.	379 880
Essences	lbs.	31,378 7,724
Fish, salted	cwt.	5,695 11,054
Fruit, dry and pickled	ditto	5,100 3,842
Oranges and lemons	boxes	304,584 75,000
Lemon juice	galls.	254,567 4,316
Linned	qrs.	20,364 34,938
Other seeds	cwt.	11,490 1,338
Liquorice paste	cwt.	6,532 6,532
Oil olive	galls.	245,320 30,250

Wine and spirits	galls.	724,940 87,001
Other articles		6,000
Total value		695,325

Messina is the see of an archbishop, and the residence of a Greek *protopapas*, with authority throughout Sicily, but who is nominated by the pope. It is the seat of a royal court of appeal, and of criminal, civil, and commercial tribunals; and has a municipal bank, several *monti di pietà*, or government loan banks, and other benevolent institutions. Next to commerce, its inhabitants are chiefly occupied in the tunny and other fisheries; and in the manufacture of silk stuffs, especially damasks and satins. It has an ecclesiastical seminary, a lyceum, a royal college for law and medicine, and an extensive public library; but Simond says that Messina appears to have made slow progress in refinement, compared with Catania or Palermo. "The education of young people is more neglected; very few in the lower ranks can read; and the nobility do not in general reside in Messina: in short, it is neither habitable, nor learned, nor rich; nor is it, I think, particularly hospitable." (*Simond's Italy*, &c., 523.) But, how deficient soever in these respects, Messina has advantages of another sort that entitle her, in the estimation of her citizens, to look down with contempt on most other places. These consist in the possession of an autograph letter of the Virgin Mary, addressed to the Messinians, and assuring them of her special protection; and what is, if possible, still more precious, a lock of the Virgin's hair, given by her to the persons entrusted with the conveyance of the letter: To question the genuineness of these valuable relics would, in Messina at least, be rather hazardous; and, under such circumstances, we need not wonder that it is firmly believed that, on one occasion, the city was saved from famine by the opportune arrival of a supply of corn, sent by the Virgin. The only wonder is, that she has allowed it to be so often brought to the brink of destruction by earthquakes, and devastated by the plague. A splendid *fête* is annually given in the great square in honour of the exalted protectress and benefactress of the city. Very few vestiges of ancient city remain; a consequence, no doubt, of the numerous earthquakes by which it has been visited.

The accounts of the origin and early history of Messina differ considerably. It is admitted on all hands to be very ancient; and most probably derived the name it has so long borne from a settlement having been made in it by a body of emigrants from Messene, in Greece. Having been seized by the Mamertini, it became, under them, one of the most populous, wealthy, and powerful cities of Sicily. It was the first town of the island that came into the possession of the Romans. (*Callist. Orbis Antiqui*, l. 178; *Ancient Universal History*, iii. 512, 8vo. ed.)

The principal political events in the history of Messina, in modern times, are its successful resistance to Charles of Anjou, by whom it was besieged, after the *Mothian Vespers*; and its revolt against the Spaniards in 1674, followed in the ensuing year, by the defeat of the latter in its vicinity by a French force. In 1743 the plague broke out in Messina, with the most destructive violence, sweeping off the greater number of the inhabitants.

METHUEN, p. t., Essex co., Mass., 30 m. N. by W. Boston, 454 W. Bounded S.E. by Merrimac river. Watered by Spicket river, which has a fall of 30 feet, two miles above its entrance into Merrimac river, and affords great water power. It contains three churches, a Congregational, Baptist and Universalist, four stores, two cotton factories with 4568 spindles, two grist-mills, two saw-mills, two paper-mills; 10 schools, 650 scholars. Pop. 2061.

* According to the official returns, the population, in 1793, was only 46,056, so that it would appear to have nearly doubled in the interval.

† This, in the old Sicilian language, was called *Zaxxà*, whence the original name of the town. (*Thucydides*, lib. vi. cap. 6.)

METZ.

METZ (an. *Disiodorum*, afterwards *Mediomatrici* and *Matis*, whence its present name), a strongly fortified city of France, dep. Moselle, of which it is the capital, at the junction of the Moselle and Seltz, 80 m. W.N.W. Strasbourg, and about 189 m. E.N.E. Paris; lat. 49° 7' 5" N., long. 6° 1' 15" E. Population, in 1836, 42,793. "Metz is a fine old city; but, like most fortified places, the streets are narrow, and the houses lofty. Near the river it is more open, the quays are broad, and the bridges magnificent. The river is clear and rapid, and swells to an expanded stream where not confined by the embankments, as it is within the fortifications." (*Jacob's View of Germany*, &c., p. 436.) Metz was fortified by marshals Vauban and Belleisle: it has several strong outworks, and a citadel on the Moselle; but the latter was partly dismantled during the revolution, and its esplanade has been laid out in public walks, which command a noble view of the valley of the Moselle and its bounding hills. The city has nine gates and drawbridges, but only six are in use. The most conspicuous public building is the cathedral, a vast pile, commenced in 1014, but not finished till 1546. It is about 390 feet in length, the height of the nave being about 140 feet, and that of the tower about 400 feet.* The latter, which is a fine specimen of Gothic architecture, has in it a bell weighing 36,000 lbs. The whole edifice is remarkable for lightness. Mr. Jacob says that the cathedral of Metz was the most perfect Gothic structure he saw on the continent; and that, though not so old as Westminster Abbey, it may vie in external beauty with that venerable pile. The military hospital, built in the reign of Louis XV., is a noble edifice, consisting of two ranges of building, and capable of easily accommodating 1500 patients. The *Hôtel du Gouvernement*, a large, though rather heavy fabric, fronts the esplanade; it is appropriated to the courts of justice and the city library; the latter has above 30,000 volumes, among which are numerous works printed in the 15th century, and about 800 MSS., some of the 10th century. (*Guide du Voyageur*.) The barracks, military magazines, prefecture, townhall, and mint, several of the churches, the new market, the theatre, with a portfolio of the Tuscan order, &c., are among the other edifices. The Moselle and the Seltz, in and near the city, are crossed by at least 30 bridges. The principal school of artillery and military engineering (*École de Génie d'Application*) in France is established here. Its library has a choice collection of about 10,000 volumes of military and scientific works, with sundry MSS. of Vauban and other distinguished persons. Exclusive of the above, Metz has two other public libraries, with several convents and charitable asylums, a Protestant church, a synagogue, a royal college, a university academy, an ecclesiastical school, and other seminaries; a school for the fine arts, a royal society of arts and *belles lettres*; an agricultural society, a society for the encouragement of primary instruction, and collections in natural history, mineralogy, and chemistry; a botanic garden, a lying-in hospital, a savings' bank, a *mont-de-piété*, &c.

Metz is the see of a bishop, and the seat of a royal court for the depts. of Moselle and Ardennes, and of tribunals of primary jurisdiction and commerce, and a chamber of commerce, and the head-quarters of the third military division of France. "It is also a manufacturing city, in which are made woollen goods of various kinds, hosiery, cotton goods, table-linen, printed paper, musical instruments, starch, and gunpowder; it has, besides, several extensive tanneries. Much trade originates here from the produce of the vines, some portion of which is converted into wine, but more into brandy and vinegar; and Metz is celebrated for the preparation of various kinds of confectionary. It is encircled by hills, covered from the bottom to the top with fruit-gardens and vineyards. The vineyards are mostly in small divisions, and principally cultivated by small proprietors, who are extremely poor, and almost all involved in debt to the capitalists of the city, who take from them their wine, brandy, and vinegar as soon as it is made." (*Jacob's View of the Agric. of Germany*, &c., 426-428.)

The royal gunpowder factory, on an island in the Moselle, near the city, is superior to most others in the kingdom. Metz has also a royal cannon foundry, a saltpetre refinery, and produces leather, cotton yarn, military and other hats, umbrellas, beet-root sugar, chlorey, nells, and other articles of hardware, cutlery, buttons, glue, &c.

This is a very ancient city. It still possesses several ruins belonging to the Roman period, among which are the remains of an aqueduct, that appears to have conveyed water to a *naumachium* near the S. extremity of the city. The site of the latter is now occupied by outworks belonging to the fortifications. Parts of an amphitheatre and of a Roman palace are still traceable in the city. It suffered considerably, about anno 70, from some excesses of the

MEUSE.

troops of Vitellius (*Taciti Hist.*, lib. I., cap. 73), and was nearly destroyed by the savage barbarism of Attila in 452. It had, however, recovered a large portion of its former prosperity in the middle ages, and became the capital of the kingdom of Austrasia. From the 11th century to 1552, when it was taken by Henry II., it was an independent flourishing city. In the same year that it was taken by Henry, it was besieged by the emperor Charles V., with an army of 100,000 men, but the Duke of Guise successfully defended the town, and Charles was obliged to relinquish the siege. It was finally annexed to the French crown by the treaty of Westphalia, in 1648. (*Hugo, art. Moselle; Guide du Voyageur*, &c.)

MEURTHE, a dep. of France, reg. N.E., formerly part of the prov. of Lorraine, between lat. 49° 30' and 49° N., and long. 5° 40' and 7° 30' E., having N. the dep. Moselle, E. Bas Rhin, S. Vosges, and W. Meuse. Length, E. to W., 74 m.; average breadth, about 35 m. Area, 606,933 hectares. Population, in 1836, 494,366. The Vosges mountains run through the E. part of the dep., the surface of which is mostly covered with their ramifications, though these rise to no great elevation. The dep. belongs almost wholly to the basin of the Moselle, which river intersects it W. part from S. to N., and is joined, within its limits, by the Meurthe. The latter rises in the dep. Vosges, runs generally in a N.W. direction, and after a course of between 70 and 80 m., unites with the Moselle about 5 m. below Nancy, to which it is navigable. Besides Nancy, St. Die and Lunéville are on its banks; and it receives the Mortagne, Venouse, and Meuzelle. The Seltz and Sarre are the other chief rivers of the dep. There are numerous small lakes, one of which occupies an area of 632 hectares. In 1834, it was estimated that 303,636 hectares of the surface were arable, 71,851 in pasture, 16,371 in vineyards, 116,309 in woods, and 6236 in orchards, &c. The land is very unequal in point of fertility, and is very indifferently farmed; but more corn is grown than is required for home consumption. The total produce of the harvest of 1835, was estimated at 3,434,500 hectolitres, chiefly wheat and oats: in the same year, the crop of potatoes was estimated at 2,142,000 hectolitres. Before the revolution, the culture of the vine was limited to the declivities of hills with a southern aspect; but its culture has since been very much extended, the quality of the produce being less regarded than the quantity. About 550,000 hectolitres of wine are supposed to be produced annually, of which the greater part is consumed in the dep. The wines are generally inferior, though the growths of Pagny, Thiaucourt, Arnaville, Bandonville, and others, may be classed among the secondary qualities of *vins ordinaires*. (*Julien, Topographie*, p. 48.) Dried plums and preserved apricots form important articles of commerce; and the forests, which are more extensive than in most depts., furnish a good deal of timber. The pastures are naturally good, but receive little attention from the farmer. In 1830, there were estimated to be 84,000 head of black cattle, and 167,000 sheep, in the dep., but both are of indifferent quality. The breed of horses has been improved by the fine stud of Rosières. Hogs of an improved breed are numerous, and their flesh and lard are sent to distant parts of France. A great many poultry are reared. Property is much subdivided. In 1835, of 171,062 properties subject to the *contribution foncière*, 100,343 were assessed at less than five francs, and 24,437 at from five to 10 francs. Turf and lime are among the chief mineral products; there are some quarries of marble and alabaster, and a few iron mines: but the latter have been abandoned. The salt mines and springs at Dieuze, Vic. Moyenvic, &c., yield about 45,000,000 kilogrammes of salt, and 1,000,000 do. of soda a year. About 23,000 hands are said to be employed in the manufactures of cotton cloth and yarn, woollen stuffs, glass, and earthenware, and in embroidery, dyeing cotton stuffs, tanning, &c. At Baccarat is a large glass manufactory, employing a great many hands.

Meurthe is divided into five arrondis: chief towns, Nancy the cap., Toul, Château Salins, Barrebourg, and Lunéville. It sends six members to the chamber of deputies. Number of electors, in 1838-39, 1219. Total public revenue, in 1831, 16,794,362 francs. (*Hugo, art. Meurthe; Official Tables*.)

MEUSE, a dep. of France, reg. N.E., formerly part of the province of Lorraine, chiefly between lat. 49° 25' N., and 49° 35' N., and long. 5° and 6° E.; having N. Dutch Luxembourg and the depts. Ardennes and Moselle, E. Moselle and Meurthe, S. Vosges and Haute Marne, and W. Marne and Ardennes. Length, N. to S., 80 m.; greatest breadth, about 40 m. Area, 620,555 hectares. Population, in 1836, 314,588. Surface generally hilly, the hills being ramifications of the Vosges and Fancilles mountains, with an average height of from 1000 to 1300 feet, though they sometimes reach an elevation of 1600 feet. The Meuse traverses the dep. in its entire length; the other principal rivers are the Orain, Chiers, and Aire. The plateau, in the E., separating the basins of the Meuse and the Moselle, and other

* There is some discrepancy in the authorities as to these measures; but the above must be nearly accurate.

MEXICO.

portions of the surface, are not very productive; but there are, notwithstanding, about 225,000 hectares of rich soil in the dep., chiefly in the valleys of the Meuse and Ornain. In 1834, according to the official tables, 335,190 hectares were arable, 49,473 do. in meadows, 13,540 do. in vineyards, 7387 do. in orchards, &c., and 137,755 do. in woods. The produce of corn in 1835 was estimated at 2,440,000 hectolitres, of which 1,192,000 were wheat. Potatoes, oleaginous plants, hemp, and flax, are among the other articles of culture. Gooseberries are extensively cultivated in the gardens round Bar-le-Duc, and enter largely into the confectionary, for which those towns are celebrated. The produce of wine is estimated at about 400,000 hectolitres a year. The wines of Bar-le-Duc, Bussey-la-Côte, Preuilly, Ligny, &c., are delicate light wines, ranking in the first class of *vins ordinaires*; but they do not keep above two years, and do not bear carriage. (*Jullien*, 43.) Along the Meuse are rich pasture lands; and at Vold, cheese, similar to that of Gruyère, and excellent butter, are made. A good many cattle and sheep are reared in the dep.; but live stock is in general indifferent. The produce of wool is estimated at upwards of 140,000 kilogrammes a year. In 1835, of 137,180 properties subject to the *contribution foncière*, 39,586 were assessed at less than five francs, and 52,160 at from five to 10 francs. Iron, slates, and good building-stone, are the chief mineral products. There are between 30 and 30 iron furnaces (*hauts fourneaux*) in the dep.; and the establishments at Thounelle and Stenay produce each about 1,500,000 kilogrammes of iron a year. About 500,000 kilogrammes a year of cotton yarn are made at Bar-le-Duc, which, also, has fabrics of paper, glue, &c., and is the entrepôt of a large trade in timber from the forests of the dep. There are numerous glass-works, with lime-kilns, potteries, beet-root sugar factories, &c. Many working cutlers, shoemakers, and other artisans, emigrate for a part of the year from this into other parts of France, and even to the adjacent foreign countries, with the products of their industry, or in search of employment. Meuse is subdivided into four arrondis; chief towns, Bar-le-Duc, the cap., Commercy, Montmédy, Verdun. It sends four members to the chamber of deputies. Number of electors, 1838-39, 1186. Total public revenue (1831) 9,071,543 francs. (*Hugo*, art. *Meuse*; *Official Tables*, &c.)

MEUSE OR MARX (Dutch *Maas*, an. *Mosa*), a river of W. Europe, flowing through the N.E. part of France, Belgium, and the S. of Holland; its basin being situated between those of the Marne and Scheldt to the W., and of the Moselle to the E. It rises in the dep. of Haute Marne, in France, 10 m. N.E. Langres, is about lat. 46° N., long. 50° E., and runs at first generally N. through the dep. of Haute Marne, Vosges, Meuse, and Ardennes. Near Charlemont it leaves France, but it continues its previous direction to Namur, where it receives the Sambre from the W. It here makes a sudden bend to the N.E., in which direction it continues through the provinces of Namur, Liege, and Limburg, to about lat. 51° 30' N. It afterwards curves to the W., flowing between N. Brabant and Guelderland; and finally at Woudrichem, in lat. 51° 40', and long. 50°, enters the Rhine or Waal, which loses its own name to assume that of the Maas. (See *RHINE*.) Its entire course may be estimated at 400 m.; nearly the half of which is in France. It is navigable for three fourths of this extent, or as far as Verdun, dep. Meuse. Its chief affluents are the Bar in France, the Lesne, Sambre, and Ourte in Belgium; and the Roer and Niers in Holland. Proceeding from its source to its mouth, the chief cities and towns on its banks are Neufchâteau, Verdun, Sedan, Mézières, Charlemont, and Givet in France; Dinant, Namur, Liege in Belgium; and Maastricht, Roermond, Venloo, and Grave in Holland, before its junction with the Rhine.

The Meuse communicates with the Aisne, and thence with the Seine and Somme by the canal of Ardennes; with the Scheldt by means of the Sambre and the Charleroy canal; and with both the Scheldt and the Rhine by the various branches of the Great North canal; in addition to which, many other canals connected with it are in progress. (See also *Belgium*, l. 316-17, 328.)

MEXICO (UNITED STATES OF), a federal republic of N. America, lying between the 15th and 33d parallels of N. lat., and 97° and 113° W. long., being bounded N. and N.E. by the W. districts of the United States of N. America and that wild region called New California, E. by the gulf of Mexico and the Republic of Texas, S. by Guatemala, and W. and S.W. by the Pacific ocean. The line dividing Mexico from Texas commences with the river Nueces, which it follows up to its source, and then runs N. to the head of the Colorado, whence it stretches W., forming the N. boundary of the confederation. The line of separation on the side of Guatemala is very irregular, commencing E. with the river Saratón, which it follows to its source, and then takes a N. direction to lat. 17° 30' N.; it thence runs W. and S.W. to lat. 15° 45', where it assumes a N.E. course,

including the province of Chiapa. Greatest length from N.W. to S.E., 1700 m.; greatest breadth about 600 m. Area estimated at 1,230,442 sq. m. Nothing can be more satisfactory than our acquaintance with this vast country: few even of the principal towns and rivers are correctly laid down, except, indeed, within the small circle personally visited by Humboldt, so that not even the elements of a good map exist; and, with respect to population, and other statistics, the unsettled, disorderly, and almost lawless state of the country makes inquiry all but impossible. The following table has been printed in the American edition of *Murray's Encyclopedia of Geography*, and some other works, and, though little dependence can be placed on it, it is probably as near an approximation to the truth as can, at present, be arrived at:

States.	Extent in sq. m.	Pop. in 1837.	Pop. to sq. m.	Capital Cities.
Chiapas	14,750	92,000	4.9	Ciudad de los Rios.
Chihuahua	107,600	190,000	1.8	Chihuahua.
Cobahulla	193,800	90,000	0.5	Saltillo.
Durango	54,400	120,000	2.2	Victoria.
Guatemala	8,800	500,000	66.5	Guatemala.
Mexico	36,450	1,400,000	48.3	Tenacua.
Michoacan	22,480	400,000	30.5	Valledad.
New Leon	31,000	100,000	3.2	Monterrey.
Oaxaca	32,800	600,000	20.2	Oaxaca.
Puebla	18,440	900,000	49.0	La Puebla.
Querétaro	7,500	100,000	13.3	Querétaro.
San Luis Potosi	19,000	300,000	15.8	S. Luis Potosi.
Rosera and Sinaloa	254,700	200,000	1.1	Villa del Fuerte.
Tabasco	14,470	75,000	5.1	Villa Hermosa.
Tamaulipas, or New				
barranca	25,100	168,000	4.2	New Santander.
Veracruz	37,800	180,000	4.8	Xalapa.
Yucatan	70,000	670,000	19.4	Merida.
Zacatecas	78,500	570,000	7.2	Zacatecas.
Federal district		208,000		Mexico.
Total of States	1,030,442	7,557,000	7.3	
Territories.				
New Mexico	260,000	70,000	3.7	Santa Fe.
Calima		40,000		Calima.
Tlaxcala		700,000		Tlaxcala.
Total	1,230,442	7,728,000	6.3	

The most populous cities are Mexico (1,500,000), Guadalajara (60,000), San Luis Potosi and La Puebla (55,000 each), Oaxaca and Querétaro (40,000 each), Guanajuato (34,000), and Merida (28,000).

Of this great tract of country, which is about one third as large as Europe, the portion lying S. of the tropic of Cancer, and comprising a large part of the long and narrow isthmus that connects the American peninsula, and separates the Atlantic from the Pacific ocean, is by far the most populous and rich, both in mineral and vegetable productions; and nearly all the information gained respecting Mexico has been collected in that part, to which, consequently, it is primarily applicable. The regions N. of the tropic become less populous as we proceed northward; and many large districts claimed by the republic, and divided into states and territories, are almost unknown, being inhabited only by wild Indian tribes, baffling all the attempts of their nominal masters to civilize or subdue them.

The surface of Mexico is extremely varied; and to this circumstance, nearly as much as to the difference of latitude in so extensive a country, may be attributed that singular variety of climate by which it is distinguished from most other regions. The Cordillera, or chain of mountains generally regarded as a portion of the great chain of the Andes, that enters Mexico on the S., where it borders with Guatemala, diverges, as it proceeds N., into two great arms, like the upper part of the letter Y, following the line of the coast on either side. The most westerly of these chains, or that parallel to the shores of the Pacific ocean, has some very high summits; and preserves its mountainous character till it joins, on the border of the United States, with the Oregon, or Rocky mountains. The other, or eastern arm of the Cordillera, begins to subside after reaching the 21st or 23d degree of latitude, and ultimately subsides about the 26th or 27th degree of latitude, into the vast plains of Texas. Now, the whole of the vast tract of country between these two great arms, comprising about three fifths of the entire surface of the republic, consists of a central table-land, called the Plateau of Anahuac, elevated from 6000 to upwards of 8000 feet above the level of the sea! Hence, though a large portion of this plateau be within the limits of the torrid zone, it enjoys a temperate climate; inclining, indeed, more to cold than to excess of heat. Some very high mountains are dispersed over the surface of the central table-land; and it is also traversed in parts by pretty well defined ridges, which divide it into extensive sub-plateaus, to which different names have been given. But the surface is interrupted by few transverse valleys; and in some directions it is quite unbroken, either by depressions or by hills. Thus, it is mentioned by Humboldt, that carriages proceed from the capital, in the centre of the plateau, to Santa Fe, in New

MEXICO.

Mexico, a distance of 1400 m., without any important deviation from an apparent level. (*Essai sur la Nouvelle Espagne*, I., 254.) The most remarkable tract in this elevated region is the plain of Tenochtitlan (in which is the capital), surrounded by ridges of porphyritic and basaltic rocks, running S.E. and N.N.W. It is of an oval form, 55 m. long and 37 m. broad, occupying an area of 1700 sq. m., of which about 160 sq. m. are covered with water. Its S.E. side is that most elevated, and here are seen towering above the plain the volcanoes of Popocatepetl 17,716 feet, Iztacchuatl 15,700 feet, Citlalpetl or Orizaba 17,360 feet, and Nauhcampetl or the Cope de Perote 13,416 feet above the sea. The waters of the valley are deposited in five principal lakes situated on different levels: that of Tezcuco, which is near the centre of the valley, and covers 70 sq. m., is the least elevated. Farther N. are the lakes of St. Christoval and Tonalila: while S. is the lake Chalco, occupying an area of 50 sq. m.; and these three are five feet higher than lake Tezcuco. The most elevated, however, of the whole, though the smallest, is the lake Zimapano, the level of which is 30 feet above that of Tezcuco. These lakes are fed by small rivers, and having no natural outlet, are drained by the Desague of Huchuetoca, an artificial canal cut through the rock, 12 m. in length, 150 feet deep, and 300 feet wide; having its embouchure in the river Panuco, which flows into the gulf of Mexico. This great work, completed in 1789, at an expense of £1,502,000, was undertaken to obviate the frequent inundations, some of which did great damage to the capital. The water of lake Tezcuco is salt, that of the rest is fresh; but from those to the S. sulphuretted hydrogen gas is copiously disengaged, the smell of which is often perceptible at Mexico.

Besides the volcanoes already noticed, those of Tuxtla, Jorullo, and Colima, in the table-land, are at present in a state of activity, and there are several others now extinct. Jorullo, which stands W. of the city of Mexico, first broke out in 1759: when a tract of ground, from 3 to 4 m. square, swelled up like an inflated bladder, emitting flames and fragments of rock through a thousand apertures. These active volcanoes seem to be connected with others parallel to them, and obviously of similar origin. Earthquakes are frequent in Mexico, but they seldom do much mischief.

The geological formation of the Mexican Cordilleras differs considerably from that of the great mountains of Europe and Asia, in which granite is overlaid by gneiss, mica, and clay-slate; for here we seldom meet with granite, as it is covered with porphyry, greenstone, amygdaloid, basalt, obsidian, and other rocks of igneous origin. Granite, however, appears on the surface in the chain bordering the Pacific, and the port of Acapulco is a natural excavation in that species of rock. The great central plateau of Anahuac, between lat. 14° and 20° N., is a mass of porphyry, characterized by the constant presence of hornblende, and the entire absence of quartz; and in it are contained large and valuable deposits of gold and silver. These ores, however, are found in various rocks: in the mines of Comanja rich veins of silver occur in syenite; in those of Guanajuato, which are the richest in Mexico, the metal lies in a primitive clay-slate passing into talc-slate; and those of Real del Cardenal, Xacala, and Lomo del Toro are situated in a bed of transition limestone. Humboldt says that there were, at the time of his visit, 3000 mines of gold and silver in Mexico; but the ignorance and misrule which prevail in the country have greatly diminished their importance as a source of wealth.

Rivers.—Mexico suffers serious disadvantages from the want of water, and the rivers, as compared with the extent of territory, are few and unimportant. The Rio Grande del Norte, indeed, has a course of more than 1300 m., and the Colorado runs about 700 m. into the gulf of Mexico. The Rio Grande de Santiago, called by the natives Tototlan, rises in the centre of Mexico, not far from the capital, and, after traversing the lake Chapala, falls into the Pacific at Naa Biaz. The Balsas, or Zacatula, and the Yopez, are the only other rivers on the W. side of the plateau, and on the E. side are the Tula and Tampico and the Tabasco, flowing into the gulf of Mexico; but they have bars at their mouths, which prevent the entrance of large vessels. The other rivers are short, and might more properly be called torrents. The lakes are numerous and extensive; and the principal, besides those in the plateau of Tenochtitlan, already mentioned, are Chapala, in Xalisco, which, according to Humboldt, covers an area of 1300 sq. m.; Pascuara in Michoacan, Mexitlan, Cayman, and Parras, the last two being in the tract called the Bolson de Mapimi.

Climate.—The temperature and climate of Mexico is, of course, extremely various; owing, not only to its great extent from N. to S., but also to the rapidity of the slope both on the E. and W. side. The climates, especially on the E. side, are more distinctly marked by the vegetation. On the ascent from Vera Cruz, says Humboldt, climates succeed each other in la ers; and the traveller passes in review, in

the course of two days, the whole scale of vegetation, from the parasitic plants of the tropics to the pines of the arctic regions. (*Essai Pol. sur le Nouv. Espagne*, I., 370-389.)

Mexico is divided, as respects climate, into the *tierras calientes*, or hot regions, the *tierras templadas*, or temperate regions, and the *tierras frias*, or cold regions. The first, or the *tierras calientes*, include the low grounds, or those under 2000 feet of elevation, on its E. and W. coasts, comprising the greater part of the states of Tlaxmalhuca, Vera Cruz, Tabasco, and the peninsula of Yucatan, on the former. The *tierras calientes*, on the W. coast, are less extensive, the eastern arm of the Cordillera approaching nearer to the sea. The mean temperature of this region, or, at least, of that portion of it between the tropics, may be estimated at about 77° Fahr., being from 14° to 16° above the mean temperature of Naples. It is especially suited for the growth and cultivation of sugar, indigo, cotton, and bananas, which flourish in the utmost luxuriance.

This region labours under the serious disadvantage of being nearly inaccessible by sea for half the year, and of being extremely unhealthy during the other half. The winter, on the E. coast, extends from about October to the vernal equinox; and during this season, in the gulf of Mexico, N. or N.W. winds (*los nortes*) are extremely prevalent, blowing with more or less violence. Frequently, especially in the month of March, the N. winds approach to the strength of a hurricane, and continue to blow with the utmost violence, and without intermission, for three, and, sometimes, even for 10 or 12 days together. During the whole of this season the navigation of the gulf is exceedingly dangerous; but on shore the heat is moderate, and the coast free from fever and tolerably healthy. Unluckily, however, it so happens, that during the other half of the year, or from the vernal equinox to October, when the N. winds are comparatively rare, and the ports are easily accessible, the heat is oppressive, a great quantity of rain falls, and the coast becomes the seat of pestilential fevers. A European arriving for the first time at Vera Cruz, or any other part of the coast between the tropics, in August, September, or October, has but little chance of escaping the *vomito prieto*, or yellow fever; and individuals who have merely landed at Vera Cruz, and posted on immediately for Xalapa, have, notwithstanding, caught the infection. The scourge, however, does not extend its ravages beyond the low grounds on the sea-coast; and at the height of 2000 or 2500 feet above the sea it is wholly unknown. The ports of Acapulco and the low grounds along the W. coast are also extremely hot and unhealthy; and, owing to the prevalence of strong gales, approaching to hurricanes, during the months of July, August, September, and down to October, the navigation is then extremely dangerous.

The *tierras templadas*, or temperate regions, which are of comparatively limited extent, occupy the slope of the mountain chains, or barriers, which bound, on either side, the central table-land. It extends from about 2500 to about 5000 feet of elevation. The mean heat of the year is from 66° to 70° Fahr., and the extremes of heat and cold are here equally unknown. The Mexican oak, and most of the fruits and cereals of Europe, flourish in this genial climate. The cities of Xalapa, on the E., and of Chilpancingo, on the S.W. slope, are in this region, and are famous for their salubrity and for the abundance of their fruit trees. The frequency of fogs, and the consequent humidity of the atmosphere, is the greatest drawback on the climate of the *tierras templadas*; but this, how injurious soever in some respects, produces great beauty and strength of vegetation.

The *tierras frias*, or cold regions, include all the vast plains elevated 5000 feet and upward above the level of the sea. In the city of Mexico, at an elevation of 7400 feet, the thermometer has sometimes fallen below the freezing point. This, however, is a rare occurrence, and the winters there usually as mild as in Naples. In the coldest season the mean heat of the day varies from 55° to 70° Fahr.; while in summer the thermometer seldom rises in the shade above 75°. The mean temperature of the city is about 64° and that of the table-land generally may be taken at about 62°, being nearly equal to that of Rome. But whenever the table-land rises to more than 8000 feet above the sea, it has, though between the tropics, a rude and disagreeable climate. Under the parallel of Mexico the limit of perpetual snow varies from about 12 to near 15,000 feet. Vegetation in the central plateau is not owing to the rarity of the air, so vigorous as on the *tierras calientes*, or along the coasts, and the plants of Europe do not succeed so well as in their native soil. In the tropical and central region of Mexico, and as far N. as lat. 26°, there are only two seasons; that of the rains, lasting from July to the middle of September; and the dry season, continuing from October to the end of May. From the 24th to the 30th parallel the rain falls less frequently; but this deficiency is compensated by the abundance of snow during January and February.

MEXICO.

The climate of the table-land is, on the whole, favourable to human life. But, though intermittent fevers be of rare occurrence, the natives are occasionally visited by a peculiar epidemic, called by them the *matlazahuatl*; but it owes its origin more to the habits of the people than any other cause. Indeed, famine, and its concomitant privations, have thinned the population more than epidemic complaints. The indolence of the natives prevents all exertions to raise more food than requisite for the wants of a single ordinary season; and no one ever thinks, when there is a surplus, of laying up a stock against future contingencies. Hence, when droughts and severe frosts occur, they are compelled to seek their subsistence in the forests, where roots and wild berries constitute their sole diet; and multitudes are often carried off by hunger and unwholesome food.

Animals.—The zoology of Mexico is but imperfectly known. The domestic animals introduced by the Spaniards have so much increased, that vast herds range wild through these thinly inhabited regions. The wool of the sheep is of inferior quality; but this is attributable more to neglect and mismanagement than to nature: mules are much used in the mining districts. Buffaloes abound in the prairies bordering on the Arkansas and Red river, and during winter they migrate westward, in quest of pasturage, to the milder climate of the plains along the lower part of the Rio Grande del Norte. Carnivorous animals are not numerous. Bees abound in the low country of Yucatan.

Agriculture.—Mexico, not only from its extent through 21 degrees of latitude, but also from the varying elevation of its surface, and consequent variety of climate, produces most of the plants peculiar to the tropics, as well as those belonging to the temperate regions of S. and middle Europe. "Indeed," says Humboldt, "there is scarcely a plant in the rest of the world which is not susceptible of cultivation in one or other part of Mexico; nor would it be an easy matter for the botanist to obtain even a tolerable acquaintance with the multitudes of plants scattered over the mountains, or crowded together in the vast forests at the foot of the Cordilleras." (*Essai*, tom. ii., p. 370.) The soil also is, in most parts, extraordinarily fertile; and wherever water can be procured for irrigation, the most abundant crops may be raised with very little labour. This, however, is very far, indeed, from being an unmix'd advantage; and it is, in fact, more than doubtful whether a very fertile soil and a genial climate, that makes warm clothing and comfortable lodgings of comparatively little importance, be consistent either with active industry and exertion or with a high state of civilisation. In most parts of Europe continuous industry is indispensable to existence; but it is otherwise in Mexico and many other countries, and it is found that industry is uniformly proportioned to the strength of the motives by which it is occasioned, and that, wherever the ordinary necessities and comforts of life may be procured with little labour, the mass of the people are invariably indolent. To suppose, indeed, that they should be otherwise, is to suppose what is contradictory and absurd. This effect of the peculiar nature of the soil and climate was less sensible in Mexico under the Spanish government, because it was then daily receiving adventurers from Europe, imbued with European notions, and anxious to accumulate a fortune. But now that the influx of such parties has nearly ceased, and that there are no such extrinsic and adventitious motives to prompt to activity and enterprise, everything appears to be falling into a state of apathy and languor; and indolence, with its necessary accompaniments of poverty, ignorance, and pride, bid fair to be, for a lengthened period, the distinguishing characteristics of the Mexicans.

We have stated, under the head of climate, how the more useful plants are distributed through the zones into which the country is divided. The banana, which flourishes up to the point where the mean temperature is 75° Fahrenheit, bears the same relations to the Mexicans, in the lower provinces, that the various cerealia bear to the inhabitants of Europe and W. Asia, and the different kinds of rice to the Bengalees and Chinese. About 450,000 sq. m. in the *tierras calientes* are said by Humboldt to be adapted for its cultivation. It is propagated by cuttings; and there is probably no other plant which produces on the same extent of land, and with so little labour, so great a quantity of food. Humboldt affirms that ½ hectare (about an acre) of land, planted with bananas, will furnish food for more than 50 individuals; whereas the same extent of land, if sown with wheat, in Europe, would not support more than two individuals! And all the labour required to raise this enormous produce is to cut off the stems when the fruit is ripe, and to give the earth a slight digging about the roots of the plant once or twice a year. Hence, says Humboldt, nothing strikes an European recently arrived in Mexico with more astonishment than the smallness of the patches of cultivated ground round cabins that swarm with children. It cannot be said of such a country;—

*Platanum
Colombi hand faciliem esse vram velut.*

But the ease with which subsistence may be procured, and the fewness of their wants, have made the natives in the last degree slothful. Indeed, Humboldt tells us that it has been gravely proposed, in order to stimulate their industry, and rouse their torpid faculties, to grub up and destroy the banana plantations! (*Essai*, &c., li., 226.) Such a project is, of course, impracticable and absurd; but the nature of the proposed remedy serves, at all events, to show the violence of the disease.

The same parts of the country which produce the banana produce also the casava, or manioc, the farina of which yields a very nourishing bread: It requires more care than the banana, somewhat resembles the potato, and arrives at maturity about eight months after the slips have been planted. The culture of maize is scarcely less important in the *tierras calientes* than that of the plant before named; it is not confined, however, to the low lands, but ascends as high even as the plain of Toluca (9100 ft. above the sea), the lowest average temperature favourable to its growth being about 46° Fahr. The plant, under favourable circumstances, rises to the height of 7 or 8 ft., and the returns, in common years, are most abundant; but they are more uncertain than those of any other kind of grain. Maize is the principal food of the people, as well as of most domestic animals; and a deficient harvest, whether from want of rain, or excess of cold, produces a general famine, and compels great numbers of the rural population to seek the deserts in search of wild plants.

There can be no doubt, however, that if agriculture were pursued with any spirit, and the system of irrigation generally introduced on corn lands, or even if there was the slightest degree of providence in the natives, these deaths would not occur that on several occasions have been so fatal, especially in the mining districts. The European cerealia, such as wheat, barley, &c., succeed best in the temperate regions, where the mean heat does not exceed 60° Fahrenheit: in fact, in the equinoctial regions of Mexico, these grains are not found under the level of 5300 ft. above the sea. The Mexican wheat is of excellent quality, equal, says Humboldt, to the best of the Andeanists: it is large, white, and nutritive. In well irrigated lands, and on good soils, the produce is said to average 34 fr.; but, since the revolution, this necessary branch of agriculture has been much neglected. Rye and barley would sell better than wheat, and are cultivated in the highest regions; barley yielding abundant harvests, even where the thermometer indicates a heat during the day of only 57°. Oats are little cultivated. Among the other alimentary plants, most of which have been introduced by the Europeans, are the potato (confined chiefly to the table-land), the yam, common both to the high and low country, the cassava, raised in immense quantities for its spice, which is universally used instead of salt for seasoning food, beans, and various other garden vegetables common to Europe and America. Most of the fruits of Europe are common and plentiful; the olive and vine, introduced since the revolution, generally succeed well; and nowhere are there finer pine-apples, pomegranates, guavas, alligator pears, &c. One of the most valuable plants in the country is the *maquey* (*Agave Americana*), which Humboldt not inaptly terms the vine of Mexico. The *maquey* plantations are principally found in the states of La Puebla, Mexico, and Coahuila; but the plant is very hardy, and occurs in a wild state all over the country. Its growth is slow; but when matured at maturity, its leaves are from 5 to 8 ft. in length, and the stem often attains the height of 30 or even 30 ft. Its period of flowering is very uncertain, but once in 10 years may be considered a fair average. At the flowering season, when the plant first begins to be useful, the exact time is watched when the stem of the flower is about to shoot up; the sap is then cut off, so as to form a hollow, for the reception of the sap, which is regularly drawn off; and a vigorous plant will yield 15 quartillos daily for four or five months successively. The sap, which has a slight acid-pungent taste, ferments readily in three or four days, being in its vinous state, called *pulque*, a beverage which somewhat resembles cider, though with a disagreeable smell. Immense quantities of it are drunk by all classes, and many whites as well as Indians use no other liquor. A kind of brandy, called *mezcal* (very like whiskey), is made from the distillation of pulque. The *maquey* is useful, also, in many other ways: its fibres are converted into thread ropes and paper, its prickles serve for pins and needles, and its juice is effective in healing green wounds. Large quantities of sugar are raised in the neighbourhood of the capital, and the crops are very abundant: the lands are cultivated by free labourers, and the farming seems pretty good, though the process of refining is very clumsily conducted. In the commencement of the present century there was a large export of sugar; but this has for some years wholly dis-

MEXICO.

peared, and the present supply is barely sufficient for the home consumption. Vanilla is extensively raised in the *tierras calientes*, E. of the Cordilleras, particularly in the state of Oaxaca. The cultivation of coffee is on the increase, and the quality of that raised on the best soil near the coast is said to be equal to the best produced anywhere else. Tobacco is a government monopoly, and its growth is confined to a small district near Orizava and Cordova. Its quality is inferior to that of Cuba; and, as the consumption exceeds the growth, considerable quantities are imported from the Havannah.

On the whole, it might be fairly concluded, on general grounds, that agriculture in Mexico must have retrograded since the revolution. And such, in point of fact, has been the case, and to an extent that we should hardly have conceived possible. This is evident from the following statement by M. Chevalier*, who visited Mexico in 1835. "Agriculture," says he, "is neglected. No law, indeed, prevents the planting of the vine and olive tree; not only, however, has no advantage been taken of this change, but the very lands which were cultivated in the time of the Spaniards are now lying fallow. In a circle of a few leagues round Mexico, I have seen large villages almost abandoned. In this delightful climate, the only manure which the land ever requires, is water; this is rather scarce, yet many of the hydraulic constructions raised by the Spaniards at a great cost, are in ruins, and seem likely to remain so. The lands which, by means of this artificial irrigation, were the most fertile in the world, are gradually becoming completely sterile. Their ploughs, and other agricultural instruments, are of the rudest description. No one troubles himself to introduce European improvements, or even to import better tools from the United States. I made the passage from New-Orleans to Vera Cruz with General Arista, who had been exiled in consequence of some insurrection or other in which he was concerned. Wearied with the chances of revolutions, he had determined to devote himself to agriculture. He had scarcely, however, landed at Vera Cruz, when he was thrown into prison, under some vague pretext. He still continues under arrest, and his ploughs, harrows, and winnowing machines, remain under sequestration, suspected, probably, of abetting the general in some subversive designs."

Mining Industry.—The silver and gold mines of Mexico have always been deemed the main sources of its wealth; and, unquestionably, its mineral riches far exceed those of any part of America, except, perhaps, Peru. Before the war of independence, there were, in the 37 mining districts of New-Spain, somewhat more than 3,000 mines, producing annually about 21,000,000 dollars in silver, and about 2,000,000 in gold. Towards the close of the struggle, many of the mines had been deserted, and their produce had declined a half, and does not yet materially exceed that amount. Several of the so-called companies, formed in Great Britain for working the Mexican mines, during the memorable, and we may add, disgraceful era of 1824-26, were mere swindling engines, and fell to pieces in a very short while. There were others, certainly, that had a more solid foundation; but these were mostly gone into without due consideration, and without any practical knowledge of the country, of the practices that had been followed, and the difficulties to be overcome. We need not, therefore, be surprised at the enormous losses the companies sustained at the outset, and of their want of success in the first instance. But, had the Mexican government been able and willing to repress disorder, and to enforce the observance of contracts, it is probable that the produce of the mines would have been very different at this moment from what it really is. Unluckily, however, no government has yet been established in Mexico with power, even if it had the desire, sufficient to put down disturbances, or to enforce engagements. So long, indeed, as the companies were struggling to put their mines in order, they sustained comparatively little inconvenience from this circumstance; but, as soon as they had succeeded in bringing them once more into a productive state, and were beginning to have some prospect of a return for their enormous outlays, they were annoyed by questions as to title, and by the setting up of claims on the mines, of which they had never heard before. Owing to these causes, as well as the general insecurity of property, the bad condition of the roads, and imperfect mining processes, the results have, on the whole, been very unfavourable, notwithstanding the reduction of the export duty on specie from 10 to 3 per cent.

The following statement of M. Chevalier, as to the insecurity of the miners, in 1835, discovers a state of things

disgraceful to the government; and such indeed as could hardly have been credited upon any inferior authority. "How," asks he, "can the mines be worked with any feeling of security, when it requires a little army to escort the smallest portion of the precious metal to its place of destination? Between the mine of Real del Monte and the village of Tezeyuco is a mountain pass, where a grand battle was fought between the miners and the banditti of the country. The former were defeated, overpowered by numbers; but not without having sold their lives as dearly as possible. The mine is now guarded by artillery and grape-shot, and the Englishmen employed there are regularly drilled in the use of the musket." In such a state of things, the wonder is, not that the produce of the mines has declined, but that it continues to be so great as we find it to be. The mineral riches of the country are, however, inexhaustible; and there wants only a government able and willing to afford security, to make the produce of the mines greater than ever. The subjoined statement, which cannot, however, be altogether depended on, exhibits an

Account of the number of dollars coined at the different mints of Mexico during each of the four years ending with 1837; the proportion of gold to silver being as 1 to 23, nearly:—

Mines	1834.	1835.	1836.	1837.
Mexico	852,000	847,143	754,130	656,422
Guanaxuato	2,705,000	2,607,081	2,511,972	2,608,021
Zacatecas	5,527,000	6,154,900	5,459,579	5,454,253
Guadalajara	715,000	642,250	583,731	579,601
Durango	1,215,000	1,227,965	1,224,715	925,060
San L. Potosi	929,000	1,393,206	1,099,142	1,110,777
Chihuahua	-	-	294,475	325,162
Total	12,940,000	14,609,134	14,269,492	11,816,302

The theory of mining is little understood by the Mexicans, the oldest modes of working being still generally practised, notwithstanding the improvements that have been introduced by the English; and the machinery for draining the mines and raising the ore is of the most primitive description. Indeed, many of the mines have been abandoned, owing to the imperfections of the machinery, which, under more favourable circumstances, might be again worked with profit. The ignorance of the miners is only equalled by their obstinate adherence to old, and elsewhere long exploded, practices. But this should not be matter of surprise, if the testimony of M. Chevalier respecting the education of engineers may be depended on. The school of mines (*Mineria*), the mere building of which cost 120,000*l.*, is at present in the most pitiable condition, although the learned Andres del Rio is still one of the professors. It is unprovided with the means even of the most elementary instruction. It contains a vast chemical laboratory, but without the instruments requisite for the most simple experiments. The collection of minerals is in disorder, badly classed, and very incomplete; the library and the mechanical cabinet are deplorable. The school seems also to have shared the fate of the public treasury—of having been pillaged three or four times over. The very building seems on the point of falling to pieces—an appropriate emblem of the Mexican Republic. But it cannot surely be supposed that the anarchy which has led to such deplorable results is to continue forever. If nothing may be hoped for from within, it is to be wished that foreign interference may rescue this fine country from the barbarism in which it is now involved.

The quantity of silver annually extracted from the mines of Mexico very much exceeds that furnished by all the mines of Europe; but, on the other hand, the gold is not much more abundant than in Hungary and Transylvania; the proportion which the gold of Mexico bears to the silver being as 1 to 23, nearly. Little native silver is found in any of the mines; sulphuretted and black prismatic silver is both very common and exceedingly productive in the veins of Guanaxuato and Zacatecas, two of the richest mining districts: the murate abounds in the mines of Catorce and San Pedro, near San Luis de Potosi; and the martial pyrites of Pachuca yield three marks to the hundred weight. The Mexican ore, however, is poorer than that of Europe, 1000 oz. of ore yielding only about 4 oz. of silver. The gold is produced by washing the earth and sand in some few places; but in the province of Oaxaca occur veins of native gold, usually mingled with the silver veins: the returns, however, seldom exceed $\frac{1}{4}$ oz. to the cwt. (*Poinsett's Notes on Mexico*, p. 226.) Slave labour is not tolerated in the mines; but it would be difficult to find workmen so ignorant, brutalized, and wholly worthless, as the native miners. Indeed, the ill success of the English mining companies is owing, in part at least, to the want of honest and efficient labourers. The business of the mines is followed by the native tribes from generation to generation: they lead a migratory life; removing, with their families, to districts where they expect the greatest profit from their labour: they are always paid by a share

* The promised work of this able and intelligent traveller on Mexico has not yet appeared. We have borrowed the following extracts from letters addressed by M. Chevalier to his friends in France, that were published at the time in the Paris journals. The information they contain is by far the most important that has appeared respecting Mexico since the publication of Humboldt's work.

MEXICO.

in the produce; regular wages, however high, being invariably rejected. The principal mines are in the states of Guanajuato, Zacatecas, San Luis Potosí, Chihuahua, Durango, Guadalajara, and Mexico. The richest mineral tract lies between the 21st and 25th parallels of N. lat. Many of the mines have been very imperfectly wrought; and by far the larger part of the richest veins is yet unexplored. It is worthy of remark, also, that the ores appear to increase in richness on proceeding N. The mines in the confines of Durango and Sonora are peculiarly rich, lie near the surface, and hold out, wherever they have been tried, a promise of riches superior to any that Mexico has yet produced.

Iron is found in great abundance in Guadalajara, Mechoacan, and Zacatecas; but no mines of that metal were worked before 1825. Copper is raised in Mechoacan and Guanajuato. Large quantities of copper money have been coined in the mint in the city of Mexico, the total value, during the seven years ending with 1837, having amounted to 4,712,000 dollars, or 943,400*l*. Tin is obtained partly from mines, but principally from washings in the ravines. The lead mines, though rich, are quite neglected. Zinc, antimony, and arsenic, have been found; but neither cobalt nor manganese. A quicksilver mine is wrought in the state of Querétaro. Carbonate of soda, used for smelting the silver ore, is found in great abundance, crystallized on the surface of several lakes.

Manufactures.—The selfish policy of Old Spain, by which she endeavoured to keep her colonies as much as possible dependent on her own markets, or on supplies furnished by her, led to the enactment of laws prohibiting the rearing of silk-worms, and the cultivation of flax, and of the vine and olive. Coarse woollen and cotton fabrics, worth about 1,500,000*l*. were formerly made; but these have greatly diminished since the revolution. The system on which the cloth and other factories are conducted, is disgraceful to persons having the smallest pretensions to civilization, and is wholly subversive of all improvement. Each factory is, in fact, a prison, in which the work-people are treated with the greatest rigour, and from which there is no escape; the proprietor, instead of paying his workmen in money, supplies them with spirits, tobacco, and food, at prices fixed by himself. An intelligent German, who resided 40 years in Mexico, states, that the high walls, strong double doors, barred windows, and severe corporal punishments, common to these factories, make them as bad as the worst conducted jail in Europe. Criminals and insolvent debtors are condemned to work in the factories as a punishment. This state of things existed before the revolution, and we regret to say that it has not been at all improved by the free intercourse which the Mexicans have now for several years enjoyed with the manufacturers and capitalists of Europe and the United States. "One might," says M. Chevalier, "have supposed that when the ports were thrown open to the commerce of Europe, manufactures would soon have been established in a country where manual labour is cheap, where the workmen are submissive, and skilful at imitation, where the soil produces the raw cotton, where the Spaniards had multiplied their flocks of sheep to a great extent, and where the rearing of the silk-worm might be carried on with astonishing facility. The native Mexicans are, however, destitute of all spirit of enterprise, and strangers cannot attempt any permanent establishment in a country from which, during every session of congress, they are periodically threatened with expulsion. A more than ordinary display of industry would excite the jealousy of the natives; for nothing exasperates a Mexican more than to see Europeans and North-Americans growing rich before his face. A flourishing factory, established by a foreigner, would be very likely to be pillaged during the first popular tumult. Instances of the kind have already occurred. The only European manufactory existing at Mexico, is one founded by M. Dupont, a French merchant, for making *mantas*, a coarse cotton stuff much worn in the country. The looms were made at Paterson, near New-York. When the Mexicans had achieved their independence, and were organizing their government, they created a fund for the encouragement of national industry (*bancos de avis*), and endowed it with an additional duty of 2½ per cent. on foreign importations. In this way a few hundred thousand piastres were soon procured, which were expended in the vain attempt to establish manufactures. At present, the receipts for this fund are thrown into the abyss of the national deficit, which every year increases in depth, and where they are lost like a drop of water in the sea." Cigars, hats, glass, and earthenware, are produced on a large scale; but the factories are, for the most part, extremely ill-conducted. Mexican leather is very indifferent; paper is of bad quality, and exorbitantly dear: the making of cutlery and hardware is scarcely attempted, and what is done, is badly executed; the use of cast-iron and tin for culinary utensils, is almost

unknown, and a very few years ago there was only one manufacturer of watches and optical instruments in the whole of Mexico. "The Spaniards," says Chevalier, "are bad mechanicians, and no efforts of foreigners have been able to prevail on the Mexicans to deviate from the routine of their forefathers. All their tools are wretched; the common wheelbarrow even is unknown. Some merchants had imported two models, to be used in moving the bales of goods at the custom-house, but the workmen refused to make use of them."

Commerce.—An individual, looking at a map of the world, would be apt to conclude that Mexico is one of the most favourably situated countries for commerce; and, in some respects, this is true. But her trade labours, notwithstanding, under some serious disadvantages. Though washed by the Atlantic and Pacific oceans, neither of her coasts is accessible for several months of the year. On the E. coast, or that bordering the gulf of Mexico, there is not a single good harbour; and during the season when the coasts are accessible they are extremely unhealthy. Owning, also, to the rapid ascent from the shores to the interior, the construction of roads, and the transport of commodities to and from the inner provinces, is alike difficult and expensive. No doubt, however, an efficient government and an industrious people would speedily, in a great measure, overcome these obstacles to an extensive intercourse with foreigners. But Mexico has neither the one nor the other; and, at present, her trade is confined within the narrowest limits. Down to 1778, when the Spanish government relaxed the old prohibitive system, the foreign goods legally imported into Mexico comprised only a few Chinese and European manufactures; the former brought annually in one galleon of about 1400 tons, and the latter sent *once in three years* exclusively in ships chartered by government from Seville or Cadiz! On the opening of the trade in 1778, private capitalists engaged in it, and after that period, at an average of 12 years before and after, the returns for exports alone rose from 11,000,000 to 19,000,000 of dollars, the difference being chiefly in the quantity of specie. How much greater would the increase have been, if the trade had not been fettered with vexatious duties, 1. on articles of Spanish produce in the markets of Seville and Cadiz; 2. on shipping for Mexico; 3. at Vera Cruz; and, 4. with an *alcabala*, or transfer duty, at every step, from the merchant to the consumer? On the breaking out of the civil war, the ports of Tampico, Mazatlan, and San Blas were opened by the new government; and soon afterward foreign vessels were admitted into all the ports on the same terms as Spaniards. The Spanish capitalists retired to Cuba or Spain; and their places were supplied by British and American merchants, who established themselves in the interior, and supplied the inhabitants in return for dollars with manufactured goods, the superior quality and cheapness of which has, no doubt, had some influence in depressing native manufactures. The jealousy of the natives, however, and the absurd threats of the government against foreign artificers and traders, has tended to prevent their settling in the country, and engaging in any considerable undertaking, other than the mines; and the depressed state of the latter, which have always furnished the principal articles of export, has tended still farther to depress and paralyze commerce. The roads, too, instead of being improved, have been suffered to fall into a state of almost irreparable decay. In this respect, the evidence of M. Chevalier is decisive. "The splendid road which, during the domination of the Spaniards, was constructed across deserts and precipices, by the merchants of Vera Cruz, to the summit of the upper country, is a melancholy instance of the carelessness with which the public interests of the country are directed. During the war of independence, this road was cut up in various points; and, down to this day, the enfranchised Mexicans have not replaced a single stone, nor filled up a single trench, nor even cut down one of the trees, which, in the absence of any considerable traffic, and under the influence of a tropical sun, are rapidly growing up to a magnificent size in the very middle of the road. In the upper country nothing would be more easy than to open noble means of communication. The soil is naturally level; and basaltic rocks, particularly adapted for the construction of roads, are found in great abundance. But even where there are roads, the Mexicans make little use of them. They carry to a yet more extravagant length the inconceivable predilection of the Spanish race in favour of transporting their goods on the backs of animals. To expect to meet with carts and wagons: no such thing, every thing is conveyed on the backs of mules or Indians. Troops of little consumptive donkeys bring into the city parcels, not much bigger than a man's two flat shoes, the charcoal required for the culinary operations of the inhabitants. The price of every bulky article is thus increased to an enormous degree. The interior districts are as inaccessible as if they were cut off by an enemy's army, and famine frequently ensues."

MEXICO.

The following table furnishes an official account of the vessels entering the ports of Vera Cruz, Tampico, San Blas, and Mazatlan during the year 1838, with the invoice value of their cargoes, &c.

Countries.	Inward.			Outward.		
	Ships.	Tons.	Value.	Ships.	Tons.	Value.
I. Vera Cruz:			£			£
British	6	1,338	167,750	7	1,531	Port blockaded by the French, and value not stated.
British	98	1,590		19	1,308	
American	9	1,450		11	1,973	
French	5	1,153		8	2,113	
Others	2	269		2	269	
Total at Vera Cruz	44	5,879	167,750	47	7,312	
II. Tampico:						
British	25		925,198	27		1,183,938
American	16	1,300	18,500	16	1,368	800
American	90	2,239	183,400	90	2,316	287,983
Others	9	992	104,908	7	685	7,000
III. San Blas:						
British	6	970	110,808	6	970	108,600
American	3	783	70,800	3	783	17,400
Sardinian	2	492	18,900	2	492	2,800
Others	6	813	31,008	4	685	16,900
IV. Mazatlan:						
British	6	1,453	57,000	4	1,198	65,208
American	5	1,110	80,000	2	516	49,408
Others	5	2,907	78,000	4	715	1
Total	147	18,018	1,143,570	142	16,876	1,673,681

The above statement, though not complete, shows the comparative trade of different countries with Mexico, and proves that about half her imports come from Great Britain, which also takes off about five sixths of her exports, bullion, the chief article, amounting to about £1,900,000. The nature and amount of the direct trade with this country will be seen by the following statement of the different articles of home and colonial produce sent to Mexico in 1838:—

Articles.	Quantities.	Declared Value.
I. British produce and manufactures:—		£
Cotton fabrics	2,428,204 yds.	268,320
hosiery		6,114
yarn and twist	311,900 lbs.	15,707
Linen fabrics	1,886,028 yds.	76,708
Woolen do.	9,287 pieces	37,300
Do.	26,185 yds.	8,980
Silk goods		7,564
Hardware and cutlery	1,120 cwts.	8,988
Iron wares and iron	267 tons.	2,528
Machinery		2,264
Tin and pewter wares		4,178
Earthenware and glass		7,247
Other articles		
II. Colonial and foreign produce:—		
Quinquina	253,042 lbs.	200,636
Cinnamon	34,911 —	
Raw silk	5,000 —	
Linen fabrics	2,264 pieces	
Wine	2,150 gallons	
Total of British exports to Mexico		800,639

These returns show a great apparent increase of trade since 1831, when the exports from Great Britain to Mexico amounted only to £160,739; but, instead of going direct, as at present, the exports there were mostly indirect, through America and other places. The foreign trade is in truth insignificant, regard being had to the extent and resources of the country and its population.

The Mexican congress has fixed a tariff regulating the duties on the chief articles of import, and all articles not decided pay an *ad valorem* duty of 40 per cent.; such as oil, wooden frames for houses, printed books, maps, and music, philosophical and musical instruments, artificers' tools, agricultural and mining instruments, seeds, and plants, are admitted duty free. All articles which are the growth and produce of Mexico may be exported duty free, except gold, in coin or wrought, which pays 2 per cent. *ad valorem*. Silver, the duty on which is 34 per cent. *ad valorem*. Gold and silver ore, ingots, or dust, are prohibited under penalty of seizure.

Government.—On the resignation of Iturbide, the Mexicans determined on establishing a federal government. The present constitution, dated October 4, 1824, is modelled on that of the United States; the republic was then divided into 19 states, each of which is permitted to manage its own affairs, while the whole were cemented together in a body politic by fundamental and constituent laws.

The powers of the supreme government are divided into three branches—legislative, executive, and judiciary.

The legislative power was vested in a congress consisting of a house of representatives, a senate, and a president. Representatives, elected by each state at the rate of one member for 80,000 inhabitants, hold their places for two years. The qualifications requisite are 25 years of age, and eight years' residence in the state. The senate consists of two members for each state, of 30 years of age each, who are elected by a plurality of votes in the state congress. The members of both houses receive salaries of 3000 dollars a year. The president and vice-president are elected by the congress of the states, hold office for four years, and cannot be re-elected for four years after. Congress sits annually from January 1 to April 15. A council of government, consisting of the vice-president and half the senate, sits during the recesses of congress. The city of Mexico is the seat of government. The legislatures of the 19 states are similar to that of the republic in general. But the federal has lately been consolidated into a central government with a single legislative body for the entire republic, the states being formed into departments with subordinate councils.

These arrangements appear, however, to be disliked by a large proportion of the people; at all events Mexico has continued, since the establishment of the federal government, to be little better than a theatre for insurrections. The testimony of M. Chevalier is conclusive with respect to the condition of the country in 1835, and there has been no material improvement in the interval. "I have only been two months in Mexico, and already I have witnessed five attempts at revolution. Insurrections have become quite ordinary occurrences here, and their settled forms been gradually established, from which it is not considered fair to deviate. These seem almost as positively fixed as the laws of backgammon or the recipes of domestic cookery. The first act of a revolution is called *pronunciamiento*. An officer of any rank, from a general down to a lieutenant, *pronounces* himself against the established order, or against an institution which displeases him, or against anything else. He gets together a detachment, a company, or a regiment, as the case may be, and these generally, without more ado, place themselves at his disposal. The second act is called the *grito*, or outcry, when two or three articles are drawn up, to state the motives or objects of the insurrection. If the matter is of some importance, the outcry is called a *plan*. At the third act, the insurgents and the partisans of government are opposed to one another, and mutually examine each other's forces. At the fourth act they come to blows; but, according to the improved system lately introduced, the fighting is carried on in a very distant, moderate, and respectful manner. However, one party is declared victor, and the beaten party *dispronounced*. The conquerors march to Mexico, and their triumphal entry into the capital constitutes the fifth act of the play: the vanquished meanwhile embark at Vera Cruz or Tampico with all the honours of war."

The laws are alleged to be mild and just, but they are almost powerless; for nothing can well be conceived more

MEXICO.

appealing than the state of anarchy described by the very intelligent traveller just quoted.

"With tranquillity, unfortunately, everything else is also lost. There is no longer any security. It is a mere chance if the diligence from Mexico to Vera Cruz proceed the whole way without being stopped and robbed. It requires whole regiments to convey the *conductos* of piastres to Vera Cruz. Travellers who cannot afford to pay for an escort go armed from head to foot, and in little caravans. Here and there, rude crosses erected by the side of the road, and surrounded by heaps of stones, thrown by passers-by, in token of compassion, point out the spot where some wayfarer, and almost always a stranger, has perished by the hand of robbers." "The immediate environs of the most populous cities are infested by malefactors, and even in the interior of cities, not excepting the capital, there is no longer any security. There are numerous instances of people being robbed on a Sunday, and at the hour even when the greatest number of people are abroad, within a league of Mexico. An English chargé d'affaires was lamed on the Alameda, the public walk, in the middle of the day. In the evening, after sunset, notwithstanding the numerous guardians of the night (*serenos*), notwithstanding the videttes of cavalry at every corner of the streets, notwithstanding the law prohibits the riding on horseback through the streets after eight o'clock, in order to prevent the use of the *casaca*, a man is not safe in Mexico, not even in his own house. If, in the evening at eight or nine o'clock, you visit a friend, before the porter consents to open the enormous gate lined with iron or bronze, there pass as many formalities as if it were a question of letting down the drawbridge of a fortress. Persons on whose words I think I can rely have assured me that as many as 900 dead bodies are yearly deposited in the *morgue* of Mexico."

Revenues.—The amount of the revenue at different dates has been as follows:

1700 . . .	\$3,000,000	1837 . . .	\$10,494,999
1703 . . .	5,705,576	1839 . . .	15,233,285
1802 . . .	30,900,000	1839 . . .	14,493,169
1825 . . .	10,680,008	1830 . . .	18,923,999
1836 . . .	13,299,693	1831 . . .	16,413,000

About half the receipts proceed from the customs' duties: the other sources are, the mint, monopolies of tobacco, salt, pulque, and gunpowder; lotteries, post-office, stamps, tolls, and privileges. The produce of the state lands, none of which have been yet put up to sale, is estimated to be capable of producing from three to four millions of dollars.

Army.—The army consisted, in 1839, of about 20,000 men, exclusive of an active militia of about 30,000. But the troops are without science or a proper feeling of honour, so that they are really worth very little. The military, however, is a favourite service, from the high pay and privileges of the soldier. There are five fortresses—San Juan de Ulloa, Campeche, Perote, Acapulco, and San Blas.

Religion.—The Roman Catholic is the only publicly recognized religion, but others are tolerated. The church establishment consists of the archbishop of Mexico and nine bishops, having an aggregate income of 530,000 dollars, with 3677 parochial clergy. There are also 10 cathedrals, having 169 canons and other dignitaries, and one collegiate church. The regular clergy comprises 1978 monks, chiefly Franciscan; and there are 156 convents. Ecclesiastical property is free from taxation, and they have the sole management of all money bequeathed for pious uses. The annual income of the ecclesiastics is valued at about 12,000,000 dollars. The Spanish monks and priests were expelled during the revolution; and their places are filled by creoles, whose morals are at the lowest ebb. Religion has little influence over the white population, and the hold of the church over the Indians, never complete, is now fast lessening; for they are all, more or less, inclined to idolatry. (*Edwards's History of Texas.*)

Education.—The necessity of education is recognized by the new constitution, which requires that the priests should teach all persons to read and write; but the regulation has little practical effect. Under the old government, botanical pursuits were much encouraged: chemistry and mineralogy were taught in the school of mines; but the progress of science, literature, and the arts have all been checked by the unsettled state of the country since the revolution.

"In fact," says M. Chevallier, "elementary instruction has remained what it was in the time of the Spaniards. The clergy had then the exclusive management of it, and having so still, show but little inclination to enable the poor to read the books published under the régime of a free press. There are even fewer schools than there were, in consequence of the diminution in the number of the clergy. Education of a superior kind is even worse provided for. Under the Spaniards, there existed at Mexico a school for the fine arts, richly endowed: I have been unable to discover its existence now. There is a building called a museum, where

I found nothing of interest except a collection of the portraits of the viceroys since the time of Cortes, and a few Aztec manuscripts. Some years ago, the establishment of a polytechnic school was decreed, but the decree has yet to see the commencement of its execution. There is not even a military school, though the attention of the government is almost exclusively devoted to the army. There is nothing deserving the name of a school of law or medicine; and it may be well imagined that schools of industry or commerce are wholly unknown."

Population.—The amount of the population has been estimated at different periods, both before and after the revolution; but, owing to the jealousy of the old government, and the distracted state of the country, since the declaration of independence, very little credit can be attached to these estimates. The following are those by the best authorities:

1794 . . .	Humboldt . . .	2,300,000
1803 . . .	Do. . .	6,500,000
1813 . . .	Poinsett . . .	6,282,125
1825 . . .	Do. . .	6,500,000
1837 . . .	Ward . . .	8,000,000
1835 . . .	Chevallier . . .	7,000,000

The lower estimate of Chevallier may be explained by the emancipation of Texas and California, and by the cessation of the disturbances. The classes of the population are singularly varied and are characterized by distinctions more striking than those in any other country. Four distinct and rival classes may be enumerated: 1. the *Chapetones*, or pure Spaniards, never exceeding 80,000 in the palmy days of New Spain, but now hardly amounting to 94,000, and, politically considered, a degraded class; 2. the *Creoles*, or native whites of European descent, forming the wealthiest and most powerful part of the pop., estimated by Chevallier at 1,300,000; 3. the *Indians*, or native Mexicans, constituting the great mass of the rural labourers, and supposed to amount to 3,000,000; 4. the mixed castes, comprising *Mestizos*, *Mulattoes*, *Zambos*, *Quadrans*, and *Quintans*, somewhat exceeding 1,900,000.

The king of Spain formerly exercised a right of conferring the exclusive privileges enjoyed by the white population on individuals of any shade by a decree of the *audiencia*, *Quis longs pro blanco*—that he be deemed white. These distinctions of colour have been done away with, as far as political privileges are concerned, by the revolution, which admits persons of all colours to the equal enjoyment of civil rights; and hitherto, indeed, this has been by far its best if not its only good effect. The mulattoes and *zambos* principally reside in the low country, the whites on the table land. The Indians are divided into numerous tribes, speaking upwards of twenty languages, totally distinct from each other, and of which fourteen grammars and dictionaries have been published. Their character remains much the same as it is alleged to have been at the time of the conquest. Indolence, blind submission to their superiors, and gross superstition, are as much their characteristics now as formerly. The form of their religion is changed, and that is nearly all; they take the same childish delight in the idle ceremonies and processions of the Catholic church as they once took in the fantastic mummeries of their aboriginal idolatry. They are scattered over the country as labourers, distributed in villages, or else live in the towns as artisans, workmen, or beggars. In a few instances they have accumulated property, and acquired respectability; but, in general, they are indolent, ignorant, and poverty-stricken. We believe them to be wholly incapable of any high degree of civilization; but they might, perhaps, be improved, were measures taken to enforce their education, and to make a fair distribution among them of the many thousands of acres which have been thrown out of cultivation by the consequences of the revolution. They are classed in two great divisions: 1. *Mansos*, comprising those who have a fixed residence, cultivate the land, adopt the habits of civilized society, and maintain an amicable intercourse with the other races; 2. *Bravos*, comprising those who live a wandering life, supporting themselves by hunting, and avoiding all intercourse with the other classes, with whom many of their tribes are in a state of perpetual warfare. The latter principally inhabit the N. states along the river Gila, and the extensive and little known mountain ranges on the upper part of the course of the Rio Grande del Norte and the N.W. of Texas, called the Bolso de Mapimi, from the lake of Man. An independent tribe, called Mayas, inhabits the tract between Yucatan, Tabasco, and central America. It has made some progress in civilization, cultivating maize and cocoa, and wearing garments made of cloth prepared from cotton and the bark of the caoutchouc tree.

"Mexico," says Chevallier, "is a country so rich, that famine scarcely visits even the most indolent. In the *terras calientes*, and even on the plateau, the natives are content to dwell with their families in a cabin of bamboo trellis work, so slight as scarcely to hide them from the stranger's gaze, and to sleep either on mere mats, or at best on beds

MEXICO.

made of leaves and brushwood. Their dress consists simply of a pair of drawers, or petticoat, and a *serape* (a dyed woollen garment), which serves for a cloak by day, and a counterpane by night. Each has his horse, a sorry beast, which feeds at large in the open country; and a whole family of Indians is simply supplied with food by bananas, chilli, and maize, raised, almost without labour, in a small enclosure round the hut. Labour, indeed, occupies but a trifling portion of the Indian's time, which is chiefly spent in drinking *pulque*, sleep, or singing to his wretched mandolin hymns in honour of Notre Dame de Guadalupe, and occasionally carrying votive chaplets to deck the altar of his village church. Thus, he passes his life in dreamy indifference, and utterly careless of the ever-reviving *tlaxcalas* by which the peace of Mexico is disturbed. The assassinations and robberies which the almost impotent government allows to be committed with impunity on the public roads, and even in sight of the capital, are to him only matter for conversation, the theme of a tale or ditty. And why should he trouble himself about it? Having nothing in the world but the dream which he stands, his lance, spurs, and guitar, he has no fear of thieves; nor will the poniard of the assassin touch him, if he himself, drunk with pulque or chingarito, do not use his own."

Antiquities.—Humboldt, Bullock, and other European travellers, have furnished excellent descriptions of numerous ancient monuments, which show that the native Mexicans, before the loss of their independence, had been in some respects a comparatively civilized and ingenious people. Among the most extraordinary are pyramids, somewhat similar in exterior form to those of Egypt, and in some instances even of larger dimensions. The base of the pyramid of Cholula is a square of 1423 ft. on each side, and its height is estimated at 177 ft. A far more elegant building, of similar shape, is situated in the N. part of the state of Vera Cruz; it is formed of large blocks of porphyry, highly polished, and arranged in six stages, diminishing in size according to the elevation, and having all its materials most nicely adjusted. The base is a square of 89 ft. on the side; it is 65 ft. high; and the ascent to its top is by a flight of 51 stairs: the front is richly adorned with hieroglyphics and curious sculptures. The mountains of Tezcucoc are nearly covered with the remains of ancient buildings and ruins. The ruins of Palenque, near the Rio Chacamas, a ranch of the Usumasinta, extend upwards of 20 m. along the ridge of a mountain; and their architecture resembles more that of Europe than Mexico. The remains of an Aztec city, called by the Spaniards La Casa Grande, are to be seen about a league S. of the river Gila. In the state of Occidente. They are spread over a space of more than a square league. In the centre is a *teocalli*, laid down according to cardinal points, its sides being 445 ft. by 276 ft. It has five stories and a terrace, but no stairs. Within are five apartments, each 27 ft. long, 11 broad, and 11 high. A wall with towers surrounds the main building. The traces of an artificial canal to the river are visible. The neighbouring plain is strewn with fragments of red, blue, and white earthenware, and pieces of obsidian, which prove that the Aztecs had passed through a country abounding with this precious substance before they dwelt on this spot, previous to their final settlement in Mexico. In the W. part of the state of Chihuahua are similar ruins of great extent, which are also considered to have been the site of one of the temporary stations of the Aztecs during their migration southwards. Besides sculptures, vases of elegant form have been found, similar to those of Etruria and Egypt. Roads formed of large hewn blocks of stone may be traced, not only in the neighbourhood of those ruined cities, but at great distances from them.

History.—The first settlers in Mexico are believed to have been the *tlaxcalas*, a tribe of Indians from the Rocky mountains who fixed themselves, after several migrations, near the present city of Mexico, and flourished there for nearly four centuries. Drought, famine, and pestilence at length exterminated them, but not till they had imparted some degree of civilization to the barbarous *Chichimecas*, who were the first possessors of the soil, and were in their turn displaced by the Aztecs, who, in 1160, migrated southward from a country N. of the gulf of California, and first fixed themselves in the city of Zumpango, in the valley of Mexico, but afterwards in some islands in the lake Tezcucoc. Here they sustained themselves by fishing and agriculture, till, in 1325, they founded their chief city on the island of Tenochtitlan, and called it *Mexico*, in honour of their martial deity *Mexi*. This nation rapidly increased in power; and, if the remains of monuments and large cities were a just test of civilization, the Aztecs might claim to rank pretty high among the nations of antiquity. But they had invented no alphabet, and nothing better than a rude species of picture writing to record events, and were ignorant even of the use of metals. Their barbarism is sufficiently shown by their custom of sacrificing great numbers of human victims on

coronation fêtes. Montezuma I., the greatest of their sovereigns, extended the Aztec dominions on one side to the gulf of Mexico, and on the other to the Pacific ocean; but it must be stated at the same time, that many tribes within this tract yielded only a reluctant obedience, and some even retained their independence. Such, briefly, was the state of Mexico when Munces de Balboa first landed on its shores. Its conquest was effected by Fernando Cortes, who sailed thither in 1519 with a small force, comprising, on the whole, only about 700 men. He was met at Vera Cruz by ambassadors from Montezuma the younger, sent to discover his intentions, and to command him to withdraw from the country. But Cortes having refused to return till he had communicated in person with the emperor, at once proceeded to the capital. Here having got possession of the person of Montezuma, Cortes endeavoured by his intervention to effect the subjugation of the empire. But the Mexicans having recovered from the surprise into which they were first thrown by the seizure of the emperor, resolved at all hazards to attempt the expulsion of the Spaniards. Montezuma was soon after killed in a conflict in the city; and Cortes was compelled to retreat to Tlascala. Here having reorganized his small force, secured the co-operation of a large body of Indians, and built brigantines to be employed in the navigation of the lake Tezcucoc, he again pushed forward to the city; and having recommenced the siege, took it after an obstinate resistance of 75 days. The fate of the capital decided that of the empire. Province after province submitted, and the power of Spain was extended from Vera Cruz to the Pacific. Cortes, on his return to Spain, was received at first with high honours and liberal rewards; but his court favour soon declined: the emperor refused to appoint him captain-general of Mexico; and after some adventures, suited to his ardent and determined spirit, he died near Seville, in 1554, at the age of 63.

Under the Spanish arrangements Mexico was a subordinate kingdom, governed by a viceroy, with powers nearly equal to those of the sovereign, checked only by the *residencia*, or court of investigation, before which he was liable to be called to account for his administration, on his return home, and by the *audiencia*, or court of final appeal in Mexico. By these arrangements, also, the natives were to be considered as freemen and vassals of the crown; and the Spanish discoverers, settlers, and their posterity, were to have a preference in all civil and ecclesiastical appointments. The natives were thus, in fact, excluded from holding all offices of trust or profit. The great object of the Spanish government was to keep the country in the hands of the European or white population; and the means adopted to effect this object were, 1st, to discourage native manufactures, for the benefit of those belonging to the mother-country; 2dly, to make all the ecclesiastical establishments wholly dependent on the king, without any interference of the pope. The growth of flax, hemp, and saffron was prohibited under severe penalties; that of tobacco was made a government monopoly. The cultivation of the vine and olive was likewise prohibited; that of coffee, cocoa, and indigo tolerated only under certain restrictions, and in such quantities as might suffice for the demands of the mother-country. This system was maintained nearly three centuries; during which Mexico continued to be a blank in the history of nations, and known only by the name of the precious metals. In 1808, however, the news of the abdication of Charles VI. of Spain gave a shock to the royal authority which it never recovered. The natives and coloured population embraced this opportunity of asserting their claim to the rights of freemen, which was opposed by the *audiencia*, who also seized on the viceroy, Hurrigarray, and sent him prisoner to Spain, where he was confined till the general amnesty. An open insurrection against the European authorities broke out in 1810, at the head of which were Hidalgo and Morelos, two priests of New Spain; and under the auspices of the latter the first national congress assembled at Chilpancingo in 1813. One of its earliest acts was a declaration of the independence of Mexico.

For several years the history of the revolution is only that of a sanguinary guerrilla warfare, leading to no permanent results. At length, in 1821, Iturbide, who had previously been a royalist, declared suddenly in favour of the liberals, and published his celebrated manifesto of Iguala in favour of a constitutional monarchy. His cause was embraced with such enthusiasm by the whole population, that he succeeded not only in putting down the Spanish government, and forming a national congress, but also prevailed on that body to make him emperor of Mexico, under the title of Augustus I. His dissolution of the congress, however, by military force, raised a feeling against him, which, finding it impossible to repress, he abdicated the throne. He was not only allowed to withdraw from the country, but rewarded for his past services by an annual allowance of £5000, accompanied by an edict of outlawry in case of return. In spite, however, of this prohibition, he returned

MEXICO.

clandestinely, and was soon discovered, apprehended, and executed.

On the expulsion of Iturbide the congress was reassembled, a provisional government formed, and an executive appointed, consisting of Victoria, Bravo, and Negrete, all persons of proved patriotism. The government was modelled on that of the United States; but the hopes then formed of its stability have proved fallacious. Since this epoch repeated attempts at revolution have convulsed the country. During the whole of the struggle for independence, the population had been split into two parties; at first distinguished by the names of Imperialists, who adhered to the mother country, and republicans, who asserted its independence; but these parties afterwards merged into those of Centralists and Federalists: the former advocating a single superintending government, and the latter that of the independent government of states, only federally connected. This struggle between the rival parties has now continued for about 17 years, and been a fertile cause of insurrection. Texas and California have already separated from the confederacy, and it is probable that their example will be followed by other states. In fact, there can hardly be said to be anything like regular government. The Centralists are lords of the ascendant to-day; but a successful *revolucion* (as the Parisians term it) may dash all their prospects to-morrow. Meanwhile, all the bonds of society are loosened, property has become almost worthless from its utter insecurity, and life is not safe from assassination and violence. Whether the proposal of the 8. American republics to unite their interests with those of Mexico, and form together one grand federation, will be accepted, and whether, if accepted, it would contribute to the improvement of Mexico, is matter for speculation only; but certainly that country, as it exists at present, affords one of the most melancholy examples that modern history has presented of an extensive, fertile, and well situated region being reduced, through anarchy and misgovernment, to a state bordering on barbarism.

Mexico, or Mexico (*Mex. Tzucuilatlan*), the cap. of the united states of Mexico, and anciently the chief city of the empire of Montezuma, 7426 ft. above the sea; lat. 19° 25' 40" N., long. 101° 25' 30" W. Pop. 150,000. It stands nearly in the centre of an elevated plain, or plateau, surrounded by mountains, and having an area of about 1700 sq. m., one tenth of which is covered by four lakes, the largest of which (Texcoco), nearest the city, has an area of 77 sq. m. The old city of Mexico, or that taken by Cortes, was built on a group of islands in the lake Texcoco; but though the modern city occupy its site, it is, owing to the diminution of the waters of the lake, partly originating in natural and partly in artificial causes, situated about 24 m. W. from the lake. The ground on which it stands is, as might be anticipated from the statement now made, low and swampy; the largest buildings are erected on piles, and the roads leading to it are raised 6 or 8 feet above the surrounding flat. Though within the tropics, it is so elevated that its mean temperature is only 65° Fahr., coincident with that of May in England. It is said, by Humboldt, to be "undoubtedly one of the finest cities ever built by Europeans in either hemisphere; being inferior only to Petersburg, Berlin, London, and Philadelphia, as respects the regularity and breadth of its streets, as well as the extent of its public places." The architecture is generally of a very pure style, and many of the buildings are of noble construction, though usually of somewhat plain exterior. Two sorts of hewn stone, porous amygdaloid and porphyry, are used in the better parts of the city. The balustrades and gates are of Biscay iron, ornamented with bronze; and the houses, which are three or four stories high, have flat-terraced roofs, like those in Italy and other S. countries. (*Nouv. Espagne*, ii. 51.) The streets are wide, well-paved and flagged, but not lighted or watched at night; so that robberies and assassinations are scarcely less common than in Spain. They run almost uniformly at right angles to each other, many of them being nearly 9 m. in length, perfectly level and straight, and offering, from every point, a view of the mountains that surround the valley. Nearly all the houses are hollow squares, with open courts surrounded by colonnades, and ornamented with plants, &c. The stairs to the interior front the outer gate, and the best apartments, which are showily painted in mosaic and arabesque, generally face the street. (*Poinsett's Notes on Mexico*, p. 66.) Numbers of houses are covered with glazed porcelain, in a variety of elegant designs and patterns. The *Plaza Mayor*, or grand square, is one of the finest to be seen in any metropolis: its E. side is occupied by the cathedral and *separaria*, or parish church, and its N. side by the palace, while on the other sides are handsome rows of shops and private dwellings. In its centre is a colossal statue of Charles IV., said to be the finest work of its kind in the new world. The effect of this square, however, is much impaired by the introduction of a paltry building, called the *Parian*, a large ungainly pile, in one angle, used as a market or bazaar, appropriated to the sale of miscellaneous articles, and the resort of the idlest portion of the

inhabitants. The palace, or government-house, is a building, nearly square, with a front several hundred feet in extent, comprises four large courts, in which are the public offices, barracks, prison, and a large domestic garden; but most every part of it is falling to decay: the majestic staircases, and chandeliers have disappeared, and all is now in the most appalling disorder. (*Lafitau's Routes in Mexico*, p. 168.) In this building, also, is the site of the state of Mexico. The college has greatly declined; for whereas, before the revolution, it amounted to 18 or 19 millions of dollars, it was estimated, in 1839, at 1,200,000 dollars, and, in 1835, at only 547,145 dollars. The cathedral, on the N. side of the square, on the site of the great temple of the god Mexitli, is a heterogeneous edifice; one part of the front is low, and of bad Gothic architecture, while the other and more modern part is in the Italian style, and displays such symmetry and beauty; its two towers are ornamented with pilasters and statues. The interior is imposing, lofty, and magnificent; but the grandeur of the effect is much diminished by the ponderous erections in different parts, and a profusion of massive carved ornaments, pictures, and painted statues. The high-altar and its appendages are incased by a massive railing of mixed metal; so valuable, on account of the gold it contains, that a silver-smith of Mexico is alleged to have offered the bishop a new altar rail of equal weight in return for the old metal! (*Bullock's Mexico*, i. 143.) In the interior, also, are some curious remains, including several idols and a "stone of sacrifice." One is a stone on which the human victim was placed when the priest tore out his heart! On the outer wall is fixed the *El Lenda*, a circular stone of basaltic porphyry, covered with hieroglyphic figures, by which the Aztecs, or native Mexicans, used to designate the months of the year, and which is supposed to have formed a kind of perpetual calendar. (*Lafitau*, p. 177-178; *Ward*, ii. 48.)

Few monuments of antiquity, however, remain; and we may echo the exclamation of Antonio de Gama, the first among Mexican antiquaries, "*Quantos preciosos monumentos de la antigüedad, por falta de inteligencia, habrán perecido en esta manera*."—How many remains of antiquity have thus perished through ignorance of their value! The church services are celebrated with great magnificence, nor, even in Rome herself, is greater attention paid to the external minutiae of religious observances. Besides the cathedral, there are said to be from 50 to 60 other churches, most of which display, more or less, the barbarous mixture of style that characterized Spanish architecture during the 16th and 17th centuries; there are, also, numerous religious houses, two of which, viz., the Franciscan and Dominican convents, are extensive and wealthy establishments. Opposite to the latter of these is the palace of the Inquisition, now applied to other, and it is hoped, more useful ends. Bullock describes it as "very elegant, exhibiting little or no appearance of the purposes for which it was intended." This tribunal was abolished by Iturbide, in 1822. The papal religion, however, still maintains its ascendancy; few buildings, whether public or private, are without their parais; and the traveller every where meets with religious pictures, and processions. The *Mineria*, or college of engineers, was originally a large and handsome building; but, owing either to a want of care in making the foundations, or to the effect of earthquakes, the walls have settled in several parts, and the front is visibly out of the perpendicular. Lectures are given occasionally on the sciences connected with mining; and in one of the rooms is a tolerably good collection of minerals, though generally very inferior to those in European museums, and, as respects a country like Mexico, quite insignificant. In fact, not only the *Mineria*, but the academy of fine arts, the university, founded in 1596, and public library, are in a state of neglect, disgraceful alike to the government and the people; and we are afraid that the diffusion of elementary instruction since the revolution has not been such as to compensate for the decline of the institutions for the higher branches of instruction. We have seen, in the previous article, the statements of M. Chevallier as to education generally in 1835, thus which nothing can be more deplorable. The *Acordada*, or public prison, is a large substantial structure, fitted to contain about 1300 prisoners; the barracks, also, formerly used as a hospital, are very extensive and well constructed. The theatre is a respectable building, of considerable size; but the establishment has for some years had so little success that it is very seldom opened. The *Plaza de Toros*, for the exhibition of bull-fights, consists of a great circular inclosure, fixed up exactly like that of Madrid, and fitted to accommodate from 2000 to 3000 spectators. The great cigar manufactory, which belongs to the government, stands on the S.W. angle of the city, and comprises a very extensive establishment, which supplies the whole legitimate demand of the confederation for cigars. The Alameda, or public walk, at the W. end of the city, somewhat resembles a park; but has the stiff formal appearance of Dutch and French grounds. It

MEXICO.

the centre is a fountain, supplied with water from the great aqueduct leading from Santa Fe to the city. Another open space, called the Paseo, about 2 m. in length, planted with double rows of trees, is much frequented, on holidays, by persons in carriages and on horseback. In the city, also, are several *Portales*, or covered colonnades, lined with shops and stalls, and forming a favorite evening promenade long after the Alameda and Paseo have ceased to be frequented. The environs, also, present, on fine dry evenings, a very lively scene of bustle and gaiety; hundreds of canoes of various sizes, mostly with awnings, and crowded with native Indians or *Mestizos*, are seen passing in every direction along the lake and canals, each boat with its guitar-player at the stern, and some of the party either singing or dancing.

The manufactories are not generally remarkable, either for extent or fitness or of workmanship. Nothing is exposed in the shop-windows, and most of the articles are made in the places where they are offered for sale. Gold and silver lace, trimmings, epaulets, &c., are made in great perfection, and are sold at a much lower rate than in England. Silver-smiths' work is also done on a pretty extensive scale: the ornaments are finished by hand; the chasing is sometimes well executed, but in general the articles are heavy and clumsy. Jewellery employs a few hands; but all precious stones, except rubies, are scarce, and the work is much coarser than in Europe. Cabinet-work is extravagantly dear, and of very inferior quality, made with clumsy tools, and of bad wood; the saw is scarcely known, and the turning-lathe is of the most primitive construction. Coach-making is much better understood; the Mexican vehicles are firmly put together, of handsome shape, and well finished; and, in respect of painting, gilding, or varnishing, they are but little inferior to those made in Europe, whence the handles and metal furniture are procured. There is a considerable manufacture of hard soap here and at Puebla; but it has greatly fallen off since the time of Humboldt, who states the quantity made in Mexico, in 1802, at 200,000 arrobas. Beaver and felt hats and cotton cloaks are made on a large scale, for the supply of all parts of the union, these being important articles in the internal trade of the country. Woollen clothes are three times as dear as in England, and are uniformly ill-made. Men, not women, are milliners; and it is not uncommon to see some 50 or 30 fellows, who should be porters or coalheavers, employed in decorating ladies' dresses, making flowers, and trimming caps and boucées. (*Bullock*, i. 302.) The bakehouses are large establishments; and the bread, which is excellent, is made exclusively by slaves, who also perform the work in the cloth factories. See *Manufactures*, in art. MEXICO, UNITED STATES, &c.) Shops for the sale of *pulque* (a kind of beer made from the *Joe*), and native and Spanish brandy, are very common, and save a gay appearance. The markets are well supplied with animal and vegetable productions, brought along the lake and canal of Chalco by crowds of canoes, usually navigated by women. Turkeys, fowls, pigeons, and many varieties of wild water-fowl, are very abundant and cheap: as are hares, rabbits, tortoises, frogs, and salamanders, all of which are esteemed good eating by the inhabitants. The best market is well supplied with beef, mutton, and pork, and veal is prohibited. The meat, however, is not of the best quality, though, perhaps, this may be owing to its bad preparation by the butcher and cook. There is great variety of vegetables and fruits, and a most enormous consumption a proportion to the population. The vegetable market is larger than Covent garden, but yet unequal to the daily supply; and the ground is entirely covered with bananas, plantains, citrons, shadocks, melons, pomegranates, dates, mangoes, tomatoes, and other vegetable productions of tropical countries.

The greater part of these are cultivated on the *chinampas*, floating gardens, of which there are two sorts: one movable, the other fixed, and attached to the shore. On the marshy banks of the lakes of Xochimilco and Chalco, the water, in the time of the great floods, carries away pieces of earth covered with herbs, and bound together by roots, these, being driven about by the wind, sometimes unite to small islands, which, being taken possession of, are sowed with flowers and roots. Artificial *chinampas*, or lands, are also frequently formed, of reeds, rushes, roots, oshwood, &c., well compacted together, and covered with sick mould: these sometimes contain the cottage of the *diaz* who acts as guard. They are towed or pushed with long poles, and are thus removed from bank to bank. The *chinampas* are parallelograms from 300 to 400 feet in length, and from 10 to 30 feet in width. They rise about 3 4 feet above the water, and afford, from their command water, beans, small peas, pimiento, potatoes, artichokes, alfalfa, and a great variety of other vegetables. The population of Mexico is of an extremely mixed character, comprising about 60,000 creoles, or descendants of Spaniards; 25,000 *Mestizos*, or half-casts between Europeans and Indians, but many of whom are scarcely distin-

guishable by colour from the former; about 35,000 copper-colored natives; 10,000 mulattoes; and only about 6000 Europeans. There is, or, at all events, used to be, an extreme disparity of wealth in this city. Many of the nobles and successful speculators in mines were excessively rich; but the bulk of the population were at once indolent and indigent. The lower orders are filthy, despise labour of every kind, and are constantly seen lying in the church porches, leaning against the walls, and loitering about the markets. In many respects they bear a striking resemblance to the lazzaroni of Naples; but the latter are not stained with the crimes of robbery and assassination, for which the *leproses* of Mexico are disgracefully notorious. There is here also a general torpor of the faculties, and the *dolce far niente* seems to be the *summum bonum* of all classes. The dress of the higher orders of men closely resembles that of Europeans, the large cloak being as common here as in Spain. The costume of the ladies is universally black, with the veil and mantilla; but, on holidays and public occasions, their dresses are remarkable as well for gayness of colours as for expensiveness of material. Indeed, when in their carriages on the Paseo, they contrast somewhat strangely with the same persons, when seen at home in complete *deshabille*, without stockings, squatting on the floor, and either pursuing their favourite amusement of cigar-smoking, or eating cakes and capucino out of the dirty earthenware basins of the country. (*Latrete*, p. 150.) The ladies seldom go out during the day; but, after sunset, young and old come forth from their hiding-places, and the Alameda, Paseos, and Portales swarm with the *damas* and *señoritas* of the city, chatting and smoking with their gallants. Many gentlemen belonging to the higher classes are intelligent, and a few even fond of literature; but the city is so badly supplied with libraries, and other means of study, as to give little encouragement to such pursuits. There are three or four newspapers; but they are miserable productions, containing little besides the merest chit-chat, copiously interspersed with advertisements. The white creoles are distinguished by their mildness, courtesy, and hospitality: their besetting sin is gambling. Female virtue is on the same low level as in Old Spain; but the Mexican ladies are better educated, and would be agreeable but for the practice of smoking, which is bad enough in men, and intolerable in women. (*Poinsett's Notes*, p. 160.)

The original city of Mexico, or, as it was called, *Tenochtitlan*, built, as already stated, on a group of islands in the lake Texcoco, was founded in 1335: it was connected with the main land by three principal causeways of stone and earth, about 30 feet in breadth, and extending from 3 to 6 m. over the surrounding marshes. These dikes still exist, and their number has since been increased. They form, at present, paved causeways across the marshy grounds, which were formerly covered with water; and, being of considerable elevation, are useful in securing the city from inundations. The better to preserve the city from the chance of this calamity, the great drain alluded to in the previous article, was commenced in 1607, which has now reduced the lakes of Ximapa and San Cristoval within comparatively narrow limits, and prevented their waters in the rainy season from flowing into the lake of Texcoco, and threatening, as they sometimes did, to submerge the city.

Mexico, when first discovered by the Spaniards, was a rich and populous city; the seat of government, religion, and trade. According to Cortez, it was as large as Seville or Cordova, was well built, and well supplied with various products; but these are the statements of parties naturally disposed to magnify their own services, and should be received with considerable modification. It was taken by the Spaniards in 1521, after a protracted siege, in the course of which it was nearly destroyed. (See previous article.)

Mexico, p. t., Oswego co. N. Y., 156 m. W.N.W. Albany, 381 W. Bounded N. by lake Ontario. Drained by Salmon creek. It contains three churches, a Presbyterian, Baptist, and Methodist, eight stores, two fulling-mills, one woollen factory, one furnace, five grist-mills, eight saw-mills, one oil-mill, four tanneries; one academy, 164 students; 40 schools, 1020 scholars. Pop. 3792.

Mexico (GULF OF), a large inland sea connected by the Florida channel with the N. Atlantic ocean, and by the channel of Yucatan with the Caribbean sea, situated between lat. 16° and 31° N., and between long. 81° and 95° W. Length from E. to W., 1300 m., average breadth, 650 m.; area, about 800,000 sq. m. This sea, which is of an irregular circular shape, is, unlike the Caribbean sea, almost clear of shoals and islands, none being found except on the coasts of Yucatan and Florida. Along the coasts of Mexico its soundings are very regular, with 100 fathoms at a distance of 30 m. from the shore. On the N. side, and especially opposite the mouths of the Mississippi, the depth is considerably diminished, and at its E. extremity the navigation is rendered intricate and dangerous by the Tortugas bank, Florida reef, and various other *keys*, shoals, and

MEZE.

islets, including the great Bahama bank, which surround the N. coast of Cuba. The E. trade winds prevail from April to October, this being usually the wet season: the *Nortes* begin in October, but are not violent till the middle of November, from which time till the end of February they blow with great fury, and are objects of much dread to navigators. These gales last for four or five, and occasionally even ten, days; but their extreme fierceness is usually spent in the first 48 hours. At these times the larger vessels, which cannot enter the shallow harbours of the Mexican coast, are obliged to slip their anchors, and keep as far as possible off shore. Examples are not wanting also of *nortes* happening between May and August, at which time they are particularly furious. Luckily, however, the hurricanes and tornados of the gulf are by no means so fierce and destructive as those in the Caribbean sea.

The principal current of the gulf of Mexico, and the only one worth mention, is that which sets W.N.W. between cape St. Antonio and cape Catoche: this runs from 12 to 30 m. a day, and is perceptible even during the *nortes*, except close along the shores of Mexico. At the N.W. extremity of the gulf its course gradually changes, till, at the mouth of the Mississippi, it turns E., and afterward S.E., as it again rushes out into the Atlantic ocean, at the rate of 80 m. in the 24 hours. (This remarkable current, commonly known as the *gulf stream*, is described in the article ATLANTIC OCEAN, l., 290, of this work.) The tides of the gulf of Mexico are of no great importance, they nowhere exceed 3 or 4 feet; but their average rise is not more than 2 feet. The colour of the water is a deep indigo, darker or more intense than that of the ocean: phosphorescent lights shine on it with great brilliancy, and between the coasts of Yucatan and Louisiana great quantities of *Lucas natans* occur in parallel lines from S.E. to N.N.W., and are carried out in large masses through the straits of Florida. (*Blunt's American Pilot*; *Purdy's Atlantic Ocean*; *Darby's Geogr. of United States*; *Humboldt's Pers. Narr.*, i., 50-60.)

MEZE, a town of France, dep. Hérault, cap. cant., on the lagoon of Thau, 5 m. N.W. Cette. Pop. (1836) 4940. It has a small port, capable of receiving 60 vessels of 40 tons each, and manufactures of brandy and liqueurs. Near it is the abbey of Vallemagne, an edifice of the 13th century, well worth the traveller's notice. (*Guide du Voyageur en France*.)

MEZIERES, a fortified town of France, dep. Ardennes, on the Meuse, which mostly surrounds the town, and is here crossed by two stone bridges, 80 m. N.W. Metz. Lat. 49° 45' 47" N., long. 4° 43' 31" E. Pop., in 1836, 3817. It is walled, and is farther defended by a strong citadel. It is ill built, and has few edifices worth notice, except the town-hall, prefecture, the hospital, founded in 1412, and a parish church of considerable antiquity. Mézières, though the nominal capital of the department, has no court of primary jurisdiction, that tribunal being seated at Charleville (which see): it is, however, the seat of boards of taxation, artillery, and forest inspection, a society of agriculture, &c.; and has tanneries, breweries, and some trade in leather, coarse woollens, and linens. The Chevalier Bayard, with a garrison of only a few thousand men, successfully defended Mézières, in 1520, against a powerful Austrian army; and, in 1815, the town held out for two months against the Prussians. (*Hugo, art. Ardennes, &c.*)

MIAKO, a large city, and the ecclesiastical cap. of the Japanese empire, in the island of Nippon, on the Yedogawa, 230 m. W. by S. Yedo; lat. 35° 9' N., and long. 139° 30' E. Pop. (according to the Dutch traders, on whom, however, little reliance can be placed,) 600,000, exclusive of the *Dairi*, or Mikado's court, supposed somewhat to exceed 50,000. It is situated in a spacious plain, enclosed on all sides by high mountains, and almost entirely formed into fine gardens, interspersed with temples, monasteries, and palaces. It is nearly 4 m. in length, and about 3 m. broad, with narrow but regular streets, lined by houses two stories high, built of wood, lime, and clay, most of them being very slightly and poorly constructed. The sacred Mikado, or supreme emperor, emphatically termed, "the Son of Heaven," has his residence on the N. side of the city, in a quarter comprising about a dozen streets, and separated from the rest of the buildings by walls and ditches; but, owing to the great diminution of the revenues furnished by the *sjogun*, or viceroy (the substantial sovereign), the whole is reported to have a very shabby and dilapidated appearance, little in accordance with the rank of a being more divine than human! On the W. part of the town is another palace, built of stone, and strongly fortified: it belongs to the *sjogun*, who resides in it when he comes to pay his respects to the emperor. This practice, however, has long been discontinued, and the building is now used for the accommodation of certain functionaries, sent thither from Yedo to watch the proceedings of the *Dairi*. The members of this court, who view themselves as a species of superior beings to the rest of the Japanese,

MICHAEL (ST.)

are chiefly engaged in the study of literature and science, the *Dairi* being, in fact, the highest college in Japan for the cultivation of theology, and various other branches of learning. The almanacs, formerly imported from China, are now constructed, including the calculation of eclipses, in the *Dairi* college; and, at least, 2 of all the works published in Japan, are produced by the *Mikado* of Miako, some of whom, however, are connected with other colleges and high schools, wholly independent of the *Dairi*.

This city is likewise the principal manufacturing depot of the empire, every kind of handicraft known in Japan being carried to the greatest perfection. Nearly every house has its attached shop well provided with every description of goods, and the japanned wares, carved ornaments, &c. of Miako, are unequalled either in Japan or China. Miako is one of the places visited by the Dutch traders, when they, once in four years, pay their respects to the *sjogun* at Yedo: they usually spend some days here, which are chiefly occupied in making purchases of Japanese manufactures. Various celebrated temples (of which there are many, though not described,) are freely exhibited to them; and in the gardens attached to one of these buildings, tents are pitched for the purpose, not only of giving a sumptuous entertainment to the *Captain-General* (as they term the Dutch president of the mission), but also of gratifying the curiosity of the natives with a sight of a few strangers from a distant land. (For further particulars, see JAPAN; see also, *Manners and Customs of the Japanese*, p. 140-157; *Siebold*, i. and ii.)

MIAMI river, O., rises in Hardin co., and flowing westerly 100 m., enters Ohio river in the S.W. corner of the state. It is 300 yards wide at its mouth, and is navigated, to a limited extent, for 75 m. It affords extensive water-power, and is connected to Auglaize river, a southern branch of Maumee river, by a portage of five miles. But its navigation will be superseded by the Miami canal, constructed along its borders.

MIAMI, county, O. Situated in the W. part of the state, and contains 410 sq. m. Organized in 1807. Watered by Miami river and its branches. It contained in 1840, 14,657 neat cattle, 30,650 sheep, 94,954 swine; and produced 136,159 bushels wheat, 16,998 of rye, 531,139 of Indian corn, 2169 of buckwheat, 3393 of barley, 163,931 of oats, 22,453 of potatoes, 153,323 of sugar. It had three commission houses in foreign trade, 54 retail stores, three fulling mills, one woolen factory, 18 flouring-mills, 21 grist-mills, 45 saw-mills, two oil-mills, two tanneries, 11 distilleries, three breweries, one pottery, four printing-offices, one bindery, three weekly newspapers, and one periodical; 6 schools, 3625 scholars. Pop. 19,698. Capital, Troy.

MIAMI, county, Ia. Situated toward the N. part of the state, and contains 390 sq. m. Organized in 1832. Watered by Wabash, Eel and Mississinewa rivers. The Wabash and Erie canal passes through the centre of the county. It contained in 1840, 2910 neat cattle, 3977 sheep, 7584 swine; and produced 8157 bushels of wheat, 17,143 of Indian corn, 18,487 of oats, 19,735 of potatoes, 1690 pounds of tobacco, 20,548 of sugar. It had 14 stores, two flouring-mills, three grist-mills, five saw-mills, three tanneries, one printing-office, one weekly, and one semi-weekly newspaper; 15 schools, 356 scholars. Pop. 2948. Capital, Peru.

MIAMI, L., Hamilton co., O. Situated on the north bend of Ohio river, which bounds it on the S. Bounded N.E. by Miami river. Pop. 2160.

MIAMI, L., Clermont co., O. It has two stores, one flouring-mill, one grist-mill, two saw-mills, one tannery, two distilleries; eight school, 537 scholars. Pop. 3033.

MIAMI, L., Greene co., O. Drained by Little Miami river and its branches. It has five stores, two flouring-mills, three saw-mills. Pop. 1226.

MIAMI, L., Logan co., O. It has 13 schools, 1309 scholars. Pop. 3250.

MIAMI, L., Montgomery co., O. It has one cotton factory, eight grist-mills, six saw-mills, six distilleries; 13 schools, 1369 scholars. Pop. 3259.

MIAMI, L., p. v. Miami, L., Montgomery co., O., 12 m. S. by W. Dayton, 78 m. W. by S. Columbus, 473 W. Situated on the E. side of Miami river, on the Miami canal. It contains two churches, 17 stores, three warehouses, a market-house, one cotton factory, one iron foundry, one brass foundry, two grist-mills, one steam saw-mill, one brewery, one tannery, and about 150 dwellings. One mile S.E. of the village is one of the largest ancient mounds in the state.

MIANA, a market town of N.W. Hungary, co. Neutra on the Miava, a tributary of the Morava, 48 m. N.E. Presburg. Pop. 8650, mostly of Slavonian origin, and Lutherns. It has manufactures of woollen stuffs and bagging, several distilleries, and some trade in hemp and flax.

MICHAEL (ST.), an inconvertible bar, and market town of England, co. Cornwall, in pars. Newlyn and

MICHIGAN.

leader of hunt. Fyde. This, which is said to have been a town of some importance, previously to the Norman conquest, is now, like others of the Cornish boroughs, an inconsiderable village. It returned two members to the House of Commons from the 6 Edward VI. down to the Reform Act, by which it was disfranchised. The market has long been extinct; but sheep fairs are held here July 28, and Oct. 15.

MICHIGAN, one of the north-western United States, consists of two peninsulas; the principal of which, denominated Michigan proper, is bounded N. by the straits of Michilimackinac, which connect lake Michigan to lake Huron; E. by lake Huron, St. Clair river, lake St. Clair, Detroit river, and lake Erie, which separate it from Upper Canada; S. by Ohio and Indiana; and W. by lake Michigan. This main portion of the state is 369 m. long from N. to S., and has a mean breadth of about 140 m., containing about 30,850 sq. m., or 25,597,840 acres. But the upper peninsula of Michigan is a distinct territory, bounded N. by lake Superior; E. by St. Mary's river; S.E. by lake Huron, lake Michigan, and Green bay; and S.W. by Menomonee and Montreal rivers, which separate it from Wisconsin territory. This portion of the state is 334 m. long, with an average breadth of 60 m., containing 30,664 sq. m. The whole territory of both peninsulas is 50,520 sq. m., or 39,728,800 acres of land surface. To this should be added 26,324 sq. m. of water surface. It lies between 41° 30' and 47° 30' N. lat., and between 82° 25' and 90° 30' W. long., and between 39° 23' and 12° 25' W. long. from W. The population in 1810, was 4398; in 1820, 20,448; in 1830; 31,430; in 1840, 219,967. Of these, 113,305 were white males; 98,165 were white females; 363 were coloured males; 314 were coloured females. Employed in agriculture, 54,581; in commerce, 726; in manufactures and trades, 6990; in navigating the ocean, 84; do. canals, lakes, and rivers, 168; in mining, 40; in the learned professions, 904.

There were in 1840, 39 organized counties, which, with their population, were as follows:

Counties.	Pop. 1840.	Counties.	Pop. 1840.
Alcona	1,753	Leavenworth	17,599
Barnes	1,079	Livingston	7,430
Berrien	5,011	Macomb	923
Branch	5,715	Michilimackinac	9,716
Calhoun	10,599	Monroe	9,922
Cass	5,710	Oakland	23,646
Chippewa	534	Ogemaw	208
Clinton	1,614	Ontonagon	496
Eden	2,379	Saginaw	3,103
Genesee	4,298	St. Clair	4,696
Hillsdale	7,440	St. Joseph	5,058
Ingham	2,496	Shiawassee	3,403
Ionia	1,525	Van Buren	1,910
Jackson	13,130	Washtenaw	20,571
Kalamazoo	7,380	Wayne	34,173
Leit	2,697	Total	219,967
Lapeer	4,695		

Detroit, on the W. side of Detroit river, is the seat of government.

The surface of the surveyed part of the southern peninsula is generally level, undulating or rolling, and sometimes broken or hilly. In the eastern part, from the southern boundary to Saginaw bay, the land, to the distance of from 5 to 25 m., is mostly level. Proceeding westward, the land gradually rises to an irregular ridge, in some places 600 or 700 feet high, which divides the waters which flow eastwardly from those which flow westwardly to lake Michigan. This ridge is much nearer the eastern than the western shore. The central counties are somewhat hilly. These hills consist of an irregular assemblage of somewhat conical elevations, sometimes rising to the height of from 150 to 300 feet, though ordinarily not more than from 30 to 40 feet. But the main portion of the central and western part consists of a table land, gradually descending toward the lake, exhibiting a gently undulating, but very rarely a broken surface. The unsettled portion of the state lies N. of a line passing E. and W. through the centre of Saginaw bay. It is a but imperfectly known, but it is represented as not very fertile, interspersed with sand ridges and marshes, having a rapid descent from the highlands eastwardly, but a gradual slope to the W. In general, the interior of the state may be regarded as level, but the coasts of lakes Michigan and Huron exhibit high and steep banks; and along the former are bluffs and sand banks from 100 to 300 feet high. A large part of the soil of the peninsula is fertile, and well adapted to the purposes of agriculture. The forest trees recent a great variety; oak, hickory, walnut, ash, linden, sugar maple, soft maple, elm, ash of various kinds, sycamore, ashberry, cotton-wood, butternut, box or dogwood, poplar, whitewood, and cherry. On the N.E. border evergreens seem to predominate, as pine, spruce, and hemlock, and in the N. part, large forests of pine and well timbered land extend into the interior. The soil in the settled parts of the peninsula is well adapted to wheat, rye, oats, barley, flax,

hemp, garden vegetables, and grasses. No part of the United States is better supplied with fish, aquatic fowls, and wild game. The fish are chiefly white fish and salmon trout, and are extensively taken for exportation. The trout weigh from 10 to 70 pounds, and the white fish are equally large. They constitute a substitute for the codfish in the N.W.

The upper peninsula has been but imperfectly explored; but the geological survey of the state, now in progress, may be expected to make it better known. The lake coast has been estimated at between 700 and 800 m., five tenths of which can be reached by the common lake vessels. It is diversified by mountains, hills, valleys, and plains, rising gradually from lakes Michigan and Superior to the interior. Porcupine mountains, which form the dividing ridge between the waters which flow into lake Superior and those which flow into lake Michigan, have summits towards the western boundary, estimated at from 1800 to 3000 feet high. A greater portion of this peninsula, except the sand plains, consist of millions of acres of *white and yellow pine*, and a mixture of spruce, hemlock, birch, oak, and aspen, and on the rivers, maple, ash, and elm. For a large, and 60 smaller rivers flow into the lakes, and will hereafter afford mill-sites, and the means of transportation of a vast amount of lumber. This region does not promise much to agriculture, though there are doubtless fertile tracts; but in minerals it is undoubtedly rich. Iron, copper, and lead, are known to exist, and some surprising masses of native copper have been discovered in Ontonagon river. The climate is cold, but healthy; and though the summers are short, vegetation is exceedingly rapid. The extremes of temperature are 90° above, and 25° below zero of Fahrenheit, which has caused it to be denominated the Siberia of Michigan.

The southern peninsula of Michigan is drained by several large rivers, and many smaller streams. They originate in the dividing ridge, and pass off in an easterly and westerly direction, with some exceptions, to the lakes. Raisin and Huron rivers flow into lake Erie; Rouge into Detroit strait; Clinton and Black rivers into the strait of St. Clair; Saginaw river, formed by the junction of several large branches, enters Saginaw bay; Thunder bay river, Cheboygan, and several smaller streams flow N. into the straits of Mackinaw. But the largest rivers flow W. into lake Michigan. They are St. Joseph, Kalamazoo, Grand, Muskegon, and Manistee rivers. Some of these are navigable, to a considerable extent. The counties of Oakland, Livingston, Washtenaw, Barry, Jackson, and Kalamazoo abound with small clear lakes, well stocked with fish.

There were in 1840, 20,144 horses or mules, 185,190 neat cattle, 99,618 sheep, 295,880 swine; poultry was produced to the value of \$93,730. There were produced 2,157,108 bushels of wheat, 197,893 of barley, 2,114,051 of oats, 34,935 of rye, 2,277,030 of Indian corn, 113,599 of buckwheat, 2,109,905 of potatoes, 153,375 pounds of wool, 11,381 of hops, 4533 of wax, 1603 of tobacco, 966 of silk cocoons, 1,326,764 of sugar, 120,805 tons of hay, 755 of hemp or flax. The products of the dairy were valued at \$301,693; of the orchard at 16,905; and of lumber at \$393,385.

Michigan lake is the largest lake that lies wholly within the United States, being 350 m. long, and on an average 60 m. broad, containing 16,981 sq. m., or 10,698,000 acres. It has Green bay, a large branch on the N.W. The straits of Michilimackinac, 40 m. long, connect lake Michigan with lake Huron. Saginaw bay is a large branch of lake Huron, 60 m. long, and 28 m. wide.

Detroit is much the largest and most commercial place in the state. A large number of steamboats and other vessels ply between this place and Buffalo, and other places on the lakes. The other principal places are Monroe on the river Raisin; Pontiac on Clinton river, 16 m. N.W. from Detroit; Adrian, Ypsilanti, Ann Arbor, Kalamazoo, Marshall, and Jackson in the interior; and St. Joseph and Grand Haven on lake Michigan, at the mouths of St. Joseph and Grand rivers.

The exports of Michigan in 1840, amounted to \$162,229, and the imports to \$126,510. There were 96 commission houses in foreign trade, with a capital of \$177,500; 612 retail dry goods and other stores, with a capital of \$2,238,988; 312 persons employed in the lumber trade, with a capital of \$45,800; 453 persons employed in the fisheries (lake), with a capital of \$28,640.

The amount of home-made or family manufactures was \$113,955; 16 fulling-mills and four woollen manufactures employed 37 persons, producing articles to the amount of \$9734, with a capital of \$34,120; 15 furnaces produced 601 tons of cast iron, employing 99 persons, and a capital of \$60,800; one paper-mill employed six persons, produced to the amount of \$7090, capital \$30,000; 19 persons manufactured tobacco to the amount of \$5000, capital \$1750; hats and caps were manufactured to the amount of \$30,463, and straw bonnets to the amount of \$659, employing 43 persons, and a capital of \$30,007; 36 tanneries employed 99 persons, and a capital of \$70,940; 101 other manufactures of leather, as saddlery, &c., produced articles to the amount of \$192,190,

MICHIGAN.

with a capital of \$69,909; one glass-house employed 34 persons, produced to the amount of \$7399, with a capital of \$25,000; three potteries employed 40 persons, and produced to the amount of \$1100, with a capital of \$1900; three persons produced confectionery to the amount of \$3000, with a capital of \$1900; 67 persons produced machinery to the amount of \$47,000; seven persons produced hardware and cutlery to the amount of \$1939; one person manufactured the precious metals to the amount of \$5000; 35 persons manufactured granite and marble to the amount of \$7000; 226 persons produced bricks and lime to the amount of \$69,413; six persons produced 78,100 pounds of soap, and 57,975 pounds of tallow candles, with a capital of \$6000; 34 distilleries produced 337,761 gallons, and 10 breweries produced 308,696 gallons, the whole employing 116 persons, and a capital of \$194,900; 59 persons produced carriages and wagons to the amount of \$90,075, with a capital of \$13,150; 93 flouring-mills produced 993,890 barrels of flour, and, with grist and saw-mills, employed 1144 persons, producing articles to the amount of \$1,535,363, with a capital of \$2,460,900; vessels were built to the amount of \$10,500; 65 persons manufactured furniture to the amount of \$25,404, with a capital of \$96,050; 29 brick or stone houses, and 1980 wooden houses erected, employed 1978 persons, and cost \$571,085; 36 printing-offices, two bladders, six daily and 36 weekly newspapers, and one periodical, employed 119 persons, and a capital of \$69,900. The total amount of capital employed in manufactures was \$3,112,940.

Michigan university at Ann Arbor has departments of literature, science, and the arts, and of law and medicine. It is designed to have academic branches in different parts of the state, and they have already been established at Detroit, Ann Arbor, Kalamazoo, White Pigeon, and Tecumseh. The institution has been well endowed by 48,000 acres of choice lands, the minimum price of which is established by law at \$12 the acre. Marshall college, at Marshall, has been established by the Presbyterians; and St. Philip's college, near Detroit, by the Roman Catholics. The colleges had in 1840, 158 students. There were in the state 18 academies, with 465 students; and 975 common and primary schools, with 90,701 scholars. There were 3175 white persons over 20 years of age, who could neither read nor write.

In 1836, the Presbyterians had 42 churches and 19 ministers; the Baptists had 17 churches and 11 ministers; the Roman Catholics had one bishop and 18 ministers; the Episcopalians had one bishop and four ministers; and the Methodists were considerably numerous.

At the commencement of 1840, the state had nine banks and one branch, with an aggregate capital of \$1,999,900, and a circulation of \$261,936. At the close of 1840, the state debt amounted to \$6,011,000. There is a state penitentiary, on the Auburn plan, at Jackson.

The most important works of internal improvement are the *Central railroad*, now completed and in operation 89 m. from Detroit to Jackson; the *Southern railroad* is completed and in operation from Monroe to Adrian, 36 m. The legislature has appropriated the proceeds of both roads for the ironing of the former to Marshall, 30 m. further W., and of the latter to Hillsdale, 29 m. further W.; and it was expected that both roads would be completed thus far in the course of the year 1843. The legislature has appropriated the proceeds or the value of 150,000 acres of the state lands for the extension of the Central road 24 m. from Marshall, the whole of which is now under contract. This road is designed to extend from Detroit to St. Joseph, on lake Michigan, 194 m. The Erie and Kalamazoo railroad is in operation 20 m. from Toledo to Adrian. The Detroit and Pontiac railroad is in operation 35 m. from Detroit to Pontiac. Other works which have been projected are, for the present, suspended or abandoned.

The governor is elected once in two years by the people. He must be a citizen of the United States, and have resided in the state two years next preceding his election. The lieutenant-governor must have similar qualifications, and is elected for the same term and at the same time by the people. He is president of the senate; and in case of the decease, impeachment, resignation, or absence of the governor discharges the duties of the office.

The senate consists of 18 members, elected by the people for two years, one half of the number being elected annually. They must be qualified electors, and reside in the county or district which they represent. The house of representatives consists of 54 members, elected annually by the people, and must have similar qualifications to the senators. The judges of the supreme court are appointed by the governor, with the advice and consent of the senate, and hold their offices for seven years. Judges of county courts, associate judges of circuit courts, and judges of probate are elected by the people for the term of four years. Every white male citizen, above the age of 21 years, who has resided in the state six months next preceding an election, is

MIDDLEBURG.

permitted to vote only in the township or district in which he resides. The legislature meet annually at Detroit, on the first Monday of January.

Michigan was visited by French traders as early as 1668. Detroit was settled in 1670. At the peace of 1763, this country was ceded by France to Great Britain, and at the close of the Revolutionary war was ceded by Great Britain to the United States. They however held possession of Detroit until 1796, when it was given up to the United States. In 1805 the state was erected into a distinct territory, and received a territorial government. The British had possession of the country in 1812-13, but were soon expelled by the Americans under General Harrison. In 1836 Michigan was admitted into the union as a sovereign state.

MICHIGAN, lake, Mich., one of the five great lakes of North America, and is the second in size; being inferior only to lake Superior and lake Huron. It is between 41° 30' 58" and 46° N. lat., and between 84° 40' and 87° 8' W. long. In the northern part it communicates with lake Huron by the straits of Michilimackinac, or Mackinac, about 8 m. wide, and 4 in its narrowest part, by which, and its southern part, it separates the two peninsulas of Michigan. (For its dimensions see Michigan state.) It is estimated to be on an average 900 feet deep, and is elevated about 300 feet above tide-water. It has few good harbours. On the west side are those of Chicago, Milwaukee, and Green bay. On the E. side are Michigan city, St. Joseph, at the mouth of St. Joseph river, and Grand Haven, near the mouth of Grand river. It is navigated by many large vessels and several steamboats, which ply from Buffalo to Chicago, stopping at the intermediate places. It affords great facilities for transportation to the N.W. country. Merchants have had their goods carried from New-York over 70 m. up Grand river, through this lake, for a dollar for one hundred pounds. The lake has pure and clear water, and abounds with excellent fish. There are several islands in its N. part. A canal is in progress from Chicago to Illinois river, which is one of the great works of the west, and will probably be soon completed.

MICHIGAN CITY, p. v., La Porte co., Ia., 157 m. N.W. Indianapolis, 66 W. Situated on the E. shore of lake Michigan, at the mouth of Trail creek. It was laid out in 1835, and is the only harbour on the lake in the state. The location is in general healthy, and it has a fine situation for trade. It contains three churches, five large warehouses, 10 stores, one flouring-mill, one iron foundry, a branch of the bank of the state of Indiana, and about 700 inhabitants.

MICHILIMACKINAC, county and strait. (See MACKINAC.)

MIDDLE, t., Cape May co., N.J. Bounded E. by the Atlantic, W. by Delaware bay. Watered by Goshon, Dyer's, Green and Fishing creeks, flowing through marshes into Delaware bay. It contains the village of Cape May courthouse, and has 19 stores, two grist-mills, two saw-mills; five schools, 298 scholars. Pop. 1604.

MIDDLEBOROUGH, p. t., Plymouth co., Mass., 49 m. E. by E. Boston, 433 W. Incorporated in 1699. It contains two large ponds, from the bottom of one of which iron ore is taken. It contains eight churches, four Baptist, three Congregational and a Methodist, eight stores, one fulling-mill, two cotton factories with 2500 spindles, one furnace, two forges, four grist-mills, 11 saw-mills; one academy, 172 students; 40 schools, 1500 scholars. Pop. 5085.

MIDDLEBOURNE, p. v., capital of Tyler co., Va., 307 m. N.W. Richmond, 375 W. Situated on the E. side of Middle Island creek, and contains a courthouse, jail, and several stores and dwellings. Net proceeds of the post-office, \$78.

MIDDLEBURG, a town of Holland, prov. Zealand, of which it is the cap., nearly in the centre of the island of Walcheren, 4 m. N. by E. Flushing, and 47 m. S.W. Rotterdam; lat. 51° 30' 6" N., long. 3° 37' 30" E. Pop. 3990. Though no longer fortified, it preserves its circular mound of earth, divided into bastions and surrounded by a broad and deep ditch. The approaches to Middleburg are somewhat more varied than to most Dutch towns, the roads passing through a number of small plantations and country houses. It is nearly circular; some of its streets are wide and handsome, and the whole are tolerably regular. The market-place forms a spacious square; and part of the town is traversed by canals, crossed by draw-bridges. The whole is extremely clean; the private houses are uniform, and some of the public buildings capacious, particularly the town-house and the Oostkerk (east church); the former is in the Gothic style, and has several statues and paintings. The other objects most worthy of notice are several of the churches, a high spire, commanding a prospect over the whole island, the public walks along the bastions, and the Molenwaer, an extensive reservoir or backwater. The chief literary institution is the *atheneum*, or academy, which affords nearly the same course of in-

MIDDLEBURY.

struction as a university, but without the privilege of conferring degrees. It has also a Latin school; a school of design; the Zealand society of literature, arts, and sciences, which possesses a good library, a collection of medals, &c.; and a society of agriculture.

Middlebury has manufactures of starch, glass, and paper, a cannon foundry, and several saw-mills, and salt refineries. Though four miles from the sea, it has quays of considerable extent, and formerly had a considerable share in the Dutch East India trade. Its other branches of commerce are the importation of wine, chiefly from Bordeaux, and the exportation of corn, brought to its market from the fertile tracts to the eastward of the island. It was the head-quarters of the British army in the unfortunate expedition of 1809. Its atmosphere, like that of the rest of Zealand, is loaded with moisture, which tends to engender agues and bilious complaints, particularly in autumn.

Middlebury is of considerable antiquity, having been first surrounded with walls in 1132. It was taken by the Dutch from the Spaniards in 1574. In 1795 it was ceded to the French, under whom it was the capital of the department Bouches-de-l'Escaut. It sends eight deputies to the provincial assembly of Zealand. (*De Cloet; Stein's Handbook; Dict. Géog. &c.*)

MIDDLEBURY, p. t., Schoharie county, N. Y., 37 m. W. Albany, 378 W. It contains a large pond or marsh called the Vly, the outlet of which flows into Schoharie creek, by which it is bounded on the W. It contains nine churches, five Methodist, a Dutch Reformed, Lutheran, Baptist and Christian, 11 stores, four fulling-mills, six grist-mills, 36 saw-mills, four tanneries; 90 schools, 868 scholars. Population 3843.

MIDDLEBURY, p. t., capital of Addison co., Vt., 33 m. S.E. Burlington, 50 m. S.W. Montpelier, 481 W. Watered by Otter creek and Middlebury rivers, which afford extensive water-power. Chartered in 1761. It contains 16 stores, six fulling-mills, two woollen factories, one cotton factory with 3600 spindles, one furnace, one forge, two grist-mills, six saw-mills, two tanneries, two printing-offices, one bindery, two weekly newspapers, and one periodical; two academies, 70 students, 12 schools, 400 scholars. Pop. 3162. The village is situated at the falls on both sides of Otter creek, which are connected by a bridge, and is one of the most flourishing villages in the state. It contains a courthouse, jail, a bank, five churches, a Congregational, Methodist, Episcopal, Baptist and Roman Catholic, and most of the above mills and manufactories. It has a fine marble quarry, which produces to the amount of from \$8000 to \$20000 annually, and affords some of the finest statuary and other marble. It is the seat of Middlebury college, founded in 1800, which has a president and five professors, or other instructors, has 771 alumni, of whom 245 have been ministers of the gospel, 56 students, and 7054 volumes in its libraries. The commencement is on the third Wednesday in August. The college edifices are two, one of which is of stone, 106 feet long, 40 feet wide and four stories high, containing 48 rooms for students. It has sometimes had over 100 students. The village contains two academies, above mentioned, one male and one female, which are flourishing.

MIDDLEBURY, p. t., New-Haven co., Ct., 32 m. W.S.W. Hartford, 310 W. Watered by branches of Naugatuck river and by Quasegang pond, the outlet of which affords water-power. It contains two churches, a Congregational and Methodist, two stores, two grist-mills, four saw-mills, one tannery, three distilleries; one academy, 32 students; six schools, 128 scholars. Pop. 761.

MIDDLEBURY, p. t., Wyoming co., N. Y., 247 m. W. Albany, 365 W. Drained by Allen's creek, a tributary of Tonawanda creek. It contains two churches, a Baptist and Presbyterian, five stores, two fulling-mills, two grist-mills, three saw-mills, two tanneries; one academy, 300 students; 22 schools, 1154 scholars. Pop. 2445.

MIDDLEBURY, p. v., Talmadge t., Summit co., O., 125 m. N.E. Columbus, 380 W. Situated on both sides of Little Cuyahoga river, which affords good water-power. It contains a Presbyterian church, of brick, an academy, seven stores, one furnace, two flouring-mills, one machine shop, two wool-carding and cloth-dressing works, one sash factory, one large chair and cabinet shop, and various other mechanical establishments, and about 600 inhabitants.

MIDDLEFIELD, p. t., Hampshire co., Mass., 124 m. W. Boston, 268 W. Incorporated in 1783. It lies on the Green mountain range. Watered by a branch of Westfield river. It contains three churches, a Congregational, Baptist and Methodist, four stores, six fulling-mills, two woollen factories, one grist-mill, seven saw-mills; nine schools, 246 scholars. Pop. 1717.

MIDDLEFIELD, p. t., Otsego co., N. Y., 64 m. W. Albany, 267 W. Bounded W. by Otsego lake and outlet, E. by Cherryvalley creek. It contains three churches, a Presbyterian, Methodist, and Baptist, seven stores, three fulling-

MIDDLESEX.

mills, five grist-mills, 18 saw-mills, one oil-mill, four tanneries, two distilleries; two academies, 58 students; 17 schools, 820 scholars. Pop. 3319.

MIDDLE PAXTON, t., Dauphin co., Pa., 9 m. N.E. Harrisburg. Drained by Fishing, Stony, and Clark's creeks. Bounded W. by Susquehanna river. It contains anthracite coal, and has a church, four stores, one furnace, three grist-mills, six saw-mills, one tannery, one distillery; one school, 75 scholars. Pop. 1560.

MIDDLESBOROUGH, a river-port, town and par. of England, N. Riding co. York, hund. Langborough, on the Tees, about 24 m. from its mouth, 16 m. E. by N. Darlington, and 215 m. N. London. Area of par., 2300 acres. Pop. of township, in 1821, only 40; in 1831, 154; but in 1841 estimated at 4500, an increase attributable to the rapid rise of its coal trade, consequent on the opening of the Stockton and Darlington railway from the collieries of S. Durham. It consists of a main street facing the river, and of another wide avenue running at right angles to it, at the corner of which are the commercial hotel and reading-rooms, surmounted by an observatory. There are also several other respectable streets; and on the whole the town is regularly and substantially built, under the superintendence of a joint-stock building company. The church, erected at an expense of £3500, raised by subscription, and opened in 1840, is a neat Gothic structure, with a rather elegant spire. A national school has been formed, and the church has likewise a well-attended Sunday school. The Wesleyan Methodists, Baptists, and primitive Methodists have also their respective places of worship, with attached Sunday schools, furnishing religious instruction to about 600 children of both sexes.

Middlesborough, the site of which only eleven years ago was occupied by a solitary farm-house, has already become the most considerable part of the Tees, though still regarded as subordinate to Stockton, from which it has taken nearly all its coal-trade, and a large portion of its ship-building. Its rapid rise is owing to its convenient position near the bar of the Tees, and the spirited conduct of Messrs. Pease, Backhouse, and other wealthy coal-owners, who, in connection with other shareholders, have built excellent staiths for loading colliers at the wharfs, and constructed a railway communicating with the important coal-field near Bishop's Auckland. The line was opened to Middlesborough (a distance of 32 m. from Witton Park colliery) in 1833; and the export of coal was stated by J. Pease, Esq., M.P., to amount, in 1839, to 510,000 tons, and the number of passengers in the same year somewhat exceeded 16,000. The entire cost of this undertaking was about £450,000, and the present gross income is upwards of £70,000, the average dividends being about 104 per cent. The staiths, which are 450 yards in length, and worked by two large steam-engines, are capable of shipping 4000 tons of coal per diem. Large docks are also in process of excavation, which, when completed, will comprise a water area of several acres. Steam tug-boats are constantly employed in bringing in and taking out vessels over the bar of the river: steamers run twice or three times a week during summer between this port and Sunderland and Newcastle; and there is a weekly steamer to and from London. Two ship-building yards, an extensive pottery, and some sail-cloth and rope manufactories are in active operation. The trade of Middlesborough, independent of coal, is already important; and it bids fair to rival, both in trade and industry, the flourishing towns of Tyne-mouth and Sunderland. (*Irish Railway Comm. Rep.; Sir G. Head's Home Tour; Grassville's Spas of Eng.; Priv. Inf.*)

MIDDLESEX, a co. of England, containing the greater part of the metropolis, having E. the river Lea, which divides it from Essex, N. the co. Hertford, W. Buckingham, and S. the Thames, which separates it from Surrey and Kent. It is one of the smallest of the English counties, comprising only 180,490 acres; surface very various. The highest eminences are Hampstead, Highgate, and Harrow-on-the-hill. In some parts along the Thames there are extensive tracts of rich loam; but the higher grounds are mostly gravelly and clayey, and not naturally fertile. There are numerous unenclosed commons in different parts of the county, and Hoemloot-heath, on its S.W. angle, is as poor and unimprovable a tract as can well be imagined. Contrary to what might have been expected, agriculture is but little advanced in this county; and, although considerable improvements have been made, the implements and processes of husbandry are still very inferior. But by far the largest portion of the county is in grass, and the business of haymaking is as well understood here as in any part of the kingdom. The rich tract of land along the Thames from Kensington to Isleworth is principally occupied by market gardeners, who send a large supply of fruits and vegetables to the London market. The cows kept for the supply of London with milk are all short-horned. Property is very much divided, and in several districts it is mostly

MIDDLESEX.

portioned out into villas and pleasure grounds; farms seldom exceed 300 acres, and their average size is supposed to be about 100. Leases pretty common, and mostly for 14 and 21 years. Average rent of land, in 1820, 38s. 8½d. Minerals of no importance; but in the vicinity of London in many places vast quantities of land have been dug up, and converted into bricks. Middlesex is well watered; besides the Thames and the Lea, by which it is bounded, it is intersected and partly bounded on the W. by the Colne; and it is also intersected by the Brent, and by the Grand Junction canal, &c. It is divided, exclusive of the metropolis, into six hundreds and 75 parishes. It returns 14 members to the House of Commons—viz. two for the county, four for the city of London, two for Westminster, two for the Tower hamlets, two for Finsbury, and two for Marylebone. Registered electors for the county in 1839—40, 13,919. In 1841, Middlesex had 207,670 inhabited houses, and 1,576,616 inhabitants; of whom 738,970 were males, and 837,646 females. Sum expended for the relief of the poor in 1838—1839, £386,679.

MIDDLESEX, county, Mass. Situated in the E. part of the state, and contains 800 sq. m. Watered by Merrimac, Charles, Mystic, Sudbury, Concord, and Nashua rivers. The Middlesex canal passes through its N.E. part. It contained in 1840, 33,706 neat cattle, 8351 sheep, 20,591 of swine; and produced 9503 bushels of wheat, 61,105 of rye, 320,473 of Indian corn, 5074 of buckwheat, 98,539 of barley, 86,031 of oats, 741,851 of potatoes. It had 13 commissioned houses in foreign trade, 553 stores, capital £1,388,400, 23 lumber yards, capital \$230,000, two furnaces, 36 forges, seven fulling-mills, 18 woolen factories, 35 cotton factories with 189,664 spindles, two flouring-mills, 98 grist-mills, 141 saw-mills, 13 paper-mills, four powder-mills, 34 tanneries, five distilleries one brewery, 13 printing-offices, 12 blind-ries, eight weekly and two semi-weekly newspapers, and six periodicals. Total capital in manufactures \$12,215,055; one college, 341 students; 44 academies, 4014 students; 389 schools, 24,876 scholars. Pop. 106,611. Capitals, Concord, Cambridge, and Lowell.

MIDDLESEX, county, Ct. Centrally situated toward the E. part of the state, and contains 342 sq. m. Connecticut river passes centrally through it, affording great facilities for commerce, and by its small tributaries, affords extensive water-power. It contained in 1840, 15,667 neat cattle, 14,758 sheep, 8494 swine; and produced 5463 bushels of wheat, 54,584 of rye, 103,920 of Indian corn, 9169 of buckwheat, 40,026 of oats, 181,673 of potatoes. It had 105 stores, seven lumber yards, eight fulling-mills, one woolen factory, eight cotton factories with 7646 spindles, one dyeing and printing works, 28 grist-mills, 42 saw-mills, one powder-mill, 15 tanneries, four printing-offices, one bindery, two weekly newspapers, and one periodical; one college, 147 students; seven academies, 326 students; 123 schools, 3225 scholars. Pop. 24,579. Capitals, Middletown and Had-dam.

MIDDLESEX, county, N. J. Situated near the centre of the state, and contains 359 sq. m. Watered by Raritan river and its branches, and by Millstone and Rahway rivers. Raritan bay forms an excellent harbor, communicating directly with the ocean, and with New-York harbour, through Staten Island sound. It contained in 1840, 12,992 neat cattle, 8310 sheep, 11,636 swine; and produced 35,933 bushels of wheat, 30,728 of rye, 194,474 of Indian corn, 48,224 of buckwheat, 1519 of barley, 185,730 of oats, 68,965 of potatoes. It had 136 stores, five lumber yards, one cotton factory, one flouring-mill, 21 grist-mills, 90 saw-mills, two paper-mills, six tanneries, 15 distilleries, three potteries, four printing-offices, two binderies, one daily and two weekly newspapers; three academies, 113 students; 70 schools, 2940 scholars. Pop. 21,893. Capital, New-Brunswick.

MIDDLESEX, county, Va. Situated in the E. part of the state, and contains 170 sq. m. Bounded N.E. by Rappahannock river, S.W. by Piankaskin river, and E. by Chesapeake bay. It contained in 1840, 3638 neat cattle, 9603 sheep, 6901 swine; and produced 17,097 bushels of wheat, 1148 of rye, 128,145 of Indian corn, 31,078 of oats, 7527 of potatoes, 1350 pounds of tobacco, 9620 of cotton. It had 14 stores, one flouring-mill, 11 grist-mills, seven saw-mills; 10 schools, 902 scholars. Pop.: whites, 9041; slaves, 9209; free coloured, 949; total, 4392. Capital, Urbanna.

MIDDLESEX, p. t., Washington co., Vt., 6 m. N.E. Montpelier, 519 W. Bounded S. by Onion or Winoski river, by the N. branch of which it is watered. Between this town and Moretown, Onion river passes through a rocky chasm, with perpendicular walls, 30 feet deep, 60 feet wide, and 80 rods long, over which is a bridge. It is a curiosity. It contains a church, one store, one grist-mill, three saw-mills, one oil-mill; 12 schools, 487 scholars. Pop. 1370.

MIDDLESEX, p. t., Yates co., N. Y., 194 m. W. Albany, 323 W. Bounded W. by Canandaigua lake. Drained by West creek. It has one grist-mill, one saw-mill; 12 schools, 610 scholars. Pop. 1439.

MIDDLETOWN.

MIDDLESEX, t., Butler co., Pa. It has two stores, one fulling-mill, five grist-mills, three saw-mills; nine schools, 345 scholars. Pop. 1692.

MIDDLE SMITHFIELD, t., Monroe co., Pa. It has two grist-mills, two saw-mills. Pop. 1144.

MIDDLETOWN, a manufacturing market town and par. of England, honour of Clitheroe, hund. Salford, 16 m. W. Lancaster, 5 m. N.N.E. Manchester, and 165 m. N. by W. London. Area of par., 11,510 acres. Pop. of par. (comprising eight townships), in 1841, 15,489; pop. of township 6003. This town, which in 1775 was an inconsiderable village, containing only 300 inhabitants, has, owing to the extension of the cotton-trade, become a large place, with several good streets and well-built houses. The church, rebuilt in 1524, has a low tower, partly of wood, and some fine carvings and painted windows: the living is a rectory, in the gift of Lord Suffield, the lord of the manor. Within the parish are, also, three Episcopal chapels, and seven places of worship for different denominations of dissenters, with 17 attached Sunday schools, furnishing religious instruction to about 9400 children. A free grammar school was founded in 1572; and within the last few years, three subscription schools have been formed for the education of the children of the working classes. The principal employments of Middletown are silk and cotton weaving, cotton spinning, calico and silk printing: there are, within the township, about 3600 silk weavers, and 1000 persons employed in the cotton-mills; besides nearly 500 engaged in subordinate trades. The Rochdale canal, the Manchester and Leeds railway, and the Bolton railway pass through the parish, and afford the greatest facilities for the conveyance both of passengers and goods. The town is governed by the county and manorial constables; and courts leet and here are held twice a year. Markets on Saturday, 1st Monday after 10th March, ditto after 15th April, and 3d Thursday after 29th Sept. (*Butterworth's Stat. of Lanc.; Baines' Lanc., &c.*)

MIDDLETOWN, a market town of Ireland, co. Cork, prov. Munster, at the confluence of the Curra and Lewis rivers, at the N.E. extremity of Cork harbour, 14 m. E. Cork. Pop. in 1831, 1946. Middletown, so called from being midway between Cork and Youghal, has a parish church, a Roman Catholic chapel and convent; an endowed grammar school, and two schools partially supported by the commissioners of education, a fever hospital and dispensary, a market-house, courthouse, and bridewell. It is built in a very straggling manner, and is neither lighted nor paved; but it contains several respectable dwelling-houses, and good shops: it is increasing, and is generally admitted to be in a thriving condition. It has two extensive distilleries, and a brewery; and it has the advantage of being in the immediate neighbourhood of the harbour of Ballinacorney, where the merchants ship their commodities, especially flour and agricultural produce. (*Man. Board Rep.*) The corporation, consisting of a sovereign, two bailiffs, 12 burgesses, and commonalty, returned two members to the Irish House of Commons till the union, when it was dissolved. Quarter sessions are held in June and Nov.; and it is a consular station. Duty was paid, in 1838, on 96,192 bush. malt, and 597,535 galls. whiskey. Markets on Saturday, fairs on the 14th Feb., 14th May, 5th July, 16th Sept., 10th Oct., and 23d Nov. Postoffice revenue, in 1839, £2985; in 1836, £469.

MIDDLETOWN, p. t., Essex co., Mass., 28 m. N. Boston, 466 W. Watered by Ipswich river. It has two stores, one fulling-mill, one woolen factory; four schools, 300 scholars. Pop. 637.

MIDDLETOWN, p. t., Rutland co., Vt., 77 m. S.W. Montpelier, 441 W. It contains a Congregational and a Baptist church, several stores, nine saw-mills, nine schools, 353 scholars. Pop. 1037.

MIDDLETOWN, t., Newport co., R. I., 26 m. S. by E. Providence. It is the middle of three townships, into which Rhode Island is divided. Incorporated in 1763. It has two grist-mills, five schools; 148 scholars. Pop. 691.

MIDDLETOWN, city, p. t., port of entry, semi-capital of Middlesex co., Ct., 14 m. S. Hartford, 24 m. N.E. New Haven, 35 m. N.W. New-London, 396 W. The township is 9 m. long, with an average breadth of nearly 7 m. A range of hills with a base of granite crosses the Connecticut, a little below the city, where the river is compressed to the width of 33 rods; and a range of greenstone mountains passes through its W. part. Opposite to the city the river is from 80 to 97 rods wide. A horse ferry boat crosses to Chatham. The township, including the city, contains 27 stores, capital \$269,500, three lumber yards, capital \$40,000, one fulling-mill, one woolen factory, one cotton factory, with 11,000 spindles, one dyeing and printing works, two grist-mills, five saw-mills, one powder-mill, one rope-walk, two tanneries, four printing-offices, one bindery, two weekly newspapers, and one periodical; three academies, 115 students, 33 schools, 1286 scholars. Pop. 7210.

MIDDLETOWN POINT.

The city is situated on the W. bank of Connecticut river, 31 m. above its mouth in Long Island sound, in 41° 33' 8" N. lat. and 73° 39' W. long. The ground rises gradually from the river, and in the back part attains a commanding elevation, affording a delightful view of the river and of the surrounding country. The principal streets run parallel with the river, and are crossed by other streets running at right angles with them, making over eight in the whole. The principal street is Main-street, elevated from 45 to 50 feet above the river, running N. and S., about 1 mile in length, is broad and straight, and contains the principal stores and public buildings. The city is at the head of ship navigation, and admits to its wharves any vessels which can pass the bar at the mouth of the river, having ten feet of water. It was first settled in 1651, and was incorporated as a city in 1784, and contains a handsome courthouse, a jail, a fine custom-house of stone, two banks, besides one for savings, seven churches, two Congregational, an Episcopal, Methodist, Baptist, Universalist, and an African, and most of the above mentioned stores and manufactures. The tonnage of the port in 1840, was 14,231. Vessels for Hartford and other towns on the river are registered here. It contains about 490 dwellings, and 3511 inhabitants.

It is the seat of the Wesleyan university, under the direction of the Methodists, founded in 1831, which has a president and nine professors or other instructors, 143 alumni, of whom 49 have been ministers of the gospel, 133 students, and 11,000 vols. in its libraries. The commencement is on the first Wednesday in August. It has a valuable philosophical apparatus, and mineralogical cabinet. The buildings occupy a commanding site in the upper part of the city, over half a mile from the river. Two miles above the city is the village of Upper Middletown or Middletown Upper-houses, which contains two churches, a Congregational and Baptist, and has had considerable ship-building for more than a century. West river, a small stream, enters Connecticut river between this and the city, and affords water-power. The steamboat from Hartford to New-York stops at the city daily in the season of navigation.

MIDDLETOWN, p. L. Delaware co., N. Y., 79 m. W.S.W. Albany, 335 W. Watered by Papacott, branch of Delaware river. It was organized in 1789, and contains eight stores, two fulling-mills, seven grist-mills, 19 saw-mills, three tanneries; 30 schools, 754 scholars. Pop. 2008.

MIDDLETOWN, p. L. Monmouth co., N. J., 51 m. E.N.E. Trenton, 220 W. Bounded N. by Sandy-hook and Raritan bays, E. by the Atlantic. The beach forming Sandy-hook runs 6 m. N. from Shrewsbury inlet, on the N. point of which stands Sandy-hook lighthouse. Drained by Swimming and Neversink rivers. It contains three churches, a Dutch Reformed, Episcopal, and Baptist, 33 stores, three lumber-yards, two fulling-mills, 11 grist-mills, six saw-mills, three tanneries, eight distilleries; one academy, 60 students, 19 schools, 1230 scholars. Pop. 8063.

MIDDLETOWN, L. Bucks co., Pa., 20 m. N.N.E. Philadelphia. Watered by Nesquehanna creek and its tributary, and Bristol creek. It has four stores; one academy, 37 students; two schools, 164 scholars. Pop. 2124.

MIDDLETOWN, L. Delaware co., Pa., 30 m. W. Philadelphia. Bounded W. by Chester creek, E. by Ridley creek. It has three stores, two fulling-mills, one woollen factory, four cotton factories, with 4950 spindles, two grist-mills, three saw-mills; five schools, 193 scholars. Pop. 1451.

MIDDLETOWN, p. v., Frederick co., Va., 158 m. N.N.W. Richmond, 67 W. Situated on Meadow run, on which are several mills. It contains two churches, an academy, five stores, and about 400 inhabitants. Wagons are extensively manufactured.

MIDDLETOWN, p. v. Lemon t. Butler co., O., 30 m. N. Cincinnati, 90 m. W.S.W. Columbus, 460 W. Situated on the E. side of Miami river. The Miami canal passes through it. It contains three churches, 11 stores, two pork-houses, one woollen factory, one grist-mill; one academy, 150 dwellings, and about 1000 inhabitants. A toll bridge here crosses Miami river.

MIDDLETOWN, L. Columbiana co., O. It has seven schools, 147 scholars. Pop. 1601.

MIDDLETOWN POINT, p. v., port of delivery, Middletown t. Monmouth co., N. J., 43 m. E. by N. Trenton, 200 W. Situated on Middletown creek, 3 m. from its entrance into Raritan bay. It contains a Presbyterian church, a bank, 10 stores, and about 100 dwellings, many of them neat.

MIDDLEWICH, a market town and par. of England, hund. Northwick, co. Chester, at the confluence of the Dane and Croke, 18 m. E. Chester, and 151 m. N.W. London. Area of par. which comprises 14 townships, 13,330 acres; pop. of do., in 1841, 4755; pop. of township, 1395. The town, though small, is neat and regularly built, its principal public edifices being a large church, three places of worship for dissenters, and a free school. Middlewich has long been celebrated for its brine-springs, the water of

MIFFLIN.

which is alleged to yield $\frac{1}{4}$ its weight of salt (muriate of soda). The manufacture of salt is hence the chief employment of the inhabitants; but some additional advantages have been derived, within the last 30 years, from the introduction of the cotton trade: there is also a silk-mill, which employed, in 1830, about 40 hands.

Middlewich has an extensive internal navigation by means of the Grand-trunk canal, which passes through the town, and by a branch connecting the town with the Chester canal. It is distant only $\frac{1}{4}$ m. from the Winsford station, on the Grand Junction railway, and about $\frac{1}{4}$ m. from the yet unfinished Manchester and Birmingham railway. Petty sessions are held here for the hund. of Northwick. Markets on Tuesday; cattle fairs, May 1, Holy Thursday, and Aug. 5.

MIDHURST, a pari. bor., market town, and par. of England, co. Sussex, hund. Easebourne, and rape Chichester, near the Arun, 10 m. N. by E. Chichester, and 46 m. S.W. London. Pop. of pari. bor. (which includes the entire pars. of Midhurst, Easebourne, Heyshott, Chithurst, Graffham, Didding, and Cocking, with portions of parishes. Steep, Bignor, Wool-Lavington, Bepton, Woolbeding, Lynch, Siedham, Sping, Trotton, Sellham, and Lodsworth), in 1831, 5637. The town is small, but particularly clean-looking, and has several good detached houses in its immediate neighbourhood. The church is a small stone building, with a square tower surmounted by a diminutive steeple: the living is a curacy in private patronage. A free grammar school was founded here in 1672, and there is a national and Sunday school for poor children of both sexes. "Midhurst has very little trade, except in corn, large quantities of which are sold at its weekly markets. The surrounding district is entirely agricultural, though formerly iron-works existed within a few miles of it." (*Bessand. Rep.*) It is a borough by prescription, and sent two members to the House of Commons from the reign of Edward II. down to 1832, the right of voting being in the holders of burgh tenures. The Reform Act deprived it of one of its members; the electoral limits being, at the same time, so much enlarged as to include, in addition to the parish or old borough of Midhurst, six entire parishes, and portions of 11 others, as above specified. Registered electors, in 1839-40, 261. Petty sessions are held here for the hund. of Easebourne. Markets on Thursday; cattle fairs 5th of April and 29th of Oct.

About $\frac{1}{4}$ m. E. of Midhurst, and close to the Arun, are the ruins of Coudry house, formerly the residence of the family of Montague, destroyed by fire, with its costly furniture, pictures, books, &c., on the 24th Sept., 1793: the same day that its noble owner was drowned in an attempt to sail down the falls of the Rhine at Schaffhausen.

MIDLAND, county, Mich., recently formed. Bounded E. by Saginaw bay. Watered by Tittabawassee river and its branches. Capital, Midland.

MIDNAPORE, a dist. of British India, presid. Bengal, properly belonging to the prov. Orissa, but which has long been attached to that of Bengal; principally between lat. 21° 40' and 23° and long. 86° and 89° E.; having N. the Jungle Mahals, E. the Hooghly district and river, S. Cuttack, and W. some seminarys, tributary to the British. Area, 6260 sq. m. Pop., in 1832, 1,914,000. Notwithstanding this amount of population, a considerable portion of the surface consists of jungles, partially inhabited by a very low caste of Hindoos called *seetals*. The land is generally very fertile, and most part of the articles grown in Bengal are cultivated here; the people, however, are poor and depressed, and it is doubtful whether they ever enjoyed a much higher state of prosperity and civilization than at present. Midnapore has some manufactures of fine calico and gauzes, but of late these have greatly declined. Land revenue, in 1829-30, 1,307,614 rupees. Chief towns, Midnapore, Jailsore, and Pimpely. Midnapore, the capital and residence of the judge, collector, &c., of the district, is in lat. 23° 25' N., long. 87° 25' E. Its chief buildings are the jail, hospital, and barracks. (*Hamilton's E. I. Gaz.*)

MIFFLIN, county, Pa. Situated near the centre of the state, and contains 900 sq. m. Watered by Juniata river, along which proceeds the Pennsylvania canal. It contained in 1840, 6933 neat cattle, 11,323 sheep, 15,002 swine; and produced 307,696 bushels of wheat, 47,466 of rye, 180,451 of Indian corn, 8619 of buckwheat, 227,331 of oats, 51,499 of potatoes. It had 47 stores, four furnaces, two forges, two fulling-mills, five woollen factories, 24 grist-mills, 61 saw-mills, 14 tanneries, five distilleries, one brewery, two printing-offices, one weekly newspaper; one academy, 27 students; 67 schools, 2125 scholars. Pop. 13,092. Capital, Lewistown.

MIFFLIN, L. Lycoming co., Pa., 23 m. N.W. Williamsport. It has three grist-mills, five saw-mills, one distillery, one pottery; five schools, 445 scholars. Pop. 1294.

MIFFLIN, L. Alleghany co., Pa., 8 m. S. Pittsburg. Bounded N.E. and S.E. by Monongahela river, by small tributa-

MIFFLINSBURG.

ries of which it is drained. It contains five stores, four flouring-mills, three saw-mills, four distilleries; five schools, 180 scholars. Pop. 1654.

MIFFLIN, t. Cumberland co., Pa. Bounded S. by Cone-dogwinnt creek. It contains two stores, two fulling-mills, three grist-mills, seven saw-mills, two tanneries; eight schools, 310 scholars. Pop. 1413.

MIFFLIN, t. Columbia co., Pa., 17 m. S.E. Danville. It has five stores, one fulling-mill, two flouring-mills, two grist-mills, seven saw-mills, three tanneries; five schools, 148 scholars. Pop. 2150.

MIFFLIN, t. Dauphin co., Pa., 23 m. N.E. Harrisburg. Watered by Wiconisco creek. It contains a Lutheran church, seven stores, one fulling-mill, five flouring-mills, one grist-mill, eight saw-mills, three tanneries, one pottery; seven schools, 230 scholars. Pop. 1781.

MIFFLIN, p. t. Richland co., O., 5 m. E. Mansfield, 72 N. by E. Columbus, 360 W. Pop. 1800.

MIFFLINSBURG, p. b., Buffalo t., Union co., Pa., 76 m. N. Harrisburg, 186 W. Situated on the S. side of Buffalo creek. Incorporated in 1837. It contains two churches, a Lutheran and a Methodist, six stores, two tanneries, two breweries, two potteries; one academy, 25 students; three schools, 180 scholars, 100 dwellings, and 704 inhabitants.

MIFFLINTOWN, p. b., Fermanagh t., capital of Juniata co., Pa., 45 m. N.W. Harrisburg, 136 W. Situated on the N. bank of Juniata river, on the Pennsylvania canal. It contains a courthouse, jail, two churches, a Presbyterian and Lutheran, an academy, several stores, about 100 dwellings, and 450 inhabitants.

MIHIEL (ST.), a town of France, dep. Meuse, cap. cant., on the Meuse, 20 m. N.E. Bar-le-Duc. Pop., in 1836, 5706. It was formerly surrounded with walls, but these were demolished in 1635. It is well laid out, and has several remarkable churches, in one of which is a fine piece of sculpture, representing Christ laid in the sepulchre, the work of L. Richier, a pupil of Michael Angelo. It is the seat of the court of primary jurisdiction for the arrond. of Commercy, and of the court of assize for the dep.; and has a communal college, a public library, and manufactures of cotton cloth and yarn. (*Hugo, art. Meuse, &c.*)

MILAN (Ital. *Milano*, Germ. *Mailand*, Lat. *Mediolanum*), the principal city of N. Italy, and the cap. of the Austrian dom. S. of the Alps, in a fertile and highly cultivated plain, between the Olona and Lambra, with which rivers it is connected by the *Naviglio Grande* and other canals, 150 m. W. Venice, and 79 m. E.N.E. Turin; lat. 45° 28' 10" N., long. 9° 11' 30" E. Pop., in 1837, 145,500, including only the inhabitants of the city-proper; but with the immediate suburbs, 171,268; and including the garrison and strangers, about 185,000. (*Bergheus*.) It is nearly circular; and is surrounded, except on the N.W., by a bastioned wall of little strength, and broad ramparts, planted with trees, and about 10 m. in circuit. The area thus enclosed comprises, however, not only the city and its suburbs, but a number of gardens and orchards. The city-proper, or, more correctly, the centre, is surrounded by a canal nearly 5 m. in circumference. Like other old cities, it is irregularly laid out, and most of its streets are narrow and winding; but it has some noble thoroughfares, and is generally extremely well paved. Upon the whole, it is one of the finest and most pleasing cities of Europe. "Milan," says Von Raumer, "stands in a sea of green trees, as Venice in a sea of green waters. In the latter city everything reminds you of the past, as the great and important period; here, on the contrary, the present is full of life, and all that belongs to antiquity is thrown into the back ground. Everything reminds one that Milan is a great central point of wealth and activity. No signs of decay, no unoccupied people, unless in the upper classes, where the possession of fortune invites to the *far niente*, which, in Venice, goes hand in hand with wretchedness and want. In Venice, and also in Verona, each house is built according to individual fancy or convenience, and the greatest variety of architecture, and the most wanton deviations from all law, order, or harmony, are seen. In Milan, on the contrary, every building is perfectly symmetrical, and scrupulously kept in repair; and not the least symptom is to be seen of a poor or declining population, so evident is everywhere the progress of improvement." (*Italy and the Italians*, l. 100.)

"The principal public edifice is the cathedral; an immense and imposing Gothic structure, inferior in size only to St. Peter's, Rome, and St. Paul's, London. It stands in the centre of a spacious square, nearly in the middle of the city, and is built wholly of white marble. It was begun by John Galeazzo, first duke of Milan, in 1385; but on so large a scale, that it is not yet quite finished; and, from having been continued by many different architects, of adverse tastes, it has a great admixture of styles. Its principal facade has a fine general effect; but it presents the incongruity of Grecian doorways and windows introduced into a Gothic front. The entire building is in the form of a Latin

MILAN.

cross; its length internally is 493 feet; width, 177 feet; total length of the transept, 283 feet 10 inches; height of the nave, 151 feet 11 inches; height to the top of the lantern, 247 feet; do. to the top of the spire and steeple, 336 feet. There are 52 piers, 98 pinnacles, and, inside and out, no fewer than 4400 statues. (*Wood's Letters of an Architect*, p. 207.) In fretwork, carving, and statues, it goes beyond all churches in the world, St. Peter's itself not excepted. "Its double aisles, its clustered pillars, its lofty arches, the lustre of its walls, its numberless niches, all filled with marble figures, give it an appearance novel even in Italy, and singularly majestic." (*Classical Tour*, iv., 7, 8.) In this cathedral there is no screen, and the chancel is entirely open, and separated from the nave only by its elevation. Neither are there any chapels, properly so called; and the high altar stands, as in the Roman Basilica, and, indeed, in all ancient churches, before the choir, and between the clergy and the people. The pillars, or rather clusters of pillars, which support the vault, though above 90 feet in height, are only 8 feet in diameter, from which comparative thinness they scarcely conceal any part of the interior from the eye. The pavement is of different coloured marbles, disposed in various figures. The dome is surmounted by a tower and obelisk, which last was erected about the middle of the 18th century, adding, however, little to the beauty or magnificence of the edifice. On the top is the figure of the Virgin, to whom the church is dedicated. In a subterranean chapel immediately beneath the dome is the shrine, enclosing the remains of St. Charles Borromeo, archbishop of Milan in the 16th century, to which numerous pilgrims resort. On the whole, however, the cathedral is, both internally and externally, overladen with ornaments; and there can be no doubt that the removal of 2000 or 3000 of its statues would be a signal improvement; but, with all its faults, it is certainly the finest Gothic edifice in Italy; and, in the opinion of some travellers, the finest church after St. Peter's.

Several other churches in Milan are worthy of notice. The first is that of St. Ambrose, the scene of many ecclesiastical councils and civil conflicts, and in which the German emperors usually received the Lombard crown. It is of high antiquity, and possibly some remains of the original edifice, erected by St. Ambrose towards the end of the 4th century, may form part of the modern building; but the bronze doors, and the court in front, surrounded by arcades, are acknowledged to belong to the 9th century; and the most ancient part of the building, having any character of architecture, appears to be of the same period. This church is divided by arcades into a nave and two aisles, and vaulted in nearly the same manner as the church of the Carthusians at Rome (the great hall of Diocletian's baths). Among its curiosities are the tombs of St. Ambrose and other saints, some Greek mosaics, old paintings in stucco, sarcophagi of considerable antiquity, and a large brazen serpent, said to be that fabricated by Moses in the wilderness. The churches of St. Victor, St. Mark, San Celso, St. Eustorgio, the Madonna della Grazia, &c., are among the handsomest or most remarkable in Milan, and some of them are adorned with rare works of art. Baste, however, notwithstanding his disposition to eulogize, says that many of the churches "lose much of their majesty, and even of their beauty, by the profusion of rich and splendid decorations that encumber them. The materials of all are costly, the arrangement of most is tasteless; yet there are few which do not present some object of curiosity worthy of a visit." (*Classical Tour*, iv., 27.) The steeple of St. Gothard is a curious specimen of the architecture of the 14th century.

In the old Dominican convent is the famous *Cenacolo*, or "Last Supper," by Da Vinci. This magnificent work has suffered severely from damp and age, and, also, as is alleged, through the wantonness of the French soldiers and prisoners when they were quartered in the building. But what better could be expected from common soldiers, when a superior of the convent did not hesitate to cut away the feet of the principal figure, that a doorway might be heightened! It occupies one side of the refectory, and is about 30 feet in length, by 15 in height. It has been so often repaired and retouched, that it is now nearly in the condition of Sir John Cutler's silk stockings: three of the apostles' heads are said to be all that remains of the original work, and even they owe their colouring to the pencil of restoration. Hogben's admirable engraving gives now, perhaps, the best idea of the picture and of the genius of the painter. On the wall opposite the "Last Supper" is a fresco, by Motassar, an artist of the 15th century; more curious on account of its age, than remarkable for beauty.

The Royal palace (*Palazzo del Corte*), now the residence of the viceroy of Austrian Italy, a noble structure fronting the square of the cathedral, was erected by the French on the site of the old Sforza palace. It has numerous spacious apartments, and some admirable frescoes by Appiani. The

MILAN.

floors are beautifully inlaid, and some of the rooms are hung with Gobelin tapestry; but the magnificent paintings, representing the exploits of Napoleon, that formerly decorated the two large saloons, have been removed. The government, judicial, and archiepiscopal palaces, the city-hall and mansion-house, the mint, and the custom-house and treasury, are among the other principal edifices. The large hospital (*Ospedale Grande*), is of much greater extent than Bethlehem hospital in London; being about 860 feet in length, by 360 feet in depth, and inclosing several open courts. It is not remarkable for its architecture, but is under excellent regulations. It was founded by Francis Sforza in the 15th century, and was left by one individual 4,000,000 livres (about £190,000), and by another three fourths of that amount. It is open to all applicants, whatever their country, religion, or disorder: attached to it is a dispensary, whence medicines are distributed to the poor *gratis*, on the specification of any physician. The most extensive building in Milan is, however, the Lazaretto, beyond the walls, also founded in the 15th century, for those infected with the plague. It consists of four ranges of building, about 1500 feet each in length, inclosing an area of more than 30 acres. The city abounds in charitable institutions, including several other hospitals, four asylums for poor children, two workhouses, a government loan-bank, in a magnificent edifice built in 1496, &c. (*Oesterr. Nat. Encyc.*)

One of the principal attractions of Milan, especially to strangers, is the famous *Teatro della Scala*. This, which is the largest theatre in the Austrian empire, and, next to San Carlo at Naples, the largest in Italy, has six tiers of boxes, exclusive of the pit, which accommodates 900 visitors. Simond gives the following account of his visit to this theatre. "The house, which is certainly very fine, exceeds perhaps any in Paris or London, and the full band in the orchestra filled it well. Soon, however, the flapping of doors, incessantly opening and shutting, the walking to and fro over that part of the pit which is without seats, and, above all, the universal chattering, overpowered the music. Disappointed in our expectations of hearing this, and finding our attention to what was passing on the stage altogether fruitless, we turned to the spectators, and observed that the boxes, which are little rooms very neatly fitted up, had, by degrees, filled with company; and the lights in some of them (for there were none in the house except the row of lamps on the stage) enabled us to see the people receiving company, taking refreshments, gesticulating in earnest conversation, and laughing. In those boxes where there were no lights, the company remained invisible, and a sort of *chiaro-scuro* pervaded the fore part of the house. But, when the ballet began, the general hubbub at once ceased, and heads suddenly popped out, cards and conversation being suspended to look at the dancing. This, though much inferior to that of Paris or London, evidently possessed attractions superior to those of music, which was no sooner resumed, after the ballet, than the noise began again as before. A box at the opera, holding eight persons, of whom four only can see, costs 11 francs; and three additional francs are paid by each person for his ticket of admission." (*Travels*, p. 17, 18.) There are eight other theatres, two of which are open for performances in the day-time.

Milan has many spacious and extensive barracks, nearly all of which are in the W. suburbs. The largest, or *Caserna Grande*, occupies an area of about 900 feet in length, by 700 feet in width, having in front, and on either side, the *Foro (Fiere-Bonaparte)*, an esplanade, planted with trees, and laid out in elegant public walks. Behind the *Caserna* is a large open space, called the Place of Arms (*Piazza d'Armi*), from which the Sathon-road opens by the *Arco della Pace*, one of the finest monuments erected in modern times. This arch, commenced in 1807 and finished in 1837, designed and principally completed by the Marquis Cagnola, is altogether of marble, richly adorned with statues and bas-reliefs. It is nearly 73 feet in length, 43 feet in depth, and 74 feet in height; but to the summit of the principal statue is 98 feet. Four fluted Corinthian columns decorate either front; and on the top a bronze herald of victory stands at each angle; and facing the city is a colossal bronze statue of Peace, in a car drawn by six horses. On another side of the *Piazza d'Armi* is the amphitheatre, built by the French in 1806, a poor imitation of the antique structures of the same kind. It is nearly 300 yards in length, by 165 in breadth, and is capable of accommodating 30,000 spectators. It may be made an amphitheatre, a circus, or a *naumachia*, "for charioteers to drive, and athletes to wrestle, and a navy to give battle on an ocean 4 feet deep; for the area could be laid under water at pleasure. The walls of this counterfeit of Roman work are scarcely 25 feet high; and their thin facing of stone, already giving way, shows the rubbish underneath. But the palace annexed to this circus is adorned with columns of red granite, of great size, and each made of a single block. It is, in

every respect, as beautiful as the rest is paltry and contemptible." (*Simond*, p. 19.)

The private palaces of Milan have received little notice from travellers, but some have considerable elegance, as the *Palazzo Belgiojoso*, formerly the villa of Napoleon, and afterward the residence of Prince Eugene Beauharnois, the *Serbelloni*, *Vitti*, *Marino*, and *Visconti* palaces, &c. Besides the *Arco della Pace*, the city is entered by 10 gates, of which the *Porta Orientale* is the richest and most remarkable.

Milan, though less striking in its general appearance than Turin or Genoa, is much richer in objects of varied interest, art, and science. The Ambrosian Library, founded in 1609 by Card. F. Borromeo, comprises, according to the Austrian *Encycl.*, 95,000 printed volumes, and 15,000 MSS. Many of the latter are highly valuable, including the note-book of Leonardo da Vinci, some MSS., supposed to date as far back as the 4th century, containing fragments of Cicero's lost orations discovered by Mail. Attached to the library is a hall of painting, with several fine works by Titian, Da Vinci, Luini, Albano, &c., and sketches by Raphael, Pietro da Cortona, Carravaggio, &c. The *Brera*, formerly the principal establishment of the *Umilianti*, is now converted to the use of the Royal academy of arts and sciences. It has a noble collection of pictures by almost all the first and second-rate masters of Italy, collections of casts and engravings, rooms for the exhibition of the produce of the useful arts, a well-furnished observatory, a good library, and a botanic garden. Many of the private collections in art and literature are excellent; in the *Trivulzio* palace is a library of 30,000 printed volumes, and many MSS., a considerable collection of coins, and many curious relics of antiquity.

Milan is the seat of government for Austrian Italy, and of the provincial assembly, the court of appeal, and high criminal court of Lombardy. It is the residence of a delegate, and an archbishop's see; and has two lycæums, six gymnasia, a teachers' seminary, a high female school, many primary schools, a deaf and dumb school, colleges of medicine, midwifery, veterinary surgery, and architecture, a military geographical institute, various societies of literature, agriculture, &c., and a tribunal of commerce.

This city is the centre and most important emporium of the silk trade of Lombardy. Not only do the transactions of the Lombardo-Venetian provinces in silk centre here, but many of the neighbouring states either sell their silk in Milan, or remit it thither in transit to foreign countries; and this is the case, not for raw silk alone, but also for organzine and tram. English houses, in particular, frequently make their advances at Milan to the consignees of silk. The spinning and throwing of silk is also extensively carried on in the city and its immediate neighbourhood, and many of its throwing-mills have steam-engines. (*Bowring's Reports*.) Velvets, silks, ribands, lace, cotton stuffs, carpets, artificial flowers, paper, goldsmiths' wares, glass, felt hats, leather, earthenware, chocolate, &c., are exclusively made in Milan, and it has a royal tobacco manufactory. In addition to silk, Milan has an extensive commerce in rice and Parmesan cheese, and is, next to Venice, the largest book mart in Italy. As a place of residence, it has the advantages of cheap and plentiful provisions, every facility for study and amusement, a well-regulated police, and polite society. Among its drawbacks, are the heats of summer, and the fogs of the autumn; the climate is, however, considered healthy.

Mediolanum, supposed to have been founded by the Insubrian Gauls, was annexed to the Roman dominions by Scipio Nasica, anno 191 B.C. In the 4th century, it held the rank of the sixth city in the Roman empire; and is one of the few, in Italy, which have survived the devastations of the middle age, and brought down its celebrity to modern times. It retains, however, but few antiquities; the only good specimen of ancient Roman architecture remaining being a range of 16 beautiful Corinthian columns, with their architrave, before the church of San Lorenzo. In the 12th century, Milan was the capital of a republic, and it subsequently became the capital of a duchy. In the families of Visconti and Sforza. After the battle of Pavie it was held by Spain, until, in 1714, it was ceded to Austria. The French took it in 1796, and again in 1800, after the battle of Marengo. Under their government it was at first the capital of the Cisalpine republic, and, from 1805 to 1814, it was the capital of the kingdom of Italy. Milan has given birth to many distinguished individuals, among whom may be specified the illustrious painter Leonardo da Vinci; the mathematician Cavalieri; Becaria, the author of the celebrated treatise on Crimes and Punishments; Signora Agnesi, famous for her mathematical and scientific attainments; the poets Parini and Manzoni, &c. There appears to be no foundation for the statement that Valerius Maximus was a native of Milan. (*Essai sur la Littérature de l'Italie*, i. 1-36; *Simond's Trav. in Italy*, 9-23; *Wood's Letters of an Architect*, 305-321; *Förberg*; *Von Raumer, Italy and the Italians*, i., 365)

MILAZZO.

100-123; *Cramer's Anc. Italy*, 1, 51, 52; *Borghese; Osserv.*, *Nat. Encepe*, &c.)

MILAN, p. L. Duchess co., N. Y., 63 m. S. Albany, 322 W. Drained by a branch of Jansen's creek. It has five stores, one fulling-mill, five grist-mills, five saw-mills; five schools, 366 scholars. Pop. 1735.

MILAN, p. L. Erie co., O., 103 m. N. Columbus, 396 W. Watered by Huron river. It has 11 schools, 608 scholars. Pop. 1531. The village is situated on the S.E. bank of Huron river, 8 m. from lake Erie, on a bluff 60 or 70 feet above the level of the river. A ship canal is designed to connect it with the lake. It contains a brick church, an academy, 10 stores, one grist-mill, two saw-mills, one oil-mill, a carding machine and fulling-mill, and about 800 inhabitants.

MILAZZO, or MELAZZO (an. *Mylo*), a fortified seaport town on the N. coast of Sicily, instead of Messina, cap. canton, on the E. side of an elevated narrow promontory, at the bottom of a bay 25 m. W. by S. the Faro point of Sicily; lat. of lighthouses 39° 15' 58" N., long. 15° 14' 10" E. Pop., in 1831, 9200. It is divided into the upper and lower towns, both of which are irregularly built; and though it has a number of large edifices, none of them are remarkable. "The churches, with the exception of that of St. Francis, are generally mean, and the convents poor and dirty; the prison is a filthy sink; the public hospital is badly provided; and the *malta-di-peste* languishes in bad hands." (*Smyth's Sicily*, p. 103.) The town is principally distinguished by its fortifications; being so strong, by nature and art, that it may be regarded as the Gibraltar of Sicily. Besides subordinate fortifications, it has a citadel on the highest point of the promontory, 330 feet above the sea, commanding the town and the port. Beneath it is a spacious grotto, called the Cave of Ulysses. The promontory is bounded on all sides by steep rocks, inaccessible from the sea; and might, according to Captain Smyth, be easily rendered impregnable. In the lower town is the fountain of Mylas, one of those alluded to by Pliny (*Hist. Nat.*, lib. xlii., cap. 4) as existing in this part of Sicily, the waters of which (in consequence, perhaps, of the melting of snow) are most abundant in summer.

Milazzo is the residence of a military commandant. Its inhabitants are occupied chiefly in the tunny fishery, and in the export of wine, silk, fruit, rags, soap, white and red argols, corn, olive and linseed oils, and *vino cotto*; the last is a cordial made by boiling must with potash. Its trade is principally with Marseilles, Leghorn, and Genoa. Its bay is large and the water deep. Ships may anchor abreast of the town in from 10 to 25 fathom stiff mud, about $\frac{1}{2}$ m. from the shore.

The gulf of Milazzo (an. *Basilius Sinus*), between the peninsula on which the town stands and cape Rasaculmo, has been the theatre of some important naval conflicts. The first of these occurred anno 361 B.C., when the consul Dullius defeated a Carthaginian fleet, and showed his countrymen how to conquer by sea as well as by land. Another and far more important contest, which influenced, indeed, in no small degree, the fate of the Roman world, took place in this gulf anno 31 B.C., when the fleet of the younger Pompey was entirely defeated, and all but destroyed, by Octavius Cæsar, or rather by his general Agrippa. (*Ancient Universal History*, xiii., 459, 8vo ed., and the authorities there referred to.) A third action took place here in 830, between the fleet of the Saracens and that of the Greek emperor Basilus.

MILBORNE-PORT, a decayed borough, market town, and par. of England, co. Somerset, hund. Horethorne, on the Ivel, 38 m. E. by S. Taunton, and 108 m. W.S.W. London. Area of par. 3150 acres. Pop., in 1841, 1740. The town, though considerably enlarged and improved within the last few years, is very irregularly built, consisting chiefly of detached houses, and having the appearance of a mere village. An ancient guildhall stands in the High-street, and near it is the market-house, now converted into warehouses. The church, an ancient cruciform structure, is surrounded by a massive square tower, supported by two pointed and two semicircular arches: the living is a vicarage, in the gift of the Marquis of Anglesey. The Wesleyan Methodists and Baptists have likewise their respective places of worship, with attached Sunday-schools. Milborne-port had formerly considerable manufactures of dowlas, ticking, and sail-cloth, but they have long ceased to exist. The glove trade, however, was introduced here from Yeovil about 25 years ago; and it is stated in *Hull's History of the Glove Trade*, published in 1834 (p. 74), that about 25,000 dozen pairs were then annually produced; and that great efforts had been made by several intelligent and persevering manufacturers to equal the French in this department, and that in some kinds of gloves they had succeeded. The market is dispensed, but fairs are held for cattle and pedlary June 5, and October 25.

Milborne-port, which, at the time of the Norman conquest, had a market and 56 burgesses, is a borough by pre-

MILETUS.

scription, and sent two members to the House of Commons, with some interruption, from the reign of Edward I. down to the Reform Act, by which it was disfranchised. It had been for a lengthened period a mere nomadism borough.

MILDENHALL, a market town and par. of England, hund. Lackford, co. Suffolk, on the Lark, 23 m. N.W. Ipswich, and 63 m. N.N.E. London. Area of par. 13,710 acres. Pop., in 1841, 3731. The town is of considerable extent, and well built, consisting of several detached streets, or rows, that form, as it were, a series of little villages. The church is a large and handsome structure, with a rich carved roof and lofty tower: the living is a vicarage, in the gift of Sir H. Bunbury, the chief landowner of the parish. The inhabitants, with the exception of a few retail traders, are chiefly engaged in agricultural pursuits. Petty sessions for the hund. are held here. Markets on Friday; fair for wool, October 10.

MILES, L. Centre county, Pa. Drained by branches of Penn's creek. It contains two stores, four grist-mills, five saw-mills, one tannery, one distillery; seven schools, 710 scholars. Pop. 1198.

MILETUS (Gr. *Μίλητος*), a once famous but now ruined city of Asia Minor, the cap. of Ionia, near the mouth of the Meander (hod. *Menderes*), 85 m. S. Smyrna. This is a very ancient city, and had borne several names before it received that of Miletus, given to it by Neleus, son of Codrus, king of Athens, who conducted thither a colony of Ionians, anno 1190 B.C.* Few cities have been more celebrated for their population, wealth, commerce, and civilization. The citizens of Miletus early distinguished themselves by their skill in navigation, and still more by the number of the colonies they had established along the coast of the Hellespont, the Propontia, and the Euxine, which enabled them to engross the greater part of the trade in slaves, which, in antiquity, were principally furnished by the country round the Bosphorus, as well as the trade in corn, fish, and furs. She is also famous for her numerous works of art, the magnificence of her festivals, and the luxury, refinement, and splendor of her people. Among her most illustrious citizens were the venerated names of Thales, one of the sages of Greece; Hecateus, one of the most ancient historians; the philosophers Anaximander and Anaximenes; Cadmus, the first who wrote in prose, and Timotheus, a famous musician and poet.* She also gave birth to Aspasia, the most accomplished and celebrated of courtesans; and Venus had nowhere more numerous and beautiful priestesses. Miletus was, in fact, the Athens of Ionia, *urbem quondam lonæ totius belli pacisque arbitram principem.* (*Mela*, lib. i., cap. 17.)

Near the *Posidium Promontorium*, (hod. cape Arhori), about 19 m. S. by W. Miletus, was an oracle and splendid temple of Apollo, surnamed Didymæus. This temple having been burned down by Xerxes, was rebuilt on a still more magnificent scale, by the Milestians. Part of the ruins yet remain; and "the columns are so exquisitely fine, the marble mass so vast and noble, that it is impossible, perhaps, to imagine greater beauty and majesty of ruin." (*Chandler*.) Miletus had also within her territory, mount Latmos, famous for the loves of Endymion and Diana; and the fountain Byblis, so called from the unhappy sister of Apollo, who here expired of love and grief. (*Ovid's Met.*, lib. ix., lin. 454, &c.)

But *quantum mutatus!* Miletus is now a mean desolate place, which still, however, bears the name of Palæa, or Palatia, the *Palæce*. The principal existing memorial of her ancient grandeur is a ruined theatre, which must, when entire, have been a magnificent structure. It is 457 feet in front, and is visible at a great distance. The site of the ancient city is encumbered with heaps of rubbish, and overrun with thickets, interspersed with fragments of walls, broken arches, fallen columns, and pedestals. It is evident, from the remains of a number of mosques, that Mohammedanism had once flourished here; but, with a single exception, the ruins seem to have belonged to mean and petty structures.

In antiquity, Miletus underwent many vicissitudes. Having joined in the revolt of the Ionian cities, she was besieged and taken by the Persians, in the reign of Darius Hystaspes, anno 493 B.C., when the inhabitants were obliged to evacuate their city. But being afterward allowed to return, Miletus again rose to great wealth and distinction. She opposed a vigorous resistance to Alexander the Great; but, instead of punishing, the conqueror magnanimously restored the city to her ancient freedom. She appears to have been indulgently treated by the Romans; and continued to be a considerable city, till she fell, in an evil hour, under the ferocious and brutal sway of the Turks, who first sacked, and subsequently destroyed, this ancient glory of Ionia! To complete her misfortune, her port is now almost filled up.

* This Timotheus must not be confounded with his namesake whom some embellished the fable given by Alexander the Great, and whose wonderful career is subject of Dryden's noble ode. The latter belonged to Thales (*Biographic Universelle*, art. Timotheus).

MILFORD.

The government of Miletus, and of the other cities of Ionia, was usually popular and republican; but, like their mother cities, they were distracted by faction, and frequently subjected to oligarchs or tyrants. Of the Milesian tyrants, the most celebrated was Thrasylbulus, whose answer to the inquiry of Pericles of Corinth may be seen in *Aristotle's Politics*, lib. iii., cap. 10.

Miletus and the principal states of Ionia, including the islands of Chios and Samos, being connected by the ties of a common origin and interest, were in the habit of sending deputies to a general council or assembly, to debate and determine upon measures for promoting their union and security. This council met at Panionium, so called from the circumstance, on the N. side of mount Mycale, opposite Samos, about midway between Ephesus and Miletus; the place was regarded as sacred, and was put under the especial protection of Neptune, the chosen guardian and favourite divinity of the Ionians. (*Ibi est Panionium, sacra regio, et ob id eo nomine appellata, quod eam communiter Iones colant. Mela, ubi supra; see also Pliny, Hist. Nat., lib. v., cap. 19; and Herodotus, lib. i., cap. 148.*) Thales, who saw that, without a more intimate union, the Ionians could make no effectual resistance to foreign aggression, advised his countrymen to establish a really federal system of government, and to concert and execute their public measures in common. (*Herod., lib. i., cap. 170.*) But this judicious advice was not acted upon; and it was only on urgent occasions, such as the invasion of Ionia by the Persians, that a sense of common interest and danger prevailed over their mutual jealousies and antipathies, and made any considerable number of the cities act in unison.

Most commonly the debates and decrees of the assembled deputies seemed to have referred only to matters connected with religion, precedence, or ceremony. This appears evident from the circumstance of the deputies meeting at Panionium, when the Ionian cities were subject to the Persians and others, as well as when they were independent. (for farther information as to Miletus, see *Herodotus*, lib. i., caps. 142, 143, 148, &c., and lib. vi., caps. 18 and 21; *Strabo*, lib. xiv.; *Candler's Travels in Asia Minor*, caps. 42, 43, and 45; *St. Croix, de l'Etat et du Sort des Anciennes Colonies*, p. 323-329, &c.)

MILFORD, p. t., Hillsborough co., N.H., 33 m. S. by W. Concord, 458 W. Watered by Souhegan river, which affords water-power. It contains four stores, one fulling-mill, one grist-mill, one saw-mill, two tanneries; 11 schools, 367 scholars. Pop. 1455.

MILFORD, p. t., Worcester co., Mass., 30 m. S.W. by W. Boston, 409 W. Watered by Charles and Mill rivers. Incorporated in 1780. It has three Congregational churches, eight stores, one woollen factory, five grist-mills, five saw-mills; one academy, 22 students; five schools, 165 scholars. Pop. 1773.

MILFORD, p. t., New-Haven co., Ct., 45 m. S.S.W. Hartford, 391 W. Bounded W. by Housatonic river, S.E. by Long Island sound. Watered by Wepawaug river, which affords water-power, and Indian river. A quarry of beautiful serpentine marble is found here. A drawbridge 80 rods long crosses Housatonic river, and connects the town to Stratford. The harbour, though not deep, admits vessels of 200 tons burthen. Excellent oysters and clams are taken on the coast, and shad are taken in Housatonic river. An island containing ten acres lies off the shore, and connected with it by a sand-bar, which is bare half the time. A breakwater from Indian point towards the island would form a spacious harbour. It has four churches, two Congregational, an Episcopal, and a Baptist; 11 stores, a lumber-yard, four grist-mills, three saw-mills, one tannery; two academies, 35 students; 14 schools, 764 scholars. Pop. 2455.

MILFORD, p. t., Otsego co., N.Y., 13 m. S. Cooperstown, 77 m. W. Albany, 365 W. Watered by Susquehanna river and its tributaries. It contains a Presbyterian and a Methodist church, four stores, one fulling-mill, one woollen factory, two grist-mills, eight saw-mills, three tanneries; 12 schools, 550 scholars. Pop. 3095.

MILFORD, p. t., capital of Pike co., Pa., 162 m. N.E. by E. Harrisburg, 256 W. The village is situated on a commanding eminence, on the W. side of Delaware river, which is here crossed by a fine bridge. It contains two churches, an academy with 46 students; one school, 36 scholars; 150 dwellings, and 648 inhabitants.

MILFORD, t., Becks co., Pa., 18 m. N.W. Doylestown, 36 m. N.W. Philadelphia. Drained by Swamp creek, a branch of Perkiomen creek. The village of Charlestown contains a church. It has seven stores, one fulling-mill, 10 grist-mills, 10 saw-mills, one oil-mill, two tanneries, four potteries; two schools, 47 scholars. Pop. 2193.

MILFORD, t., Juniata co., Pa., 6 m. S.E. Lewistown. Bounded S.E. by Tuscarora creek. Watered by Licking creek. It has one academy, 30 students; 10 schools, 423 scholars. Pop. 1894.

MILLEDGEVILLE.

MILFORD, t., Somerset co., Pa., 7 m. S.W. Somerset. Watered by Castleman's river and Laurel Hill creek. It contains iron ore and coal, and has three stores, two fulling-mills, five grist-mills, 15 saw-mills, one oil-mill, two tanneries, two distilleries, two potteries; one school, 24 scholars. Pop. 1632.

MILFORD, p. v. and hundred, Kent co., Del., 95 m. S. Philadelphia, 21 S. by E. Dover, 199 W. Situated on the N. side of Mispillion creek, which flows into Delaware bay. The hundred contains 13 stores, six grist-mills, three saw-mills, two tanneries; two academies, 65 students; six schools, 331 scholars. Pop. 2356.

MILFORD HAVEN, an extensive basin, or inlet of the sea, deeply indenting the S. part of the co. Pembroke, in S. Wales, and forming one of the most capacious and safest asylums for shipping in the British dominions. St. Anne's head, forming the N.W. extremity of the entrance to the haven, lat. 51° 41' N., long. 5° 10' 25' W., is 145 ft. in height, and is surmounted by two lighthouses, with fixed lights, respectively 15 and 45 ft. in height. The entrance is about 1½ m. in width; what may be called the haven is from 10 to 11 m. in depth; but it branches out into an immense number of deep bays, creeks, and roads. The water is deep; and being completely land locked, and the anchorage-ground of the very best description, ships ride within the haven as safely as if they were in dock. At springs the tides rise from 22 to 30 ft., affording unusual facilities for the repair of ships, enabling them to get to sea with comparatively little difficulty, and to sail in, even though the wind should be contrary. It may be entered without a pilot as well by night as by day.

MILFORD TOWN, on the N. side of the basin, 6 m. W. by N. St. Anne's head, was founded in 1784. It is finely situated; is especially remarkable for the mildness of its climate, and has some good buildings, including a handsome church. A dock-yard constructed here in 1790 has, however, been removed to Pater-Dock, on the S. side of the haven, and the town has not increased in the degree that was anticipated. It is probable, too, that the advantage of having the rendezvous for the fleets in stations better adapted for watching the coasts of France will always prevent Milford, or any other port on the haven, from attaining that importance as a naval depot which the excellence of the haven might seem to insure; while the barrenness of the surrounding country, and the want of all internal communication with any considerable manufacturing district, have prevented, and most likely will continue to prevent, any of the places on the haven from becoming of much consequence in a commercial point of view. The mail-packets for Waterford sail from Pater. (*Stat. of the Brit. Empire*, I., 51; *Nicholson's Cambrian Guide*, p. 425.)

MILHAU (an. *Emilianum*), a town of France, dep. Aveyron, cap. arrond., on the Tarn, 30 m. S.E. Rodez. Pop., in 1836, 9437. It is generally well built, and its streets, though narrow, are regular. It has several squares and public fountains, and a good bridge over the Tarn. Few vestiges exist of its ancient castle and walls; the latter were demolished by Louis XIII. in 1629, after which, says Hugo, *La ville cessa de s'occuper des affaires politiques ou religieuses, et tourna tous ses efforts vers le commerce et l'industrie, qui en ont fait la ville la plus riche et la plus peuplée du département.* It produces woollen cloth, leather and leather gloves, silk twist; and has a considerable trade in cheese, timber, cattle, wool, almonds, wine, and other agricultural products. It is the seat of a court of primary jurisdiction, a tribunal and a chamber of commerce, a communal college, society of agriculture, &c.: it was one of the strongest holds of the Calvinists in the French religious wars.

MILL, t., Tuscarawas co., O. Watered by Big Stillwater creek. It has two commission-houses in foreign trade, three retail stores, one grist-mill, two saw-mills; seven schools, 364 scholars. Pop. 1255.

MILLBURY, p. t., Worcester co., Mass., 43 m. W.S.W. Boston. Bounded N.E. by Blackstone river. The Blackstone canal passes through it. It contains a bank, four churches, three Congregational and a Baptist; five stores, 11 fulling-mills, five woollen factories, three grist-mills, three saw-mills, one paper mill; one academy, 45 students; 10 schools, 463 scholars. Pop. 3171.

MILL CREEK, hund., Newcastle co., Del. It has three schools, 145 scholars. Pop. 3144.

MILL CREEK, t., Hamilton co., O. lies N. of Cincinnati, and is a suburb of it. It contains one college (Lane Seminary), 23 students; one academy, 125 students; nine schools, 169 scholars. Pop. 6949.

MILLEDGEVILLE, city, capital of Baldwin co., Ga., and of the state, 158 m. N.W. Savannah, 89 m. W.S.W. Augusta, 193 m. N. Darien, 648 W. Situated on the W. bank of Oconee river, at the junction of Fishing creek, at the head of steamboat navigation. The surface is uneven. It contains 10 streets running parallel with the river, cross-

MILLER.

ed by 10 others at right angles with them. The streets are 100 feet wide, excepting Washington, a central street, which is 150 feet wide. There are three public squares, made by the omission of a street in each direction, which are State-house-square, Governor's-square, and penitentiary-square, 450 feet each on a side. The statehouse is on an eminence in the centre of Statehouse-square, three fourths of a mile from the river, a tasteful edifice of Gothic architecture, erected in 1898 at a cost of \$115,000, with an excellent clock in the cupola which cost \$1000. The representatives' hall is 60 by 54 feet, ornamented with full length portraits of General Oglethorpe and La Fayette, and the senate chamber with those of Washington and Jefferson. In the executive office is an old portrait of General Oglethorpe, in an antique dress, and a sitting posture, examining the map of Georgia. The edifice contains offices for the state treasurer, comptroller, surveyor-general, besides clerks' and committee rooms, and several fire-proof rooms for public records. On Statehouse-square are also an academy, a state arsenal, and a powder magazine. The other public buildings are a governor's house, in a range with the N. side of Statehouse-square, three churches, a Presbyterian, Methodist, and Baptist; three banks, and a market-house. A toll-bridge crosses the Oconee, here 550 feet wide, which cost about \$30,000. It contains 14 dry goods and 20 grocery stores, wholesale and retail, four printing-offices, four weekly newspapers, 250 dwellings, and 5005 inhabitants. It was laid out in 1803, and the first house was erected of logs in 1804, and the first framed house in 1805. It exports considerable cotton, for which it presents great facilities. It is governed by an intend and four commissioners. Nett proceeds of the postoffice, \$5043. Near to Milledgeville, in Medway village, is Oglethorpe college, founded in 1836, which has a president and five professors or other instructors, 65 students, and 3000 volumes in its libraries.

MILLER, county, Mo., situated in the centre of the state, and contains 555 sq. m. Watered by Osage river. It contained in 1840, 2835 neat cattle, 2280 sheep, 9304 swine; and produced 5005 bushels of wheat, 90,180 of Indian corn, 8183 of oats, 3418 of potatoes, 4001 pounds of tobacco, 1309 of cotton. It had two stores, five grist-mills, one saw-mill, three distilleries; three schools, 85 scholars. Pop.: whites, 2170; slaves, 111; free coloured, 1; total, 2282. Capital, Tusculum.

MILLERSBURG, p. v., Hardy t., capital of Holmes co., O., 57 m. N.E. Columbus, 343 W. Situated on the E. side of Killbuck creek. It contains a courthouse, jail, a church, 10 stores, a printing-office, issuing a weekly newspaper, 100 dwellings, and about 600 inhabitants.

MILLVILLE, p. t., Cumberland co., N.J., 67 m. S. by W. Trenton, 178 W. Drained by Maurice river and its tributaries. It contains five stores, five glasshouses, five grist-mills, nine saw-mills; five schools, 254 scholars. Pop. 1771.

MILLO (an. *Meloe*), an island of the archipelago, belonging to Greece, in the group of the central Cyclades, the summit of mount St. Elias; in its S.W. angle, 3636 ft. above the sea, being in lat. 36° 46' 35" N., long. 24° 23' 14" E. Pop. 2500? This island is said by Pliny to be circular (*Omnis rotundioris*, lib. iv., cap. 13); but it is really of an oblong shape, being about 13 m. in length from E. to W., and, where broadest, about 7 m. across: it is indented on its N. side by a spacious bay, stretching N.W. and S.E. about 6 m., which has deep water throughout, and forms one of the best asylums for shipping in the Levant. This island is obviously of volcanic origin; mount Calamo, indeed, is at this moment a semi-active volcano, emitting smoke and sulphurous vapours; in many places the earth is hot, and there are numerous hot springs, one of which, in a natural grotto, is used by the natives as a sudatory. It also furnishes abundant supplies of iron, alum, sulphur, and salt.

A considerable portion of the surface is rugged and mountainous, and has a naked and sterile appearance; but the valleys and low grounds are extremely fertile, such small portions of them as are cultivated producing corn, wine, oil, cotton, oranges, and other fruits in the greatest profusion. In point of fact, however, Millo is now almost depopulated, and nearly a desert; a result that is partly to be ascribed to the ravages of the plague, the badness of the water, which is generally brackish, and the prevalence of malaria; but far more to the influence of that brutalising despotism under which it has groined for centuries. Millo, the capital, situated near the bottom of the bay, is rendered unhealthy from the vicinity of salt marshes, and is an inconsiderable, wretched place.

Castro, another town, near the entrance to the harbour, on its E. side, is built on the summit of a conical hill, the houses appearing to rise above the roofs of each other. A little to the S.W. of Castro, near the shore, are the ruins of the ancient city. The remains of a theatre, built of large masses of the finest marble, and fragments of solid walls have been discovered. In the vicinity are numerous catacombs, cut in the porous rock. (*Tournefort, Voyages de*

MILTON.

Levant, letter iv.; Olivier, Empire Ottoman, ii., cap. 9; Turner's Tour in the Levant; Purdy's Sailing Directions for the gulf of Venice, &c., p. 97.

Such is the present state of this once famous island. Melos is said by Thucydides to have been independent 70 years before the Peloponnesian war. The most probable opinion seems to be that the Melians were descended from the Lacedaemonians; but, however that may be, they declined taking any share in that contest, and though pressed by the Athenians to espouse their cause, declared their neutrality. The Athenians, however, having the command of the sea, determined to coerce the Melians into submission to their mandates; and though the first expedition sent against them failed of its object, the second was more successful. Thucydides gives the substance of the speeches made by the Athenian commanders to the Melians previously to their commencing hostilities; and on no occasion has the robber's plea, that whatever the powerful may please to command, the weaker are bound to obey, been more broadly and unequivocally asserted. The sequel of their conduct was worthy of the principle thus laid down; for the Melians having, after a stout resistance, surrendered at discretion, the Athenians put all the full-grown males to the sword, and carried the women and children to Aetia, where they were sold as slaves! This detestable atrocity was perpetrated shortly before the Athenians engaged in their expedition against Syracuse; and is related by Thucydides, without note or comment, as if it had been a legitimate and ordinary occurrence! (*Thucyd., lib. vi., c. 48.*) The fortune of war having, however, soon turned against the Athenians, the captive Melians were restored to their native country; and the island continued to be comparatively prosperous till, after innumerable vicissitudes, it was seized upon by the Turks, under whom it has been reduced to the abject state in which we now find it. It seems to have retrograded materially between the visit of Tournefort, in 1700, and that of Olivier, at the end of the century. It is now, however, included in the kingdom of Greece, and will, most probably, recover some portion of its former prosperity.

MILLO, p. l., Yates co., N. Y., 193 m. W. Albany, 330 W. It contains the v. of Penn Yan, the capital of the county. Bounded W. by Crooked lake, E. by Seneca lake. Watered by the outlet of Crooked lake, which affords water-power. It contains 20 stores, one furnace, four fulling-mills, two grist-mills, nine saw-mills, one oil-mill, one tannery, one distillery; 17 schools, 938 scholars. Pop. 3968.

MILTON, or MILTON-ROYAL, a fishing town and par. of England, lathe Scray, co. Kent, hund. its own name, 11 m. N.E. Maidstone, and 36 m. E. by S. London. Area of par., 2540 acres. Pop., in 1831, 2533. The town, on the declivity of a hill, sloping down to a creek which opens into the channel between the Isle of Sheppey and the coast of Kent, is old and irregularly built. It has a market-house and shambles near its centre; and at its N. end is an old courthouse. The church, which stands at a considerable distance from the present town, is a spacious fabric, with a square tower of flint stone laid in even rows. The bing is a rectory, in the gift of the dean and chapter of Canterbury. There are places of worship, also, for Wesleyan Methodists and Baptists, with attached Sunday schools; a free school was founded in 1718.

Milton has, for many centuries, almost entirely depended on its oyster fisheries, the produce of which is highly esteemed, and distinguished as the "Milton oysters." The right of the fishery, within certain limits, formerly belonging to the abbey of Faversham, and afterwards to the crown, is now held on lease from the lord of the manor by a company of free dredgers, composed of the principal fishermen of the town; and in 1831 there were 119 families immediately dependent on the trade in oysters, which is principally carried on with the metropolis. The town has four wharfs; and, besides oysters, considerable quantities of corn and farm produce are shipped for the London market. Both the town and port are under the jurisdiction of a portreeve, elected annually by the inhabitants paying poor's rates.

Milton disputes with Richborough the honor of having furnished the Roman epicures with the oysters alluded to by Juvenal:—

"Retupiorne edita fundo
Ostrea."

Sat. iv. 141.

MILTON, p. t., Stafford co., N. H., 47 m. N.E. Concord, 515 W. Organized from Rochester in 1802. Bounded E. by Salmon Fall river for 13 m. by a branch of which it is watered. It has Tenerife mount in its E. part. It contains four churches, a Congregational, Methodist, Free-will Baptist and Christian, six stores, three fulling-mills, one woollen factory, three grist-mills, five saw-mills, two tanneries, 10 schools, 408 scholars. Pop. 1322.

MILTON, p. l., Chittenden co., Vt., 35 m. N.W. Montpelier, 388 W. Chartered in 1763. Watered by Lamotte river,

MILVERTON.

which affords extensive water-power, having near the v. a fall of 130 feet in 50 rods. It contains three churches, a Congregational, Methodist, and Baptist, nine stores, two grist-mills, two saw-mills, one paper-mill, three tanneries; 14 schools, 645 scholars. Pop. 2134.

MILTON, p. t., Norfolk co., Mass. 7 m. S. Boston, 435 W. Chartered in 1669. Watered by Neponset river, which affords water-power. The first paper-mill erected in New-England, was built here in 1798. It contains three churches, a Congregational, Methodist, and Unitarian, two commercial and two commission houses in foreign trade, eight retail stores, two woolen factories, one grist-mill, one saw-mill, two academies, 45 students, five schools, 436 scholars. Pop. 1892.

MILTON, t., Saratoga co., N. Y., 30 m. N. by W. Albany. It contains the v. of Ballston Spa, the capital of the co. Drained by Kayaderoseras creek, and its tributaries. It contains 16 stores, six fulling-mills, three woolen factories, two furnaces, six grist-mills, 10 saw-mills, one oil-mill, one paper-mill, one printing-office, one weekly newspaper; 12 schools, 267 scholars. Pop. 3166.

MILTON, p. b., Turbot t., Northumberland co., Pa. 71 m. N. Harrisburg, 181 W. Situated on the E. bank of the west branch of Susquehanna river, on both sides of Limestone run. It contains three churches, a Presbyterian, Associate Reformed, and German Reformed, an academy, 13 stores, two grist-mills, one saw-mill, one tannery, four distilleries, one brewery, one pottery, two printing-offices, one weekly newspaper, four schools, 350 scholars. Pop. 1508.

MILTON, p. t., Trumbull co., O., 157 m. N.E. Columbus, 316 W. Watered by Mahoning river. It has eight schools, 429 scholars. Pop. 1377.

MILTON, t., Richland co., O. It has 247 scholars in schools. Pop. 1861.

MILTON, t., Wayne co., O. It has two stores, five saw-mills. Pop. 1157.

MILVERTON, a market town and par. of England, co. Somerset, hund. its own name, 64 m. W. Taunton, and 130 m. W.S.W. London. Area of par. 6400 acres. Pop. in 1831, 2233. The town situated in a richly-wooded and well cultivated country, is small and ancient, consisting chiefly of three irregular streets, with the church, a large building standing on an eminence in the centre. An extensive manufacture of serges and flannels is carried on here; and there is a silk-mill, which in 1830, employed 54 hands. Milverton was formerly a borough, and is still governed by a portreeve, appointed by the lord of the manor. Petty sessions for the hundred are held here. Markets on Friday; cattle fairs, Easter Tuesday, July 25, and October 16.

MILWAUKEE county, Wis. Situated in the W. part of the territory. Watered by Milwaukee, Root, Des Plaines, and Fox rivers. Bounded E. by lake Michigan. It contained in 1840, 5100 neat cattle, 708 sheep, 8914 swine; and produced 34,336 bushels of wheat, 36,299 of Indian corn, 1269 of buckwheat, 36,863 of oats, 64,943 of potatoes, 48,686 pounds of sugar. It had three commission houses in foreign trade, 25 stores, eight grist-mills, 13 saw-mills, two printing-offices, two weekly newspapers; nine schools, 186 scholars. Pop. 5696. Capital, Milwaukee.

MILWAUKEE, p. v., capital of Milwaukee co., Wis. 83 m. E. Madison, 608 W. Situated on both sides of Milwaukee river, near its entrance into lake Michigan. The river affords water-power. Steamboats ply between this place and Buffalo, in the season of navigation. It contains a courthouse, jail, a United States land office, two churches, a Presbyterian and Methodist, and in 1842, 2900 inhabitants. It had in 1840, three commission houses in foreign trade, 31 retail stores, one furnace, one saw-mill, two printing-offices, two weekly newspapers; one school, 25 scholars. Pop. 1712.

MINCHIN-HAMPTON, a market town and par. of England, co. Gloucester, hund. Longtree, 12 m. S. by E. Gloucester, and 59 m. W. by N. London. Area of par., 4880 acres. Pop. in 1831, 5114. The town, on the W. escarpment of the Cotswold hills, consists of a long irregular street, extending N. to S. along the road from Gloucester to Chippenham, and crossed by another leading to the parish church, near the market-house. The church is a large cruciform structure, surmounted by an octagonal embattled tower, rising from the intersection of the nave and transepts: the living is a rectory in private patronage. The Wesleyan Methodists and Baptists have also their respective places of worship, with attached Sunday schools; and there is a well-attended national school, for children of both sexes, besides a respectfully endowed grammar-school. Minchin-Hampton, which is only 4 m. S.E. of Stroud, the centre of one of the largest cloth-districts of the county, has numerous cloth-factories on the banks of the numerous brooks in the vicinity; and in 1839 it had 12 woolen-mills, furnishing employment to 785 hands. Nearly 100 hands were then, also, engaged in hand-loom weaving. Trade, however, has for some years been on the decline, and its fluctuations have caused great distress among the weaving

MINEHEAD.

population: the average earnings of each family when in full work amount to 10s. per week, of which 6s. 10d. may be assumed as the produce of hand-loom labour. Markets on Tuesday: fairs for cattle, horses, and cheese, Trinity-Monday and October 30. See STRAUB. (*Hand-loom Weavers' Rep.* &c.)

MINCIO (an. *Mincius*), a considerable river of N. Italy, which has its source in the Lago di Garda; and which, flowing S., with many windings, by Mantua, unites with the Po 12 m. S.E. that city. In the upper part of its course, till it approaches Mantua, it is rather rapid; but from near Mantua to the Po it has a sluggish current, and is navigated by the boats that ply on the latter. Virgil, who first saw the light on the banks of this river, has celebrated its praises:

"Tardis ingens ubi scilicet errat
Mincius, et tenera præmit arundine ripas."

Georg., lib. iii. l. 14.

MINDEN, a strongly fortified town of the Prussian states-prov. Westphalia, cap. reg. of its own name, on the Weser, here crossed by a bridge 600 ft. in length, near the Hanoverian frontier, 60 m. E.N.E. Munster, lat. 53° 17' 47" N. long. 8° 53' 26" E. Population (1838) 7800. It is irregularly built, and has no remarkable edifice, except a handsome cathedral, and new and good barracks. Minden has a gymnasium or college, a normal school, an orphan asylum, four hospitals, and other public institutions, and is the seat of a court of justice for the town and district, and of a board of taxation; but the court of appeal for the regency is at Paderborn. Manufactures considerable; consisting of woollens, stuffs, linen, hosiery, hats, gloves, tobacco, soap, refined sugar, &c. A number of saw-mills are employed in the preparation of the wood brought down the Weser, and it enjoys a considerable share of the transit trade on this river between Bremen and Prussian Westphalia, Hesse-Cassel, &c. In the neighbourhood are coal mines and salt springs, both very productive. The fortifications of Minden have been much improved since 1815. This town was the residence of several early German emperors, and various diets were held in it.

The French were defeated in the vicinity of Minden in 1756, by the Prussians under prince Ferdinand, brother to Frederick the Great, and the British under Lord George Sackville. The non-compliance of the latter with the orders of the former is said to have saved the French from a complete rout, and gave rise at the time to a great deal of acrimonious discussion. (*Borghese's* &c.)

MINDEN, p. t., Montgomery co., N. Y., 61 m. W.N.W. Albany, 306 W. Organized in 1798. Bounded N. by Mohawk river. Drained by Otseque creek. It contains a Presbyterian and Universalist church, 36 stores, two grist-mills, 12 saw-mills, three tanneries, one distillery; 16 schools, 900 scholars. Pop. 3567.

MINERAL POINT, p. v., capital of Iowa co., Wis., 32 m. V.S.W. Madison, 854 W. Situated on the head branch of Pkatonookes river, and contains a courthouse, jail, a United States land office, several stores, and about 700 inhabitants. In the vicinity are three smelting houses for copper, and several for lead.

MINERSVILLE, p. b., Norwegian t., Schuylkill co., Pa., 66 m. N.E. Harrisburg, 176 W. Situated in the valley of the West Branch of Schuylkill river on the West Branch railroad. It contains eight stores, two saw-mills, various mechanic shops, 109 dwellings, and about 600 inhabitants. It is surrounded by anthracite coal mines, of a good quality. Incorporated in 1831.

MINISINK, p. t., Orange co., N. Y., 190 m. S.E.W. Albany, 370 W. On the E. it is covered with the "drowned lands," through which Wallkill river flows, with a sluggish course. It contains six churches, four Presbyterian and two Baptist, 17 stores, two fulling-mills, four woolen-factories, 11 grist-mills, 16 saw-mills, six tanneries, 10 distilleries; four academies, 367 students, 23 schools, 1308 scholars. Pop. 5093.

MINEHEAD, a seaport, decayed bor., and market town of England, hund. Carhampton, co. Somerset, on the Bristol channel, 30 m. N.W. Taunton, and 149 m. W. by S. London. Area of par., 3780 acres. Population, in 1841, 1489. The town comprises three distinct masses of building, forming a triangle, the sides of which are about ½ m. long; the best part, which contains some good houses and inns, being about ¼ m. from the sea. The church, which is large and handsome, stands on the slope of a hill N. of the town: there is also a place of worship for Wesleyan Methodists, and a well attended Sunday-school. A free school for 30 boys is supported by the lord of the manor; besides which, there are several bequests of money-charities for the relief of the poor. Minehead formerly had a considerable share in the herring fisheries; and had a large trade with Ireland, as well as with the Mediterranean and N. America. Its consequence, however, as a port, has greatly declined, notwithstanding its commodious harbour and pier; but it

MINORCA.

has lately been much frequented as a watering place and, the inhabitants are at present mainly supported by the influx of visitors. Minehead received its charter of incorporation in 1 Eliz., from which time down to the Reform Act, by which it was disfranchised, it returned two members to the House of Commons, the right of election being vested in the resident housekeepers in the parishes of Minehead and Dunster. The corporation was considered too insignificant to be mentioned in the Mun. Reform Act. Markets on Wednesday.

MINORCA (*Balearis Minor*), the second in size of the Balearic islands, belonging to Spain, in the Mediterranean, off the E. coast of Spain, from which it is distant about 140 m. Mahon its cap. being in lat. 39° 51' 10" N., long. 4° 18' 7" E.; it is of an oblong shape, extending from W.N.W. to E.S.E., but somewhat concave on its S. side. Length 32 m.; average breadth, 9 m.; area about 290 sq. m. Population, according to Mifano, 44,147. The coast is indented on every side, but particularly on the N., with small bays, or deep creeks, and is surrounded with islets, rocks, and shoals. Surface very uneven, with abrupt hills and knolls; but there are no mountains, except El Toro, near its centre, which rises 4793 feet above the sea. Iron, lead, and copper have been found, though in too small quantities to be wrought; but marble is extremely abundant, and of many beautiful varieties, as is seen in the churches and houses of Port Mahon. Water is scarce, and the climate is less mild and agreeable than that of Majorca. The air in winter is damp and raw, owing to the frequency of the N. winds; but snow is seldom seen. The temperature during spring is mild, and the air pure, though somewhat moist; the summer heat is very oppressive, and the autumn is remarkable for its frequent and heavy rains. The soil is in most parts poor, sandy, and unproductive; but on the hill sides are several fertile tracts, on which good crops of corn and wine are raised with little labour. Excepting a few evergreen oaks near the centre of the island, Minorca is almost destitute of trees; a circumstance attributable partly to the devastations of war, and partly to the violent N. winds, which are extremely injurious to plantations. Wheat and barley are the grains chiefly cultivated; both being of middling quality, and scarcely sufficient to supply two-thirds of the consumption of the island. Red and white wines are made in large quantities, and about 10,000 arrobas a year are exported, but the olive will not thrive in consequence of the cold N. winds. Capers grow spontaneously, and form an important article of export. Flax, hemp, saffron, and the cotton plant succeed well, but are little attended to. Fruits of various kinds are abundant, though much inferior in flavour to those of Majorca. Vegetables, also, are plentiful, and of good quality. The island is well suited for pasturage, and is well supplied with cattle, sheep, goats, and mules; wool is exported in considerable quantities; and the cheese of Minorca is considered by the Italians as equal, if not superior, to Parmesan. Bees, also, are reared in great abundance, and furnish large supplies of excellent honey and wax. Partridges, quails, and other game, are plentiful. Lizards swarm; and there are several varieties of venomous reptiles, but no beasts of prey. Fish, especially anchovies abound on the coast, and the oysters of Minorca are held in high estimation by the Catalonians.

The trade of Minorca, chiefly carried on at Port Mahon, consists in the export of wine, wool, cheese, capers, honey, and wax, chiefly to Spain, but also to Genoa, Leghorn, and the ports of France. The imports comprise wheat, oil, linen, cotton and woollen fabrics, wood, tobacco, and a variety of manufactured goods and colonial products from Spain, France, and Italy. The possession of Minorca by the British during the greater part of last century did something to awaken a spirit of activity and enterprise among the inhabitants. Since its restoration to Spain, however, its industry and commercial importance have greatly declined. Accounts are kept in Spanish money; but some of the inhabitants still retain the English mode of accounting.

"The inhabitants of Minorca," says Fischer, "are ardent, courageous, ingenious, and make excellent sailors. That activity of mind which distinguishes the Mallorcans, they possess, perhaps, in a still higher degree; for they are extremely lively, sociable, and even convivial. As the climate and soil of Minorca are greatly inferior to those of Majorca, the people of the former island are much less opulent than the Mallorcans; but they bear a close affinity to each other in language, manners, and religion." (*Pict. of Valencia*, p. 280.) They are enthusiastically fond of religious processions, and are as bigoted and ignorant as possible. Dancing and playing on the mandolin are their chief amusements. The modern inhabitants are said to be as expert as their ancestors in the use of the sling.

Minorca is divided into the four districts, or *terminos*, of Mahon, Alayor, Mercadel, and Ciudadela, which are the names also of the four largest towns. Mahon, the cap. (an *Portus Majoris*), at the E. end of the island, with a popu-

MIRANDOLA.

lation of about 10,000, is on the whole, well built, chiefly in the English style; but the older streets are narrow, crooked, and badly paved. The harbour is one of the best and most capacious in the world: three large quays have, more than once, been at anchor in it at the same time, and there is excellent mooring ground in five and six fathoms, sheltered from every wind. It has three rocky islets: on one stands a hospital, on another the lazaretto, and on the third is an arsenal, with naval stores, all built by the English. Ciudadela (which see) is the ancient capital, but its population is not above 8000. The other towns are little more than mere villages.

The ancient history of Minorca is nearly identical with that of Majorca. In 1385 the Moors were finally expelled from both islands, which were then formally annexed to the crown of Arragon. In 1708, during the war of the Spanish succession, the English took possession of the island, with the intention of making it a naval station. It was confirmed to the British by the peace of Utrecht, and remained in their possession till 1756, when it was taken by a French fleet and army, after the failure of the attempt to relieve it by Admiral Byng, which led to the memorable trial and death of the latter. At the peace of 1763 Minorca was restored to Great Britain, but in 1781 it was retaken by the Spaniards. It was once more taken by the British in 1798, and was finally ceded to Spain at the peace of Amiens in 1802. (*Fischer's Valencia*, p. 280-282; *St. G. Trevelyan's Excursions in the Mediterranean*, i. 12-15; *Mifano*.)

MINOT, p. l., Cumberland co., Me., 45 m. S.W. Augusta, 576 W. Bounded E. by Androscoggin river, S. by Little Androscoggin river, which afford extensive water-power. A bridge crosses Androscoggin river to Lewiston. It contains 15 stores, one furnace, two falling-mills; 28 schools, 1250 scholars. Pop. 3550.

MINSK, a government of Russian Poland, comprising the former palatinate of Minsk, and portions of the palatinates of Polock, Wilna, Novogrodek, &c. It is principally included between the 53d and 56th degs. of N. lat., and the 26th and 30th of E. long., having N. and Z. the gov. Wilna, and Mogilev, S. Kief and Volhynia, and W. Grodno and Wilna. Area about 42,000 sq. m. Population, in 1823, 1,034,800, of whom about 100,000 were Jews. Surface mostly level, but in the N. a chain of hills separates the waters flowing towards the Black sea from those that fall into the Baltic. In the S. is a large extent of marsh land, along the banks of the Pripiet. Exclusive of this river and the Dnieper, the other principal rivers are their affluents, the Beresina, Styr, Gorin, Pechiza, &c.: the Dvina forms, for a short distance, the N. and the Niemen the W. boundary of the government. There are a number of small lakes, and in spring a great portion of the country is inundated, so as to form a vast sheet of water. Though one of the poorest and worst cultivated parts of the empire, Minsk produces more corn, principally rye, than is required for home consumption. Hemp and flax are important products, as are potash and tar. The forests are very extensive; and, next to agriculture, sawing and trading in timber is the principal occupation of the population, and numerous large rafts are floated down the rivers to Kherson on the one hand, and to Riga and Konigsberg on the other. The rearing of live stock is mostly ill-conducted; pasturage is good in some parts, but the sheep yield only inferior wool. A great many bees are reared. Some little iron is obtained. Linen weaving and distilling are pretty general; a little woollen cloth is made; there are some iron forges and glass factories; and at Pinsk, in the S.W., Russian leather is prepared. The trade of the government is chiefly conducted by strangers. In 1832, only 3159 children were receiving public instruction, and there were but three printing establishments in the government. Chief towns, Minsk the capital, Boubrouisk, and Sloutak.

MINSK, a town of Russian Poland, cap. the above government, and one of the largest in Lithuania, about 400 m. W.S.W., and 150 m. W. by S. Erodo. Lat. 53° 54' N. W.; long. 27° 32' 15" E. Pop. 14,600. Its streets are narrow, irregular, and dirty, and its houses nearly all of wood; but the town has, upon the whole, a respectable appearance, and some good buildings, among which are several Greek, Greek-united, and Roman Catholic churches, a synagogue, a gymnasium, founded in 1773, and a handsome theatre. It is the see of a Greek archbishop and a Roman Catholic bishop, and has manufactures of woollen cloth, hats, and leather. Under the Poles, Minsk was the cap. of the part of the same name. (*Schmittler's La Russie*, p. 403-404.)

MIRANDOLA, a town of N. Italy, duchy of Modena, cap. cant., on the Burana, 18 m. N.N.E. Modena. Pop. 4600. It is walled, and has a castle, but its fortifications have fallen into decay. Among its principal edifices are a handsome cathedral and numerous churches, a hospital, and a palace belonging to the Cico family. It has manufactures of silk stuffs and twist, and woollen and cotton yarn, and an active trade in these articles and in rice, &c.

MIRECOURT.

good deal of which is grown in the neighbourhood. (*Ram-pold; Diet. Gég. &c.*)

MIRECOURT, a town of France, dep. Vosges, cap. arrond., on the Madou, a tributary of the Moselle, 16 m. N.W. Epinal. Pop., in 1836, 5,567. It is ill-built, and has no remarkable public edifice; it is, however, the seat of tribunals of original jurisdiction and commerce, and has a public library of 6,500 vols. &c. It is principally noted for its manufactures of violins, guitars, barrel organs, and other musical instruments, which occupy most part of the male population, while the females are employed in making lace. (*Hage, art. Vosges.*)

MIREPOIX, a town of France, dep. Ariège, cap. cant., on the Lers, a tributary of the Ariège, 13 m. N.E. Foix. Pop., in 1836, inc. com., 4,060. It is well built and clean, and has a large hospital, a parish church, a town-hall, and a bridge over the Lers, all handsome structures. Its inhabitants manufacture coarse woollen and cotton cloths.

MIRZAPORE, a distr. and town of British India, presid. Bengal. The district is included in the province of Benares, and is in about lat. 25° N., and between long. 82° and 83° E. Area, estimated at 36,50 sq. m. Pop. uncertain, but probably about 1,000,000. Land revenue (1839-30), 10,82,391 rupees. The cap. Mirzapore, on the Ganges, 30 m. S.W. Benares. Lat. 25° 10' N., long. 83° 33' E. It has numerous handsome European and native houses, Hindoo temples and ghats, and is the chief mart for silk and cotton goods in the British middle provinces. Cotton stuffs and carpets, of a superior kind, are made here; and there are some iron works in the vicinity. (*Hamilton's E. &c. Gaz.*)

MISITRA. See SPARTA.

MISKOLCZ, a large market town of Hungary, co. Borsod, of which it is the cap., on the great road from Pesth to Upper Hungary, 23 m. N.E. Ertau. Pop., according to the *Austrian Encyclopedia*, nearly 27,700, principally Protestants. It is well built, and has numerous churches, a Protestant and a Roman Catholic gymnasium, a Greek national school, a synagogue, a Minorite convent, &c. The wine grown in the vicinity is the chief article of traffic at Miszkolcz.

MISSISQUE, r., Vt., rises in Orleans co., and pursues a northeasterly course into Canada. But it soon returns into Vermont, in the N.E. part of Richford. It then runs south-westerly and westerly to Swanton, whence it flows north-westerly and it enters Missisquoi bay, near the Canada line. It has falls affording good water-power, particularly at Swanton, but the current is generally moderate. It is about 75 miles long by the course of the river, and is navigable for vessels of 50 tons, 6 m., to Swanton falls. It is one of the four large rivers which enter lake Champlain from Vermont.

MISSISSIPPI, one of the southern United States, is bounded N. by Tennessee, E. by Alabama, S. by the gulf of Mexico and Louisiana, and W. by Pearl and Mississippi rivers, which separate it from Louisiana and Arkansas. It is between 30° 10' and 35° N. lat., and between 89° 10' and 91° 35' W. long., and between 11° S. and 14° 38' W. long. from W. Its extreme length is 336 m., and its breadth 135 m., containing 45,700 sq. m., or 99,396,400 acres. The pop., in 1816, was 45,091; in 1830, 75,448; in 1830, 136,806; in 1840, 373,651, of whom 199,911 were slaves. Of the free population, 97,256 were white males, 81,818 were white females; there were 715 coloured males, 654 were coloured females. Employed in agriculture, 139,794; in commerce, 13,003; in manufactures and trades, 4151; in navigating the ocean, 33; do. rivers, canals, &c., 100; in the learned professions, 1508.

Jackson, in Hinds county, a little W. of Pearl river, is the capital of the state. Mississippi has a sea coast of only about 70 miles, with no harbour in this distance which admits large vessels. A chain of low and sandy islands along the coast encloses Pascagoula bay, which is 65 m. long and 7 m. wide, forming an inland navigation between Mobile bay and lake Borgue, which communicates with the gulf of Mexico by a number of entrances, that admit vessels requiring 8 ft. of water. The S. part of the state, for about 100 m. from the gulf of Mexico, is a level country, covered chiefly with pine forests, cypress swamps, open prairies, or inundated marshes. Advancing north, the country becomes more hilly and broken, though there are in the state no elevations that can properly be denominated mountains. From 31° to 35° N. lat., near the Mississippi river, is a range of bluffs, which in a few places reach the margin of the stream, though generally at a little distance from it. They are an extension of the table land which extends over a portion of the state, into the low grounds on the Mississippi river, and have a fertile soil. The alluvial land on the rivers, where not liable to be overflowed, is the most valuable land in the state. The soil in its natural condition is covered with a vast growth of oak, hickory, magnolia, sweet gum, ash, maple, yellow poplar,

MISSISSIPPI.

pine, and holly, with a great variety of underwood, grape vines, pawpaw, spice wood, &c., and cypress in the swampy alluvions of the Mississippi bottoms. By cultivation, the state produces abundantly cotton, Indian corn, sweet potatoes, tobacco, indigo, peaches, melons, and grapes. The lands watered by the Yazoo, through its whole course in the N.W. part of the state, are very fertile, while much of the land in the state, covered with pine, has a light soil. Cotton is the staple production of the state, and it is found to be more profitable than others to which the soil is also well adapted.

The state is divided into 56 counties, which, with their population in 1840, were as follows:

Counties.	Pop. 1840.	Counties.	Pop. 1840.
Northern District.			
Attala,	4,303	Covington,	2,717
Bolivar,	1,256	Franklin,	4,775
Carroll,	10,491	Greene,	1,086

Amite,	9,511	Wilkinson,	11,108
Chickasaw,	13,079	Yazoo,	10,400
Clarke,	2,398	Total,	223,351
Copiah,	8,954	Total of State,	373,651

There were in this state, in 1840, 100,397 horses or mules, 693,197 neat cattle, 198,367 sheep, 1,001,909 swine; poultry was raised to the value of \$309,432. There were produced 196,636 bushels of wheat, 11,444 of rye, 13,161,237 of Indian corn, 1854 of barley, 668,934 of oats, 1,630,100 of potatoes, 175,196 lbs. of wool, 6835 of wax, 83,471 of tobacco, 777,195 of rice, 193,401,577 of cotton. The produce of the dairy was valued at \$358,585; of the orchard at \$14,458; of lumber at \$193,794; tar, pitch, and turpentine, amounted to \$248 lb.

The climate is mild, but very variable. The extremes of heat and cold at Natchez, for 1840, were from 26° to 94° of Fahrenheit. The sugar cane and orange tree cannot be successfully cultivated N. of lat. 31°.

The Mississippi river washes the entire western border for a distance, by the windings of the stream, for 530 m. A large portion of its bank in this state consists of inundated swamp covered with cypress, excepting occasional elevated bluffs, which immediately border the river. The Yazoo is the largest river which flows wholly within the state, and enters the Mississippi 12 m. above Vicksburg. It is 100 yds. wide at its mouth, is 900 m. long, and is navigable for large boats for 50 m. It flows through an elevated and healthy country. Big Black is the next river in size, and enters the Mississippi immediately above the Grand Gulf, by a mouth 40 yds. wide. Its length is 200 m., and it is navigable for 50 m. Homochitto is a small river, which enters the Mississippi, 43 m. below Natchez. Tombigbee rises in the N.E. part of the state, and flowing into Alabama, unites at length with Alabama river, to form Mobile river. Pearl river rises near the centre of the state, and drains its southern part, and enters the Rigolets between lake Pontchartrain and lake Borgue. Below the thirty first degree of N. lat., it divides the state from Louisiana. Pascagoula river waters the S.E. part, is formed by the junction of Chickasawha and Leaf rivers, and enters Pascagoula sound. It is navigable for 50 m., for vessels requiring 6 ft. of water, and for boats 100 m. farther; but the bay at its mouth has only 4 ft. of water.

The largest and most commercial place in the state is Natchez, on the Mississippi, situated on a bluff elevated 250 ft. above the surface of the river, 300 m. above New-Orleans, by the course of the river. Vicksburg, 106 m. above Natchez, and 19 m. below the mouth of Yazoo river, has had a rapid growth and is flourishing. The other principal places are Jackson, the capital, Woodville, 18 m. from the Mississippi, in the S.W. part of the state, Port Gibson and Grand Gulf, its port on the Mississippi, Columbus on the Tombigbee, Pontotoc and Hernando in the N., and Mississippi city on the gulf shore.

MISSISSIPPI.

There were in the state, in 1840, seven commercial and 67 commission houses in foreign trade, with a capital of \$673,940; 755 retail dry goods and other stores, capital, \$5,004,490; 288 persons engaged in the lumber trade, employing a capital of \$132,175; 40 persons employed in internal transportation, with 15 butchers, packers, &c., employed a capital of \$4850.

The amount of home made or family articles was \$663,945; 53 cotton manufactories with 318 spindles, employed 81 persons, produced articles to the amount of \$1744, with a capital of \$6490; hats and caps were manufactured to the amount of \$5140, employing 13 persons, and a capital of \$8100; 128 tanneries employed 149 persons, and a capital of \$70,870; 49 other manufactories of leather, as saddleries, &c., produced articles to the amount of \$118,167, with a capital of \$41,945; one pottery, employing two persons, produced to the amount of \$1300, with a capital of \$300; four persons produced drugs and paints to the amount of \$3125, with a capital of \$500; two persons produced confectionary to the amount of \$10,500; 274 persons produced machinery to the amount of \$942,225; 603 persons produced bricks and lime to the amount of \$73,870, with a capital of \$222,745; there were produced 319,064 lbs. of soap, 31,957 of tallow candles, and 97 of wax or spermaceti candles; 123 persons produced carriages and wagons to the amount of \$49,663, with a capital of \$34,335; 16 flouring mills produced 1809 bbls. of flour, and with other mills, manufactured articles to the amount of \$466,864, with a capital of \$1,219,845; vessels were built to the amount of \$13,935; 41 persons manufactured furniture to the amount of \$24,450, with a capital of \$28,610; 14 distilleries produced 3150 gal., and two breweries 132 gal., employing 12 persons, and a capital of \$910; 14 stone or brick houses, and 2247 wooden houses, were built by 2487 persons, and cost \$1,175,513; 35 printing-offices, and one bindery, two dailies, one semi-weekly, and 98 weekly newspapers, employed 94 persons, and a capital of \$53,510. The total amount of capital employed in manufactures was \$1,707,737.

There are three colleges in this state. Jefferson college at Washington, 6 m. E. of Natchez, was founded in 1812, and has been liberally endowed; Oakland college, at Oakland, was founded in 1831, and is prosperous; Centenary college, at Brandon Springs, was founded in 1841, by the Methodists, and is flourishing. The colleges existing in 1840, had about 250 students. There were in the state 71 academies, with 3553 students; and 368 common and primary schools, with 6536 scholars. There were in the state 8300 white persons over 20 years of age who could neither read nor write.

The Methodists and Baptists are the most numerous religious denominations. In 1830, the Methodists had 53 travelling preachers and 9707 communicants; the Baptists had 94 churches, 34 ministers, and 3199 communicants; the Episcopalians had four ministers; the Presbyterians of different descriptions had 32 churches and 96 ministers.

In the beginning of 1840, the state had 23 banks and 15 branches, with an aggregate capital of \$30,379,403, and a circulation of \$15,171,630. The state debt amounts to \$7,000,000, incurred for banking purposes.

A railroad extends from Vicksburg 50 m. to Jackson, and is extended 14 m. farther to Brandon. A railroad extends from Natchez, and is designed to be continued through Jackson to Canton, a small part only of which is completed. Several other railroads have been projected, and some work done on them.

The governor is elected biennially by the people, but is ineligible for more than four years in any term of six years. He must be 25 years of age, and have been a citizen of the United States for 10 years. The senate consists of 30 members, elected for the term of four years, one half of the number being elected every two years, by the people. A senator must be a citizen of the United States, have resided in the state for four years, and in the district for which he is chosen for one year next preceding his election, and be thirty years of age. The house of representatives consists of ninety-one members, citizens of the United States, elected biennially by the people. Every representative must have resided in the state for two years, and in the city, town, or district, for which he is chosen, for one year next preceding his election. The judges of the high court of errors and appeals are elected by the people for six years; the judges of the circuit court for the term of four years; the chancellor for the term of six years; the judges of probate for the term of two years. The judges of the high court of appeals and errors must be 30 years of age; and the others be 25 years of age. The secretary of state, the treasurer, and the sheriff, are elected by the people, for the term of two years. Every white male person of 21 years of age or over, a citizen of the United States, who has resided in the state for one year, and in the county for which he offers his vote four

months next preceding an election, enjoys the right of suffrage. The legislature meets biennially at Jackson, on the first Monday in January.

In 1716, the French formed a settlement at the place where the city of Natchez now stands, and laid claim to the country as belonging to Louisiana. This colony was massacred by the Indians in 1720. In 1763, it was ceded to the British, and N. of the thirty first degree of N. latitude was in the chartered limits of Georgia; S. of that, it belonged to W. Florida, which was ceded to the United States in 1796 by Spain. In 1800, this state, with Alabama, was constituted a territory, under the name of the Mississippi territory. In 1817, Mississippi was separated from Alabama, and was admitted to the union as a sovereign state. The constitution was formed in 1817, and revised and amended in 1832.

Mississippi, an immense river of the United States; which, whether we consider its great length, its vast tributaries, the extent of country which it drains, and the distance to which it is navigable, well deserves the title which the Indians give it of the "father of waters." The import in the Algonquin language of *Missi Sipi*, the name by which it is designated, is great river. It drains a country of over 1,000,000 square miles in extent, eminently fertile, and sending through it to its destined market, a vast amount of produce, and receiving in return the productions of other parts of the world. Its extreme source was discovered by Schenck in July 13th, 1832, to be Itasca lake, in 47° 14' N. lat., and 94° 54' W. long., at an elevation of 1380 feet above the ocean, and 3180 m. from its entrance into the Gulf of Mexico. Itasca lake, or lac la Biche of the French, is a beautiful sheet of water, of an irregular shape, about eight m. long, situated among hills covered with pine forests and fed chiefly by springs. It has its outlet to the N., which is about 10 or 12 ft. wide, and from 12 to 18 in. deep, and flowing northwardly, it passes through lakes Irving and Turner, and then turns eastwardly, and proceeding through several small lakes, it enters lake Cass. This lake is about 16 m. long, contains several islands, is about 3000 m. from the gulf of Mexico, at an elevation of 1330 ft. above the ocean, and 192 m. below lake Itasca, the source of the Mississippi. It then flows E. to lake Winnipeg, and S.E. to Little lake Winnipeg, below which it receives Leech lake fork, the outlet of a considerable body of water of a very irregular form, called Leech lake. This was formerly regarded as the source of the Mississippi. The most northerly point obtained by the Mississippi is a little short of 49° N. lat. From the junction of Leech lake fork, the river expands to a hundred feet in width, and increases of depth, and flows with a mean current of one and a half miles per hour, and a descent of three inches in a mile, through a low prairie country covered with wild rice, rushes, sweet-grass and other aquatic plants, and is the favourite haunt of waterfowl and various amphibious quadrupeds. At the falls of Peckagama, the first rocky stratum, and the first wooded island is seen, at the distance of 665 m. above the falls of St. Anthony. At the fall of Peckagama, the river descends 30 ft. in 300 yards, by a rapid which entirely obstructs navigation. At the head of these falls, the prairies entirely cease, and below, a forest of elm, maple, birch, oak and ash, overshadow the stream. The river now takes a southerly course, curving to the west, and again to the east, to the falls of St. Anthony. The fall of the river above may be computed at six inches in a mile, with a current of three miles an hour, extensive of some rapids, and has some dry prairies on its shores, the resort of the buffalo, elk and deer, and are the only part of the Mississippi in which the buffalo is now found. At the falls of St. Anthony, 843 m. above the mouth of the Missouri, the river has a perpendicular descent of about 16 ft. with a formidable rapid above and below. The rapid above the falls has a descent of 10 feet in the distance of 20 yards, and below the falls, a descent of 15 ft. in the distance of half a mile. An island at the brink of which it divides the current into two parts, the largest of which is on the west of the island, and immediately below the falls are large fragments of rock, in the interstices of which some alluvial soil has accumulated, supporting a stunted growth of cedars. The whole fall has a descent of about 41 ft. in less than three-fourths of a mile. This all has nothing of the grandeur of Niagara, but the contrast, and the surrounding scenery are widely picturesque and beautiful. In times of high floods it may approach to the sublime. The width of the river above the falls is 500 or 600 yards, and at the falls is 327 yards; but narrows to 200 yards, a short distance below. The portage around the falls is about 980 rods. In 1805 the United States purchased of the Sioux tribe of Indians a tract of nine miles square, including the falls of St. Anthony for a military post, for the sum of \$2000. On this territory, Fort Snelling is situated. A considerable tract of fertile land has been put under cultivation by the garrison. As an indication of the climate, the last

MISSISSIPPI.

green peas were eaten here on the 15th of June, and the first green corn on the 30th of July; and on the last of July, Schoolcraft found much of the corn too hard to be boiled for the table, and some ears might have been selected sufficiently ripe for seed corn. A little below the falls of St. Anthony, the St. Peter's river enters from the W., and is much the largest tributary of the upper Mississippi. For 300 miles above its entrance, Carver found about 100 yards wide, with a great depth, and it receives several important tributaries. It is 150 yards wide at its mouth, and ten or fifteen feet deep. About 44° N. lat. the St. Croix enters on the N.E. side, which is 100 yards wide at its mouth. About 300 yards above its mouth it expands into a lake called St. Croix lake, which is 36 miles long and from one and a half to three miles broad, and the river is said to be navigable for boats for 200 miles. About 15 miles below the mouth of the Croix, the Mississippi expands into a beautiful sheet of water, called lake Pepin, which is 24 miles long, and from two to four miles broad, and is 100 below the falls of St. Anthony. On the E. shore is a range of limestone bluffs, and on the W. an elevated level prairie, covered with a luxuriant growth of grass, and nearly destitute of forest trees, with occasional conical hills, which appear like artificial mounds. At the lower termination of lake Pepin, Chippewa river enters from the N.W., after a course of about 300 miles. In 43° N. lat. Wisconsin river enters on the E. side, forming an easy communication with lake Michigan by Fox river, which enters Green Bay. It is boatable more than 200 miles. A little below this comes in Turkey river from the W., and La Mine river from the E., so called from its traversing the lead mine region of Illinois. A little below 42° N. lat. enters the Webbsville, a considerable river from the W., and a little down, Rock river, a clear and beautiful stream enters on the E. side. A little above Rock river, are long rapids, which at low water, render it difficult for boats to ascend. A little W. of 40° enters the Iowa, a large river from the W., and below that enter on the same side, Skunk and Des Moines rivers. The latter is perhaps the largest western tributary above the Missouri. It is 150 yards wide at its mouth, and said to be boatable for nearly 300 miles. A few miles above its mouth are rapids, nine miles long, forming a serious impediment to navigation at low water. In about 39° N. lat. comes the Illinois river, a noble, broad and deep stream, and the most considerable tributary of the Mississippi above the Missouri. It is nearly four hundred yards wide at its mouth, is about 400 miles long and navigable for boats more than three hundred miles. A canal is in progress to connect it with lake Michigan. A little below 39° N. lat., comes in from the W. the mighty Missouri, which is longer, and probably discharges more water than the Mississippi; and had it been early explored, it would probably be considered as the parent stream; but it will henceforth be considered only as a tributary. The Mississippi above the junction is a remarkable clear stream, but this is entirely destroyed by the entrance of the turbid Missouri, which communicates its own muddy appearance to the Mississippi through the remainder of its course, thus asserting its lordship over it. (See Missouri river.) Near 38° N. lat. the Kaskaskia river comes in on the E. side. It is 80 yards wide at its mouth, flows through a beautiful country, is over 300 miles long, and is boatable in high water, over 100 miles. Between 36° and 37° N. lat. comes in from the E. the beautiful Ohio, "*Le Belle Riviere*" of the French, and is much the largest eastern tributary; and from the densely populated and highly fertile country on its borders, it is at present, much the most important branch of the Mississippi. The large tributaries, the Cumberland, Tennessee and Wabash, contribute to its magnificence and importance. Between 35° and 34° the St. Francis enters from the W., 300 yards wide at its mouth, and supposed to be navigable by one of its forks for 300 miles. A little above 34° N. lat., White river enters on the W. side, by a mouth from 300 to 400 yds. wide, and is probably about 1200 m. long. Thirty miles below, between 34° and 33° the Arkansas enters from the W., by a mouth 500 yds. wide, and is supposed to be 2200 m. long. It is next to the Missouri, the largest western tributary, and its waters are of a dark flame color, when the river is full. Between 33° and 32°, a little above the Walnut hills in the state of Mississippi, the Yazoo river enters on the E. side, by a mouth from 200 to 300 yds. wide. A little above 31° Red river enters on the W. side. It is nearly as large as the Arkansas, and discharges about as much water. Here the Mississippi carries its greatest volume of water, as immediately below this, and at intervals after, it sends off several large outlets. Three miles below the mouth of Red passes off on the W. side, the Atchafalaya or Chaffin Bayou, as it is called, which is supposed to carry off as much water as the Red river brings in. Here the Mississippi has a famous "cut-off" by crossing the isthmus of a large bend, so that the main channel does not pass the mouth of Red river. The Atchafalaya has been

supposed to be the ancient bed of Red river, by which its waters were discharged without mingling with the Mississippi, and much of its water is now discharged by this outlet. A little below Baton Rouge the Iberville passes off on the E. side, going through lakes Maurepas, Pontchartrain and Borgne into the gulf of Mexico. La times of flood it carries off considerable water. Between this outlet on the E. and the Atchafalaya on the W., is what is called the Delta of the Mississippi. Between Atchafalaya and New-Orleans pass off on the W. side Plaquemine, which joins the Atchafalaya, and La Fourche, which pursues an independent course to the gulf of Mexico. At the distance of 105 miles below New-Orleans by the course of the river and 90 m. in a direct line this majestic river enters the gulf of Mexico by several mouths, the principal of which are called the Balize or north east pass, in 29° 7' 25" N. lat., and 89° 10' W. long. and the south west pass in 29° 8' N. lat. and 89° 25' W. long. The depth of water on the bar at each of these passes is 12 feet, but much greater a little without and within the bar. Most of the vessels enter and leave the river by the N.E. pass. It might naturally be expected from the extent of country drained by the Mississippi, that the spring floods would be great. From the mouth of the Missouri, the flood commences in March, and does not subside before the last of May, at an average height of 15 feet. From the Missouri to the Ohio it rises 25 feet, and for a great distance below the Ohio it rises 50 feet. At every flood it overspreads the country, chiefly on its W. side for 500 miles from its mouth, to the distance of from 10 to 30 miles. From the falls of St. Anthony to the mouth of the Missouri, it has a medial current of two miles an hour; and at every place, except at the rapids of the Des Moines, it has a depth of water of not less than four feet at the lowest stages. Below the Missouri its depth is greatly increased, but its width, except in the forests and swamps, when overflowed, is very little increased. To the mouth of the Ohio it has in the channel six feet of water at its lowest stages, and at its highest, of twenty-five feet. From the mouth of the Ohio to the St. Francis, there are various shoal places, where at low water, pilots are often perplexed to find a sufficient depth of water. Below that point, there is no difficulty for vessels of any draught, except to find the right channel. Above Natchez, the flood begins to decline. At Baton Rouge, it seldom exceeds thirty feet; and at New-Orleans, twelve. This river is exceedingly winding in its course, and sometimes a bend will occur of 30 miles, where the distance across the neck will not exceed a mile. The mighty volume of water often carries away a large mass of earth with its trees, from a projecting point, and frequently endangers vessels. Trees are also often bedded in mud, with their tops projecting, producing snags and sawyers, as they are called, dangerous to navigators. The whirls or eddies which are produced by the tortuous course of the river and its projecting points, render the navigation to a degree difficult and dangerous. Below the Missouri, the medial current is about four miles an hour. It is difficult on viewing it for the first time to have an adequate idea of its grandeur, and the amount of water which it carries. In the spring, when below the mouth of the Ohio its banks are overflowed, although the sheet of water that is making its way to the gulf may be 30 miles wide, yet finding its way through forests and swamps which conceal it from the eye, no expanse of water is seen but that which is included between its wooded banks, which seldom exceeds, but often falls short of a mile in width. But when it is seen from time to time to swallow up many large rivers, it will be easily conceived that it must have a great depth. At the lowest water, at the efflux of the Atchafalaya, at the head of the Delta, it is from 75 to 80 feet deep, at the outlet of La Fourche at Donaldsonville, 130 feet; upwards of 100 feet at New-Orleans, and from 75 to 80 feet, three miles above the main bars. Vessels are often from five to 30 days in ascending from the mouth of the river to New-Orleans; though they will, with a favourable wind, often descend in 12 hours. Before the introduction of steam-boats, it required eight or 10 weeks to go to the Illinois. Boats of 40 tons ascend the river to the falls of St. Anthony, more than 2000 miles from its mouth. The use of steam-boats has nearly superseded all other vessels for ascending the river. Large flat-bottomed boats, denominated arks, which are not designed to return, are extensively used for transportation down the river. The first steamboat on the western waters was built at Pittsburg, in 1811; there are now over 300 on the Mississippi and its tributaries, many of them of great burthen. The passage from Cincinnati to New-Orleans and back, has been made in 19 days. Large ships, moved by sails, rarely ascend above Natchez. There are no tides in the Mississippi. (For the tributaries of the Mississippi, see the several articles, Missouri, Ohio, &c.)

MISSISSIPPI, county, Ark., situated in the N.E. part of the state, and contains 1000 sq. m. Bounded E. by Mississippi

MISSISSIPPI CITY.

MISSOURI.

river, W. by St. Francis river. Watered by Whitewater river. It contained in 1840, 30,493 neat cattle, 76 sheep, 5923 swine; and produced 107,615 bushels of Indian corn, 3006 of potatoes, 23,500 pounds of cotton. It had one store; one school, 25 scholars. Pop. whites, 900, slaves, 510; total, 1410. Capital, Osceola.

MISSISSIPPI CITY, p. v., capital of Harrison co., Miss., 935 S.E. Jackson, 1143 W. Situated on the coast of the gulf of Mexico. Its harbor admits small vessels. It contains a courthouse, and several stores and dwellings.

MISSOURI, one of the western United States, is bounded N. by Iowa territory, E. by the states of Illinois, Kentucky, and Tennessee, from which it is separated by Mississippi r., S. by Arkansas, and W. by the Indian territory, from which it is in part separated by Missouri river. It is between 36° and 40° 36' N. lat., and 89° and 95° 45' W. long., and between 110° 59' and 180° 43' W. long. from W. It is 278 m. long, and 235 broad, containing 64,500 square m., or 41,920,000 acres. The population in 1810, was 19,833; in 1830, 66,586; in 1830, 140,074; in 1840, 363,702, of whom 58,240 were slaves. Of the free population, 173,470 were white males; 150,418 were white females; 883 were coloured males; 691 were coloured females. Employed in agriculture, 92,408; in commerce, 2523; in manufactures and trades, 11,100; in mining, 743; in navigating the ocean, 39; do. rivers, canals, and lakes, 1885; in the learned professions, 1496.

The state is divided into 68 counties, which, with their population in 1840, were as follows:

Counties.	Pop.	Counties.	Pop.
Audrain	1,949	Miller	2,932
Barry	4,795	Monroe	9,505
Benlon	4,265	Morgan	4,407
Boone	13,351	Montgomery	4,271
Buchanan	6,987	New Madrid	4,544
Caldwell	1,489	Newton	3,790
Callaway	11,765	Perry	6,760
Cape Girardeau	9,359	Pettis	5,390
Carroll	5,425	Pfaff	9,913
Chariton	4,746	Pike	10,646
Clark	6,846	Polk	8,449
Clay	8,382	Pulaski	6,529
Clinton	2,734	Ralls	6,570
Cole	9,894	Randolph	7,186
Cooper	10,484	Ray	6,553
Crawford	3,461	Ripley	2,856
Davies	2,736	Rives	4,798
Franklin	7,515	St. Charles	7,911
Gasconade	6,380	St. Francis	3,211
Groves	5,372	St. Genevieve	3,148
Howard	13,108	St. Louis	35,979
Jackson	7,612	Saline	5,258
Jefferson	4,936	Scott	5,974
Johnson	4,471	Seely	3,056
Lafayette	6,815	Stoddard	3,153
Lewis	6,040	Taney	3,364
Lincoln	7,449	Van Buren	4,893
Linn	2,245	Warren	4,253
Livingston	4,213	Washington	7,913
Macon	6,084	Wayne	3,403
Madison	3,383	Total	363,702
Marion	3,923		

Jefferson city, on the S. bank of the Missouri river, 13 m. above the mouth of Osage river, is the seat of government.

The state presents a variety of surface and of soil. South of Cape Girardeau, with the exception of some bluffs along the Mississippi, it is alluvial, and a large proportion consists of swamps and inundated lands, most of which are heavily timbered. From thence to the Missouri river, and westward to the dividing ridge between Gasconade and Osage rivers, the country is generally covered with timber, rolling, and in some parts quite hilly; but no parts of the state are properly mountainous. Along the head waters of Gasconade and Big Black rivers, the hills are frequently abrupt and rocky, with fertile alluvion along the water courses. Much of this region abounds with various minerals, as lead, iron ore, gypsum, manganese, zinc, antimony, cobalt, ochre, common salt, nitre, plumbago, porphyry, Jasper, chalcodony, buhrstone, marble and free stone. The lead is inexhaustible in quantity and rich in quality. The iron ore of this region is sufficient to supply the whole United States for many thousands of years. Bituminous coal exists in inexhaustible abundance. The difficulty of transporting these products to the market is the only inconvenience. The western part of this state is divided into prairie and forest land, and much of the soil is fertile. The whole is undulating, and along the Osage it is hilly, abounding with good water, salt springs and limestone. North of the Missouri, the surface is diversified, and divided between timber and prairie land. From the Missouri to Salt river, good springs are scarce, and in several counties artificial wells are dug, to be filled with rain water from the roofs of houses. Between Salt river and Des Moines river is a beautiful country, with a very fertile soil. In the middle counties N. of the Missouri the surface is rolling, and there are some bluffs and hills, with considerable good prairie, and much timber. To the W. of this, and also to the N.,

the prairie predominates. Much of the prairie land in this state, is inferior to the same kind of land in Illinois. But independently of some barren and inundated land, the state contains a great proportion of fertile soil. Indian corn, wheat, rye, oats, hemp, tobacco, flax, sweet potatoes, and in the southeastern parts cotton, are produced. The forest trees and underwood, black and white, are walnut, oak of various kinds, locust, ash, cotton wood, papaw, yellow poplar, sycamore, dog wood and grape vines. In the southern part of the state cypress and red cedar are found. On Gasconade river, about 100 m. above its confluence with the Missouri, the timber is principally yellow and white pine, which is very valuable, being rare in the valley of the Mississippi. The state is particularly rich in minerals. The lead region, the centre of which is 70 m. S.W. of Missouri, is 70 m. long, and 45 wide, covering an area of 3150 sq. m. The greatest part of this country is situated in Washington and St. Francis counties, but a part extends into St. Genevieve and Jefferson counties. The ore is of the richest kind. It yields from 80 to 85 per cent of the true metal. Iron ore is equally abundant. In the S.E. part of Washington county is the celebrated "iron mountain" one mile broad at its base, and 3 m. long, and from 300 to 450 feet high, filled with micaceous oxide of iron, which yields 80 per cent of the pure metal. There is another body of iron ore denominated Pilot Knob, 300 feet high, and a mile and a half wide at the base, which is equally rich. Washington county is a perfect bed of metallic treasures.

There were in 1840, 186,133 horses or mules, 433,875 neat cattle, 348,018 sheep, 1,371,161 swine; and there were produced 1,037,396 bushels of wheat, 68,608 of rye, 17,332,284 of Indian corn, 15,318 of buckwheat, 9801 of barley, 2,334,947 of oats, 783,768 of potatoes, 592,255 pounds of wool, 58,461 of wax, 9,067,913 of tobacco, 121,121 of cotton, 274,853 of sugar, 49,063 tons of hay, 18,010 of hemp or flax; poultry valued at \$270,647. The products of the dairy were valued at \$100,439, of the orchard at \$90,878, of lumber at \$70,353.

The climate is healthy, though subject to great extremes of heat and cold. The extreme range of the thermometer is from 100° above zero to 80° below. But these extremes are short, and not of frequent occurrence. The Missouri is frozen so hard as to be safely crossed by loaded wagons, for a number of weeks in winter. The air is generally dry, pure, and salubrious.

The Mississippi winds along the entire boundary of the state, for a distance of 400 miles, and receives the waters of the mighty Missouri, which crosses the state, and deserves to be regarded, on account of its length, and the volume of its waters, as the parent stream. The Missouri is navigable 1800 miles from its mouth in the Mississippi, to the mouth of Yellow Stone river, for four or five months in the year. The Missouri receives La Mine, Osage, and Gasconade rivers on the S. side, and Grand and Chadron rivers on the N. side. Salt river crosses the N.E. part of the state and enters Mississippi river, 85 m. above the mouth of Missouri river. Des Moines river forms a part of the N.E. boundary of the state. Maramee river rises near the head waters of Gasconade river, and after a devous course northward, enters the Mississippi 18 m. below St. Louis. St. Francis, Current, Big Black, and Whitewater rivers drain its S.E. part.

St. Louis, on the W. bank of Mississippi river, 18 m. below the mouth of Missouri river, is much the largest and most commercial place in the state. St. Genevieve, on the Mississippi, 64 m. below St. Louis, was settled by the French, and has considerable trade, particularly in lead. Potosi, in the mining district, is a flourishing town. Herculaneum is environed by bluffs, which are surmounted by tall towers, and is the principal place of deposit for the lead mines. It is on the Mississippi, 30 miles below St. Louis. New Madrid is the most noted landing place for boats, above Natchez, and Clarksville and Hannibal are noted landing places above St. Louis. St. Charles on the Missouri, 20 m. above St. Louis is a flourishing place, and was the capital of the state until Oct. 1826. Booneville, Lexington, Liberty and Independence are growing places in the W. part of the state.

There were in the state in 1840, three commercial and 30 commission houses engaged in foreign trade, with a capital of \$746,500; 1107 retail dry goods and other stores, with a capital of \$3,158,802; 345 persons employed in the lumber trade, with a capital of \$318,029; 79 persons engaged in internal transportation, who, with 138 butchers, packers, &c., employed a capital of \$173,630. Home made or family manufactures amounted to \$1,149,544; nine woolen manufactures employed 13 persons, produced articles to the amount of \$13,750, with a capital of \$5000; two furnaces produced 180 tons of cast iron, and four forges produced 118 tons of bar iron, the whole employing 80 persons, and a capital of \$79,000; 21 smelting houses produced 3,285,453 pounds of lead, employed 252 persons, and a capital of

MISSOURI.

\$235,006; 80 persons produced 240,302 bushels of bituminous coal, with a capital of \$9488; 36 persons produced 13,150 bushels of malt, with a capital of \$3550; 19 potteries produced articles to the amount of \$13,175, employing 33 persons, and a capital of \$7250; 191 persons produced machinery to the amount of \$190,413; 48 persons produced 959 small arms; 19 persons manufactured the precious metals to the amount of \$5450; 73 persons produced granite and marble to the amount of \$33,050; 671 persons produced bricks and lime to the amount of \$185,334; 293 distilleries produced 308,368 gallons, and seven breweries produced 374,700 gallons, the whole employing 365 persons, and a capital of \$189,976; 301 persons produced carriages and wagons to the amount of \$97,112, with a capital of \$45,074; one powder-mill, employing two persons, produced 7500 pounds of gunpowder, with a capital of \$1080; eight persons produced drugs and paints to the amount of \$13,500, with a capital of \$7000; 64 flouring-mills 49,363 barrels of flour, and with other mills, employed 1336 persons, producing articles to the amount of \$900,058, with a capital of \$1,306,019; 413 brick or stone houses, and 2902 wooden houses were built by 1966 persons, and cost \$1,441,573; 40 printing-offices, six daily, five semi-weekly or tri-weekly, and 24 weekly newspapers, employed 143 persons, and a capital of \$79,350. The total amount of capital employed in manufactures was \$2,704,405.

The university of St. Louis, under the direction of the Roman Catholics, was founded in 1829; Kemper college at St. Louis, under the direction of the Episcopalian, was founded in 1840; St. Mary's college at Barren's, a Roman Catholic institution, was founded in 1830; Marion college, in Marion co., was founded in 1831; St. Charles college, under the direction of the Methodists, was founded in 1839; Missouri university at Columbia, was founded in 1840; Fayette college at Fayette, is a new institution. In the colleges founded before 1839, there were in 1840, 495 students. There were in the state, 47 academies, with 1226 students; and 648 common and primary schools, with 16,768 scholars. There were 19,457 white persons, over 30 years of age, who could neither read nor write.

In 1838, the Methodists had 51 travelling preachers, and 26923 members; the Baptists had 146 churches, 86 ministers, and 4973 communicants; the Presbyterians had 33 churches and 17 ministers; the Roman Catholics had one bishop and 30 ministers; the Episcopalian had three ministers. There were besides, a number of Cumberland and Associate Reformed Presbyterians, and one Unitarian minister.

In 1839 there was one bank and two branches, with an aggregate capital of \$1,116,153, and a circulation of \$410,740.

At the close of 1842, the state debt amounted to \$3,073,361. The governor is elected once in four years by the people, but is ineligible for the next succeeding four years. He must be a natural born citizen of the United States, be at least 35 years of age, and have resided in the state for four years, next preceding his election.

The lieutenant governor is elected at the same time, in the same manner, and must possess similar qualifications. He is president of the senate; and in case of the death, resignation, or removal from office of the governor, discharges the duties of that office, until it is regularly filled.

The senate consists of 18 members, chosen for four years; one half the number being elected biennially. A senator must be at least 30 years of age, a citizen of the United States, have resided in the state for four years, next preceding his election, and for one year in the district for which he is elected, and must have paid a state or county tax.

The house of representatives consists of 49 members, elected biennially by the people. A representative must be at least 24 years of age, have been an inhabitant of the state for two years next preceding his election, and have paid a state or county tax, and be a citizen of the United States.

The governor, with the advice and consent of the senate, appoints the judges of the superior and inferior courts, and the chancellor, who hold their offices during good behaviour. They cannot be appointed before they have attained the age of 30 years, nor hold their offices after the age of 65 years.

Every white male citizen, of 25 years of age or upward, who has resided in the state for one year, next previous to an election, and the last three months in the district in which he offers his vote, is entitled to the right of suffrage. The general assembly meets biennially at Jefferson city, on the first Monday of December.

The territory of this state was included in Louisiana, purchased by the United States of France, in 1803. The town of St. Louis was settled by the French in 1764, as a trading port with the Indians, and remained such, until it was purchased by the United States. In 1804 Louisiana was divided into the territory of Orleans, extending to the 33° of N. lat., and the residue was styled the district of

MITTAU.

Louisiana. In 1805 the district of Louisiana was erected into a territorial government, under the name of the territory of Louisiana, and in 1813 its name was changed to the territory of Missouri. In 1821 a part of this territory was admitted to the union as the state of Missouri, after much debate on the subject of slavery, which was allowed by its constitution, under certain restrictions.

Missouri, a large river of the United States, rises in the Rocky mountains, and takes this name after the union of three branches, denominated Jefferson, Gellatin, and Madison, in 49° 10' N. lat., and 110° W. long. The springs which give rise to the Missouri are not more than a mile distant from some of the head waters of the Columbia, which flows W. into the Pacific ocean. At the distance of 411 miles from the extreme point of the navigation of its head branches, are what are denominated the "Gates of the Rocky mountains," which present a view exceedingly grand. For the distance of 34 miles the rocks rise perpendicularly from the margin of the river to the height of 1900 feet. The river is compressed to the width of 150 yards, and for the first three miles, there is only one spot, and that only of a few yards, on which a man could stand, between the water and the perpendicular ascent of the mountain. At the distance of 110 miles below this, and 321 m. from its source are the Great falls, 2573 miles above its entrance into the Mississippi. The river descends, by a succession of rapids and falls, 357 feet in about 164 miles. The lower and greatest fall has a perpendicular pitch of 87 feet; the second of 19 feet; the third of 47 feet; the fourth of 26 feet. Between and below these falls are occasional rapids of from 3 to 18 feet descent. These falls, next to those of Niagara, are the grandest on the continent. The course of the river above, these falls is northerly. The Yellowstone river, 800 yards wide at its mouth, probably the largest tributary of the Missouri, enters it on the S.W. side, 1216 miles from its navigable source, and about 1890 miles from its mouth. This river, at the place of junction, is as large as the Missouri. Steamboats ascend to this place, and could go farther by each branch. Chienne river, 400 yards wide at its mouth, enters the Missouri on the S.W. side, 1310 miles from its mouth, in 44° 30' N. lat. White river, 300 yards wide, enters it on the S.W. side, 1130 miles from its mouth. Big Sioux river, 110 yards wide, enters it 653 miles from its mouth, in 43° 45' N. lat., on the N.E. side. Platte river, 600 yards wide at its mouth, enters it on the S.W. side, 600 miles from its mouth, in 40° 50' N. lat. Kansas river, 330 yards wide at its mouth, enters it on the S.W. side, in 39° 5' N. lat., at the distance of 340 miles from its mouth. Grand river enters it on the N.E. side, 240 miles from its mouth, and is 190 yards wide. Le Mine river, 70 yards wide, enters it 900 miles from its mouth. Osage river, 307 yards wide at its mouth, enters it on the S.W. side, in 36° 31' N. lat., 133 miles from its mouth. Gasconade river enters it on the S.W. side, in 36° 45' N. lat., 100 miles from its mouth. The Missouri enters Mississippi river, 3006 miles from its source, which added to 1953 miles, the distance to the gulf of Mexico, makes its whole length 4349 miles; and it is probably the longest river in the world. Through its whole course, there is no substantial obstruction of the navigation, before arriving at the great falls. Its principal tributaries are each navigable, from 100 to 800 miles. The alluvial, fertile soil on this stream and its tributaries is not very broad, and back of this are prairies, of vast extent. Through the greater part of its course the Missouri is a rapid and turbid stream, and in the upper part of its course, flows through an arid and sterile country. It is over half a mile wide at its mouth, and through a greater part of its course it is wider. Notwithstanding it drains such an extensive country, and receives so many large tributaries, at certain seasons it is shallow, hardly affording sufficient water for steamboat navigation, owing to its passing through a dry and open country, and being subject to extensive evaporation.

MISTRETTA (an. *Amastria*, or *Mystristrum*) a town of Sicily, intend. Catania, on a high hill, 5 m. S.W. Carouia. Pop. about 8000.

MITCHELSTOWN, an inland town of Ireland, prov. Leinster co. Cork, on an affluent of the Funcheon, 26 m. N.N.E. Cork. Pop. in 1831, 3545. It consists of a well-built square, and two principal streets. It has a parish church, and Roman Catholic chapel, both handsome modern structures; a college, which maintains 19 poor Protestant gentlemen, and 18 gentlemen, endowed by the Kingston family; a small barrack, and a market-house. A minor court for pleas of the amount of £2 is held every third Monday, and petty sessions every Wednesday. It is a constabulary station. Markets on Thursdays: fairs on the 10th Jan. 25th March, 2nd May, 30th July, 12th Nov., and 2d and 6th Dec. Postoffice revenue in 1830, £364; in 1836, £394. Adjoining the town, on the W., is the magnificent seat of the earl of Kingston, erected in 1823.

MITTAU a town of European Russia, cap. Courland, on

MOBILE.

the As, 25 m. S.W. Riga, lat. 56° 30' 10" N., long. 28° 43' 38" E. Pop. 13,609. It is but indifferently built; the houses being mostly of wood, and the streets, with a few exceptions, unpaved. It has a castle, erected in 1720, which served in 1793 as an asylum for Louis XVIII. of France, and is now the residence of the governor and the official authorities. It has a gymnasium and a good library; a theatre, capable of accommodating 3000 spectators; a hospital, a literary society, &c. The nobility and gentry of the province assemble here at stated times for the despatch of business connected with the administration of the province, and many of them reside in town during the winter, when it becomes unusually gay. Its situation is low, sandy, and exposed to inundation. (*Schmittler, La Russie, &c.*, p. 593; *Gravelle's Travels*, l. 370.)

MOBILE, bay, Ala., sets up from the gulf of Mexico, and is 30 m. long and 19 m. wide at an average breadth. It has Dauphin island at its mouth, with an entrance on each side. The channel on the W. side has five feet water; that on the E. side has 18 feet of water. The bay has 14 feet of water to the bar in its upper part, on which is 11 feet of water. The channel to the bay is within a few yards of Mobile point, on the E. side. It receives the waters of Alabama river, which is formed by the union of several large rivers, the Tombigbee, Black Warrior, Cahawba, Coosa, and Tallapoosa.

MOBILE river, Ala., is formed by the junction of Alabama and Tombigbee rivers, 40 m. above Mobile city. It enters Mobile bay by two channels, the main or W. channel is called the Mobile, and the E. is called Tenaw river. It is navigable for vessels requiring five or six feet of water by the Tombigbee branch to St. Stephens, 50 m. from the bay, and for steamboats to Tuscaloosa, 285 m. and to Columbus, Miss. The Alabama or W. branch is navigable for vessels of five or six feet draft, 100 m. to Claiborne, and for steamboats to Montgomery, 300 m. by the course of the river. The navigation of these rivers has some obstructions at low water. In time of flood it sometimes rises 50 or 60 feet.

MOBILE, county, Ala. Situated in the S.W. part of the state, and contains 9259 sq. m. Bounded E. by the Tombigbee and Mobile rivers, by branches of which it is watered on the E., and on the W., by branches of Pascagoula river. It contained in 1840, 12,350 neat cattle, 934 sheep, 8009 swine; and produced 31,991 bushels of Indian corn, 32,900 of potatoes. It had 21 commercial, and 93 commission houses in foreign trade, 948 retail stores, 23 grist-mills, 30 saw-mills, five printing-offices, one bladders, three dailies, four weeklies, and one semi-weekly newspaper; one college, 62 students; 11 academies, 297 students; 11 schools, 170 scholars. Pop.: whites, 11,763; slaves, 6191; free coloured, 787; total, 18,741. Capital, Mobile.

MOBILE, city, port of entry, and capital of Mobile county, Ala., 317 m. E. by W. Tuscaloosa, 1013 W. Situated on the W. side of Mobile river, at its entrance into Mobile bay, 20 m. N. of Mobile point, at the entrance of the bay, 55 m. W. by N. Pensacola, Flor., 10 m. W. by S. Blakeley, 100 E.N.E. New-Orleans. It is in 30° 40' N. lat. and 86° 21' W. long. Pop. in 1830, 3194; in 1840, 19,673. It contains a courthouse, jail, custom-house, a U. States naval hospital, a city hospital, three banks, Barton academy, seven churches, a Presbyterian, Episcopal, two Methodist, a Baptist, Roman Catholic and an African. It is pleasantly situated on an extended plain, elevated 15 feet above the highest tides, and has a beautiful prospect of the bay, from which it receives refreshing breezes. Vessels requiring a draft of more than eight feet water, cannot come directly to the city, but pass up Spanish river, six miles round a marshy island, into Mobile river, and then drop down to the city. It has 46 wharves, and next to New-Orleans, is the largest cotton market in the United States; 290,000 large bales have been exported in a year. The exports amount to from 12 to 16 millions of dollars annually. Tonnage of the port in 1846, 17,942. The city is supplied with excellent water, brought in iron pipes for a distance of two miles, and distributed over the city. It is defended by fort Morgan, (formerly fort Browne,) situated on a long low sandy point, at the mouth of the bay, opposite to Dauphin island. It was surrendered to the Americans by Spain in 1812, chartered as a town in 1814, and incorporated as a city in 1819. It has suffered severely by fire. In 1837, 170 buildings were burned, and in 1839, 600 buildings. But it has been rebuilt, with increased convenience and additional beauty. There is a lighthouse on Mobile point, the lantern of which is 55 feet above the level of the sea.

MOCHA, the principal port in the Red sea frequented by Europeans, in that port of Arabia called Yemen, about 40 m. N. from the strait of Bab-el-mandeb; lat. 13° 19' 30" N., long. 43° 30' E. Population variously estimated; but may, perhaps, amount to from 5000 to 7000. It is encircled with walls, and indifferently fortified. Its appearance from the sea is imposing, but internally it is poor and mean.

MODENA.

MOCHA is situated on the margin of a dry sandy plain. It is built close to the shore, between two points of land, which project and form a bay. Vessels drawing from 12 to 13 feet water may anchor within this bay at about a mile from the town; but large ships anchor without the bay in the roads, in five or seven fathoms water; the great mosque bearing E.S.E., and the fort to the S. of the town S. by E., distant about two miles from the shore. The great article of export from Mocha is coffee, which is universally admitted to be of the finest quality. It is not possible to form any very accurate estimate of the quantity exported; but we believe it may be taken at 10,000 tons, or perhaps more. The greater portion is sent to Britain and Suez; but there is a pretty large export to Bombay and other parts of India, whence some is sent to Europe; occasionally, however, the exports from Mocha and Aden, direct for Europe, are very considerable. Besides coffee, the principal articles of export are, dates, adams, or palm made of dates, myrrh, gum Arabic, oilbassam, anna (*Cassia-Senna*), sharks' fins, tragacanth, horns and hoofs of the rhinoceros, balm of Gilead, ivory, gold dust, clove, oil, saffron, &c. The principal articles of import are, tin, piece goods, iron, and hardware, &c. The ivory, gold dust, and clove, met with at Mocha, are brought from the opposite coast of Abyssinia; whence are also brought shew, ghee, &c.

MODBURY, an old bor., market town, and par. of England, hund. Erminington, co. Devon, 30 m. S.S.W. Exeter, and 181 m. S.S.W. London. Area of par., 5539 acres. Pop., in 1841, 2046. The town, which is very largely laid out, has four principal streets, meeting in a large open market-place. The church is large and well built, having a spire 134 feet high: the living is a vicarage, in the gift of Eton college, to which Henry VI. gave the estates of an alien priory of Benedictines that formerly stood near the church. The Wesleyan Methodists, Independents, Baptists, and the Society of Friends have their respective places of worship; and there were, in 1835, three Sunday schools, furnishing religious instruction to about 300 children. A Lancasterian school is attended by 70 boys; and about 20 children receive instruction in two infant schools.

Modbury had formerly a considerable share in the manufacture of serge, plush, and felt hats; but these branches of industry have long decayed, and the present inhabitants are mostly engaged in agriculture and retail trade. The town, which is a borough, though without an act of incorporation, is governed by a portreeve and other officers; and in the reign of Edward I. it sent two members to the House of Commons; but it afterwards was divested of this privilege, because of its inability to bear the expense. Markets, for corn and other provisions, on Thursday; sheep cattle fairs, the second Tuesday in each month, and an annual fair, May 14.

MODENA (DUCHY OF), called by the Italians *stato Estense*, a state of N. Italy, consisting of the united duchies of Modena and Massa-Carrara, principally included between the 10th and 11th degrees of N. lat. and the 43th and 45th of E. long.; having N. Austrian Italy; E. the N. delega. of the Papal states; W. Parma, and a portion of the Sardinian dominion; and S. Tuscany, Lucca, and the Mediterranean. Area estimated at 2000 sq. m., and the population at 403,000. The N. part of this duchy consists of a portion of the great plain of Lombardy; the S. is reversed from W. to E. by the Apennines, one of the summits of which in this duchy, M. Cimone, rises to upwards of 6000 feet above the sea. The Po constitutes a small portion only of the N. boundary; next to it the principal rivers are its affluents, the Panaro, Secchia, Crostolo, &c., which have their sources on the N. slope of the Apennines, and flow N. to the Po; and the Magra and Stivichio, which rise on the S. slope of the Apennines, and fall into the Mediterranean. The climate differs on the different sides of the mountains. On the N. it is similar to that of Parma and the Lombardo Venetian kingdom; snow falls and cold winter lasts for several weeks in the winter; while to the S. of the mountains the climate is like that of Genoa, and the olive and orange flourish in the open soil. The plain country is very fertile, and abundantly watered by rivulets and canals. In the mountains there are many peasant proprietors, but not in the plains. A great evil here, as in other parts of Lombardy, is the practice of the lords and the possessors of lands in mountain holding to middlemen, who relate to metayers; under which system all the lands of the duchy. The tenant furnishes half the cattle, and the landlord the other half. Apparently there is not a labourer's house in the country, all being metayer farmers. (*Archer Young's Trav.* h. 157.)

The distribution of the land is much the same as in the rest of the plain of Lombardy, where, according to Chateaubriand, very few farms exceed 60 acres. The metayer should receive half the produce for their labour and attention, but the actual quantity falling to their share varies

considerably according to circumstances, and in many cases is not more than one third part of the crops produced. The custom of sharing the produce is, however, almost universal; and a lease at a fixed rent being extremely rare, we need not wonder at the low state of industry. (*Chateaubriand, Italy and its Agric.*, p. 17, &c.) Rice, wheat, maize, fruits, wine, oil, and hemp are the principal articles of culture; but the supply of corn is notwithstanding inadequate for the consumption. The wine of the duchy is strong, but not of superior quality: the oil of the mountains is equal to that of Genoa, but that produced in the N. plains is very inferior. Bees, poultry, and hogs are numerous. Cattle breeding is not very extensively pursued, except in the valley of Garfagnana, where it is almost the sole occupation of the inhabitants. The pasturages on the mountains are excellent; but only the duke and a few of the larger proprietors possess any considerable flocks of sheep. Horses few; oxen of the Lombard and Swiss breeds, and asses, supplying their place for draught, &c., on almost every farm. The delicacies of the Apennines are clothed with fine woods of oak, beech, pine, and chestnut; indeed, chestnut flour forms the principal food of the peasantry in the upland region for a considerable portion of the year. The labouring classes, even in the more productive parts of the duchy, live very sparingly; soup of Turkish wheat, or *poltina*, salads, and beans or other pulse, fried in oil, are their ordinary food. Butcher's meat scarcely ever appears except on the tables of the more opulent farmers, and their best beverage is refined wine, or wine of the second pressure.

Next in importance to rural husbandry, is the culture and manufacture of silk, though the products be of indifferent quality. The other manufactures are on a small scale. They consist principally of canvases, leather, paper, glass, and earthenware. In Garfagnana some iron is forged. The finest statuary marble is found in inexhaustible quantities at Carrara; and amber, petroleum, sulphur, &c., are met with elsewhere.

This duchy is divided into four districts, Modena, Reggio, Garfagnana, and Massa-Carrara. Modena is the capital: the other principal towns are Reggio, Carrara, Massa, and Finale. The government is an absolute monarchy, and perhaps the most despotical in its form in any Europe. The duke monopolises both the legislative and executive power; but he avails himself of the services of a prime minister, two secretaries of state, and a privy council. The Austrian civil code of laws has been adopted since 1815. There are tribunals of primary jurisdiction in Modena, Reggio, and Massa, and a high court of appeal in Modena. A college is established in each of the principal towns, and the capital has a university and some superior schools; but owing to the jealousy of the government and the restrictions laid on the press, public instruction is in a very backward state. The military force consists of 1750 men. It is recruited by volunteers; the recruit receives a premium, and the family of which he is a member is exempted from all personal taxes. The public revenue is estimated at about 1,500,000 florins a year.

The greater part of this territory was erected in 1453 into a duchy, under Borno D'Este, son of Pope Nicholas III. It was taken by the French in 1797, and subdivided into the departments of Panaro and Crostolo. In 1814 it was given to the present ducal family, a collateral branch of the House of Austria.

MODENA (an. *Mutina*), a city of N. Italy, capital of the above duchy, in a fine plain between the Panaro and the Secchia, 24 m. W.N.W. Bologna: lat. 44° 38' 33" N., long. 10° 53' 13" E. Pop. about 97,000. Modena has a citadel, and is surrounded with ramparts, which, however, conduce less to its strength than to its beauty. It is regularly laid out, well built, and clean. It has been much improved and embellished within the last fifty or sixty years, and is divided into the new and the old city by the *Strada Nuova*, a part of the *Emilian way*, which intersects it from end to end. The general architecture of Modena is striking and agreeable; almost all its streets are bordered with arcades over their footways. The ducal palace is the finest public building; it stands isolated in the great square, and, unlike the palace of Parma, it has been completed, and is superbly furnished, and kept up in suitable style. It had formerly a noble collection of paintings; but some of its *chefs d'œuvre* were purchased by the elector of Saxony, and conveyed to Dresden in 1746, and others were taken away by the French: still, however, it is one of the best collections in Italy; it includes works by Raphael, Carlo Dolce, Andrea del Sarto, Guido, Guercino, the Caracci, and Procaccino, the Crucifixion by Pomarancio, a copy of the famous *Notte* by Correggio, &c. The ceiling of the gallery is painted in fresco by Francesconi; and in one of the rooms is a recumbent Cleopatra by Canova. The ducal library, known as the *Biblioteca Estense*, is a valuable collection of 60,000 volumes. Two of the best scholars, and

most laborious, diligent, and able writers of whom Italy has to boast, Muratori and Tiraboschi, were successively librarians during the last century. In the square before the palace is a fine statue of Duke Francis III., the founder of the university. The cathedral is a Gothic edifice of considerable antiquity and imposing appearance, but not in a pure style. It is principally remarkable for a square marble tower, one of the loftiest in Italy, in which is kept the famous bucket, once the cause of a serious feud between Modena and Bologna, and which has been immortalized by Tassoni in the *Secchia rapita*. One of the most celebrated works of Guido, the presentation in the temple, formerly adorned the cathedral, but it was carried off by the French, and has not been restored. (*Conder's Italy*, ii., 45.) The churches are numerous; but few deserve notice, except those of St. Vincenzo, St. Agostino, and the Dominican church, with some colossal statues. The city has several hospitals and asylums, a theatre, some public baths, better inns than most Italian towns, various good scientific collections, and a public library of 80,000 vols., comprising many rare editions of the 15th century, and some valuable MSS. It is well supplied with water by numerous subterranean cisterns; and is united to the Panaro by a canal navigable by boats of 30 tons. Its inhabitants depend principally on the supply of necessaries to the court and government functionaries. Weaving and spinning silk were formerly important branches of industry; but these have greatly declined; and manufactures of hemp, woollen cloths, leather, hats, and glass have, to a great extent, taken their place. It has a large weekly market for agricultural produce, provisions, &c.

Mutina is supposed to have been founded by the Etruscans. It is said, by Livy, to have been colonized by the Romans, A.U.C. 568, (xxix., 55); and it is styled by Cicero, "*Armistrium et splendidissimum populi Romani colonisium*." (Phil. v., 2.) A few Roman antiquities, mostly tombs, still exist at Modena. It suffered many disasters in the times of Attila, Odoacer, and the Lombard kings; and was afterwards governed successively by its bishop and magistrates, and belonged to the Popes, Venetians, and the dukes of Milan, Mantua, and Ferrara, before it became the property of the house of Este. Under the French it was the capital of the department Panaro. The learned antiquary Egonius, the poets Molina and Tassoni, and the celebrated anatomist Fallopius, were natives of Modena. (*Conder's Italy*, ii., 49-46; *Cramer's Anc. Italy*, i., 88, 87; *Thomson; Starke, &c.*, passim.)

MODICA (an. *Motyca*), a town of Sicily, intend. Syracuse, cap. district of its own name, on the Sicili, 31 m. W.S.W. Syracuse. Pop. in 1831, incl. cant., 25,838. It is situated among craggy rocks, and generally ill built. According to Smyth, it has some fine edifices; but it appears to possess few conveniences, for a recent English traveller could find only one inn in the town, which was wretched and dirty in the extreme. Among the public buildings are a castle, numerous churches and convents, a ducal residence, a town-hall, two hospitals, several public schools, and a government loan-bank. The Franciscan convent is said to possess some fine mosaics. In the adjacent valley of Ipeica are numerous troglodytic caves, fully described by Smyth (*Sicily*, p. 190) and Russell (*Tour in Sicily*, p. 134-137). In 1833 a good many houses and upwards of 160 persons were buried by the fall of a mountain near Modica.

The district of which this town is the capital has an area of nearly 120,000 acres, with several towns, and a population of about 80,000. It was endowed with peculiar privileges by Roger, king of Sicily, the principal being that its courts of justice should be independent of those of Sicily. These privileges would appear to have been productive of a good effect. "There is a very superior spirit of activity and industry among the natives, attended by greater affluence and comfort than any other agricultural part of Sicily displays, though it is not naturally so fertile as the rest. Modica is, in general, rocky and hilly, with very bad roads; but it boasts several fine plains, and romantic ravines. The soil is mostly loose, calcareous, and dry; but many successful agricultural efforts are made to render it productive, as is testified by the abundant produce of corn, tobacco, oil, wine, soda, hemp, canary-seed, cheese, butter, and carobs; while, from the attention paid to pasturage, the cattle are in great request. This co. also produces bitumen and salt; and there is so great a quantity of game, as to form an article of export. The trade is principally with Malta, which is supplied from hence with the above necessities, in exchange for cloth, spirits, hardware, and colonial produce." (*Smyth's Sicily*, p. 101.)

MOFFAT, a village of Scotland, celebrated for its mineral springs, co. Dumfries, on the Annan, at the head of an extensive valley, and bounded, almost immediately on the S., by an amphitheatrical of hills, the highest in the S. of Scotland, 45 m. S. Edinburgh, and 90 m. N. by E. Dumfries. Pop. 1600: in summer, during the season of the Spa, the

MOGADORE.

population may be 3000. This, which is an extremely neat, clean, and well-built village, consists principally of a wide street along the line of road from Dumfries to Edinburgh. The public buildings are the parish church, a dissenting chapel, and two good inns. The Earl of Hoptown has a house in the town. The mineral springs, which are sulphureous and chalybeate, rise at no great distance from the town, on the slope of the adjacent hills. One of these springs was discovered in 1633, the other in 1748. They are a good deal resorted to, but less now than formerly.

MOGADORE, or MOGODOR, called by the Moors *Saïra-ra*, a seaport town, and the principal emporium of Morocco, on the Atlantic, about 105 m. W. Morocco; lat. 31° 30' N., long. 9° 30' W. Pop. estimated at 10,000. It stands on a patch of granular sandstone rock, which, at high water, is nearly insulated by the sea. The country around is low, flat, and unproductive; so that vegetables have to be brought from gardens from 4 m. to 12 m. inland, and cattle and poultry from a still greater distance. Water is also scarce, and rather dear; being either rain water collected and preserved in cisterns, or brought from a river about 2 m. distant. The white stone buildings give the town an imposing appearance from the sea. It is divided into two contiguous portions, both surrounded by walls: that called the citadel, comprises nearly half the entire town, with the royal palace, the houses of most of the governors and chief officers, the custom-house, the foreign consulates, and a street of well-built shops of red sandstone, formerly occupied by European traders. Beauchamp says, that the houses in this part are well-built and lofty, that the streets are swept, and that it was cleaner than any other town he had seen in the Moorish dominions. It is shut off from the rest of the town by a high wall, with a strong gate, which is closed at nine o'clock every night. The other portion of Mogadore is not so well laid out, nor so clean, the Jews' quarter, in particular, being excessively filthy; it has, however, a very extensive mosque, with a high square tower, and other public buildings. It is entered by three principal gates; which, with many in the interior, are closed at sunset. To the S. of the citadel, is what is called the port, being an inner roadstead, protected by a rocky island, about 1½ m. in length, 3 m. from the shore. It has not more than 10 feet or 12 feet water at low tide, and 23 feet when deep; it is therefore fit only for small vessels, large ships anchoring outside the harbour, the long battery bearing E., distant 1½ m. The island bounding the harbour is appropriated exclusively to a state prison; and is supposed to be defended by a few crazy pieces of ordnance, enconcealed behind mud-wall embasures. The landing-place is a long stone slip, near the arsenal, protected on the W. by a long battery, mounting several brass cannon, and containing a large tank, and a number of prison cells. The arsenal with which this battery communicates, is a really handsome structure, consisting of a large range of bomb-proof casemates, flanked at either end by an elegant square tower, with turrets at their angles, connected by a battery of two tiers, having in its centre a lofty arched gateway. The long battery defending the whole town on the W., is an extensive line-wall along the shore, crowned with brass ordnance, and having beneath a range of bomb-proof casemates, capable of containing 4000 or 5000 men. On the land side, Mogadore is protected from the attacks of the Arabs by a round tower, furnished with brass cannon. All the fortifications were erected under the superintendence of a European engineer in the last century, and, to an unskilled eye, they appear strong, and well executed; but Beauchamp says they are too flimsy to bear five minutes' breaching. The long battery, offers, however, a fine promenade for enjoying the fresh air of the ocean.

The trade of Mogadore was formerly very extensive; her port was open to the ships of the different European countries, most of whom had consuls here. Most part of the commerce between Europe and Morocco is still carried on through Mogadore; but England and Sardinia are the only states that retain consuls. The principal imports are English woollen and cotton stuffs and hardware, German linens, tin, copper, earthenware, mirrors, glass, sugar, pepper, paper, &c. The exports principally consist of sweet and bitter almonds, gum Arabic, and other gums, bees' wax, cow and calf skins, ivory, ostrich feathers, gold dust, olive oil, dates, &c. Accounts are kept in *nutkeels* of 10 ounces; the ounce being divided into four *blankels*, of 24 *suces* each. The *blankel* may be valued at 1d., the ounce at 4d., and the *nutkeel* or ducat, at 3s. 4d. The corn measures are, for the most part, similar to those of Spain. The quintal = 119 lbs. avoird. The market lb., for provisions, = about 1½ lb. avoird. The canna, or cubit, = 21 English inches, is the principal long measure. Mogadore has no peculiar manufacture; but a good deal of the excellent woollen cloth of the country is sold in its markets.

The mutton of Mogadore is of a very inferior quality, and the beef but poor. Kids form a great part of the consump-

MOHILEF.

tion of those who indulge in meat: fowls are very cheap, and a dozen eggs may be bought for 1d. Red-legged partridges are always to be had in abundance. The climate is decidedly healthy, the heats being moderated by the sea breezes. Agues are, however, sometimes prevalent. Mogadore was founded in 1760, by the emperor Abd Mohammed, who himself worked at its construction, and granted many privileges to mercantile settlers. (*Beauchamp's Journey to Morocco*, 250-257; *Jackson's Morocco*.)

MOGHILEF (Pol. *Mohylef*), a town of Russian Poland, gov. Podolia, cap. circ. on the Dniester, 58 m. S.E. Pankinets, and 180 m. S.W. Kief. Pop. nearly 7000, of whom many are Jews. From its situation, sheltered on every side by mountains, its climate is milder than that of the rest of Podolia; its fruits are excellent, and the silk-worm thrives well. It has several Greek, Roman Catholic, and Armenian churches, and a Greek convent; and is the residence of an American bishop. It has a brisk trade with Wallachia and the adjacent provinces, in raw produce, and some well-estimated fairs. (*Schnitzler. La Russie*, 503; *Müller-Bres. Tableau de la Pologne*, 448.)

MOHACZ, a mean but large village of Lower Hungary, on the Danube, co. Barany, 35 m. E. by S. Pankinets. Pop. 6300. Near this village, on the 29th of August, 1526, the Turks, under Solymán the Magnificent, obtained a great victory over the Hungarians. Louis, king of Hungary, two archbishops and six bishops, many nobles, and about 8,000 private soldiers, are said to have been killed in the battle and in the pursuit. In 1687, the Turks were themselves defeated in the vicinity of this village by the Imperials, under the Duke of Lorraine.

MOHAWK, river, N. Y., rises by its extreme source in Lewis county, but chiefly in Oneida county, near the territories of Black river. It flows S. about 90 m. to Rome, where it suddenly turns to S.E., and proceeds 37 m. to the Little falls, where the river descends 49 feet. Two miles from its mouth are Cahoon falls, where the river descends perpendicularly about 70 feet, presenting, in high water, a sublime and interesting spectacle. Both the above falls afford extensive water-power. Three quarters of a mile below the Cahoon falls is a bridge across the river from which is a fine view of the cataract. The river at the falls is 90 feet wide, and the banks below it have a height of 80 or 90 feet. The Erie canal passes along the S. bank of the river as far W. as Rome. The valley of the Mohawk, particularly the river bottom, is distinguished for its fertility.

MOHAWK, J., Montgomery co., N. Y. It contains the village of Fonda, the capital of the county, 43 m. N.W. Albany, 406 W. Bounded S. by Mohawk river. It contains seven stores, two fulling-mills, one flouring-mill, one grist-mill, four saw-mills; nine schools, 968 scholars. Pop. 2113. MOHILEF, or MOGHILEF (Pol. *Mohilew*), a gov. of European Russia, formerly included in the gov. of Vitepsk, between the 52d and 55th degrees of N. lat., and the 28th and 33d of E. long.; having N. Vitepsk, E. Smolensk, S. Tchernigov, and W. Minsk. Length, N. to S. 216 m.; average breadth nearly 85 m. Area about 17,779 sq. m. Pop., in 1838, 846,000. The only physical difference between it and the gov. Vitepsk is, that it belongs to the basin of the Dniester, while the latter government belongs to that of the Dvina. In the N. of the government is a low chain of hills, separating the two river basins; but the rest of the surface is an extended plain, partly covered with forests, and in many parts marshy. The course of the river is mostly S.; the principal, next to the Dniester, are its tributaries, the Soja and Drouets. Small lakes are numerous. The climate is milder and drier than that of Vitepsk. The soil is generally fertile; and though agriculture be extremely backward, nearly four million *chetverts* of corn are annually grown, a quantity considerably exceeding the home demand. Rye, barley, oats, hemp, and flax are the principal products; and in the gardens, hops, pulse, &c. The breeds of cattle and horses are very inferior; but lately the sheep have been improved, by crossing with the breed of Saxony. Goats and hogs are numerous. This is one of the most richly wooded of the Russian governments; and its forests, the produce of which are floated down the rivers to the Black sea, furnish the building-yards of Nicolaïev, Odessa, Sevastopol, &c., with timbers and masts for the largest ships. Only a small proportion of the forest land belongs to the crown. Bog iron is plentiful, but it is dug only by the poorest classes. In respect of manufactures, Mohilef is behind almost all the other governments of the empire. There is no capital, and the inhabitants are without enterprise. The condition of the mass of the population appears to be most wretched. According to Schnitzler, *le régime Polonois à l'établissement des Juifs, qui ne sont pas admis à habiter l'intérieur de l'empire Russe, ont produit ici de tristes fruits*. Except a few tanneries, all the manufactures are in the hands of the Jews; but, with the exception of some distilleries, and soap and potash works, they are quite unimportant, and did not, in 1830, employ 1000 hands! It is divided

MOISSAC.

into 13 districts; Mohilev, the capital, and Matimlavi are the principal towns. The inhabitants are mostly Russians and Jews, with some Poles, Lithuanians, Moldavians, and Wallachs; their religion is partly that of the Greek and partly of the Roman church, each of which has an archbishop in the government.

MOHILEV, a town of European Russia, capital of the above government, on the Dnieper, 85 m. S.W. Smolensk, and 116 m. E. by S. Minsk; lat. $53^{\circ} 53' 49''$ N., long. $30^{\circ} 24' 45''$ E. Pop. estimated, in 1834, at 21,000, of whom above 9000 were Jews. It has a better appearance than most Russian towns, many of its houses being of stone or other solid material. It is divided into four quarters, one of which consists of the *krem* or castle, built on an eminence, and two of the other quarters are surrounded by ramparts. In the centre of the town is a large octagonal area, with most stone buildings, including the residence of the Greek archbishop. It has at least 20 churches, three fourths of which are Greek; there are also several convents, a Lutheran church, and two synagogues. The government offices and magazines are handsome edifices. Mohilev is the head quarters of the Russian "army of the west," and the seat of Greek and Roman Catholic archbishops, the latter having authority over all the Roman Catholics of Poland and Russia; it has two episcopal seminaries, a gymnasium, a town-school, and various charitable institutions. The business of tanning is extensively carried on; it has an extensive trade with Riga, Königsberg, Dantzic, and Odessa, to which it sends leather, hides, lard, wax, honey, especially the latter, potash, hemp, flax, oil, corn, and other raw products; receiving in return, among other foreign goods, a good deal of thrown silk. The fairs of Mohilev are well frequented. The epoch of its foundation is unknown. After several times changing masters, it was finally annexed to Russia in 1773. (*Schmitzer, la Russie*, p. 395-400.)

MOISSAC, a town of France, dep. Turn et Garonne, cap. arrond., on the navigable river Turn, crossed here by a handsome stone bridge, 14m. W.N.W. Montauban, and 97 m. S.E. Bordeaux. Pop. in 1836 (ex. com.), 6190. It is tolerably well built, and has an elegant fountain in its principal square. The most remarkable feature of the place, however, is a ruined abbey founded in the 11th century, formerly possessing great wealth and importance; the buildings are of great extent, but are for the most part either in ruins, or converted into private dwellings. The church-porch is of high antiquity, and has some curious sculptures; the cloisters are highly interesting; but the church itself is more modern, and of a heavy style. A good deal of corn is ground here for the use of the colonies; and the town has a considerable trade in wheat, oil, saffron, wine, &c.

Moissac, founded in the 5th century, appears from its walls to have been formerly much larger than at present. It suffered severely from the religious wars. (*Hugo*, art. *Turn et Garonne*, &c.)

MOLA DI BARI, a seaport town of the Neapolitan dom., prov. Bari, on the Adriatic, 13 m. S.W. Bari. The population, which at the beginning of last century amounted to 13,000, is now reduced to about 6000. It consists of an old and a new division; the former, which has a castle and is surrounded by a wall and ditch, has narrow, crooked, and gloomy streets, and poor houses. The other, or more modern division, is, on the contrary, comparatively well built along the sea-side, and has three creeks, where the small vessels which frequent the port load oil, cotton, and carobs. The traces of an unfinished mole show that this was formerly a place of some commercial importance. The port, between this mole and a rocky reef to the N. is insecure; but here is an open roadstead on either side the town, where vessels may anchor in 10 fathoms water with a sandy bottom. (*Craesen's Trav.*, &c., p. 154, 155; *Purdy's Sailing Directions*.)

MOLD, a market town, par. and parl. bor., contrib. to Flint, hund. of its own name, co. Flint, 10 m. W. by S. Chester, and 171 N.W. London. Pop. of par., in 1841, 10,653, that of township and parl. bor., 3132. The town, situated in a valley, close to the Alyn, and surrounded by lofty hills, is small and irregularly built; but there is a very handsome town-hall, and, in the environs, are numerous handsome seats and elegant mansions. The church, a large structure of the 16th century, has a highly ornamented embattled tower, and contains some curious monuments. The Wesleyan Methodists, Calvinists, and Baptists, have, likewise, their respective places of worship, with attached Sunday-schools. A cotton-mill, in the town, gave employment, in 1830, to 396 hands; but "there is no other particular branch of trade carried on here, nor is it likely, judging from present appearance, that it will increase in size or importance; within the parish, however, there are extensive all-pits, lead and iron mines, which, in 1831, employed 629 labourers. (*Bownd. Rep. and Parl. Census*.) Mold was constituted, by the Reform Act, a parl. bor. contrib. (with others) to Flint. Registered electors in Mold, in 1830-40,

MOMPOX.

87. The county amizes are held here. Markets on Wednesday and Saturday. Fairs, February 13, March 21, May 12, August 9, and November 22.

About 1 m. W. from the town is a noted spot called Maes-Garmon, the scene of a victory gained in the 5th century, by the Welsh over the Picts and Saxons; a pillar, with an inscription, commemorates the event. About $\frac{1}{4}$ m., also, on the Chester road, are some remains of Offa's dike, the ancient boundary between Wales and England. (*Homing-way's Pen. of N. Wales*; *Parl. Papers*, &c.)

MOLDAVIA. See WALLACHIA and MOLDAVIA.

MOLDAU, a river of Bohemia, and, next to the Elbe, the principal in that kingdom, through the S. and central parts of which it flows. It rises in the Bohemian forest, about lat. 49° N., and long. $13^{\circ} 35'$ E.; runs at first S.E. to Rosenberg, and thence generally N. to its junction with the Elbe at Meinkn, in about lat. $50^{\circ} 20'$, long. $14^{\circ} 30'$, after a course estimated at somewhat more than 200 m. It is properly the head stream of the Elbe, being continuous with the latter in a direct line, and carrying more water to it than the river called the Upper Elbe. It receives the Woltawa, Luschnitz, Sazawa, and Beraun; Rosenberg, Budweis, and Prague are on its banks. The Danube and Elbe have been united by a railway 75 m. in length, completed in 1829, from Linz, in Upper Austria, to Budweis, where the Moldau becomes navigable for boats of from 10 to 15 tons. This railway consists of one line only, and the carriages on it are drawn by horses. The line was rendered unnecessarily expensive through an ill-judged economy, inasmuch as it became necessary to take up the original wooden rails, which were covered with metal plates, and substitute others of cast iron in their stead. The traffic on this road has hitherto chiefly consisted in salt sent from Upper Austria into Bohemia. The nett revenue derived from it amounted, in 1837, to £2130. It belongs to about 13,000 shareholders, at 50 flor. a share; hitherto, however, they have derived no profit from the undertaking. (*Oester. Nat. Encyc.*, &c.)

MOLFETTA (an. *Respa*), a seaport town of the Neapolitan dom., prov. Bari, cap. canton, on the Adriatic, 16 m. W.N.W. Bari. Lat. $41^{\circ} 12' 32''$ N., long. $16^{\circ} 39' 36''$ E. Pop. about 12,000. Its appearance from the sea is imposing; and though its streets be narrow and dirty, it has many good houses, among which Mr. Burgess remarked some elevations in a chaste style of architecture, and of a stone almost equal in beauty to white marble. (*Greece*, &c., i., 13.) It has a cathedral, several other churches, a college, &c., and is the see of a bishop. Its port, formed by a mole, is sheltered from all winds except the N. Opposite to it is a sandbank, which serves as a natural breakwater; the entrances to the harbour being at either extremity of the bank. It has some linen fabrics, a saltpetre manufacture, and some slips for ship-building; and has a considerable trade in the shipping of corn, oil, almonds, &c. (*Rampoldi*; *Schütz, Allg. Erdkunde*; *Dict. Geog.*, &c.)

MOLTON (SOUTH), a mun. bor., market town, and par. of England, hund. of its own name, co. Devon, on the Mole, 24 m. N.N.W. Exeter, and 164 m. N. by S. London. Area of par., 6160 acres; pop. in 1831, 3296. The town, occupying an eminence W. of the river, at the union of several high roads, comprises a large market-place, and several well paved and lighted streets, the whole having a peculiarly clean and neat appearance. The guildhall is a handsome and commodious building, near which is a small jail. The church, adjacent to the market-place, is built in the perpendicular style; the living is a perpetual curacy in the gift of the dean and canons of Windsor. The Independents and Wesleyans have also their respective places of worship, and there are three Sunday-schools, attended by about 600 children of both sexes. A grammar-school, founded in 1614, is respectably conducted, and there are two other schools, supported by endowments and subscriptions. S. Molton has a manufacture of serges, shalloons, and felts, employing about 70 families, besides which there is a woolen-mill, which, in 1830, employed 79 hands. The lace manufacture has lately been introduced, but with no great success. The borough is governed (according to the Municipal Reform Act) by a mayor, three other aldermen, and 12 councillors. It is one of the polling places at elections for the N. division of the county. Quarterly and petty sessions are held here, and a court of record sits once in three weeks. Markets on Tuesday, Thursday, and Saturday; that on Saturday being one of the largest in N. Devon. Great markets (not chartered as fairs), Saturday after Feb. 13 and April 37, Wednesday before June 22, and after August 26, Saturday before October 10 and December 12, chiefly for cattle. (*Parl. Papers*, &c.)

MOLUCCAS, or SPICE ISLAND. See AMBOYNA.

MOMPOX, or MONFOX, a city of S. America, repub. New Granada, and next to its cap., the most important in the prov. Cartagena; on the Magdalena, about 25 m. above the confluence of the Cauca; lat. $9^{\circ} 14' 20''$ N., long. $74^{\circ} 37' 30''$ W. Pop. estimated at 10,000, or, with the neigh-

MONACO.

houring villages, 15,000. "At a distance, on ascending the river, the white houses, with their red roofs, have a neat and clean appearance; but, on a nearer approach, this is exchanged for the general distressed look of Spanish cities. The town is above a mile in length; the streets are of a good breadth, crossing each other at right angles, and some are even furnished with footways. The only decent-looking houses, however, are in the centre of the place, the rest being mere sheds." (*Meltein*.) It has a custom-house and a fine quay, built very high, on account of the floods which take place in December. Several gunboats are stationed here, for the protection of the navigation. Mompox is a place of some commerce. The chief exports are corn, hides, and Brazil wood. Pamploona and Caenpa transmit some tobacco, sugar, and chocolate to this entrepôt; Antioquia sends gold, and Bogota the produce of the Upper Magdalena. Mompox is surrounded by swamps, and liable to inundations; and alligators come up to the very banks of the river to feed on the offal thrown from the city. "The climate, in the daytime, is burning, the thermometer ranging from 25° to 30° Reaumur; the inhabitants consequently pass the evenings seated in the streets, to breathe the fresh air, and to escape the stings of the mosquitoes. The sky is constantly cloudy, and scarcely a day passes without showers. The nights, on the contrary, are beautifully clear, and truly delicious. It is then a great pleasure to promenade the streets and observe the lively parties which present themselves before the doors of the houses. Loud bursts of laughter are heard on every side, in which the passengers take part without the least ceremony. Far from this familiarity being offensive, it gives great satisfaction, for the frankest cordiality prevails at these meetings. Thus passes the life of the inhabitants of Mompox. The day is spent in their hammocks, the night in the street." This manner of living differs little from that which the inhabitants of the other hot countries in South America have adopted. All classes in Mompox are said to be much addicted to ardent spirits. The surrounding country is wholly in a state of nature. (*Meltein, &c., in Mod. Trav.*, xvii., 301-2; *Geog. Account of Colombia*.)

MONACO, a town and small principality of N. Italy. The principality, which is under the protection of the king of Sardinia, is about 8 m. in length by 64 in breadth, having W. the div. of Nice, E. that of Genoa, and S. the Mediterranean. Area, 92 sq. m. Pop. about 7000. Being sheltered on the N. by lofty mountains, its climate is very mild, and it produces large quantities of oranges, lemons, and other fruits, from which the revenue of the prince, amounting to about £5000 a year, is mostly derived. The pastures are tolerably good, and cattle numerous. Its inhabitants are occupied almost wholly with agriculture, fishing, and petty coasting trade.

Monaco, the capital (an. *Portus ad Arx Herculis Monacensis*), is built on an elevated promontory stretching into the sea, about 9 m. E.N.E. Nice. Pop. 1300. It is walled and defended by a fort; and has an appearance of strength, but is entirely commanded by an adjacent hill. The largest town in the principality is Mentone, about 64 m. E.N.E. Monaco, with a tolerable port and 3000 inhabitants.

This principality was founded in the 10th century, and has remained ever since in the Grimaldi family. The reigning prince is a peer of France, with the title of Duc de Valentinois, and usually resides in Paris. (*Almanack de Göttinge, &c.*)

MONADNOCK, mountain, commonly called grand Monadnock, Cheshire co., N.H., is 23 m. E. of Connecticut river, extending 5 m. from N. to S., and 3 m. from E. to W. It is an isolated mountain, which rises 2354 feet above the level of the sea, and may be seen for 60 m. in every direction. Its summit, once covered with evergreens, has been by repeated fires converted into a bald rock, and presents a delightful view of the surrounding country, on which the spectator looks down as on a map. Thirty ponds are visible. On ascending it, plates of earth are found sufficient to give growth to the blueberry, cranberry, and ash, and a variety of shrubs. Plumbago or black lead is found in large quantities on the E. side, and there is a mineral spring near its base in Jaffrey.

MONAGHAN, an inland co. of Ireland, prov. Ulster, having N. Tyrone, E. Armagh, S. Louth and Meath, and W. Cavan and Fermanagh: area, 327,048 acres, of which 9236 are unimproved mountain and bog, and 7844 water. Surface hilly, but the hills are mostly arable; soil moderately fertile. There are some large, and a great many small, estates. The land is very much subdivided; so much so, that it is said by Mr. Wakefield that the larger class of farms do not average 25, nor the smallest 6 acres! (l. 270), and but little change has taken place, in this respect, in the interval. Cereals are very general here, and agriculture is in the most depressed state. Principal crops, oats, potatoes, and flax, the latter being very extensively cultivated; but a

MONDOVI.

good deal of wheat is now grown, and its culture is extending. Considerable improvements have lately been effected in the breed of cattle; and a good deal of butter is made, though there are no large dairies. Goats are very generally kept by the cottagers for the sake of their milk. A great deal of work is done by the spade. Average rent of land, 13s. 3d. an acre. The linen manufacture was at one time very widely diffused over the county, most of the small farmers having looms; but this combination of employments, which has been injurious alike to agriculture and manufactures, is now, owing to the greater cheapness of machine-made yarn and fabrics, greatly diminished. The value of the unbleached linen sold in the county in 1834, was estimated at about £196,000. (*Railway Report, Appendix B, p. 31*.) The county has vast beds of limestone; and lead ore, and indications of coal have been discovered. There are no rivers of any importance. Monaghan has five baronies, and 19 parishes; and sends two members to the House of Commons, both for the county. Registered electors, in 1830-40, 3421. Principal towns, Monaghan, Clontarf, Carrickmacross, &c. In 1831 this county had 35,225 inhabited houses, 34,708 families, and 195,536 persons; of whom 95,679 were males, and 99,857 females.

MONAGHAN, an inland town of Ireland, prov. Ulster, co. Monaghan, of which it is the cap. on the main road from Dublin to Londonderry, nearly half way between them. Pop. in 1831, 3843. The town consists of a central square, called the Diamond, with several diverging streets. In public buildings are the parish church, Roman Catholic chapel, three Presbyterian, and two Methodist meeting-houses; the county jail on the radiating plain, courthouse, diocesan school for the sons of Raphoe, Kilsnoo, and Ogher, a national school, a cavalry barracks, a market-house, and the county infirmary. "It does not appear to possess any important advantages or consequences, except as a market town, chiefly for the sale of agricultural produce, &c." (*Mss. Board Report*.) The corporation, consisting of a provost, 13 burgesses, and commonalty, sent two members to the Irish House of Commons down to the time when it was disfranchised. The assizes for the county are held here, with general sessions four times a year, and petty sessions on Thursdays. It is a considerable linen trade, a large brewery, and is a great mart for agricultural produce. Markets on Mondays, Tuesdays, Wednesdays, and Saturdays; fairs on the 1st Monday in every month. The Ulster canal passes near the town. Postoffice revenue in 1830, £738; in 1833, £914. Branches of the provincial and Belfast banks were opened in 1831 and 1835.

MONASTIR, or BITOLIA, a town of European Turkey, prov. Macedonia, cap. sanjak of same name, on the Vardar, 82 m. N.N.E. Yambina, and 90 m. W.N.W. Salonica. The population has been estimated at 15,000, but we incline to think that this is much beyond the mark; it is the principal entrepôt for merchandise passing from Albania into Roumelia. It suffered great injury from fire in 1836 and was plundered by Ali Pasha. (*Dict. Geog. &c.*)

MONDONEDO (an. *Brixiana*), a city of Spain, in Galicia, cap. prov. same name, 30 m. N.N.E. Lugo, and 5 m. W. Oviedo. Pop. according to Miñano, 6074. It is situated on the N. side of the Asturian chain, and is old and irregularly built: its principal public building is a cathedral, with 11 dignitaries and 94 canons, a parish church, two convents, now converted into hospitals, and a royal seminary and college. Linen weaving, tanning, and book-binding, are the only branches of manufacturing industry in the town; two large fairs are held in May and October, and the oak-timber of the neighbourhood is better adapted for building than any other in Spain. (*Miñano*.)

MONDOVI, a town of the Sardinian dom. div. Cune, cap. prov. Mondovì, on and round a hill near the Elenco, N.E. by S. Coni. Pop. in 1838, including com., 15,022. It is divided into four parts: the town proper, called the Pizzo on the hill, at an elevation of 1700 ft. above the level of the sea; and the three suburbs of Caramone, Rood, and Piano della Valle, built at its foot. The distance between the upper and lower part of the town is considerable; and the road by which they are connected is inconveniently steep. The town proper has a small citadel, and is surrounded with walls, of no great strength, instead of ramparts. It has a great number of religious houses and churches; the latter including a cathedral, with a handsome altar and sacristy. Its inhabitants are chiefly clergy and country gentry, and it has very little commerce or wealth. The suburbs, on the contrary, are entirely devoted to trade, and have manufactures of woollens and cottons, with tanneries and iron forges; but the chief branch of industry is the spinning of silk. Mondovì is the see of a bishop, and has several seminaries of education. It is comparatively modern, having been founded, according to an inscription on one of the chapels in the cathedral, in the year 1522. It

MONGHIR.

was taken and smoked by the French, under Marshal Soult, in 1793. Beccaria, the natural philosopher, was a native of Mondovì; but he must not be confounded with the Marquis Beccaria, author of the famous treatise on Crimes and Punishments, who was a native of Milan.

MONGHIR, or MUNGGER, a town of British India, prov. Behar, distr. Bhagulpore, 80 m. S. Patna; lat. 25° 23' N., long. 86° 26' E. Pop. estimated at 30,000. It is finely situated on a bend of the Ganges, and is of great extent, its ramparts being about $\frac{1}{2}$ m. in length by 1 m. in width. The houses, however, are much scattered, and in one quarter only are so close as to resemble a town. Monghir, while a British frontier town, was a station of considerable importance: and when Hober visited it, it was in better condition than most native towns. Though the houses are generally small, there are many with an upper story; and the roofs, instead of the flat terrace or thatch, as in Bengal, are generally sloping and covered with red tiles. The principal edifices are an old Hindoo temple, now occupied by some invalid soldiers; an elegant small mosque; the residence of the commandant and other military officers; barracks for five companies of sepoy; and the remains of a palace built by a brother of Aurangzeb. The shops are numerous; "and I was surprised," says Hober, "at the neatness of the kettles, tea-trays, guns, pistols, tinning-forks, cutlery, and other things of the sort, which may be procured in this tiny Birmingham. I found afterward that the place had been from very early antiquity celebrated for its smiths, who derived their art from the Hindoo Vulcan, who had been solemnly worshipped, and was supposed to have had a workshop here. The only thing which appears to be wanting to make their steel excellent is a better manner of smelting, and a more liberal use of charcoal and the hammer. As it is, their guns are very apt to burst, and their knives to break; precisely the faults which, from want of capital, beset the works of inferior artists in England. The extent, however, to which these people carry on their manufactures, and the closeness with which they imitate English patterns, show plainly how popular those patterns are become among the natives" (l. 266-268). Monghir has also excellent gardeners and tailors. A great deal of clothing for the native army is made here, with shoes in the native and European fashion, furniture, palanquins, carriages, &c. There are several native schools, and the town is a station of the Baptist Missionary Society. (*Hamilton's E. I. Gaz.*; *Hober's and Valentia's Trav.*; *Mod. Trav.*, ix.)

MONGOLIA, an extensive tract of country in the N.E. part of Asia, and one of the colonial possessions of China, between the 35th and 53d degrees of N. lat., and the 89d and 123d of E. long.; being bounded N. by the government of Irkutsk, N.E. and E. by Manchuria, S. by China, and W. by Chinese Tartary. Length, from E. to W., about 1700 m.; greatest breadth, 1000 m. area, about 1,400,000 sq. m. The limits, however, are subject, in consequence of wars among the tribes, to constant and great variation. Population conjectured by Timkovsky to be about 2,000,000. Mongolia may be generally described as an elevated plain, almost destitute either of wood or water, enclosed southward by the mountains of Tibet, and northward by various offsets belonging to the great Altaic range. The central part of Mongolia is occupied by the great sandy desert, or Ta-Gobi, which stretches from S.W. to N.E. about 1300 m., with a breadth, in some parts, of from 500 to 700 m. (*See Asia*, l. 163-4.) The most desolate part of the Gobi is called, by the Chinese, the Shamo, or sand sea, from its surface consisting of moveable sand. The desert is, however, intersected by some comparatively fertile tracts, and in other parts a few stunted trees are met with. The chief mountains of this region are, 1. the Altai and its various subordinate chains, extending eastward, under the names of Tange, Khangai, and Kente, as far as the banks of the Amour, by which the range is deflected northward and joins the Yablonoi-khrebet; 2. the Tschentschola and Irchan ranges, which commence in lat. 49° N., long. 107° E., and curve N.N.E. and northward as far as the Amour, in lat. 53° N., where they join the Altai. The mountains of Inner Mongolia are very little known. The rivers are numerous, chiefly in the N., belonging to the basins either of the Irish or Amour. Connected with the former are the Selenga, Orkhon, and Tula, which unite their streams and flow into lake Balkal; the Keroulou and Onon, which are tributaries of the Amour, rise near each other on opposite sides of the Kente range, and, taking a N.E. course, unite in lat. 53° 30' N., and long. 121° E. In the S. are the Leao-u-ho, rising on the eastern slope of the Irchan range, and falling into the gulf of Leao-u-long, and several rivers in the region of Koko-nor, some independent, and connected only with lakes, but others tributary to the Hoang-ho. The chief lakes S. of the great Gobi desert are the Koko-nor, the Oring, and Dzaring, the two latter being near the sources of the Hoang-ho. Inner Mongolia has no lakes of any

MONGOLIA.

importance, and those in the N. region, inhabited by the Kalkas, are of inferior size; but Koko, the N.W. district, is a country of lakes as well as mountains, the principal being Upe-nor, Altai-nor, and that called the Ike-arai-nor, which receives the waters of the Djabkan, the largest internal river of Mongolia. The air of this country is cold, owing chiefly to its great elevation, but also to the abundance of sulphate of natron, with which the steppes are in many parts covered. Timkovsky reports that the temperature, during October and November, ranged between 9 and 10° Fahrenheit; but he was assured that this was an unusually severe season. Great quantities of snow and rain fall in the Kalkas country; where, also, fogs and heavy dews, with cold mornings, are common in the height of summer. There is no great diversity of soil throughout this vast territory, which is generally sandy, stony, and barren. The banks of the rivers and the mountain valleys abound in good pastures, and in some places there is land fit for tillage. The N. part of the Kalkas region, in particular, is well wooded, and would be very suitable for agriculture; but the people are wholly nomad, and averse to the formation of permanent settlements. The S. sides of the Altai abound also with gold and silver; but the Mongols are entirely destitute of the knowledge necessary for the working of mines.* S. of Ounga, in lat. 47° N., begin the arid steppes of Gobi: the soil is gravelly, pasturage and water are rare, the grass is short and poor; and yet in these tracts, so little favoured by nature, are to be seen numerous herds of large camels, vigorous horses and oxen, with flocks of sheep and goats, all in good condition. The steppes abound in salt, and the atmosphere is dry and bracing; but there is a total absence of wood, and the ground is quite unfit for agriculture. Caravans are liable to great hardships in passing through the great desert, owing to the want of water and pasturage: the valleys, hills, and mountains offer nothing to the view but a yellow sand. S. of the 30th parallel the arid soil ceases, and is succeeded by lands well watered by rivers, and pretty well adapted to agriculture. Wheat is raised by the Mongols of Koko-nor, and also by those living more eastward, in the fertile districts near the great wall of China. The people, however, generally speaking, are too indolent to be good cultivators: they sow millet, barley, and wheat, but in small quantities, and in the most careless manner. Most of them, indeed, pass their whole lives in the open air, on the steppes, and disdain the laborious occupation of cultivating the ground.

"When we asked them," says Du Halde, "why they did not raise even a few vegetables in small enclosures, their prompt reply was, that herbs were the food of animals, whose flesh was the only proper support of man." (*Desc. de la Chine*, iv., 38.) In fact, so great is their love of idleness, that, even in those countries which abound with wood and pasturage, they never make any provision for the winter, except, perhaps, a few stacks of hay; and consequently when there is a heavy fall of snow, and the cold is severe, they sometimes lose nine tenths of their flocks and herds. The quadrupeds of Mongolia are the wild horse, wild boar, stag, goats of various kinds, bears, wolves, hares, foxes, sables, and squirrels: the birds are cranes, wild geese and ducks, moor-fowl, quails, and swans. Of the domestic animals it may be remarked that the horse, though small and shabby looking, is strong and spirited; that the camels have two humps, and that the sheep are white, with long black ears, and furnish very delicate meat. The Mongols have dogs, but very few cats; and mules, as well as asses, are bred in large quantities by the tribe of Karatchin immediately N. of the great wall.

Mongolia is composed of 36 aimaks, or principalities, all recognizing the sovereignty of the emperor of China, and each governed by one of its eldest princes, called *tschakis*. The division of the Mongol hordes is founded on the necessity of a military administration; but all the officers superintend likewise the direction of civil affairs. According to this military division (introduced by the Manchoes), the whole nation is divided into 135 banners, which are again subdivided into regiments and companies. Each Mongol is bound to serve as a horseman from his 18th to his 60th year. The property of the soil is in the princes, to whom their subjects pay a moderate contribution of cattle, supplying them also with servants and shepherds for guarding their flocks and herds. These princes decide in the last instance all disputes between their subjects, according to the laws established to preserve order in their armies; but the supreme administration is confided to the tribunal of foreign affairs at Peking, which appoints inspectors-general for the different principalities: these are always chosen from the Manchoo nation. With respect to the attachment of the Mongols to the present Manchoo dynasty of China (Ta-

* Du Halde mentions some tin-mines in the Kalkas country, and Malte-Brun says that there are iron foundries about 40 reeb. from Kookhi; but Timkovsky doubts their existence (*Comp. Du Halde*, iv., 28; *Malte-Brun*, ii., 484; and *Timkovsky*, ii., 234.)

MONKTON.

Thaing) it is difficult to speak positively. The Mongols still maintain their ancient hatred of the Chinese; and, though the latter have been enabled to subdue the warlike spirit of these nomads, and to declare them tributary, the court of Peking sends to Mongolia about 10 times the value of the tribute received from it, under pretext of rewarding the zeal and fidelity of its princes and military officers. Thus, the native Mongol chiefs are bribed into subjection and obedience; but they are, at the same time, vigilantly watched by the Manchoo inspectors, and any misconduct, or show of opposition, is speedily visited by an abridgment or deprivation of their usual presents. The religion of the Mongols is Buddhism, supposed to have been introduced in the 17th century. The temples are not numerous, nor are the lamas much distinguished from the common people by their knowledge and morals. They learn to read Tibetan, because the sacred books and services are copied and printed in those characters; but few of them are even tolerably acquainted with the language, or know the origin and meaning of the religious ceremonies. The lamas observe celibacy, and follow a strictly monastic life: there are also female recluses, who submit to an austere and holy life; but some are married.

The proper or E. Mongols are divided into three great nations; the Kalkas, northward, the Tshakhar, near the wall of China, and the Sunnit, who range over the great desert of Gobi. Their physical conformation, language, general habits, and history, have already been described at some length in the article *ASIA*, in this work (vol. I., p. 184, 185), to which the reader is referred for these particulars. The dress of the men is very simple, consisting of a long dark-blue robe, either of cotton or cloth, secured by a leather girdle; their shirts and under garments are of coloured nankeen, their boots of leather, and very thick: in winter they wear peluses of sheepskin, and fur caps. The costume of the women resembles, in many respects, that of the men. The saddles and bridles of the Mongols are furnished with copper or silver. A bow and arrows, with a short sword, are the arms of a soldier; and muskets or rifles are used only in the chase. Their tents consist, like those of the Khirgis, of a skeleton of osier, covered with felt, of which there are in winter three layers: the door commonly faces the S.; the hearth is in the centre; and the right side, near the entrance, belongs to the women. The tents of the common people are low, close, and disagreeable; but those of the richer Mongols are spacious and lofty, comprising two or three distinct apartments, the best of which is covered with a Persian or Turkish carpet. Milk, cheese, and butter, with a little mutton and game, form the chief food of this robust and active nation: brick-tea is the principal beverage of the rich as well as the poor. In summer, also, they drink *sérak*, a fermented liquor made from milk, besides *kowassie* and brandy, purchased from the Chinese. Hunting, horse-racing, wrestling, and archery are their chief amusements: they seem to have no idea of dancing, but their songs are poetical and highly characteristic. The Mongols marry young: a plurality of wives is not forbidden, and divorces are frequent, the least discontent on either side being deemed a sufficient reason for the step. They generally bury their dead, but sometimes burn them, and occasionally even leave them exposed to the birds and wild beasts. Almost every Mongol is a skilful warrior and huntsman; but there are very few workmen or artificers; and, on examining his dress, furniture, and saddle, we find that he is supplied with everything by the Chinese, who give, in exchange for horses, camels, oxen, and sheep, large quantities of brick-tea, tobacco, brandy, silk, cotton, and woollen fabrics, boots, and various utensils in iron, tin, and copper. To carry on this trade, the Chinese go to Mongolia, to the towns of Dolon-nor and Kalgan, or to the great entrepôts of Klakhta and Ourga, in the country of the Kalkas. The Mongols receive considerable profits from the conveyance of goods through their country: payment is made by the Chinese sometimes in silver, but more frequently in articles of merchandise. (*Yim-kowsky's Travels through Mongolia*, II., 307-358; *Du Halde, Desc. de la Chine*, IV., 21-38; *Chinese Rep.*, I., 117-121, &c.)

MONKTON, p. t., Addison co., Vt., 50 m. W. by S. Montpelier, 500 W. Watered by branches of Lewis cr. Excellent iron ore is found, in large quantities, in the S. part. A mile N. of the ore bed is found an extensive bed of kaolin, or porcelain earth. It contains three churches, three stores, one grist-mill, three saw-mills; 12 schools, 555 scholars. Pop. 1310.

MONMOUTH, a marit. co. in the W. of England, adjoining Wales, having N. the cas. of Brecknock and Hereford; E. Gloucester, from which it is separated by the Wye; S. the Bristol Channel; and W. Glamorgan, from which it is separated by the Rumney. Area, 317,440 acres, of which 370,000 are supposed to be arable, meadow and pasture. It is divided into two not very unequal parts by the

MONMOUTH.

Usk, which flows through it from N. to S.; the tract to the W. of that river being comparatively rugged and mountainous, and that to the E. comparatively level and well-watered. The S. part of both divisions along the Bristol Channel, contains large tracts of marshy land; in some parts of a deep, rich, loamy soil; and in others, of a black peat earth. Large embankments have been raised in different places along the shore, to protect the marsh land from inundation. In other parts of the county, the soil, which is in general good, mostly consists, in the elevated grounds, of a red sandy loam, and in the valleys of a red clay; the substratum is frequently limestone. The arable land is generally clean, and in good order; but the rotation of crops might be a good deal improved. Draining is extensively practised. Cattle principally of the Hereford breed; and inferior only to the same breed in their native county. There are numerous orchards; and, in a few places, hops are cultivated. Stock of sheep estimated at from 170,000 to 180,000. There are some large estates; but property is, notwithstanding, a good deal subdivided. The size of farms varies from 60 to 300 acres, 140 acres being supposed to be about the average. They are generally held at will; and the want of leases is much and justly complained of. Average rent of land, in 1830, 12s. 9d. an acre. Principal minerals, coal, iron, and limestone. The abundance of these has led to the establishment of many very extensive iron works, especially in the N. and W. parts of the county; which were estimated to produce, in 1840, about 200,000 tons of iron. The access to the mines has been facilitated by the formation of canals and railways. A good deal of flannel is made in different parts of the county. *Bathes* the Wye, Usk, and Rumney, it is watered by the Avea, Sirhowey, and Elwry. Monmouth has six hundreds, and 127 parishes; and sends four members to the House of Commons, viz. two for the county, and two for the borough of Monmouth. Registered electors for the county, in 1830-40, 4,447. In 1831, Monmouth had 18,612 inhabited houses, 19,911 families, and 98,130 persons; of whom 51,005 were males, and 47,035 females. Sum paid for poor-rates, 1830-31, 20,574. Annual value of real property, in 1835, 28,981; profits of trade and professions in ditto, 108,971.

MONMOUTH, a parl. bor., market-town, and par. of England, cap. of the above co., hund. Skeenforth on the Wye, 25 m. N. by W. Bristol, and 112 m. W. by N. London. Pop. of parl. bor. (which includes the par. of Monmouth and a part of that of Dinton), in 1841, 5,446. The town, which is well built, well paved, and lighted with gas, comprises a principal avenue, with other smaller streets, one of which leads to an old stone bridge over the Wye. The guildhall, in the market-place, is a neat and commodious edifice; and at the N. end of the town is a prison, which, though externally of imposing appearance, is much too small for the wants of the district. The parish church, partly rebuilt in 1740, has a spire 300 feet in height: the living is a vicarage in the gift of the duke of Beaufort. Another small church stands at the S. W. angle of the town, besides which there are four places of worship for dissenters, with attached Sunday-schools. A free grammar-school was founded here in the reign of James I.; an infant-school has recently been opened, and there is a large schoolhouse for 20 old men and women. "The town is not flourishing in appearance, and in point of prosperity, is said to be almost stationary. Independently of the conversion of pig-iron into bars, and of tin plates, the chief trade of Monmouth consists in the export of bark and timber to Bristol and Ireland, and the general supply of the neighbouring agricultural districts. Coal, for the use of the town, is obtained from the forest of Dean, by means of a railroad: but it is alleged to have been an unprofitable speculation to the projectors." (*Atlas. Corp. Rep.*) Monmouth is also a considerable thoroughfare; and from its situation on the romantic banks of the Wye, is likely to maintain its respectability, its neighbourhood having been selected as the residence of numerous persons of independent fortune. Woollen caps were once largely manufactured in Monmouth. They are referred to by Shakespeare (*Henry V.*, act v. scene 7); and it was ordered by the act 13 Elizabeth, cap. 19, that they should be universally worn on Sundays and holidays.

Monmouth, which was first incorporated in 1330, has been governed, since the passing of the *Municipal Reform Act* by a mayor and three other aldermen, with 19 councillors: it has likewise a commission of the peace, under a recorder. The borough, in conjunction with Usk and Newport, has sent one member to the House of Commons since the 27th Henry VIII., the right of election down to the *Reform Act* being vested in burgesses residing within seven miles of the borough. The electoral limits were left unchanged by the *Boundary Act*; and, in 1830-40, Monmouth, with its contributory boroughs, had 1304 registered electors. Wye also the principal polling-place and election-town for members of county, as well as the chief town of a poor-law unit.

MONONGAHELA.

Markets on Saturday; wool fairs, Whit-Tuesday, June 18 and Sept. 4.

MONMOUTH, county, N. J. Situated in the E. part of the state, and contains 1030 sq. m. Bounded E. by the Atlantic, along which are Long Beach and Island Beach, enclosing Little Egg harbour and Barnegat bays. Watered by Neversink, Shrewsbury, Tom's and Forked rivers, which flow E. into the Atlantic; and Assumpink and Crosswick's creeks, flowing W. to Delaware river. Marl is found and extensively used as a manure. It contained in 1840, 19,592 neat cattle, 18,694 sheep, 23,941 swine; and produced 39,368 bushels of wheat, 166,013 of rye, 493,554 of Indian corn, 39,256 of buckwheat, 3411 of barley, 144,096 of oats, 273,260 of potatoes, 1834 pounds of silk cocoons. It had 147 stores, eight lumber yards, seven furnaces, two forges, two fulling-mills, 54 grist-mills, 56 saw-mills, one rope-walk, 15 tanneries, 29 distilleries, two printing-offices, two daily newspapers; 94 schools, 4695 scholars. Pop. 32,900. Capital, Freehold.

MONMOUTH, p. t., Kennebec co., Me., 16 m. S. W. Augusta, 592 W. Watered by Cobbeconco river. Incorporated in 1792. It contains seven stores, one fulling-mill, three flouring-mills, four grist-mills, one saw-mill; one academy, 164 students. Pop. 1892.

MONMOUTH, p. v., capital of Warren co., Ill., 190 m. N. W. Springfield, 850 W. Situated in a prairie, a little S. of Cedarford of Henderson's river. It contains a courthouse, jail, six stores and groceries, and about 25 dwellings.

MONONGAHELA r., Pa., rises in Randolph co., Va., at the foot of Laurel mountains, and flowing northwardly for about 300 m., unites with Alleghany river at Pittsburg to form Ohio river. It is nearly 400 yards wide at its mouth, is navigable for light boats, 60 m. to Brownsville, and for small boats nearly 300 m. from its mouth. Its principal tributaries are Youghiogheny and Cheat rivers, which enter it on the E. side.

MONONGAHELA t., Greene co., Pa., 14 m. S. E. Waynesburg. Bounded E. by Monongahela river. Watered by Whittier creek. It contains six stores, one fulling-mill, one woollen factory, three grist-mills, seven saw-mills, one glass house, two tanneries, four distilleries; three schools, 75 scholars. Pop. 1178.

MONONGALIA, county, Va. Situated in the N. W. part of the state, and contains 360 sq. m. Watered by Monongahela river, and its branch, Cheat river. It contained in 1840, 10,230 neat cattle, 38,517 sheep, 19,563 swine; and produced 166,496 bushels of wheat, 6259 of rye, 351,316 of Indian corn, 9936 of buckwheat, 280,093 of oats, 61,723 of potatoes, 14,915 pounds of tobacco, 115,569 of sugar, 167,900 tons of bituminous coal. It had 18 stores, seven furnaces, three fulling-mills, three flouring-mills, 29 grist-mills, 63 saw-mills, one paper-mill, 13 tanneries, 19 distilleries, one pottery, one printing-office, one weekly newspaper; one academy, 14 students, 38 schools, 630 scholars. Pop. whites, 16,962; slaves, 260; free coloured, 146; total, 17,368. Capital, Morgantown.

MONOPOLI, a seaport city of the Neapolitan domain, Bari, on the Adriatic, 67 m. S. E. by E. Bari, and 32 m. N. N. E. Taranto; lat. 40° 57' 19", long. 17° 18' 58" E. Pop., in 1839, 15,535. It stands on an eminence surrounded by a wall, and is defended by a castle. Swinburne calls it "a dark, disagreeable town, with narrow crooked streets, and very lofty flat-roofed houses;" but the account given by Craven is not quite so unfavourable. It is approached from the N. by a newly-built suburb, the small but regular houses of which have each a neat garden. The city has several churches, including a cathedral, which has a fine painting of St. Sebastian by Palma, and a chapel dedicated to the Virgin, and enriched with inlaid marbles of all colours. The town has two ports capable of accommodating vessels of large size; but the deepest is open to the N. and is consequently exposed to the *Bora*, or N. E. wind, which often blows from the Adriatic with much violence. Monopoli has manufactures of cotton and linen cloths, and some trade in wine and olives. It is not very ancient, being probably built by the Greeks of the lower empire, partly with the ruins of *Egnatia*, which stood about three miles S. E., and some traces of which still exist. (Swinburne; Craven; *Cramer's An. Italy*, &c.)

MONREALE, a city of Sicily, intend. Palermo, on a steep hill four m. S. W. Palermo, with which city it communicates by a fine road and causeway, supported by strong buttresses, ornamented with many seats, fountains, urns, &c., laid down at the expense of a late archbishop of Monreale. Pop., in 1831, 19,003. Monreale, though not a fine town, has several remarkable edifices. The cathedral, a large edifice founded in 1174, ranks next after that of the capital: for though heavy, and without symmetry, it has an imposing appearance. Its architecture is a mixture of Lower Greek and Saracenic, and its interior, above the pillars and arches, is wholly incrustured with mosaic work, representing different subjects from the Bible. A destructive fire, in

MONROE.

1811 did great injury to the structure; but the portions destroyed have been since rebuilt exactly in the former style. An adjoining Benedictine convent has a magnificent cloister, a large library, a collection of coins, and numerous paintings, including one of the finest pictures, of the Sicilian artist, Novelli Monrealese. Near the town is also another rich Benedictine establishment, founded by Pope Gregory the Great. (*Smyth's Sicily*, p. 90-92.) Monreale is healthy, and commands fine prospects. Its vicinity is very fertile, in corn, oil, and fruit being exported from it to Naples, Genoa, and other parts of Italy. (*Ortelani, Diction. della Sicilia; Smyth's Sicily*, &c.)

MONROE, county, N. Y. Situated toward the N. W. part of the state, and contains 607 sq. m. Drained by Genesee river and small streams flowing into Lake Ontario, which bounds it on the N., Iron ore, gypsum and marl abound, and it has several sulphur springs. The water-power furnished by Genesee river at Rochester, is unsurpassed in the United States. The Erie canal, the Genesee valley canal, and the Auburn, Rochester and Tonawanda railroad pass through it. It contained in 1840, 35,335 neat cattle, 129,970 sheep, 59,309 swine; and produced 1,074,813 bushels of wheat, 3447 of rye, 406,021 of Indian corn, 37,094 of buckwheat, 61,787 of barley, 523,655 of oats, 721,500 of potatoes, 181,119 pounds of sugar. It had two commercial houses in foreign trade, capital \$15,100, 340 retail stores, capital \$1,568,940, five lumber yards, capital, \$32,300, six furnaces, 30 fulling-mills, 12 woollen-factories, one cotton factory with 3000 spindles, 36 flouring-mills, 18 grist-mills, 69 saw-mills, one oil-mill, two paper-mills, 21 tanneries, seven distilleries, five breweries, two powder-mills, one pottery, nine printing-offices, one bindery, four daily, five weekly, and one semi-weekly newspaper, and one periodical. Total capital in manufactures, \$2,633,714; 11 academies, 1466 students, 305 schools, 17,056 scholars. Pop. 64,902. Capital, Rochester.

MONROE, county, Pa. Situated in the E. part of the state, and contains 750 sq. m. Organized in 1836. Bounded E. by Delaware river, N. W. by Lehigh river. Watered by Broadhead's, Bushkill, and Tobyhanna creeks. It contained in 1840, 6519 neat cattle, 9428 sheep, 10,642 swine; and produced 10,951 bushels of wheat, 84,923 of rye, 58,391 of Indian corn, 50,563 of buckwheat, 57,513 of oats, 99,337 of potatoes. It had 19 stores, one flouring-mill, 25 grist-mills, 107 saw-mills, nine tanneries, two printing-offices, two weekly newspapers; two academies, 31 schools, 794 scholars. Pop. 9679. Capital, Stroudsburg.

MONROE, county, Va. Situated in the W. part of the state, and contains 750 sq. m. Bounded W. by New river. Watered by Greenbrier river. It has an elevated surface, and contained in 1840, 12,458 neat cattle, 30,047 sheep, 13,768 swine; and produced 67,993 bushels of wheat, 38,672 of rye, 200,408 of Indian corn, 5743 of buckwheat, 194,228 of oats, 62,065 of potatoes, 78,825 pounds of sugar. It had 16 stores, one woollen factory, two flouring mills, 24 grist-mills, 29 saw-mills, three oil-mills, seven tanneries, eight distilleries; one academy, 60 students, five schools, 119 scholars. Pop.: whites, 7457; slaves, 868; free coloured, 97; total, 8423. Capital, Union.

MONROE, county, Geo. Situated near the centre of the state, and contains 570 sq. m. Bounded N. E. by Ocmulgee river, by branches of which it is drained. It contained in 1840, 10,037 neat cattle, 5541 sheep, 35,903 swine; and produced 63,651 bushels of wheat, 1506 of rye, 511,941 of Indian corn, 49,931 of oats, 18,001 of potatoes, 4,673,963 pounds of cotton. It had 13 stores, four tanneries; 17 academies, 753 students, 14 schools, 368 scholars. Pop.: whites, 7604; slaves, 8447; free coloured, 94; total, 16,575. Capital, Forsyth.

MONROE, county, Flor. Situated in the S. part of the peninsula, having the Florida channel on the S. and the gulf of Mexico W. It contains a part of the Everglades, an insulated region covered with pine and hammock islands, a famous resort of the Indians in the Florida war. In the N. W. part is some fertile land. It contained in 1840, four commission houses in foreign trade, 16 retail stores, one printing-office, one weekly newspaper; three schools, 23 scholars. Pop. 689. Capital, Key West.

MONROE, county, Ala. Situated toward the S. part of the state, and contains 980 sq. m. Watered by Alabama river and its branches. It contained in 1840, 16,182 neat cattle, 3654 sheep, 33,073 swine; and produced 5335 bushels of wheat, 391,504 of Indian corn, 10,769 of oats, 40,406 of potatoes, 33,351 of rice, 10,000 pounds of tobacco, 986,327 of cotton. It had 30 stores, 32 grist-mills, 15 saw-mills, six tanneries; 19 schools, 306 scholars. Pop.: whites, 5370; slaves, 5399; free coloured, 18; total, 10,680. Capital, Monroeville.

MONROE, county, Miss. Situated toward the N. E. part of the state, and contains 650 sq. m. Drained by the Tombigbee river and its tributaries. It contained in 1840, 19,027 neat cattle, 9833 sheep, 25,300 swine; and produced 23,528 bushels of wheat, 331,190 of Indian corn, 39,685 of oats,

MONROE.

19,002 of potatoes, 6797 pounds of tobacco, 712,065 of cotton. It had two commission houses in foreign trade, 24 stores, one flouring-mill, 15 grist-mills, eight saw-mills; one tannery, five distilleries, one pottery, one printing-office, one weekly newspaper; three academies, 93 students; 10 schools, 110 scholars. Pop.: whites, 5145; slaves, 4063; free coloured, 21; total, 9230. Capital, Athens.

Monroe, county, Tenn. Situated in the S.E. part of the state, and contains 750 sq. m. Drained by branches of Tennessee river. It contained in 1840, 6530 neat cattle, 5605 sheep, 17,361 swine; and produced 30,525 bushels of wheat, 2331 of rye, 345,387 of Indian corn, 90,815 of oats, 4750 of potatoes, 1540 pounds of tobacco, 3180 of cotton. It had three stores, one flouring-mills, 10 grist-mills, four saw-mills, two tanneries, nine distilleries, one pottery; two academies, 77 students; 19 schools, 173 scholars. Pop.: whites, 11,125; slaves, 884; free coloured, 67; total, 12,056. Capital, Madisonville.

Monroe, county, Ky. Situated toward the S. part of the state, and contains 375 sq. m. Drained by Big Barren river and its branches. It contained in 1840, 6314 neat cattle, 6853 sheep, 20,306 swine; and produced 33,676 bushels of wheat, 1945 of rye, 311,047 of Indian corn, 77,098 of oats, 11,100 of potatoes, 480,019 pounds of tobacco, 42,930 of cotton, 18,490 of sugar. It had 15 stores, 19 grist-mills, 10 saw-mills, one oil-mill, four tanneries, 30 distilleries; one academy, 25 students; eight schools, 156 scholars. Pop.: whites, 5811; slaves, 763; free coloured, 12; total, 6586. Capital, Tompkinsville.

Monroe, county, O. Situated toward the S.E. part of the state, and contains 530 sq. m. Watered by Little Muskingum river, and Sunfish, Duck and Willi's creeks. It contained in 1840, 11,303 neat cattle, 20,518 sheep, 27,354 swine; and produced 168,795 bushels of wheat, 3430 of rye, 428,301 of Indian corn, 7568 of buckwheat, 173,174 of oats, 73,983 of potatoes, 1,036,866 pounds of tobacco, 77,996 of sugar. It had 28 stores, three fulling-mills, one flouring-mill, 35 grist-mills, 37 saw-mills, one oil-mill, 12 tanneries, eight distilleries, one brewery, two potteries; 23 schools, 830 scholars. Pop. 18,521. Capital, Woodfield.

Monroe, county, Mich. Situated in the S.E. part of the state, and contains 540 sq. m. Bounded S.E. by lake Erie, N.W. by Huron river. Watered by Raisin river, and Swan, Stony, Otter and Bay creeks. It contained in 1840, 8364 neat cattle, 2010 sheep, 9981 swine; and produced 49,856 bushels of wheat, 2103 of rye, 74,407 of Indian corn, 7887 of buckwheat, 2199 of barley, 68,794 of oats, 83,016 of potatoes, 40,687 pounds of sugar. It had 94 stores, one fulling-mill, one woollen factory, two flouring-mills, five grist-mills, 11 saw-mills, one paper-mill, two printing-offices, two weekly newspapers; 30 schools, 777 scholars. Pop. 9922. Capital, Monroe.

Monroe, county, Ia. Situated a little N.E. of the centre of the state, and contains 390 sq. m. Watered by the W. fork of White river and its tributaries, which afford water-power. It contained in 1840, 4019 neat cattle, 7470 sheep, 19,701 swine; and produced 57,636 bushels of wheat, 2348 of rye, 407,968 of Indian corn, 95,281 of oats, 9780 of potatoes, 30,929 pounds of sugar. It had 29 stores, one furnace, seven woollen factories, six flouring-mills, 19 grist-mills, 10 saw-mills, four oil-mills, 15 tanneries, 13 distilleries, three printing offices, three weekly newspapers; one college, 90 students; one academy, 60 students; 17 schools, 538 scholars. Pop. 10,143. Capital, Andersonstown.

Monroe, county, Ill. Situated toward the S.W. part of the state, and contains 399 sq. m. Bounded W. by Mississippi river. Watered by Horse, Prairie de Long and Eagle creeks. It contained in 1840, 8632 neat cattle, 3338 sheep, 16,516 swine; and produced 23,518 bushels of wheat, 293,462 of Indian corn, 21,975 of oats, 10,016 of potatoes. It had 15 stores, two flouring-mills, three grist-mills, four saw-mills, three tanneries, two distilleries; five schools, 188 scholars. Pop. 4481. Capital, Waterloo.

Monroe, county, Mo. Situated towards the N.E. part of the state, and contains 744 sq. m. Watered by Salt river and its branches. It contained in 1840, 6591 neat cattle, 9760 sheep, 20,585 swine; and produced 19,906 bushels of wheat, 5437 of rye, 401,854 of Indian corn, 99,014 of oats, 16,710 of potatoes, 182,414 pounds of tobacco. It had 20 stores, 13 grist-mills, 14 saw-mills, four tanneries, seven distilleries, one pottery; three academies, 125 students; 20 schools, 479 scholars. Pop.: whites, 7813; slaves, 1687; free coloured, 5; total, 9505. Capital, Paris.

Monroe, county, Ark. Situated in the E. part of the state, and contains 1150 sq. m. Watered by Cache and White rivers. It contained in 1840, 2310 neat cattle, 135 sheep, 4074 swine; and produced 54,549 bushels of Indian corn, 3400 of oats, 3706 of potatoes, 38,375 pounds of cotton. It had four stores, four flouring-mills, two schools, 33 scholars. Pop.: whites, 788; slaves, 148; free coloured, two; total, 936. Capital, Lawrenceville.

Monroe, p. t., Waldo co., Me., 54 m. N.E. Augusta, 649

W. Watered by Marsh river, a tributary of Penobscot river. It contains two stores, two grist-mills, seven saw-mills; eight schools, 609 scholars. Pop. 1602.

Monroe, p. t., Washington co., Vt., 14 m. N.N.E. Montpelier, 528 W. Chartered in 1781 by the name of Woodbury. Received its present name in 1828. Watered by branches of Onion or Winooski and Lamotte rivers. It has one grist-mill, two saw-mills; 13 schools, 367 scholars. Pop. 1092.

Monroe, p. t., Fairfield co., Ct., 54 m. S.W. Hartford, 283 W. Incorporated in 1823. It contains four churches, a Congregational, Episcopal, Methodist, and Baptist, five stores, one grist-mill, four saw-mills; one academy, 28 students, six schools, 220 scholars. Pop. 1351.

Monroe, p. t., Orange co., N. Y., 14 m. S.E. Goshen, 117 m. S. by W. Albany, 279 W. Drained by Ramapo river, which flows into Passaic river. It contains a Presbyterian and a Methodist church, an academy, four stores, one fulling-mill, one grist-mill, one saw-mill; nine schools, 417 scholars. Pop. 3014.

Monroe, t., Middlesex co., N. J. It has eight stores, four grist-mills, five saw-mills, one paper-mill, five distilleries; one academy, 25 students, eight schools, 283 scholars. Pop. 2433.

Monroe, t., Bradford co., Pa. It has five stores, four grist-mills, 18 saw-mills; six schools, 278 scholars. Pop. 1131. Monroe, t., Cumberland co., Pa., 7 m. S.E. Carlisle. Watered by Yellow Breeches creek, which affords water-power. It has six stores, one fulling-mill, one woollen factory, four flouring-mills, two saw-mills, four tanneries, one distillery. Pop. 1570.

Monroe, t., Armstrong co., Pa. It has five stores, two fulling-mills, three grist-mills, three saw-mills, two tanneries; five schools, 240 scholars. Pop. 1151.

Monroe, p. v., capital of Walton co., Ga., 61 m. N.W. Milledgeville, 635 W. Situated 24 m. E. of Alcovese river, a branch of Ocmulgee river. It contains a courthouse, jail, two churches, a Baptist and a Methodist, an academy, 11 stores and about 50 dwellings.

Monroe, p. v., capital of Washita par., La., 200 m. N.W. by N. New Orleans, 1190 W. Situated at the head of steamboat navigation, on the E. side of Washita river. It contains a courthouse, jail, a U. States land office, an academy, four stores, 100 dwellings and about 600 inhabitants.

Monroe, p. v., Lemon t., Butler co., O., 95 m. W.W. Columbus, 479 W. It contains two brick churches, a saw-mill, of the Associate Reformed church, four stores, 2 dwellings, and about 300 inhabitants.

Monroe, t., Clermont co., O. It has seven stores; an academy, 44 students, nine schools, 499 scholars. Pop. 168.

Monroe, t., Knox co., O., 6 m. N.E. Mount Vernon. Watered by Ecken's creek, which affords water-power. It has six schools, 233 scholars. Pop. 1949.

Monroe, t., Licking co., O. It has seven schools, 27 scholars. Pop. 1156.

Monroe, t., Logan co., O. It has five schools, 15 scholars. Pop. 1203.

Monroe, t., Miami co., O. Bounded E. by Miami river. Watered by its W. branch. The Miami canal pass through it. It contains three flouring-mills, one grist-mill, four saw-mills; five schools, 261 scholars. Pop. 1494.

Monroe, t., Richland co., O. Watered by Moccasin creek. Pop. 1694.

Monroe, t., Putnam co., Ia. It has three grist-mills, two saw-mills; two schools, 144 scholars. Pop. 1341.

Monroe, t., Washington co., Ia. It has two stores, one flouring-mill, seven grist-mills, seven saw-mills. Pop. 181.

Monroe, city, capital of Monroe co., Mich., 37 m. S.W. Detroit, 466 W. Situated on the river Raisin, 24 m. from its mouth. It contains a courthouse, jail, two banks, a U. States land office, seven churches, two Presbyterians, an Episcopal, Methodist, Baptist and two Roman Catholic, seven stores and forwarding houses, 23 stores, one woollen factory, one iron foundry and edge tool factory, two flouring-mills, three saw-mills, one paper-mill, two printing-offices, two weekly newspapers, a branch of the surveyors of Michigan, two female academies, a reading room, and public library of 12 or 1500 volumes. The courthouse is an elegant edifice of brown stone, which cost \$25,000, and several of the churches are handsome edifices. The water-power of Raisin river at this place has been estimated by the U. S. engineer, sufficient to propel 250 run of stones. A ship canal, 100 feet wide and 13 feet deep is constructed from the city to the lake. Steamboats from Buffalo to Detroit, stop here in the season of navigation, and many vessels ply on lake Erie. It contains about 300 dwellings and 1703 inhabitants. The town exclusive of the city has 693 inhabitants. It was first settled by the French in 1776, and was increased by the English in 1798. In Jan. 1813, the memorable battle of Frenchtown was fought near this place, when 780 Kentuckians under Gen. Winchester were massacred by the Indians, under the countenance of

MONROEVILLE.

Gen. Proctor, who ordered the burning of the place. The order was partially executed, but was stopped by the interference of the celebrated Indian chief Tecumseh.

MONROEVILLE, p. v., capital of Monroe co., Ala., 151 m. E. Tuscaloosa, 943 W. Situated on a branch of Limestone creek, 12 m. E. of Alabama river. It contains a courthouse, jail, and several stores and dwellings. Nett proceeds of the postoffice, \$142.

MONS (Flem. *Berghe*), a town of Belgium, prov. Hainaut, of which it is the cap., on the Trouille, by which it is separated into two parts, 38 m. S.W. Brussels, and 20 m. E.N.E. Valenciennes. Lat. 50° 37' N., long. 3° 57' 30" E. Pop. in 1836, 23,081. The town is built partly on level ground, and partly on the declivity of a hill, crowned by a lofty tower, rebuilt in 1692 on the site of an ancient castle, said to have been built by Julius Cæsar. Mons has been, since 1818, when its works were considerably augmented and strengthened, one of the principal Belgian fortresses. Its walls are flanked with 14 bastions, and on its E. sides are two extensive pools, by the aid of which, and the river, its ditches may be easily filled, and the environs laid under water. Without the walls are several suburbs. The town is entered by five gates; several of its streets are steep and winding, but they are in general wide, clean, well paved, and bordered with good houses, many of which are of stone. It has several good squares: of these the *Place d'Armes*, or great market-place, is the principal, and has in it the government-house, and the hall of the provincial council. The ramparts are planted with trees, forming pleasant promenades; and within the precincts of the citadel is a garden open to the public. The Trouille is here crossed by three bridges, and numerous stone pumps supply the town with water. The town-hall, erected according to Vandermaelen, in 1440, is a large Gothic edifice, surmounted by a fine cupola. The church of St. Wandrui, on the site of a chapel founded by that saint in the 7th century, is a fine specimen of Gothic architecture; and the church of St. Elizabeth is also handsome in some of its parts, but it has the incongruity of Gothic pillars supporting Corinthian capitals. The courthouse, the new college, the military hospital designed by Vauban, the arsenal, the new barracks, the theatre, and the academy of arts, are among the most conspicuous public buildings. There are civil, orphan, founding, and other hospitals, a house of correction, a workhouse, various asylums, a government loan-bank, and other charitable institutions.

Mons is the residence of a civil governor, and of a provincial and a municipal military commandant, and the seat of tribunals of primary jurisdiction and commerce, a chamber of commerce, &c. It had formerly a flourishing manufacture of lace, now much decayed, and several sugar refineries, which have been abandoned. It still, however, produces some woollen and cotton stuffs, gloves, cutlery, hardware, soap, and vinegar; and has copper and lead foundries, flour-mills, &c.; but its chief source of wealth is in the numerous and productive coal mines by which it is surrounded, and which employ a great number of workmen and steam-engines. There are also extensive bleaching grounds in the vicinity. The coal from Mons is sent in part to Paris, by a long line of internal navigation, of which the canal from Mons to Condé forms a part. This canal, commenced by the French in 1807, and finished in 1814, is perfectly straight, 15 m. in length, with seven locks, and at Condé joins the Scheldt. The greater part of it is in the Belgian territory; but a new branch of the Canal d'Antoine has been recently cut from it, avoiding France altogether, and entering the Scheldt not far from Tournay. Mons has sustained many sieges. It was taken in 1691, by Louis XIV., after an obstinate defence; and was occupied by Eugene and Marlborough in 1709. The emperor Joseph II. demolished its former fortifications in 1784. During the French ascendancy it was the capital of the department of Jemappes. (*Vandermaelen, Dict. Geog. De Hainaut, &c.*)

MONSON, p. t., Hampden co., Mass., 75 m. S.W. by W. Boston, 380 W. Chicopee river and its branches, afford water-power. Incorporated in 1760. It contains four churches, a Congregational, Methodist, Baptist and Universalist, a flourishing academy with 90 students, four stores, three woollen factories, two cotton factories with 3394 spindles, two grist-mills, three saw-mills; 14 schools, 350 scholars. Pop. 2151.

MONTAGUE, p. t., Franklin co., Mass., 85 m. W. by N. Boston, 396 W. Bounded W. and N.W. by Connecticut river, across which is a bridge connecting it with Deerfield. Entered by Saw-mill river. Connecticut river in the W. part of the town has a romantic and majestic fall, called Turner's falls, of 65 feet, which is said strongly to resemble Niagara. The principal pitch is divided by an island. A trail, 3 m. long, 25 feet wide and 12 feet deep, overcomes these falls, by eight locks, with a rise of 75 feet. The river is thrown into the canal by an immense dam, 330 yards long, and 40 feet at its greatest height. Another

MONTBRISON.

immense dam, with a canal, overcomes Miller's falls, four miles above. It contains three churches, a Congregational, Episcopal and Baptist, five stores, one grist-mill, three saw-mills; 11 schools, 365 scholars. Pop. 1855.

MONTAUGA, p. t., Sussex co., N. J., 91 m. N. Trenton, 256 W. Bounded N.W. by Delaware river, and drained by its small tributaries. Across the Delaware is a bridge to Milford, which cost \$20,000. It contains one store, four grist-mills, one saw-mill, two tanneries; six schools, 143 scholars. Pop. 1093.

MONTAGNANA, a town of Austrian Italy, deleg. Padua, cap. distr. on the Frassinia, 53 m. S.E. Padua. Pop. 6337. It is walled, and has a castle, several churches, a hospital, and a high female school. It has manufactures of woollen, and linen stuffs, hats, and leather, and a brisk trade in agricultural produce. It has several annual fairs, one of which lasts from November 25 to December 24. The hemp grown in the vicinity of this town is esteemed the best in the Lombardo-Venetian kingdom. (*Borghese, &c.*)

MONTARGIS, a town of France, dep. Loiret, cap. arrond., at the confluence of the canals of Orleans, Briare and Loing, 39 m. E. by N. Orleans. Pop. in 1836, 7757. Though ill laid out, it is pretty well built; it is in part surrounded by old walls, and has the ruins of a large castle, in which the French kings often held their court. The parish church is remarkable for the elevation and boldness of its pillars and nave. Montargis has two hospitals, a small theatre, and manufactures of coarse woollen cloths. (*Hugo, art. Loiret.*)

MONTAUBAN, a town of France, dep. Tarn-et-Garonne, of which it is the cap., on an eminence on the banks of the Tarn, crossed here by a brick bridge of seven arches, 193 m. E.S.E. Bordeaux; lat. 44° 1' N., long. 1° 30' 43" E. Pop. in 1836, ex com., 17,531, one third of whom are Protestants. The town, properly so called, is small, and irregularly laid out, with narrow ill-paved streets, lined by old houses having projecting gables; but the suburbs, which are of considerable extent, present a totally different appearance, having straight, wide, and regular streets, with new, large, and elegant mansions. It has three public squares: that of the Prefecture, the *Place d'Armes*, and the *Place Royale*, the last of which is spacious, and has many handsome houses. The chief public buildings are the cathedral, a cruciform structure with two towers; the town-hall, a large and fine square edifice; the church of St. James, with a lofty brick tower and steeple; the prefecture, bishop's palace, the public library with 11,000 vols., a small theatre, and several hotels. Near the prefecture commences a noble avenue, shaded with six rows of acacias, leading to the terraces of some adjacent promenades, which command extensive prospects of the surrounding country. The beautiful situation of Montauban, the purity of its atmosphere, the good quality as well as abundance of its water, and the cheapness of all the necessaries of life, render it a pleasant and favorite retreat for persons of small fortune. It is the seat of a tribunal of primary jurisdiction, and has a chamber of manufactures, a society of agriculture and science, and a communal college. It has manufactures of serges, flannels, coarse cotton fabrics, and silk stockings, earthenware, soap, brandy, starch, leather, and beer. It likewise carries on a considerable retail trade, and is a large entrepôt for corn.

Montauban was built in the beginning of the 14th century, and owes its foundation to the protection afforded by the Count of Toulouse to the oppressed vassals of certain barons, who claimed, among other privileges, that of *prohibition*. It afterwards acquired celebrity on account of its early adherence to the cause of the Huguenots, and its great sufferings in their behalf. In 1691, it successfully resisted an army under Louis XIII.; but a few years subsequently, after the siege of Rochelle, it was compelled to open its gates to that monarch. A few years after it was exposed to the *dragonnades*, that disgraced the reign of Louis XIV. This was the last disastrous event connected with the town, which has since gradually risen to its present importance. (*Hugo, art. Tarn-et-Garonne; Guide du Voy. en France, p. 62.*)

MONTAUK POINT, East Hampton, Suffolk co., N. Y., 140 E. New-York. It is a high promontory on the E. end of Long Island, against which the waves of the ocean continually dash, and in a storm, with fearful violence. It contains a lighthouse, the base of which is 40 feet above the ocean, and which is 100 feet high, substantially built of stone. It can be seen for 30 m. at sea, was erected in 1796, and cost \$25,000. Near it is a public house, much frequented in the summer season.

MONT BLANC, in Savoy, at once the highest mountain of the Alps and of Europe. (*Vol. I., p. 66.*)

MONTBRISON (an. *Mons Briso*), an ancient town of France, dep. Loire, of which it is the cap., 237 m. S.S.E. Paris; lat. 45° 39' 41" N., long. 4° 4' 23" E. Pop. in 1836, ex. com., 6090. It was formerly fortified, and is irregularly

MONT-DE-MARSAN.

laid out with narrow streets, and low, shabby houses. A cathedral, founded in 1905, and still in an unfinished state, a prefecture, hospital, college, with a library of 15,000 volumes, theatre, corn-exchange, and infantry barracks are the principal buildings; but the cathedral only has any architectural beauty. Though the capital of a department, and the seat of a tribunal of primary jurisdiction and commerce, and of a society of agriculture, Montbrison is very unimportant, having no manufactures, and only a limited retail trade. Indeed, it has been proposed to make the large manufacturing town of St. Etienne, 11 m. S. by E. Montbrison, capital of the department.

MONT-DE-MARSAN, a town of France, cap. dep. Landes, 64 m. S. Bordeaux. Pop., in 1836, ex. com., 3024. It is situated on the side of a declivity close to the navigable river Midouze (crossed here by a stone bridge of two arches), and is clean, well paved, and regularly laid out, the principal buildings being the parish church, town-hall, court of justice, college, public baths, barracks, a small theatre, and a library with 1300 volumes. The suburbs are planted with trees, and laid out in walks. It has manufactures of coarse woollen cloths, blankets, and sail-cloth; and some trade, with Bayonne, in wine and brandy. It is the seat of a tribunal of primary jurisdiction, and of a society of agriculture and commerce.

MONTEFASCONI, a town of central Italy, Papal States, deleg. Viterbo, on a mountain, 9 m. N.N.W. Viterbo. Pop. about 5500. It has a fine cathedral, and many other religious edifices, but is celebrated principally for its light, white, muscadel wines; but these, as they do not bear carriage, are seldom met with out of the country where they are produced.

MONTELEONE (an. *Hippopolium* and *Fibe Valentia*), a town of the Neapolitan dom., prov. Calabria Ultra II., cap. of a distr. on a mountain, 37½ m. S.W. Catanzaro. Pop. from 9000 to 10,000. Its commanding situation, with its fine old castle, gives it a fine appearance from without; but its streets are crooked and ill paved, and the houses mostly low and of wood. There are several churches, in which are some good pictures; a royal college, &c. The inhabitants are principally engaged in the tunny fishery, and in trading in silk and oil. According to Strabo (vi., 256), Hippopolium was founded by the Loeri Episcophyrili. After many vicissitudes, it became a Roman colony; and Cicero calls it *illustris et nobile municipium*. It had a fine temple of Proserpine, demolished by Count Roger of Sicily, who applied the materials to the construction of the abbey at Mileto, 6 m. distant. (*Cramer's Anc. Italy*, ii., 419-421; *Cramer's Tour*, p. 419-421; *Rampoldi*, &c.)

MONTELMART (an. *Acunum*?), a town of France, dep. Drôme, on the Jabron, near its confluence with the Rhone, 70 m. S. Lyon, lat. 44° 33' N., long. 46° 45' E. Pop., in 1836, ex. com., 6150. It is surrounded with walls, and is generally well built, the chief street being wide and paved with basalt. It has four handsome gates, and a well-planted public walk along the walls, which adds greatly to its beauty. Near the town is a mineral spring, highly esteemed for its medicinal qualities, and the neighbourhood is remarkable for the abundance and variety of its fruits, &c. The manufacture of figured silks is the only important branch of industry; but it has a considerable retail trade, and is the chief entrepot of an extensive and highly productive district. It was unsuccessfully besieged by Coligny in 1567. (*Hugo, France Pitt.*, ii., 6; *Guide du Voyageur en France*.)

MONTETULCIANO, a town of central Italy, grand duchy of Tuscany, prov. Arezzo, on a lofty hill, 97 m. S.E. Siena. Pop. from 2000 to 3000. It is surrounded by a wall with battlements, and has numerous ecclesiastical establishments, a college, a hospital, and manufactures of soap, oil, and wine flasks. It is celebrated for its desert wine, which, with exuberant partiality, is preferred by Rudi to all other wines:

"Montepulciano d'ogni vino è il re." *Bacco in Toscana.*

MONTEREAU (an. *Condote*) a town of France, dep. Seine-et-Marne, at the confluence of the Seine and Yonne, each of which is crossed here by a stone bridge, 42 m. S.E. Paris. Pop., in 1836, ex. com., 4379. It has a fine open market-place, and is well built, clean, and respectable: a parish church, town-hall, hospital, and three hotels, are the only public edifices of any importance. It is the seat of a tribunal of commerce, and has an extensive manufacture of earthenware, with some tan-yard, and a considerable trade with Paris, chiefly in corn, flour, and wood for fuel.

MONTEVIDEO, a fortified seaport city of S. America, cap. of the republic of Uruguay, on a peninsula extending into the estuary of the Plata on its N. side, 125 m. E. by S. Buenos Ayres; lat. 34° 54' 11" S., long. 56° 13' 18" W. Population variously estimated, but may probably be about 13,000. It is well fortified, and has a citadel. The houses, which are of stone or brick, are seldom above one story in

MONTGOMERY.

height; they are flat-roofed; and timber is so scarce that their floors consist, for the most part, of brick or tan ash. The streets, being unpaved, are either covered with dust or loaded with mud, as the weather happens to be dry or wet. The city is ill supplied with water, which has to be brought from a well 2 m. distant, or from a pit dug near the sea-side; or is else merely rain-water, collected in cisterns. There are but few public buildings, and those of no great importance; the cathedral is said to be a handsome edifice, but it is badly situated.

The port of Montevideo is the best on the Plata. It is a large circular basin, open to the S.W.; generally the water is shallow, not exceeding from 14 to 19 feet; but the bottom being soft mud, vessels are seldom damaged by grounding. It should, however, be observed, that the depth of water in the harbour, as well as throughout the whole of the Rio de la Plata, depends very much on the direction and strength of the winds. The harbour is exposed to the pampas, or S.W. winds, which sometimes blow with so much force and continuance as to cause the rise of a fathom or more in the depth of water; but they rarely do any damage to vessels properly moored with anchors to the S.W. and S.E., and are to the N. On the opposite side of the bay is a mountain called Montevideo, whence the city has derived its name; on its summit is a lighthouse, having the lantern 65 feet above the sea.

Montevideo has considerable commerce; the imports principally consist of British cottons, woollens, and hardware, flour, wine and spirits, linens, sugar, tobacco, beans and shoes, salt, &c. The great articles of export consist of animal products, which, in 1836, were estimated as follows: Hides, dry, No. 373,019; do. salted, 141,381; horns, No. 593,625; jerked beef, 306,354 cwt.; horse-hair, 18,000 arrobas of 25 lbs.; horse-hides, No. 37,401; wool, 33,980 arrobas; tallow, 43,182 arrobas, &c. In the same year the total value of the exports was estimated at 3,412,957 Spanish dollars; and that of the imports at 3,597,437 dollars. The trade is principally with Brazil, Great Britain, America, France, Sardinia, Spain, and Portugal.

This town was founded by a colony from Buenos Ayres, and its possession was long a matter of dispute between the Spaniards and Portuguese. It was taken by the Brazilians in 1811; and became, in 1823, the capital of the new republic of Uruguay. (*Mawe, Henderson, &c. in Mod. Trav.*, xlix.; *Parish's Buenos Ayres, Appendix; Supp. to Comm. Dict.*, &c.)

MONTZUMA, p. v., capital of Covington Co. Ala. 186 m. S.E. Tuscaloosa, 914 W. Situated on the E. side of Conecuh river, and contains a courthouse, jail, and several stores and dwellings.

MONTGOMERY, an inland co. of N. Wales, having N. Merioneth and Denbigh, E. Salop, and S. S. and W. Radnor and Cardigan. It is oval-shaped, and contains 336,940 acres. The Berwyn mountains divide this county from Merioneth; and, with the exception of some considerable valleys, of which that of the Severn is the most extensive, and that of Llanelgallen, partly in this county, the surface is, for the most part, rugged and mountainous. The soil is very various; but in the vales it is generally clayey, and is partly very fertile; on the whole, however, the land under tillage is not supposed to exceed from 70,000 to 80,000 acres. The Severn has its source at the extreme W. confines of this county, on the skirts of "huge Flynlimmon;" and runs in a N.E. direction, parallel to, and not very distant from, its S. boundary, till it unites with its important affluent, the Vyrnwy, which also belongs to this county, on the borders of Salop. The agriculture of this county, especially in the vales and along the border of Salop, has been a good deal improved; but it is extremely similar to, and quite as backward as, that of Denbigh and Merioneth (which see). The climate, though moist, is mild and salubrious. The vales of this county have been long celebrated for a superior breed of horses. Montgomery has also long been, and still continues to be, the best wooded county in Wales. It was formerly regarded as one of the principal sources of the supply of oak timber for the navy; but many of its finest oak woods have been cut down; and, though a good deal of new wood has been planted, it is doubtful whether it is sufficient to supply the place of that which formerly existed. Average rent of land, in 1810, 6s. 5½d. an acre. There are a number of fine and commodious farm-houses and offices, but, in general, they are very defective, and the cottages are quite as bad as in Merioneth. Slate is generally diffused over the county, and forms, indeed, the basis of the mountains. Slates are quarried at Llanyngy and other places; coal is raised on the borders of Salop; and there are some lead mines, but none that are very productive. Montgomery is the principal seat of the Welsh flannel manufacture, which is extensively carried on at Newton, Llanidloes, Machynlleth, and Welshpool (which see). The county is divided into nine hundreds, and 47 parishes. It sends five members to the House of Commons, viz. one for the county

MONTGOMERY.

and one for the town of Montgomery and its contributory boroughs. Registered electors for the county in 1839-40, 2942. In 1841 Montgomery had 13,650 inhabited houses, and 69,230 inhabitants, of whom 34,252 were males and 34,978 females. Sum expended for the relief of the poor, in 1839-40, £38,941.

MONTGOMERY, a parli. bor., market town, and par. of N. Wales, cap. co. of its own name, 20 m. S.W. Shrewsbury, and 146 m. W.N.W. London. Pop., in 1841, 1908. Though small, it is a clean, well-built town, in a hollow at the foot of a high hill. The guildhall stands on an eminence near the ruins of an ancient castle, close to which is the county jail, a modern stone building, well adapted for its purpose. The church, a cruciform structure, in the early English style, has a handsome tower, erected in 1816, and an exquisitely carved screen, and some curious monuments: the living is a rectory in the gift of the crown. The Calvinists and Wesleyan Methodists have also their respective places of worship; and there are two Sunday schools, and a small endowed school. No trade or manufacture is carried on in the town; and it deserves notice merely from its being the capital of a county, and a parliamentary borough. It was incorporated by Henry III. under a steward and 12 burgesses; who enjoyed, till the passing of the Reform Act, the privilege of sending one member to the House of Commons. This act, however, made Llanfyllin, Llanidloes, Machynlleth, Newtown, and Pool contributory boroughs with Montgomery in the election of the member. Registered electors for the entire district, in 1839-40, 1031, of whom only 116 belonged to Montgomery. The election for the county takes place here; and sessions are held alternately with Newtown. Markets on Tuesday: fairs, March 26th, first Tuesday in May, June 7th, September 4th, and November 14th.

Montgomery is very ancient: its castle was built prior to the Norman conquest, and from its size and strength, was frequently an object of contention during the wars between the English and Welsh. In 1254 it was in the possession of Roger Mortimer, from whom it passed to the crown. In the 15th century the stewardship of the town and castle was granted to the Herberts of Oherbury. The famous Lord Herbert, celebrated alike for his chivalry, wit, and learning, was born here in 1581. It is the birth-place also of the late Dr. Abraham Rees, the learned editor of the voluminous and valuable Cyclopædia which bears his name. (*Nicholson's Camb. Guide; Parli. Papers.*)

MONTGOMERY, county, N. Y., centrally situated, toward the E. part of the state and contains 356 sq. m. Watered by Mohawk river and its tributaries. The Erie canal passes through it on the S. side of the Mohawk, and the Schenectady railroad on the N. side. It contained in 1840, 36,806 neat cattle, 36,588 sheep, 30,108 swine; and produced 34,261 bushels of wheat, 40,868 of rye, 90,374 of Indian corn, 36,312 of buckwheat, 100,530 of barley, 422,415 of oats, 559,280 of potatoes, 51,601 pounds of sugar. It had 94 stores, two furnaces, eight fulling-mills, one woollen factory, three flouring-mills, 21 grist-mills, 67 saw-mills, 16 tanneries, six distilleries, two breweries; three academies, 396 students; 116 schools, 5555 scholars. Pop. 35,918. Capital, Ponda.

MONTGOMERY, county, Pa., situated in the S.E. part of the state, and contains 425 sq. m. Bounded S.W. by Schuylkill river, which also passes through its S. part. Drained by Perkiomen, Pennypack, and other creeks. On the Schuylkill are seven dams with short canals, which afford extensive water power. It contained in 1840, 31,652 neat cattle, 15,249 sheep, 32,707 swine; and produced 181,686 bushels of wheat, 275,069 of rye, 503,065 of Indian corn, 485,530 of buckwheat, 642,990 of oats, 230,230 of potatoes. It had 144 stores, 13 lumber yards, two fulling-mills, eight woollen factories, 26 flouring-mills, 100 grist-mills, 77 saw-mills, 19 powder-mills, nine paper-mills, 30 oil-mills, 23 tanneries, one distillery, six potteries, six printing offices, four weekly and two semi-weekly newspapers; 10 academies, 373 students; 72 schools, 4465 scholars. Pop. 47,941. Capital, Norristown.

MONTGOMERY, county, Md., situated toward the W. part of the state, and contains 576 sq. m. Bounded S.W. by Potomac river, N.E. by Patuxent river. Drained by tributaries of these rivers. It contained in 1840, 6836 neat cattle, 16,033 sheep, 19,839 swine; and produced 142,759 bushels of wheat, 27,704 of rye, 308,363 of Indian corn, 2638 of buckwheat, 225,168 of oats, 62,546 of potatoes, 1,088,412 pounds of tobacco. It had 25 stores, one woollen factory, one cotton factory with 760 spindles, one flouring-mill, 18 grist-mills, 16 saw-mills, one oil-mill, four tanneries; three academies, 173 students; 17 schools, 514 scholars. Pop.: whites, 8706; slaves, 5377; free coloured, 1313; total, 15,456. Capital, Rockville.

MONTGOMERY, county, Va., situated toward the S.W. part of the state, and contains 680 sq. m. Bounded W. by New river and drained by its branches, and by head waters of Station river. It contained in 1840, 9635 neat cattle,

13,439 sheep, 16,534 swine; and produced 106,258 bushels of wheat, 21,022 of rye, 208,885 of Indian corn, 2615 of buckwheat, 141,365 of oats, 18,071 of potatoes, 241,275 pounds of tobacco, 1000 of sugar. It had 11 stores, four flouring mills, 19 grist-mills, 19 saw-mills, eight tanneries, nine distilleries, two potteries; one academy, 40 students; 17 schools, 408 scholars. Pop.: whites, 5295; slaves, 1493; free coloured, 87; total, 7405. Capital, Christiansburg.

MONTGOMERY, county, N. C., situated toward the S.W. part of the state, and contains 500 sq. m. Watered by Yadkin river and its branches. It contained in 1840, 10,603 neat cattle, 8508 sheep, 18,034 swine; and produced 48,679 bushels of wheat, 1535 of rye, 255,496 of Indian corn, 19,359 of oats, 11,950 of potatoes, 200,567 pounds of tobacco, 2,332,292 of cotton. It had 15 stores, one cotton factory with 528 spindles, 13 flouring-mills, 48 grist-mills, 15 saw-mills, eight tanneries, 34 distilleries; 19 schools, 433 scholars. Pop.: whites, 8291; slaves, 2487; free coloured, 79; total, 10,780. Capital, Lawrenceville.

MONTGOMERY, county, Ga., situated toward the S.E. part of the state, and contains 1100 sq. m. Bounded S.W. by Little Ocmulgee river, N.E. by Great Ocmulgee river. Drained by Oconee river and its tributaries, and by Pen-dleton's creek. It contained in 1840, 6781 neat cattle, 1339 sheep, 6530 swine; and produced 1119 bushels of wheat, 22,213 of Indian corn, 4000 of potatoes, 18,280 pounds of cotton, 3615 of sugar. It had four grist-mills. Pop.: whites, 1279; slaves, 337; total, 1616. Capital, Mount Vernon.

MONTGOMERY, county, Ala., situated a little S.E. of the centre of the state, and contains 900 sq. m. Bounded N.W. by Alabama and Coosa rivers. Drained by the Tallapoosa river and its branches. It contained in 1840, 25,335 neat cattle, 9300 sheep, 54,406 swine; and produced 7907 bushels of wheat, 3059 of rye, 1,333,917 of Indian corn, 72,741 of oats, 87,314 of potatoes, 32,847 pounds of rice, 9306 of tobacco, 14,871,463 of cotton. It had two commission houses in foreign trade, 29 retail stores, one flouring-mill, eight grist-mills, five saw-mills, two tanneries, two printing-offices, two weekly newspapers; one college, 62 students; four academies, 513 students; 31 schools, 678 scholars. Pop.: whites, 8673; slaves, 15466; free coloured, 116; total, 24,574. Capital, Montgomery.

MONTGOMERY, county, Tenn., situated toward the N.W. part of the state, and contains 500 sq. m. Watered by Cumberland river and its branches. It contained in 1840, 17,711 neat cattle, 13,117 sheep, 32,768 swine; and produced 83,949 bushels of wheat, 2985 of rye, 910,000 of Indian corn, 225,527 of oats, 22,430 of potatoes, 2,549,984 pounds of tobacco, 4603 of cotton. It had 24 stores, six furnaces, three forges, five flouring-mills, 21 grist-mills, 20 saw-mills, seven tanneries, six distilleries; three academies, 127 students; 14 schools, 379 scholars. Pop.: whites, 9769; slaves, 7059; free coloured, 106; total, 16,927. Capital, Clarksville.

MONTGOMERY, county, Ky., situated centrally in the E. part of the state, and contains 260 sq. m. Drained by Red river and its tributaries, flowing into Kentucky river, and by branches of Licking river. It contained in 1840, 11,653 neat cattle, 16,189 sheep, 33,183 swine; and produced 48,191 bushels of wheat, 41,060 of rye, 735,698 of Indian corn, 60,140 of oats, 12,769 of potatoes, 64,212 pounds of sugar. It had 14 stores, 14 grist-mills, 11 saw-mills, one oil-mill, four tanneries, one distillery; 20 schools, 473 scholars. Pop.: whites, 6409; slaves, 2735; free coloured, 186; total, 9332. Capital, Mount Sterling.

MONTGOMERY, county, O., situated in the S.W. part of the state, and contains 480 sq. m. Watered by Miami river and its branches. It contained in 1840, 16,945 neat cattle, 20,631 sheep, 20,398 swine; and produced 355,938 bushels of wheat, 54,327 of rye, 814,707 of Indian corn, 3359 of buckwheat, 4798 of barley, 374,481 of oats, 34,068 of potatoes, 122,304 pounds of sugar. It had 130 stores, two lumber yards, three fulling-mills, five woollen factories, six cotton factories with 3530 spindles, 34 flouring-mills, 11 grist-mills, 56 saw-mills, two oil-mills, 12 tanneries, 30 distilleries, two breweries, two potteries, two printing-offices, two binderies, one weekly newspaper and one periodical; two academies, 62 students; 100 schools, 7122 scholars. Pop. 21,938. Capital, Dayton.

MONTGOMERY, county, Ia., situated N.W. of the centre of the state, and contains 504 sq. m. Drained by Sugar, Big and Little Racoon creeks. It contained in 1840, 12,703 neat cattle, 15,821 sheep, 35,711 swine; and produced 84,709 bushels of wheat, 3795 of rye, 993,785 of Indian corn, 1771 of buckwheat, 98,621 of oats, 25,650 of potatoes, 17,339 pounds of tobacco, 175,469 of sugar. It had 33 stores, one fulling-mill, 11 woollen factories, 12 flouring-mills, 19 grist-mills, 37 saw-mills, 10 oil-mills, 11 tanneries, eight distilleries, one pottery, two printing-offices, two weekly newspapers; one college, 100 students; two academies, 243 students; 29 schools, 636 scholars. Pop. 14,348. Capital, Crawfordville.

MONTGOMERY, Ill., situated a little S. of the centre of the

MONTICELLO.

state, and contains 684 sq. m. Drained by head branches of Sangamon river and Shoal creek. It contained in 1840, 7464 neat cattle, 7076 sheep, 13,517 swine; and produced 27,500 bushels of wheat, 1293 of rye, 3,552 of Indian corn, 1336 of buckwheat, 57,608 of oats, 9995 of potatoes, 5131 pounds of tobacco. It had nine stores, 25 grist-mills, 17 saw-mills, one oil-mill, two tanneries, three distilleries, one printing office, one weekly newspaper; one academy, 186 students; seven schools, 391 scholars. Pop. 4490. Capital, Hillsboro'.

MONTGOMERY, county, Mo., situated toward the E. part of the state, and contains 576 sq. m. Watered by Culver and Loutre creeks. Bounded S. by Missouri river. It contained in 1840, 4858 neat cattle, 3397 sheep, 9854 swine; and produced 12,717 bushels of wheat, 1149 of rye, 123,450 of Indian corn, 26,239 of oats, 74,34 of potatoes, 637,038 pounds of tobacco. It had 12 stores, three grist-mills, two saw-mills, two tanneries, one distillery; one academy, 28 students; 5 schools, 74 scholars. Pop. whites, 3524; slaves, 887; free coloured, 20; total, 4371. Capital, Dnyville.

MONTGOMERY, p. t., Orange co., 95 m. S.E.W. Albany, 268 m. W. N. Y. Watered by Wallkill river. It contains three churches, a Presbyterian, Dutch Reformed and Methodist; eight stores; one iron foundry, one grist-mill, one saw-mill; one academy, 61 students; nine schools, 440 scholars. Pop. 4100.

MONTGOMERY, t., Somerset co., N. J., 12 m. S.W. Somerville. Bounded S. by Millstone river, by branches of which it is drained. It has seven stores, one fulling-mill, one woolen-factory, three grist-mills, three saw-mills; seven schools, 919 scholars. Pop. 1469.

MONTGOMERY, t., Franklin co., Pa., 16 m. S.W. Chambersburg. Drained by Conococheague creek and its tributaries. It has 11 stores, one woolen factory, three flouring-mills, six grist-mills, 14 saw-mills, four tanneries, 10 distilleries, two potteries, one college, 64 students; one academy, 54 students; 91 schools, 795 scholars. Pop. 4300.

MONTGOMERY, t., Montgomery co., Pa., 20 m. N. Philadelphia. Drained by Wissahickon creek, and the W. branch of Nesquehanna creek. It contained three stores, one grist-mill, two saw-mills; two schools, 70 scholars. Pop. 1009.

MONTGOMERY, t., Franklin co., O. It contains in its W. part the city of Columbus, the capital of the state. It has a small territory, but is wealthy and populous. Exclusive of Columbus city, the Pop. is 1449.

MONTGOMERY, city, capital of Montgomery co., Ala., 320 m. N.E. Mobile, 119 m. S.E. Tusculum, 369 W. Situated on a high bluff, at the head of steamboat navigation on Alabama river. It contains a courthouse, jail, seven churches, a Presbyterian, Episcopal, Methodist, Baptist, a Methodist, Episcopal, Methodist Protestant, a Universalist, and a Roman Catholic; two academies; 30 stores, 309 dwellings and, (in 1843) 2850 inhabitants. There are shipped annually, 40,000 bales of cotton, weighing 500 pounds each. The merchandise sold amounts to \$200,000, annually. The Montgomery and West Point railroad is in operation 35 m. from Montgomery to Franklin. The city was laid out and began to be settled in 1817. The population according to the census of 1840, was 2199.

MONTICELLO, p. v., Thompson t., capital of Sullivan co., N. Y., 110 m. S.W. Albany, 294 W. Incorporated in 1830. It contains a courthouse and jail of wood, a county clerk's office of brick; two churches, a Presbyterian and Episcopal; seven stores, one grist-mill, two saw-mills, 80 dwellings, mostly of wood, and about 500 inhabitants.

MONTICELLO, p. v., capital of Jasper co., Ga., 35 m. N.N.W. Milledgeville, 643 W. It contains a court-house, jail; two churches, a Methodist and Baptist; a female academy; 19 stores, 60 dwellings and about 375 inhabitants.

MONTICELLO, p. v., capital of Jefferson co., Flor., 29 m. E.N.E. Tallahassee, 925 W. Situated four m. E. of Micanopy lake. It contains a courthouse, and a few stores and dwellings. Nett proceeds of the postoffice, \$533.

MONTICELLO, capital of Lawrence co., Miss., 85 m. S. Jackson, 1064 W. Situated on the W. side of Pearl river, and contains a court-house, jail and several stores and dwellings. Nett proceeds of the post-office, \$316.

MONTICELLO, p. v., capital of Wayne co., Ky., 110 m. S. Frankfort, 590 W. Situated on the N. side of Beaver branch of Cumberland river. It contains a courthouse, jail, several stores, and 143 inhabitants.

MONTICELLO, p. v., capital of White co., Ia., 73 m. N.N.W. Indianapolis, 639 W. Situated on the W. side of Tippecanoe river. It contains a courthouse, jail, and several stores and dwellings. Nett proceeds of the post-office, \$190.

MONTICELLO, p. v., capital of Platt co., Ill. Situated E. of Sangamon river, and contains a courthouse, and about 100 inhabitants.

MONTICELLO, p. v., capital of Lewis co., Mo., 145 m. N.E. Jefferson City, 912 W. Situated on the N.E. side of North Pabius river. It contains a courthouse, and several

MONTPELLIER.

ral stores and dwellings. Nett proceeds of the postoffice, \$370.

MONTILLA (an. *Montulia*), a town of Spain, in Andalusia, prov. Cordova, 19 m. S. by E. Cordova. Population, according to Milana, 12,800. It is well built, and has two parish churches, an orphan asylum, three hospitals, a royal school of Latin and rhetoric, and a boarding warehouse for wine. Its trade is considerable, chiefly with Cordova, both in manufactured goods and farm produce, particularly wine, horses, mules, and horned cattle, which, though small and ungainly in appearance, are very hardy and serviceable. An annual fair is held in September, and well attended.

MONTILUCON, a town of France, dep. Allier, cap. arrond. on the Cher, close to the canal De Berry, in a valley bordered by vine-clad hills. 36 m. W.S.W. Moulins, and 171 m. S. by E. Paris; lat. 49° 30' N., long. 2° 40' E. Pop., in 1831, ex. com., 4280. It was formerly fortified, and is well built and situated. A parish church and hospital are the only public buildings. It produces some coarse woollen and linen fabrics; and had a considerable trade in corn, wine, cheese, and cattle.

MONTMARTRE, a town of France, dep. Seine, only a few furlongs N. of Paris, on a conical hill of the same name, commanding an extensive view of the French metropolis, and its suburbs. Pop., in 1830, 6334. It is the favourite resort of the Parisians on Sundays and holidays, and contains several inns and other houses of entertainment, with some neat-looking villas and private residences. An asylum for 60 old men, a private lunatic establishment, and two schools, have been founded here, and it has oil-press manufactories, scagliola works, and woolen-mills, with mines of gypsum, which supply the whole of Paris with lime. In 1814 the hill was fortified by the Parisians, who defended it for a day against the allies.

MONTPELIER, p. v., capital of Washington co., and of the state of Vermont. The town contains 23 stores, one furnace, one fulling-mill, three grist-mills, five saw-mills, one paper-mill, six printing-offices, one distillery, two daily and six weekly newspapers, and one periodical; one academy, 191 students; 30 schools, 975 scholars. Pop. 3775. The village is situated in the S.W. part of the town, at the union of the branches of Onion or Winooki river. It is in lat. 44° 16' N., and long. 71° 32' W. Its site is a plain of moderate extent, surrounded by elevated hills. It is 16 m. north easterly from the geographical centre of the state, and is built on both sides of the river. The great road from Boston to Burlington, which passes through it, makes it a great thoroughfare; and, though this road passes through the most elevated portion of the Green mountains, along the margin of Onion or Winooki river, it passes over no high hills. The village contains a beautiful statehouse, a courthouse, jail, an academy, four churches, two Congregational, a Methodist, and Universalist (there is another Methodist and Friends' in the town), 15 stores, which sell goods annually to the amount of \$300,000, several mills and manufactories, and 1730 inhabitants. The statehouse is an honour to the place and to the state, built of granite, 73 feet wide in the centre, with two wings, each 20 feet, making the whole length 150 feet. It has a projecting portico in the centre, of six Grecian Doric columns, 6 feet in diameter and 35 feet high. The centre building is 100 feet deep and the wings 50 feet deep. The whole is surmounted by a dome, 100 feet high from the ground to the top. In the interior are rooms for various offices, and elegant halls for the senate and house of representatives. Its architecture is much admired.

MONTPELLIER (Lat. *Mons. Passerlanus*), a city of France, dep. Hérault, of which it is the cap., on the Lx, about 5 m. from the Mediterranean, and 77 m. W. by N. Marseilles; lat. 43° 36' 00" N., long. 3° 52' 45" E. Pop., in 1836, ex. com., 33,864. It is beautifully situated on the declivities of a low hill, commanding views of the Alps, the Pyrenees, the Cevennes, and the sea. It was formerly walled, and a place of considerable strength; but of its ancient fortifications there are now only a few gates, a tower, and some portions of the wall on the N.E. side of the city. It still, however, has, at one extremity, a citadel built by Louis XIII.; while at its other extremity is the *Place or Promenade de Peyrou*, one of the noblest public walks in Europe. This place is entered by a Doric arch, and ornamented with long lines of balustrades, covered ways, various sculptures, a bronze equestrian statue of Louis XIV., and numerous fountains, including a magnificent hexagonal *château d'eau* of Corinthian architecture. This, like the other public fountains of Montpellier, is supplied by an aqueduct about 84 m. in length, constructed in the middle of the last century; and which, for a distance of 800 metres, or more than half a mile, is raised on a double row of masonry arches, and, in point of elegance, rivals the boasted *Font du Gard*. Between the town and the ramparts of the citadel is the Esplanade, a fine open space planted with trees and ornamented with reservoirs, &c.; the boulevards are

MONTPELLIER.

rounding the town also afford good public walks; and in the outskirts are many newly-built and handsome terraces. The city itself is very ill laid out; its streets are narrow, steep, and winding, and its squares small and irregular; but its houses are generally good, and, according to Hugo and others, it is kept remarkably clean. The public buildings are quite unworthy so considerable a city. Of eight churches, none demands any particular notice; the cathedral is distinguished from the rest only by being larger and uglier; a singular looking porch, and a tower at three of the angles of the nave, are the principal external ornaments of this edifice. Adjacent to it is the school of medicine, occupying what was formerly the bishop's palace, a large building with several fine apartments. This school, founded by the Arabs driven from Spain in 1180, enjoys a high and well-deserved celebrity, as one of the best conducted establishments of its kind in France; and is all that now remains of the once famous university of Montpellier. It has a new and fine amphitheatre; an examination hall, in which is an antique bronze bust of Hippocrates; a council hall, with portraits of professors from the period of the 13th century, including also a portrait of Rabelais; a library, with 35,000 volumes, including many editions of the 15th century, and 600 valuable MSS. in different European and Asiatic languages; a pretty extensive anatomical museum, several spacious laboratories, &c. The general hospital has accommodation for upward of 600 patients; and there are large and well-conducted lunatic and lying-in hospitals. The botanic garden of Montpellier, which dates from the reign of Henri IV., was the first established in France, and, though small, comprises 8000 species of plants: it is one of the four principal and best arranged botanic gardens in the kingdom, which distinction it owes to its having been the scene of the labours of the late celebrated M. de Candolle. But its greatest interest to Englishmen is derived from its possessing, in one of its most sequestered parts, the tomb of Narcissus, the daughter-in-law of Young, whose funeral the poet has vividly described in "Night the Third."¹ One of the principal attractions in Montpellier is the museum, founded, in 1825, by the Baron Fabre, a native of the town. It occupies four spacious and well-lighted halls, and comprises collections of paintings, engravings, statues, medals, and other objects of art, a library of 15,000 volumes, &c., the whole estimated to be worth 2,900,000 francs. The theatre, built in 1785, is well planned, and capable of accommodating 3000 persons; it is, however, little frequented, and the pit, which is without seats, usually serves as an exchange. The palace of justice, the town-hall, exchange, prefecture, admiralty, barracks, several prisons, including a central prison, with workshops, the Calvinist chapel, synagogue, &c., are the remaining principal buildings, but none deserves especial notice. There are several very good hotels; one of which is said by Ingils to be the best in the S. of France.

Montpellier is a bishop's see, the capital of the ninth military division of the kingdom, and the seat of a royal court for the departments of Aude, Aveyron, Hérault, and Pyrénées Orientales, a court of original jurisdiction, a tribunal, and a chamber of commerce, boards of taxation, customs, artillery, and engineering, a university, academy, and a royal college. It has schools of veterinary medicine, engineering, drawing, architecture, geometry, and music; societies of agriculture, arts and sciences, medicine, and archaeology, a government loan-bank; Protestant Bible societies, a prison society; and numerous other charitable associations; several asylums, &c. It has manufactures of woolen cloths, cotton handkerchiefs, muslins, table and other linens, hats, silk, cotton, and woolen hosiery; with cotton-thread factories, distilleries, sugar refineries, breweries, chemical works, &c. It is connected with its port, Cette, 17 m. S.W., by a railway, and has a brisk trade with it, and with other towns and villages, exporting large quantities of fresh and dried fruits, wool, and other kinds of rural produce, in addition to its manufactured products. It was formerly a place of great resort for English invalids, on account of the alleged salubrity of its climate.

"About twenty-five years ago," says Ingils, "300 English families were sometimes resident here; but since fashion, caprice, or experiment, have sent consumptive patients to die in Madeira or Naples, instead of Montpellier, that number has been reduced to 40 or 50 families, who, indeed, resort thither less for the sake of health than economy. It is undeniable, however, that the air of Montpellier (however little that bustling city may resemble the retired spot pictured by the imagination) is dry and salubrious, possessing the mildness of a southern climate, and yet having its heat tempered by the sea-breeze. It is also a cheap residence, the more so from the diminished influx of strangers. Two well furnished rooms may be obtained for about 10s. a week;

MONTREAL.

and living is not expensive. Beef and mutton fetch from 5d. to 6d. per lb., fish, of about 30 different sorts, may be had at prices varying from 6 to 30 sous: fruit and vegetables are both cheap and good; wine ranges between one and two francs the bottle."

Montpellier has given birth to many distinguished persons, among whom may be specified Chaptal the chemist, Cambaceres, Daru the historian, &c. It appears to have been founded in the 8th century, and was for a while dependent on the kings of Majorca. It was acquired by Philip of Valois in 1349, but was not finally annexed to France till the reign of Charles VI. The Calvinists got possession of it under Henry III., and held it till 1633, when it was taken after a long siege by Louis XIII. (*Ingils's Swiss, and France*, p. 207; *Frossard, Tableau Pitt. de Nîmes et de ses Environs*, il. 34-63; *Hugo, art. Hérault; Guide du Voyageur en France*.)

MONTREAL, a town and river port of British America, and the second city and the chief seat of the commerce of Lower Canada; on the S. side of the island of Montreal, in the St. Lawrence, 142 m. in a direct line S.W. Quebec; lat. 45° 30' W., long. 73° 25' N. Population with its suburbs, in 1840, 37,297. Its site is not so commanding as that of Quebec, but it is in every other respect superior to that city. It is not so crowded; and some even of its older streets are of tolerable breadth. Montreal is divided into the Upper and the Lower town; the difference in their elevation is but slight, but the former being the more modern is the handsomer division. It has several suburbs, including which it stretches along the river for 2 m. from N. to S., and has, for some distance, a nearly equal breadth inland. The battlemented wall, with which it was formerly surrounded, has fallen into decay, and it is now entirely open, the wooded heights around being covered with villas and pleasure grounds. In the lower town, Paul-street, the chief commercial thoroughfare, extends parallel with the river the whole length of the city; and in the upper town several streets proceed in the same direction, communicating with Paul-street by cross streets. In the upper town and suburbs, which are mostly inhabited by the principal merchants, many of the houses are handsomely and solidly built in the modern style; but in the lower town they are principally of a gloomy looking gray stone, with dark iron window-shutters and tiled roofs. Along the bank of the river is an extensive line of quays and warehouses. Many of the houses in the suburbs are built of wood, but there are no wooden buildings within the space once encompassed by the walls; and this city and Quebec have more of the aspect of old European towns than any other towns in America.

The most remarkable public edifice is the Roman Catholic cathedral, opened in 1839, and superior to any other church in British America. It is of Gothic architecture, 255 1/2 ft. in length by 134 ft. in breadth. It is faced with stone, and roofed with tin, and has six towers, of which the three belonging to the main front are 230 ft. in height. On the roof is a promenade, 76 ft. in length by 30 in breadth, elevated 130 ft. The principal window is 64 ft. in height, and 32 in breadth. The interior is capable of accommodating from 10,000 to 12,000 persons, who may disperse by numerous outlets in five or six minutes. It comprises seven chapels, and nine spacious aisles. There are several other Roman Catholic churches, mostly belonging to the order of St. Sulpice; to the members of which Montreal chiefly owed its foundation, and who still hold the seigniorship of the island upon which it stands.

The seminary of St. Sulpice, a large and commodious building adjoining the cathedral, occupies three sides of an oblong area, 132 ft. in length by 29 deep, and is surrounded by spacious gardens. A handsome additional building, 210 ft. by 45 ft., has been lately erected, at an expense of £10,000. In these establishments, students in most of the higher branches of learning are taught at very moderate charges. The principal English church is a handsome building, in the Grecian style, surmounted by a high and beautiful spire. It has also a Scotch kirk, an American Protestant church, and chapels belonging to the Methodists and Scotch dissenters. The Montreal general hospital, erected in 1821-3 by voluntary subscription, a large and well-built edifice, is said to be one of the best regulated institutions of the kind in America. A large conventual structure, the *Hôtel-Dieu*, occupied by a superior-matron and 36 nuns, is appropriated to the reception of the sick and indigent; and the convent of the Gray Sisters partly serves as an asylum for the aged and infirm, the insane, foundlings, &c.

The *Sœurs Noires* have an extensive convent, founded 1650; its inmates consist of a superior and 60 nuns, whose duties are directed to the education of young girls. The courthouse and prison are substantial buildings, occupying the site of the former college of the Jesuits. The government-house, bank, barracks, ordnance-office, and four market-houses, are among the remaining principal buildings. In one of the squares is a colossal statue of Nelson, placed on

¹ It is stated in Johnson's (Crosby's) *Life of Young* that Narcissus, or Mrs. Temple, died at Lyons, in her way to Nice; but she, in fact, died at Montpellier.

MONTROSE.

a Doric column, the pedestal of which has bas-reliefs representing his principal actions. Besides the educational establishments noticed above, Montrose has a college, with a principal and four professors, a royal grammar school, parochial, union, national, Sunday, and other public schools; and many good private French and English seminaries. The university of McGill college, endowed by a citizen of Montreal, in 1814, with a valuable estate, and £10,000 in money, and chartered in 1821, is, we believe, not yet opened; but it is to be conducted on a liberal and enlarged scale. Montrose has a penitentiary, a house of industry, a savings' bank, a natural history society, a mechanics institution, a central auxiliary society for promoting education and industry, Bible and tract, agricultural and horticultural societies; several public libraries, an excellent news-room, &c. Several newspapers and other periodical-publications issue from the presses of the town. According to Mr. McGregor, there is a greater spirit of improvement in this city than in Quebec. There is much activity observable among all classes connected with trade. The position of Montreal at the head of the ship navigation of the St. Lawrence, and near the confluence of that river with the Ottawa, as well as its situation with respect to the U. States, necessarily make it one of the greatest emporiums of America. (*Brit. America*, ii., 300.)

The harbour, though not large, is secure, and vessels drawing 15 ft. water may lie close to the shore. Its general depth of water is from 3 to 4 fathoms. Its chief disadvantage consists in the rapid of St. Mary's, about 1 m. below, which vessels often find it difficult to stem. To obviate the obstructions in the navigation above Montreal, the Lachine canal, 9 m. long, 90 ft. wide, and 5 ft. deep, was undertaken in 1821, and completed at an expense of £130,000. The communication with the opposite sides of the river is carried on by several steam and other vessels; and, during the summer, a regular steamboat communication is kept up with Quebec. At this season, vast rafts of timber come down, and pass the city for Quebec; and scows, bateaux of about six tons, and Durham boats, bring to Montreal the produce of Upper Canada. Neither is the trade of Montreal suspended in winter, like that of Quebec. Thousands of sledges may then be seen coming in from all directions with agricultural produce, frozen carcasses of beef and pork, firewood, and other articles. Montrose is the centre of the commerce between Canada and the U. States, carried on by Lake Champlain and the Hudson; and not only is it the depot of all the adjacent country, but most of the business done in Quebec, is carried on by branches from the Montreal houses. In 1833, 98 ships, of the aggregate burden of 93,299 tons, entered, and 99 ships, burden 21,901 tons, left the port. Formerly this city was the head quarters of the fur trade, but its interest in it has greatly declined. It has, however, cast-iron foundries; distilleries; breweries; soap, candle, and tobacco manufactories; several ship-building establishments; and machinery for steam-engines. Various articles of hardware, linseed oil, floor-cloth, &c., are made in the town. The markets are abundantly supplied with good butchers' meat, fish, poultry, fruit, vegetables, &c. Mr. McGregor says that better accommodations are to be found here than in Quebec; and the society is as good. About three fourths of the pop. are of French descent; the remainder, consisting principally of emigrants from the U. Kingdom, Americans, Iroquois Indians. Montreal, originally called Villemarie, was taken from the French, in 1760. (*McGregor's British America*, ii., 300-317; *Encyc. of Geog.*, Amer. ed.; *Parl. Reports*.)

MONTROSE, a royal and parl. bor. and seaport town of Scotland, co. Forfar, at the mouth of the B. Esk, on the N. side of the river, on a projecting tongue of land, between the German ocean, on the E., and the basin of Montrose, on the W. 69 m. N.N.E. Edinburgh; lat. 56° 28' 10" N., long. 50° 27' 15" W. Pop., in 1810, 7574; in 1831, 12,055; but, including the suburbs of Inch (a small island formed by the river) and Ferryden, 12,853, exclusive of sailors, who amount to between 600 and 700. In 1841 the population was 13,532.

The town consists of one wide and regular street extending from N. to S. upwards of 4 m., with numerous closes and subsidiary streets. Many of the houses present their gables to the street, as in the Netherlands. It is a handsome town, well paved, lighted with gas, and supplied with water conveyed in pipes, from a distance of 3 m. The public buildings are the town-hall, jail, lunatic asylum, academy, trades' school, infirmary, and house of refuge, parish church, with a handsome steeple 200 ft. high. St. John's, a newly erected *quoad sacra* church, two episcopal chapels, and six dissenting chapels, of which two belong to the Associate Synod and the others to the Methodists, Baptists, Glasites, and Independents. The parish church is collegiate; and one of the two ministers is paid by a tax of 2½ per cent. on the rental of the borough. The narrow downs, principally *links*, between the town and the sea, are much resorted to by the inhabitants for golf-playing; a game which is in great favour here and in various other places in Scotland.

The most important public structures connected with Montrose is the suspension bridge, completed in 1823, over the principal branch of the South Esk, and uniting the town with the Inch. The distance between the towers of the extremities of the bridge is 432 ft.; the height of each tower is 71 ft.; the width of the bridge is 26 ft. within the suspending rods. The whole cost has been about £25,000; the postage levied amounts to about £1500 a year. The extent of the Inch is less than 2 m., and the branch of the river on the opposite side is crossed by a drawbridge; so that the communication across the two channels of the South Esk is as perfect as possible.

Montrose has long been celebrated for its schools. It was the first place, in Scotland, in which Greek was taught (*McCr's Life of Knox*, vol. i., App. n. C.); and it has preserved the character which it so dearly (1534) attained. It has at present about 30 schools, and above 1600 pupils, being about a tenth part of the entire population. Of the schools, two are entirely free; one, founded in 1816, by a Mr. White, educates 100 poor children; and another, founded in 1822, by Miss Straton, educates 42 boys and as many girls. Five schools are partially endowed; the others are voluntary and unendowed seminaries. The Montrose academy, established in 1815, is an excellent seminary. Andrew Melville, who was born in the neighbourhood, was educated at the grammar-school of Montrose. George Wishart, who afterwards suffered martyrdom, was also educated here, and subsequently held the office of teacher in the same school. The celebrated Marquis of Montrose, who made so distinguished a figure in the civil wars in the 17th century, was a native of the town. Archbishop Leighton was descended of a family whose seat was within 2 m. of the borough. There are various subscription libraries, one of which, founded in 1783, has above 8000 vols.; a mechanics' institute, which has occasional lectures on different branches of science; a Natural History and Antiquarian society, to which Lord Panmure has been a liberal benefactor; a Horticultural society; various literary and philosophical societies, and two weekly newspapers.

In addition to the funds bequeathed for the support of schools, there are no less than 12 different bequests, amounting in the aggregate to about £11,000, left for the support of the poor, or for particular classes among them. Poor rates, however, were introduced in 1836; the average amount of which is about £2900 a year. There is, also, a hospital fund, consisting of certain lands and tithes granted to the town by James VI., in 1587, amounting to about £170 yearly. The lunatic asylum, a splendid building, in an airy and healthy situation, was founded in 1779; but, having been greatly enlarged and improved, it was incorporated by royal charter in 1811. It has, at present (1841), 77 inmates. The infirmary, a handsome new building, has attached to it a fever hospital, and a dispensary. A large number of patients in the infirmary and free hospital about 21: do. of out-door or dispensary patients, who receive advice and medicines, about 580. A house of refuge was established and endowed in 1838, by a benevolent citizen, William Dorward, Esq., at an expense of £10,000. It is intended to shelter and provide for old and destitute persons of both sexes, and for destitute children. The building is handsome and commodious, and the institution, which is said to be admirably conducted, has at present about 70 inmates: the children are educated at the different charity schools. There is, also, a society for the relief of the destitute sick.

The principal business in Montrose is flax-spinning and weaving. The town and its immediate vicinity has at present (1841) six flax-spinning mills; besides one at Logie and one at Craigo, both connected with the town: it has, also, a power-loom factory, and about 500 hand-loom weavers, three fourths of which are in factories, employed on the fine and heavier linen fabrics, including sheetings, dowlas, mill-cloth, and bagging. There is also a bleach-field at Craigo, and another at Logie.

The hands employed may be estimated as under: viz. employed in spinning, 1650; in heckling, 950; in bleaching, 300; in weaving and manufacturing, 1400; total, 3300. Of the above, 300 spinners and 300 bleachers are employed at the Craigo and Logie works, and the remaining 3000 in Montrose. In 1840 about 53,000 pieces of cloth were woven in Montrose, and 26,000 in the vicinity, making together 79,000; the quantity produced in 1835 did not exceed 47,000 pieces.

Montrose has also a small soap factory, one of starch, two rope and sail works, and a machine factory. Ship-building is carried on to a considerable extent, and at present five ships are on the stocks. There is a patent slip for repairing ships. There are five breweries, two tanneries, two candle-works, and a foundry; and a meal and flour-mill driven by steam.

The harbour is one of the best on the E. coast of Scotland. The channel of the river is narrow; but, as it has 15 or 18 ft. water over the bar at low ebb, middling size merchant men may run in at any time of the tide and, at high water,

MONTSEERAT.

It is accessible to the largest ships. A dock is now in the course of being excavated below the present harbour, which will, it is supposed, cost about £50,000; but it may be doubted whether the benefit it will confer on the shipping of the port will be sufficient to counterbalance the injury arising from the increase of the harbour dues it has occasioned. The bank, immediately W. from the town, has a fine appearance on the map, but is of little use. It is nearly circular, being about 3 m. in diameter: it is shallow, and, excepting the channel of the river, dries at low water. Vessels of 50 or 60 tons, however, reach old Montserrat, at the other end of the basin. The entrance to the harbour has, on its N. side, two lighthouses, with fixed lights.

Montserrat is a customhouse station; the amount of shipping within the district being 187 ships, of the aggregate burden of 18,900 tons, of which 115 ships, measuring 14,500 tons, belong to the town. Customs revenue, in 1840, £23,484. The trade of the port has more than doubled within the last 15 years; the shore dues, which were under £1000 in 1825, having produced £3078 in 1838: they are now still greater, but the rates have been augmented. The chief imports from foreign countries are flax, hemp, and timber. In 1840, there were imported at Montserrat 4490 tons flax and hemp, 30,604 tons coal, 7400 loads timber, and 11,674 barrels raw herrings; five thirds of the latter being for exportation to London after being cured. During the same year, there were exported, exclusive of manufactures, sent almost wholly to London, 25,259 qrs. of wheat, barley, &c., 1400 boxes salmon, 4647 barrels smoked haddocks, 3275 barrels pork, and 9980 bolts potatoes (5 cwt. each). Previously to 1838, three or four ships sailed annually to the Greenland whale fishery, but this branch of trade has been abandoned. The majority of the ships belonging to the port are now engaged in the Baltic trade, in which it is believed that about 45 vessels, of the average burden of about 175 tons, are at present employed; whereas, in 1830, only about 10 vessels, of 90 tons each, belonging to this port, were engaged in the trade! The steamers that ply between Leith and the N. of Scotland regularly call at Usan, 3 m. S. of Montserrat; and a steamer, belonging to the town, plies twice a week to Leith. There are four banks in the town, a savings' bank, and an insurance society.

Montserrat was created a royal bor. by David I. in the 12th century. It was here that John Balliol, in 1296, surrendered the Scotch crown to Edward I. Montrose was the first port made by the French fleet, in 1715, with the Pretender on board; and the same personage sailed from it in February, 1716, for France.

The corp. consists of a provost, 3 bailies, and 15 councillors. Municipal revenue, about £3000 a year. Montrose unites with Arbuthnot, Brechin, Forfar, and Bervie in sending a member to the House of Commons. Registered electors, in 1840-41, 373. (*Boundary Returns; Factory Reports, 1839; New Statistical Account of Scotland, & Forfarshire, p. 171-200; and valuable Private Information.*)

MONTROSE, p. b., Bridgewater L. capital of Stasquehanna co., Pa., 175 m. N.N.E. Harrisburg, 265 W. Situated on elevated ground and contains a courthouse, jail, four churches, a Presbyterian, Episcopal, Methodist and Baptist, 14 stores, three printing offices, one weekly newspaper; one academy, 110 students; three schools, 138 scholars; 100 dwellings, and 628 inhabitants. It was founded in 1811, and incorporated as a borough in 1824.

MONTSEERAT, one of the British W. Indian islands, a dependency on Antigua, from which it is distant S.W. 37 m.; in lat. 16° 45' N., long. 61° 6' W. It is about 12 m. in length, and 5 m. in its greatest breadth. Area, estimated at about 30,000 acres. Pop., in 1838, about 7600, of whom nearly six sevenths were blacks. Montserrat consists of a range of steep abrupt mountains, or rather, perhaps, of one lofty mountain, 2960 ft. high, the summit of which has been broken into a variety of deep precipices and chasms. The upper parts are altogether barren; but the base of the mountain slopes off to the N. by a succession of gentle ridges, admitting of cultivation; and the lower parts are well watered, and very productive. With the exception of the town of Plymouth, unfavourably situated near the S.W. beach, with an amphitheatre of hills in its rear, intercepting the sea breeze, the island enjoys a comparatively high character for salubrity. (*Tobacco's Report on the Sick-ness, &c., in the W. India, p. 35.*) In 1838, 13,442 cwts. sugar, 39,460 gall. rum, and 18,336 gall. molasses, were imported from Montserrat into the U. Kingdom. The total value of the exports and imports amounted to about £3500 each. Amount awarded to the colonial proprietors for the manumission of the slaves, £103,538 18s.; the average value of a slave from 1833 to 1831, having been about £37. This island was discovered in 1493, by Columbus, who gave it its present name. It was colonized by the English in 1632. The French took it in 1683, but restored it at the peace of Utrecht. (*Parl. Papers, &c.*)

MONTVILLE, p. t., Walde co., Me., 99 m. E.N.E. Au-

MOORFIELD.

gusta, 623 W. Drained by head branches of Sheepscot river. Incorporated in 1807. It has four stores, two grist-mills, five saw-mills; 15 schools, 839 scholars. Pop. 2153.

MONTVILLE, t., New-London co., Ct., 36 m. S.E. Hartford, 360 W. Bounded E. by Thames river, and drained by its branches, which afford water-power. It contains five churches, two Congregational, two Baptist, and one Mohegan Indian, on a reservation of 2700 acres of land, reserved to the remnant of this friendly tribe, who have a school-house as well as a church. The men mostly follow the whaling business, and are only occasionally here. There are in the town four stores, three fulling-mills, five woolen factories, four grist-mills, five saw-mills, one oil-mill; 11 schools, 433 scholars. Pop. 1900.

MONZA (an. *Medetia*), a town of Austrian Italy, deleg. Milan, on the Lambro, here crossed by three stone bridges, 9 m. N.N.E. Milan. Population, in 1837, 8378. It is regularly laid out, paved with round stones, and tolerably well built. It is interesting from having been the seat of government during the time of the Lombard kingdom; and the iron crown of Lombardy is kept, with other relics, in its cathedral, an edifice supposed to date from the 7th century. The former residence of the Lombard kings is said to have been the building now occupied by the court of justice. Monza has a royal palace, with fine grounds, greatly embellished by Prince Eugene Beauharnois, and which is the usual summer residence of the Austrian viceroy; a gymnasium; two hospitals; a theatre; and manufactures of silk and cotton stuffs, shawls, hats, and leather. (*Dict. Geog.; Conder's Italy, l. 347-8.*)

MOOREB, p. t., Clinton co., N. Y., 18 m. N. by W. Plattsburg, 198 m. N. Albany, 573 W. Watered by Chazy and English rivers, the latter flowing into Canada. It contains a Congregational and Methodist church, five stores, two grist-mills, 25 saw-mills, two tanneries; 10 schools, 259 scholars. Pop. 1703.

MOOLTAN, or MOULTAN, a city of the Punjab, probably the *Mull* of Alexander's historians, cap. prov. of same name, on the Chinaub or Acesines, 190 m. S.W. Lahore. Lat. 30° 9' N.; long. 71° 7' E. Population about 60,000, one third of whom may be Hindoos; the rest are Mohammedans, the Beltes being confined to the garrison, which does not exceed 500 men. (*Burnes's Bokhara, &c., l. 95.*) The city is upwards of three miles in circumference, surrounded by a dilapidated wall, and overlooked on the N. by a fortress of some strength. A considerable portion of the two evidently stands on the *debris* of more ancient buildings. The houses are of burnt brick, with flat roofs; they sometimes rise to the height of six stories, so that the narrow streets are dark and gloomy. The fortress of Mooltan is an irregular hexagon, with a wall of burnt brick, 40 feet high on the outside, and flanked with about 30 towers. In its interior are numerous houses, now uninhabited and falling into ruin, several mosques, and a Hindoo temple of high antiquity. Mooltan has several elegant and highly venerated tombs. Its inhabitants are principally engaged in weaving and dyeing cotton cloths, and silks of a somewhat coarser texture than those of Bahawalpore, but which are largely exported into the adjacent countries. Many of the fabrics of Mooltan are, as of old, of a purple colour, and interwoven with gold. This city was formerly frequented by a great number of pilgrims, and afforded immense plunder to the Mohammedans in 712. It was captured by Mahmood, of Ghiznee, in 1010; by Mahmood Ghori, in 1176; by Timour, in 1398; and by Runjeet Singh, in 1818, since which it has belonged to the dominion of Lahore. (*Burnes's Bokhara, l. 95-100; Hamilton's E. I. Gaz.*)

MOON, p. t., Allegheny co., Pa. Bounded N.E. by Ohio river. It contains Middleton village, nine miles below Pittsburg, and has four stores, two flouring-mills, two grist-mills, five saw-mills, two tanneries; seven schools, 245 scholars. Pop. 1381.

MOORE county, N. C. Situated a little S.W. of the centre of the state, and contains 749 sq. m. Watered by Deep river and its branches, and by sources of Lumber river. It contained in 1840, 3460 neat cattle, 5430 sheep, 6570 swine; and produced 15,643 bushels of wheat, 4195 of rye, 30,285 of Indian corn, 17,241 of oats, 30,194 of potatoes, 750,640 pounds of cotton. It had seven stores, four flouring-mills, 57 grist-mills, 14 saw-mills, three tanneries, three distilleries; 11 schools, 274 scholars. Pop.: whites, 6443; slaves, 1472; free coloured, 73; total, 7988. Capital, Carthage.

MOORE, t., Northampton co., Pa. Drained by head waters of Hockendocque and Manokissy creeks. It contains four stores, two fulling-mills, five grist-mills, five saw-mills, three tanneries, one distillery; four schools, 199 scholars. Pop. 3399.

MOORFIELD, p. v., capital of Hardy co., Va., 178 m. N.W. Richmond, 139 W. Situated on the E. side of the S. branch of Potomac river, at its junction of the S. fork.

MOORSHEDABAD.

It is one of the most fertile valleys in the state, and contains a courthouse, jail, a church, free to all denominations, five stores, two flouring-mills, two carding and fulling mills, 60 dwellings and about 400 inhabitants.

MOORSHEDABAD, a large city of British India, presid. and prov. Bengal, on the Bhagirathi, or most sacred branch of the Ganges, 115 m. N. Calcutta. Lat. $24^{\circ} 11' N.$; long. $89^{\circ} 15' E.$ Pop. estimated by Hamilton at 163,000. In point of appearance Moorshedabad cannot compare with either of the other great cities of Bengal, but it is not so mean as has been sometimes represented. The houses are principally of mud and straw; the city extends for eight miles along both banks of the river, and a number of brick or chunamed houses are interspersed among the rest, with terraces, small verandahs, flat roofs, &c., "on which you may see the owners, in their Moorish dresses, smoking their hookahs, playing chess, or walking sedately in small parties." A great many small mosques are scattered throughout the city; but a large and fine looking European residence, erected by the British government for the residence of the Bengal nabob, is the only public building worth notice. On the *moetie jheel*, a pool left by a former winding of the river, are the remains of the palace, &c., built by Aliserdi Khan, in the last century, partly with materials from the ruins of Gour. Within the gateway by which the grounds are entered, is a handsome mosque of fine stone, which the zealous frequenters have concealed with thick layers of whitewash. What were formerly gardens are now mere naked fields. Only one fragment of the palace exists, but this is an elegant ruin, consisting of four arches supported by five columns, the whole of beautifully polished black marble.

Moorshedabad is considered unhealthy from the neglected state of the sewers, the closeness and filthiness of the streets, and the rank jungle intermingled with the huts and houses; and pestilential diseases have often raged here with much violence. It is also exposed to the attacks of dacoits and other plunderers, never having been fortified except by an occasional rampart during the Mahratta invasion in the last century. It is the head quarters of one of the six courts of circuit under the Bengal presid.; the seat of a zillah court; the residence of the district collector and other British functionaries, and of the nabob of Bengal; and has a British college, founded in 1826, and endowed with an income of 16,500 rupees a year.

Moorshedabad became the capital of Bengal in 1704, and continued to be the seat of government till the conquest of Bengal by the British in 1756. It was then virtually superseded by Calcutta, to which the revenue-board, collector-general, &c., were transferred in 1751. (*Hamilton's E. I. Gazetteer*, Mod. Trav., ix., 145-151.)

MOOSEHEAD, lake, Me., is 40 m. long and from 10 to 15 broad, and contains 100,000 acres. Its outlet constitutes the E. branch of Kennebec river.

MOOSEHILL LOCK, mountain, N. H., is a lofty eminence in the S.E. part of Benton, on the border of Woodstock, 14 m. E. of Haverhill. It is one of the highest mountains in New-England. The altitude of the N. peak is 4636 feet, and of the S. peak 4536 feet above tide water. It received its name from the moose which formerly inhabited it. Its summit is a bare mass of granite rock, on parts of which snow is found in every month of the year except July. Baker's river rises on its E. side.

MORADABAD, a town and distr. of British India, prov. Delhi. The town, on the Ramganga, 105 m. E. by N. Delhi, is one of the most populous and flourishing seats of commerce in the upper provinces. It has some good streets, but no public edifice of any importance. The district, or collectorate, is included between the 28th and 30th degrees of N. lat., and $77^{\circ} 40'$ and $79^{\circ} E.$ long. Area, 5800 sq. m. Pop. probably 1,500,000. It is well watered, and extensive tracts are very fertile, though a good deal of it is waste. Sugar, cotton, and wheat are the chief products; the latter is almost wholly exported, the food of the population consisting principally of jowaree, bajree, &c. At least one fifth part of the land is held rent-free. Total land revenue, (1892-30), 985,110 rupees. (*Parl. Revenue Report*, 1832; *Hamilton's E. I. Gazetteer*.)

MORAT (Germ. *Murtten*), a small town of Switzerland, cant. Freiburg, on the S.E. bank of the lake of the same name, and on the high road between Bern and Lausanne, 14 m. W. by S. the former city. Population with its suburbs, 1598. It is partially walled round; and has an ancient castle, now the residence of the *oberamman*, a hospital, and an orphan asylum, a Protestant college, a public library, superior, inferior, and commercial schools, and a brisk transit and general trade. The circumstance of several Roman antiquities having been discovered here, has led to the supposition that Morat was anciently one of the suburbs of *Aventicum* (now Avenche). This otherwise insignificant town, owes its celebrity to the great battle fought under its walls on the 28d of June, 1476, in which

MORAVIA.

the Swiss totally defeated the invading army of Charles the Bold, Duke of Burgundy.

Morav! the proud, the patriot field! where men
May gaze on glancing trophies of the slain,
Nor blush for those who conquer'd on that plain.
Here Burgundy bequeath'd his tombless host,
A bonny long through ages to remain;
Thoumstee their monument.

Chas. Hunt.

The loss of the Burgundians was immense; as many as 15,000 soldiers having, it is said, been left on the field, exclusive of those drowned in the lake. The bones of the slain were afterwards collected, in memory of the battle, in a square building, called an ossuary. This singular monument, after standing for more than 300 years, was destroyed in 1798, by the soldiers from Burgundy, in the French army. But though nothing could surpass the gallantry and devotion displayed by the Swiss on the occasion, it is pretty certain that the defeat of Charles at Morat, as well as his previous defeat at Granson, was owing quite as much to his rashness and folly, as to the bravery of his enemies. The principal strength of the duke's army consisted in its cavalry; and yet, on both occasions, he engaged in battles where they could not act. (*L'Art de servir les Dames*, part. ii., tom. ii., p. 98.)

MORAVIA (Germ. *Mähren*), an important prov. of the Austrian empire, which, including Austrian Silesia, incorporated with it since 1763, extends between lat. $49^{\circ} 40'$ and $50^{\circ} 25' N.$, and the 15th and 19th degs. of E. long., having N. Prussian Silesia, E. and S.E. Galicia and Hungary, & the latter country and Austria, and W. and N.W. Bohemia. It is of a rhomboidal shape; greatest length about 185 m.; average breadth, 55 m. Area, about 10,500 sq. m. Pop. in 1838, 2,143,052. In the N. part of the province is a mountainous ridge of no great elevation, stretching W.N.W. and E.S.E., between the Sudeten, bound on the W. and the Jablanka mountains, a branch of the Carpathians on the E., dividing the waters that flow N. into the Oder and the Baltic, on the one hand, from those that flow S. into the Mediterranean on the other. The E. and W. frontiers of the province are also defended by mountain ridges. Excepting in the N., the country is mostly level, or merely undulating, with a gentle slope to the S.; nearly all its great rivers, including the Morava, by which it is intersected from N. to S., and whence, also, it derives its name, the Iglawa, Thayer, &c., flowing in that direction. The Oder has its sources in the N. ridge. Being sheltered on the N., E., and W., by mountain ranges, and lying in general only from 500 to 1000 feet above the level of the sea, Moravia enjoys a milder climate than most countries in the same lat. The mean temperature of the year at Olmutz is about 49° Fah. The wind is mostly from the S. and the atmosphere clear. A large proportion of the soil is very fertile, and if advantageous markets could be found, large quantities of corn might be raised for exportation; but, in consequence of the want of the latter, the attention of the inhabitants has been of late devoted more to manufactures than to agriculture, and Moravia is no longer a country whence supplies of corn might be drawn, at a short notice, on a very large scale.

An estate of mean size comprises from 850 to 1400 acres of arable land, from 140 to 490 acres of meadow land, and 1000 to 2500 or more of wood, according to the situation. The estates conferring the right of representation in the assembly, and which are only held by knights or nobles, are of all sizes from a few acres to many square miles in extent. These estates can, strictly speaking, be also held by a commoner, but only on his paying a portion of the taxes twice over, and on his renouncing the right to all kinds of patronage and judicial authority. The census of mean size may be estimated at two thirds of the whole; but about 30 estates exceed 32 English square miles in extent. In purchasing land, a profit of from 4 to 4½ per cent. per annum is generally looked for. The size of the peasant's holdings is very various; in the plains it may be about 28 English acres; but in the hilly parts, where the population is thinner and the soil less productive, it is 20, and in some parts 70 acres. Half holdings, quarter holdings, as well as cottiers with small gardens, are also frequent. It is supposed that of the peasant families, two thirds hold land, and about one third may be considered as mere labourers. The mode of cultivation adopted by the peasants in the low lands consists in a rotation of three crops, viz. wheat, rye, summer corn, fallow; the fallow being only partial. In the hilly parts, the fallows are used for potatoes, turnips, flax, &c.; in the mountainous districts is more irregular. On most of the small estates of the nobles, a better rotation of crops, with clover, green food, and meadows, prevails, according as the soil, or the local advantages of common grazing (which is very extensive) render it necessary. The following rotations, among others, are pursued: 1. potatoes, with manure; 2. barley, or oats, with clover; 3. clover hay; 4. clover as pasture; 5. rye;

MORAVIA.

6. oats. In heavy soils—1. winter corn with dung; 2. barley, with clover; 3. clover; 4. wheat; 5. green fodder, with manure; 6. wheat; 7. peas and beans; 8. rye. In the low lands millet is a good deal cultivated; in the mountain flax. On the estate of a Moravian nobleman, which is cultivated in a superior manner, but is by no means of a superior quality of soil, as compared with other estates in the same province, the following is the average produce of corn per acre:

	Maximum	Minimum	Mean
	Bushels.	Bushels.	Bushels.
Wheat	35	11	24
Rye	48	10½	21
Barley	49	16	28
Oats	46 2-3	17½	26
Potatoes	408	175	280

Distilleries, and even breweries, are commonly established on the low farms; and, within a few years, beet-root sugar manufactories have become frequent.

It is not usual to let lands on lease in this part of the Austrian empire. The few cases in which this mode of tenure occurs, must rather be considered as exceptions than as a rule. From the peasants' holdings the lord usually derives—1st. All that was stipulated on the original cession of the land, whether in the shape of a rent charge in money or otherwise. 2dly. The *Landemium*, or fine on transfer, whether by sale or inheritance (usually five per cent.). 3dly. The *Rebot*, or personal service, the maximum of which has been fixed by law. This consists generally in three days' work, with a wagon and horses, weekly, for the peasant's whole holding; the half-holding gives 1½ day's work, and the quarter-holding two or three days' labour, weekly; cottagers give from 10 to 13 days per annum. 4thly. The right of grazing on uncultivated fallows and stubble; which, however, the peasant may exercise upon the land of his lord. 5thly. The great and small tithes, which are often ceded to the church, or have been otherwise transferred. Dominical property (allodial estates) pays in general no tithe. The peasant may cede, or leave by will, his holding to whichever of his sons he pleases; but it is then usually charged with a sum for each of his brothers and sisters. The custom prevails of leaving it to the eldest son; but it is often ceded during the life of the father, who retains a certain proportion of the produce for his own use: this generally happens when the father wishes to free his son from liability to the conscription.

Flax is cultivated in considerable quantities by the descendants of German and Bohemian settlers, in the circles of Brunn and Olmütz: it is celebrated for its fineness and length, and is second only to that of Silesia. In certain favourable situations, the soil and climate of Moravia are well adapted to the grape; and for some time after this was ascertained, the appropriations of land to this kind of culture were so considerable, that government supposed it necessary to interfere, and to issue, in 1803, an order prohibiting the laying out of new vineyards. Wine is mostly grown in the 8. circles of Znaim, Brünn, and Hradisch: the average yearly produce is estimated at 436,000 *emera*; a good deal of which is exported to the adjacent provinces. Large quantities of brandy and beer are also made. Fruits of many kinds are so plentiful, that Moravia is usually styled the orchard of Austria. The forests, formerly much diminished by imprudent waste, are now better attended to. The pasture grounds are extensive in the mountains, and a large proportion of the Austrian heavy cavalry horses is furnished by this province. Cattle are not very extensively bred; considerable numbers are sent thither from Poland to the markets of Olmütz, and from Hungary to those of Aussitz. In 1837, of 90,007 head of oxen sold in Olmütz, 74,184 were from Galicia. Large flocks of sheep are depastured in the mountainous districts; their numbers having increased with the increase of the woollen manufacture. The breeds have been materially improved by crossing with merinos, &c.; though, from want of proper care, the wool of Moravia is still inferior, and most part of the raw material required is imported from contiguous provinces. Hops and geese are bred in great numbers for exportation, and game is very abundant. There are valuable mines of iron, copper, lead, and coal; gold and silver mines were wrought previously to the troubles of the 15th and 16th centuries, when they were abandoned, and the works have not since been resumed. Alum, marble, and excellent building stone are found: among other minerals is a species of stone, which, when first dug up, is so soft that it may be moulded with the hand, but which hardens on exposure to the air: a great many pipe-bowls are made from it.

Manufactures and Trade.—Notwithstanding its inland position, this province has made a very considerable progress in manufactures, and has become, since the close of

last century, one of the most thriving portions of the Austrian empire. Woollens, linens, and cottons are all made on a large scale; the first two consuming not only all the wool and flax raised in the country, but requiring a large importation from other parts. Wool is brought from Hungary; flax from Silesia and Austrian Poland. The oldest woollen manufactures are in the neighbourhood of Igla, in the W.; but those of Brunn are now the most extensive and important. Woollens are also extensively manufactured in other towns; and, exclusive of the goods produced in manufacturing establishments, large quantities are made by the peasants and others for domestic use. Linen and thread are also largely produced; and cotton factories, some of which are on a very extensive scale, have been established, though with but indifferent success, in many parts of the province. Dyeing, especially fine Turkey red colour, is successfully and extensively carried on at Brunn, almost all the cloth made in Moravia being sent thither for this purpose. The other manufactures, such as those of silk, leather, paper, pot-ash, glass, beet-root sugar, &c., are also of considerable importance; and their products are exported to the contiguous countries, and to Hungary, Austria, Italy, and the Levant. The imports consist chiefly of wool, oil, flax, raw cotton, silk, cattle, wine, and hardware. The only navigable river is the Morava; and hitherto goods have been almost always conveyed in wagons. For these there are two great commercial roads, both leading from Vienna: the one passing by Prague, Znaim, and Igla, in the west; the other by Brunn and Olmütz in the centre of the province. But the facilities for trade are now in the course of being vastly augmented by the formation of the railway from Vienna to Bochnia, in Galicia, which passes through the valley of the Morava in this province as far as Magpodi, having branch railways to Brunn and Olmütz. The completion of this great undertaking will be of signal advantage to the province.

The government of Moravia, which is entitled a marquise, is administered by a governor with direct authority from Vienna. Like the other provinces of the empire, it has its states, or assembly of the clergy, nobility, knights, and citizens; but the power or influence of this assembly is very limited. It meets annually, not to determine the amount of the taxes, but their distribution and mode of collection. The province is subdivided into eight districts or circles, each of which has one or two tribunals of original jurisdiction, and a high court of appeal sits in Brünn.

Education is very generally diffused in this province, and the bulk of the people are comparatively civilized. In 1838, it had 1866 elementary schools, which were attended by no fewer than 373,638 children, being about one eighth part of the population: there is also a great number of superior schools, and the province is well provided with the higher class of seminaries. Among others, it has a university at Olmütz, which, in 1838, was attended by 586 students; it has also faculties of science at Brunn and Nicholasburg: an academy of the provincial states at Olmütz; schools of rural economy at Brünn and Olmütz, attended, in 1838, by 199 pupils; and 11 gymnasia, which, in the same year, had 87 teachers, and 2766 pupils. But, how creditable soever to the government, still it must be borne in mind, that the useful sciences, or those, rather, that are directly subservient to the progress of the arts, and in some degree, also, to the business of administration, are those only that meet with any encouragement, either here or in any other part of the Austrian dominions. All speculative studies, and especially those connected with the principles of politics and political economy, are not merely discouraged but proscribed: "Ce que veut avant tout la politique Autrichienne," says M. Saint Marc Girardin, "c'est le calme et le repos; elle veut que le peuple soit tranquille, et pour cela elle veut qu'il soit heureux. Elle veut aussi qu'il ait de l'instruction, mais cette instruction qui apprend à l'homme à mieux se servir de ses forces et de celles de la nature, qui fait les bons ouvriers, les bons laboureurs, et non cette instruction qui agace l'intelligence, qui lui apprend à douter, à raisonner, à examiner. Voulez-vous être mécaniciens, manufacturiers, agriculteurs, architectes? Vous trouverez à cet égard, en Autriche, tout ce qu'il vous faut: écoles, collèges, professeurs, laboratoires, collections. Voulez-vous être avocat, publiciste, homme de lettres, c'est-à-dire raisonner, discuter, douter? Allez ailleurs, allez bien loin; ce n'est point en Autriche que vous trouverez de bonnes écoles pour de pareilles fantaisies. L'utilité plutôt que le beau, le pratique plutôt que la théorie, le soin du corps plutôt que le soin de l'intelligence, voilà la maxime fondamentale de l'Autriche. De là suit la mesquinerie des études classiques, et la prospérité des études usuelles, le néant et l'obscurité profonde de l'université de Vienne, et la juste renommée de son institut polytechnique." (*De l'Instruction Publique en Autriche, par un Diplômé Étranger*, 1841, p. 94.)

For a lengthened period after their conversion to Chris-

MORAY.

tion, the Moravians were divided between the Latin and Greek churches; but the doctrine of the Reformation spread widely in this province in the 16th century. The intemperate proceedings of the Austrian government obliged, however, many Protestant families to emigrate into other countries, and many others to embrace the religion of the house of Hapsburg; so that at present the Roman Catholic faith greatly predominates over every other. There is now, however, the most perfect toleration for all sorts of creeds. The archbishop of Olmütz is, next to the primacy of Hungary, the richest see in the empire; and the chapter of Olmütz enjoy the valuable privilege of choosing this high functionary from among their own members. The Calvinists have their superintendent at Bruun, and the Lutherans theirs at Ingrowitz. The inhabitants are mostly of the Slavonian stock, divided into many different tribes; but among the population there are estimated to be about 450,000 Germans, residing mostly in the towns, 30,000 Jews, and a few Bohemians, Hungarians, &c. This territory was anciently inhabited by the Quadi and Marcomanni. These, or cognate, tribes are said, after the dissolution of the empire of Austria, to have founded a republic here, which maintained a precarious independence for some centuries, and was afterward erected into a kingdom, extending, in the 9th century, over Bohemia, Brandenburg, Silesia, and part of Hungary, &c. Moravia subsequently belonged alternately to the Bohemians and Hungarians: it was finally annexed to Austria, together with Bohemia, in 1527. It was the great theatre of war between the French and Austro-Russian armies, in 1805. (*Oesterr. Nat. Encyclop.; Berghaus; Allg. Landw., &c., iv.*)

MORAVIA, P. L. Cayuga co. N. Y., 158 m. W. Albany, 382 W. Bounded N.W. by Oswego lake. Watered by Oswego Inlet, an E. branch of which has a perpendicular fall of 70 feet. First settled in 1794, organized from Sempronius in 1833. It contains two churches, a Presbyterian and Episcopal, seven stores, two fulling-mills, two grist-mills, six saw-mills, two tanneries; one academy, 177 students, 19 schools, 720 scholars. Pop. 2010.

MORAY, or Elgin, a marit. co. of Scotland, on the S. side of the Moray firth, being the middle district of the old gov. of Moray, having N. the Moray firth, E. the co. Banff, S. Inverness, and W. Inverness and Nairn. It consists of N. and principal portion, and of a smaller portion on the S., detached from the main body by the intervention of a part of Inverness; and comprises in all 307,900 acres. With the exception of a considerable tract of low, light, arable land along the shore, the rest of the surface is rugged and mountainous. The climate on the coast district is comparatively mild for its latitude; and for a lengthened period wheat has been successfully raised in this district, which occasionally supplies some of the best samples to the London market. This district is also well suited for the turnip husbandry, which has been extensively introduced, and agriculture has been in other respects materially ameliorated; though, on the whole, the progress of improvement has been less rapid in this than in most districts of Scotland. Sheep-farming is not carried on upon a large scale; but the stock of cattle has been improved by crossing with the breeds of Skye and Argyle. Property mostly in large estates. Farms of all sizes; the farm buildings were formerly wretched, but those on the principal farms have been mostly rebuilt, and are now substantial and commodious. Average rent of land, in 1810, 4s. 14d. an acre. Manufactures unimportant. Lead, iron, lime, freestone, and slate are met with; but the first two are not wrought, and of the others only the freestone to any extent. It is partly intersected and partly bounded on the E. by the Spey, and on the W. by the Findhorn, and has the Lochee in its centre. The salmon-fisheries, especially those on the Spey, are important and valuable. This county is united with Nairn under one sheriff and in returning one member to the House of Commons. Registered electors for the county, in 1839-40, 630. The boroughs of Elgin and Forres unite with other boroughs in sending two members to the House of Commons. It is divided into 20 parishes; and in 1841 had 8133 inhabited houses, and 34,904 persons, of whom 16,071 were males, and 18,923 females. Valued rent of the county in 1831, £263,600 Scotch. Annual value of real property, in 1815, £73,326.

MORBIDAN, a mant. dep. of France, formerly a part of the province Brittany; between lat. 47° 15' and 49° 15' N., and long. 9° and 3° 45' W.; having N. Côtes du Nord, E. Ille-et-Vilaine, and Loire Inférieure, W. Finistère, and S. the Atlantic. Length, E. to W., about 70 m.; breadth varying from 30 to 45 m. Area, 699,641 hectares. Pop., in 1836, 433,522. The coast-line is very irregular, presenting many inlets of the sea; from one of which a capacious bay, called by the Bretons *Morbihan*, or the "Little sea," the dep. derives its name. Several islands, including Belle-Ile and Groix, belong to this dep. The N. and centre parts of Morbihan are hilly; but towards the S. are some

MOREA.

tolerably extensive plains. The principal rivers are the Viliaine, with the Oust in the E., and the Blavet, Scour, &c., in the W. Some of them are navigable for some distance, but none is of any considerable size. The canal of the Blavet, from Hennebont to Pontivy, is wholly included in this dep., and a great part of the canal from Nantes to Brest is within its limits. The climate is mild, but damp, W. winds are most prevalent. The atmosphere is cloudy, and violent storms are frequent in winter. A large proportion of the soil is stony; the vegetable mould is everywhere scanty, but towards the coast it is tolerably fertile. In 1834, it was estimated that 290,971 hectares were arable, 69,652 do. in pasture, 34,462 do. in woods, and 16,598 do. in orchards and gardens; while no fewer than 291,338 do. were occupied by heaths, wastes, &c. Agriculture is extremely backward; but more corn, principally rye, oats, and wheat, is grown than is required for home consumption; and a good deal of rye bread is made for exportation. The cultivation of the potato is on the increase. Turnips, hemp, flax, &c. are grown; and about 700,000 hectol. of cider are produced annually. Near Guer is the model farm of Costeb, where 300 pupils are instructed in the details of agriculture and the auxiliary sciences, at the expense of government. The rearing of cattle is an important business, and the breeds of both oxen and sheep are in the course of being improved. Butter, both fresh and salted, is an important article of commerce. The annual produce of wool is estimated at 390,000 kilogr. The horses, though small, are strong and good. Bees are very extensively reared; and Hugo states that 450,000 kilogr. of honey, and 39,000 kilogr. of wax, are annually exported, worth together about 375,000 francs. In 1835, of 96,605 properties, subject to the *contribution foncière*, 45,334 were assessed at less than 5 francs, and 13,389 at from 5 to 10 francs; 36 only were assessed at 1000 francs or upward. The copper, iron, and other fisheries are important; but especially that of pilchards, which employs in the season about 500 boats, manned by 2500 fishermen. About 5-7ths of the fish taken are sold fresh, and the remainder being salted, make up about 15,000 barrels. The net produce of the pilchard fishery is estimated by Hugo at 1,408,000 francs a year. Manufactures are of considerable importance. The iron-works are said to employ, directly and indirectly, from 1500 to 2000 workmen. The woollen cloth factories at Josselin and Malesroit employ together about 900 hands; and the tanneries are supposed to furnish products worth 660,000 francs a year. Paper, glass ware, linen stuffs, cotton yarn, lace, hats, beer, chemical products, &c. are also produced; there are building docks at L'Orient, Vannes, Quiberon, Port Louis, &c.; and salt is made on the coast and islands of the estimated value of 1,000,000 francs a year. Morbihan is divided into four arronds: chief towns Vannes, the cap, L'Orient, Ploemel, and Pontivy. It sends six members to the chamber of deputies. No. of electors (1839-39), 1452. Total public revenue (1831) 8,630,117 francs; expenditure in the same year, 11,933,964 francs; the greater portion of which was, however, for the maintenance of the naval and military estab. of the dep. (*Hugo, art. Morbihan; French Official Tables.*)

MOREA (an. *Peloponnesus*), a principal div. of Greece, and the most S. portion of continental Europe, consisting of a peninsula attached to N. Greece by the isthmus of Corinth, between lat. 36° 15' and 39° 30' N., and long. 20° 9' and 30° 30' E.; area estimated by Tischerich at 6800 sq. m. Pop., in 1835, about 399,008. It is said to derive its modern name from the resemblance that it bears to a mulberry leaf; and its coast, which is deeply indented with gulfs and inlets, has numerous headlands, the chief of which are cape Skylo, eastward; capes Matapan, Galia, and St. Angelo, southward, and cape Tormese westward. Its surface is extremely diversified, but may be generally described as a lofty table-land, traversed by a main ridge connected northward with the chain of N. Greece, and running southward to cape Matapan, its culminating point (mount Taygetus) rising 5115 feet above the sea. Three branches detach themselves from the main range: one running eastward into the peninsula of Argolis, and another, mount Malero (an. *Paros*), running S.E., shirting the shore of the Ægean sea; while a third, known in different parts by the different names of Cylleus, Erymanthus, and Olenos, takes a westerly course to cape Tormese. Many of these mountains attain a height of 4000 feet. Their geological constitution is of limestone lying on clay-slate, interspersed in a few places by primitive rocks; and their sides are, with a few exceptions, plentifully clothed with pines, fir, oaks, and other deciduous trees. The plains are of no great extent; the largest are those of Tripolizza in Arcadia, of Nisi in Messenia, and of Gastuni in Elis. Numerous rivers and streams run from the mountainous regions in all directions; the Roupia (*Alpheus*) is by far the largest, having a general N.W. course of more than 70 m., and with its tributaries, the Ladon and Erymanthus, draining

nearly 1-3d of the entire peninsula. Next in size is the *Gastuni* (an. *Pentius*), rising on mount *Erymanthus*, and flowing, as well as the last-mentioned, into the gulf of *Arkadia*: the *Iri* (an. *Euretes*), which is the principal river of *Laconia*, falls into the gulf of *Kolokythia*: the other streams are mere mountain torrents, rapid in winter, but dried up in summer. Embosomed in the mountains are several lakes; but none deserves any particular mention except *Zaraka* (the ancient *Stymphaleis*), which has two remarkable *kataklysmoi*, or subterranean caverns, to which its waters are almost confined during summer, and by which it was formerly supposed to connect itself with the little river *Erastinus*, falling into the gulf of *Nauplia* near the *Lernæa* lake, now little more than a reedy marsh. (See *Hæred.*, vi, 76.) The atmosphere of the *Morea* is generally pure, and the climate mild, especially in spring and autumn. The heat of summer is very oppressive in the lower districts; and in winter the country is exposed to hurricanes, and liable to be inundated by heavy rains: fogs, also, are common at that season, and the mountains are covered with snow from December to the end of February. Epidemics, originating in malaria, are common diseases in summer, especially in the neighbourhood of *Argos*, *Corinth*, and the whole of the *W. coast* from *Patras* to the mouth of the *Rouphia*, which are the most unhealthy parts of the peninsula. The coldest, and, at the same time, the healthiest region, is the central table-land of *Arkadia*: the severity of its climate is noticed by many authors, and it probably gave to its inhabitants that robust habit of body which fitted them not only for the pastoral life but for the fatigues of war, and occasioned the old proverb recorded by *Athenæus*, that "a man should choose his slaves from *Phrygia*, but his allies from *Arkadia*." (*Deipn.* i, 37.)

The more elevated regions are devoted to the feeding of sheep and goats, the latter being to the former as about one to four. The wool is coarse; but the ewes afford good milk, butter, and cheese. These flocks suffer much from jackals and wolves, as well as from a disease called the *caligula*, or plague. Colonel *Leake* states the number of sheep and goats in *Elis* alone to have been, in his time, about 450,000. The uncultivated land serves, also, for the pasture of cattle, which, however, are used only for draught, goat's flesh or mutton being universally preferred for food. The best breeds are said to be found in *Corinth*; and bulls from this district are often sent to improve the breeds in other parts of the *Morea*. The valleys and plains are, generally speaking, very fertile, and, with the most imperfect tillage, yield large crops. The produce of *Elis* comprises wheat, two kinds of *barley*, called *kalamokkoti*, maize, and flax. Wheat, on secondary land, is sown in Oct.; but on the richest, in Nov. Dec., and even so late as Jan.; harvest, on the plains, begins early in June, and is not entirely over till the middle of Aug. The *kalamokkoti* is sown in April, and gathered in Sept. Along the *N. coast* large quantities of the currant grape are raised, and the average yearly production of currants in the neighbourhood of *Patras*, is stated by Colonel *Leake* to amount to 5,000,000 lbs., or about one half the amount of that raised in *Zante*. *Argolis* produces extensive crops of rice and cotton, the former being a considerable article of trade between *Nauplia* and *Constantinople*. Cotton is likewise raised in *Messenia* and *Laconia*, and olive oil, highly esteemed all over *Greece*. Corn is raised in the irrigated parts of *Arkadia*; but the greater part of that central district is employed for pasturage. Agriculture, owing to the long-continued insecurity of property, the oppressions under which the peasantry have laboured, and to the obstinate adherence of the farmers to old and imperfect methods of husbandry, is in a most degraded state. Thiersch and *Burgess*, however, report a marked improvement in the condition of the rural population within the last few years. Land used formerly to be let on the metayer system; the proprietor being at all expences, and receiving two thirds of the crop, clear of tax; but since *Greece* has been separated from *Turkey*, nearly nine tenths of the land has fallen into the hands of government, which offers it for tillage to any one who will agree to pay a quarter part of the produce for rent: the remaining tenth part of the land belongs to individuals, chiefly small proprietors, and is charged with a tax of one tenth of its produce, and the additional burden of obliging the labouring peasant to bring his tithe in kind from a great distance to the town in which it is collected. (*Burgess's Greece and Levant*, i, 131.) The annual produce of corn was, a few years back, estimated by Colonel *Leake* at 300,000 kiloes of 22 cabs (each cask = 50 lbs.). The flora and fauna of the peninsula differ in few respects from those of *N. Greece*. The manufactures of the *Morea* are unimportant in amount, but comprise coarse cotton and woollen goods, silk fabrics, leather, and salt. The export trade consists chiefly of wine, oil, currants, rice, fruit, and wool; its chief ports being *Nauplia*, *Patras*, *Corinth*, and *Navarin*. The *Morea*, which under the *Turks* was divided into the two

sandjaks of *Tripolizza* and *Mistra*, is now distributed into the five nomes of *Argolis* and *Corinth*, *Archæa* and *Elis*, *Arkadia*, *Messenia*, and *Laconia*, these being again subdivided into 35 eparchies. *Tripolizza* was the cap. under the *Turks*, but recently it has greatly decayed; *Nauplia*, the modern cap., has about 10,000 inhabitants. The other principal towns are *Patras* (7000), *Modon* (8000), *Corinth* (5000), and *Koron* (4000).

The most interesting features, however, to the classical traveller are the remains of many ancient cities, existing in the palmey days of Grecian glory. Among the principal are three mentioned by *Homer* (Il. iv, 51.) *Sparta* is to be traced only in its ruins; but the beauty of its position, on five hills close to the *Eurotas*, still recalls the "pleasant Lacedæmon." Various remains of ancient architecture, in the form of dilapidated walls, temples, and forts, exist in different parts of the country, and are described by the general name of *Palaio-Castro*. Of the Cyclopean, or primitive mode of building with uncemented blocks of stone, the chief relics are at *Mycenæ* and *Tiryns*. At *Manthras* the circuit of the walls is still visible; and the outlines of the celebrated field of battle may be traced. The scene of the Olympic games, though not ascertained with complete certainty, was near the influx of the small river *Cladeus* into the *Alpheus*. These interesting ruins are described at some length under their respective heads, to which the curious are referred for farther information. The reader will find also some notice of the present inhabitants of the *Morea*, &c., in the general article *GREECE* (i. 1014, &c.).

The *Peloponnesus*, which, before it received that name, was called successively *Apla* and *Argos*, received its appellation from the *Phrygian* Pelops, whose descendants were afterward expelled by the *Heraclids*. Its ancient history forms a part of that of *Greece* generally. After the destruction of the *Achæan* league by the *Romans*, anno B.C., it was formed, with the rest of *Greece*, into the *Roman* province of *Achæia*; and continued, either really or nominally, a portion of that empire during 1350 years. It has taken from the *Byzantine* emperor by the *Franks* at the beginning of the 13th century; and in the division of the conquered lands the larger part of the *Peloponnesus* fell to the *Venetians*, from whom it received its modern name, either from its supposed resemblance in shape to the leaf of the mulberry (l. *more*), or from the abundance of that fruit in the peninsula. It was repeatedly invaded by the *Turks* in the 15th, 16th, and 17th centuries, and was finally confirmed to them in 1718, by the treaty of *Passarowitz*. With the exception of *Maina*, the *Morea*, with the rest of *Greece*, remained under their despotic sway till 1821, when its inhabitants joined in the general struggle for that independence, which, at length, after eight years of anarchy and bloodshed, was established by the treaty of *Adrianople* in 1829. (*Leake's Morea*, 3 vols. passim; *Hughes's Greece and Albania*, i, 167-235; *Burgess's Greece and Levant*, i, 120-265; *Dict. Geog.* 4c.)

MOREAU, p. l. Saratoga co. N. Y., 50 m. N. Albany, 421 W. Bounded N. and E. by Hudson river, which has here a great bend, that includes a part of *Baker's falls*, *Glen's falls*, and the great dam at *fort Edward*, made for the accommodation of the *Champlain* canal. It has extensive water-power, and contains five stores, two grist-mills, seven saw-mills; nine schools, 319 scholars. Pop. 1576.

MORELAND, t. Montgomery co., Pa., 14 m. N.E. Norristown, 16 m. N. Philadelphia. Watered by *Pennypack* creek and its tributaries. It contains eight stores, one cotton factory, with 1873 spindles, two flouring-mills, eight grist-mills, four saw-mills, one paper-mill, one printing-office, one weekly newspaper; one academy, 70 students; three schools, 100 scholars. Pop. 9162.

MORETOWN, p. l. Washington co., Vt., 13 m. S.W. Montpelier, 519 W. Chartered in 1763, first settled in 1790. Watered by *Mad river*, a tributary of *Onion* or *Winooki* river, which bounds it on the N. It contains two churches, a Congregational and Methodist, one store, two fulling-mills, three grist-mills, six saw-mills; nine schools, 223 scholars. Pop. 1198.

MORGAN, county, Va. Situated in the N. part of the state, and contains 330 sq. m. Bounded N. by *Potomac* river. Watered by *Cacapon* river and *Sleepy creek*. It contained in 1840, 3601 neat cattle, 3630 sheep, 5600 swine; and produced 37,267 bushels of wheat, 13,812 of rye, 63,101 of Indian corn, 4390 of buckwheat, 41,590 of oats, 17,335 of potatoes, 641 pounds of tobacco, 4328 of sugar. It had 12 stores, one fulling-mill, two woollen factories, five flouring-mills, 12 grist-mills, 25 saw-mills, four tanneries, five distilleries, two potteries; 14 schools, 347 scholars. Pop.: whites, 4113; slaves, 134; free coloured, 6; total, 4253. Capital, Bath.

MORGAN, county, Ga. Situated a little N.E. of the centre of the state, and contains 290 sq. m. Bounded E. by *Oconee* river, and watered by its branches. It contained in 1840, 11,640 neat cattle, 3360 sheep, 18,568 swine; and produced

25,940 bushels of wheat, 332,116 of Indian corn, 173,700 of oats, 8,947,150 pounds of cotton. Pop.: whites, 2481; slaves, 5646; free coloured, 14; total, 9131. Capital, Madison.

MORGAN, county, Ala. Situated in the N. part of the state, and contains 730 sq. m. Bounded N. by Tennessee river, and drained by its tributaries, Flint river, and Cotaco creek. It contained in 1849, 13,059 neat cattle, 4488 sheep, 35,844 swine; and produced 35,292 bushels of wheat, 788,063 of Indian corn, 1188 of barley, 48,954 of oats, 14,603 of potatoes, 7823 pounds of tobacco, 7,738,374 of cotton. It had one commission house in foreign trade, 12 retail stores, 16 grist-mills, five saw-mills, one tannery, five distilleries, one printing-office, one weekly newspaper; five academies, 131 students; 21 schools, 443 scholars. Pop.: whites, 6580; slaves, 3216; free coloured, 45; total, 9841. Capital, Summerville.

MORGAN, county, Tenn. Situated N.E. of the centre of the state, and contains 640 sq. m. Watered by branches of the S. fork of Cumberland river, and by Emory river and its branches. It contained in 1840, 5321 neat cattle, 1585 sheep, 10,394 swine; and produced 1361 bushels of wheat, 53,554 of Indian corn, 13,561 of oats, 4896 of potatoes. It had three stores, two tanneries, two distilleries. Pop.: whites, 1334; slaves, 84; free coloured, 43; total, 1660. Capital, Montgomery.

MORGAN, county, Ky. Situated in the E. part of the state, and contains 890 sq. m. Drained by Licking river and its branches, by which it is well watered. It contained in 1840, 6584 neat cattle, 6261 sheep, 13,566 swine; and produced 6586 bushels of wheat, 1936 of rye, 193,697 of Indian corn, 34,840 of oats, 9179 of potatoes, 1909 pounds of tobacco, 24,304 of sugar. It had six stores, three grist-mills, three saw-mills, four tanneries. Pop.: whites, 4539; slaves, 61; free coloured, 3; total, 4603. Capital, West Liberty.

MORGAN, county, O. Situated toward the S.E. part of the state, and contains 500 sq. m. Watered by Muskingum river and its branches, and by Duck creek. Salt is produced on the Muskingum, to the amount of 400,000 bushels annually, from wells from 600 to 800 feet deep. It contained in 1840, 13,134 neat cattle, 28,440 sheep, 30,636 swine; and produced 283,880 bushels of wheat, 447,630 of Indian corn, 2498 of buckwheat, 181,447 of oats, 51,301 of potatoes, 49,900 pounds of tobacco, 62,640 of sugar. It had 33 stores, one fulling-mill, 30 grist-mills, 44 saw-mills, one oil-mill, 12 tanneries, three distilleries, one brewery, one pottery, two printing-offices, two weekly newspapers; 119 schools, 4449 scholars. Pop. 30,852. Capital, McConnellsville.

MORGAN, county, Ia. Situated a little S.W. of the centre of the state, and contains 453 sq. m. Drained by the W. fork of White river and its branches. It contained in 1840, 10,964 neat cattle, 12,871 sheep, 36,931 swine; and produced 49,217 bushels of wheat, 1078 of rye, 475,753 of Indian corn, 78,757 of oats, 36,222 pounds of sugar. It had 15 stores, one woolen factory, five flouring-mills, eight grist-mills, 16 saw-mills, six tanneries, five distilleries, two potteries; 53 schools, 2050 scholars. Pop. 10,741. Capital, Martinsville.

MORGAN, county, Ill. Situated a little E. of the centre of the state, and contains 510 sq. m. Bounded W. by Illinois river, N. by Sangamon river, and drained by tributaries of these rivers. It contained in 1840, 19,558 neat cattle, 13,057 sheep, 33,568 swine; and produced 60,681 bushels of wheat, 3754 of rye, 799,210 of Indian corn, 8130 of barley, 98,527 of oats, 31,111 of potatoes, 1309 pounds of tobacco. It had 47 stores, 30 grist-mills, 16 saw-mills, one paper-mill, five tanneries, two distilleries, two printing-offices, one bindery, one weekly newspaper, and one periodical; one college, 35 students; six academies, 222 students; 60 schools, 1752 scholars. Pop. 19,547. Capital, Jacksonville.

MORGAN, county, Mo. Situated in the central part of the state, and contains 792 sq. m. Bounded S. by Osage river. Drained by Missouri river, and the S. fork of La Mine river, and their branches. It contained in 1840, 5954 neat cattle, 3913 sheep, 17,487 swine; and produced 9225 bushels of wheat, 163,490 of Indian corn, 27,632 of oats, 7177 of potatoes, 17,831 pounds of tobacco, 9135 of sugar. It had seven stores, eight grist-mills, four saw-mills, one tannery, one distillery; one academy, 30 students; five schools, 191 scholars. Pop.: whites, 3591; slaves, 512; free coloured, 4; total, 4407. Capital, Versailles.

MORGAN, t. Greene co., Pa. It contains two stores, one fulling-mill, five grist-mills, five saw-mills, one tannery, two distilleries; five schools, 195 scholars. Pop. 1004.

MORGAN, t. Morgan co., O. It contains McConnellsville village, the capital of the county. Watered by Muskingum river. It contains 10 stores, one saw-mill, two tanneries, one brewery, two printing-offices, two weekly newspapers; five schools, 475 scholars. Pop. 1518.

MORGANTOWN, p. v., capital of Monongalia co., Va., 285 m. N.W. Richmond, 218 W. Situated on the E. side of Monongahela river, at the head of steamboat navigation. It contains a courthouse, jail, two churches, a Presbyterian

MOROCCO.

and Methodist, a female academy, eight stores, one fulling-mill, two flouring-mills, one printing-office, one weekly newspaper, 100 dwellings, and about 700 inhabitants. It is surrounded by an extensive manufacturing country.

MORIAH, p. t., Essex co., N. Y., 115 m. N. Albany, 46 W. The Adirondack mountains which bound it on the W., abound with iron ore. Bounded E. by lake Champlain. Watered by Schroeon, branch of Hudson river. It contains a Congregational and Baptist church, 12 stores, four furnaces, five forges, one fulling-mill, two grist-mills, 54 saw-mills, three tanneries; two academies, 160 students; 15 schools, 597 scholars. Pop. 2535.

MORLAIX, an ancient town and seaport of France, dep Finistère, 33 m. E.N.E. Brest, and 283 m. W. by S. Paris; lat. 47° 35' N., long. 3° 52' W. Pop. in 1836, ex. com. 7800. It is situated at the foot of two hills, and at the confluence of two small rivers, forming a considerable estuary and commodious harbour for vessels of 400 tons burden. At the bottom of the harbour stands a well-fortified castle; and hills covered with gardens, formed into terraces, rise immediately above the town, the principal street of which runs parallel with the quays. The principal square (built on arches over the river) comprises many good modern houses, with a very large town-hall, portioned out into government-offices, and a public library. There are two large churches, one an elegant Gothic structure, with a fine tower. A large tobacco manufactory of modern construction, employing between 300 and 400 workmen, a hospital, school of navigation, theatre, and two hotels, are the other chief buildings. Morlaix is the seat of a subprefect, of a tribunal of primary jurisdiction on commerce, and of a society of agriculture: its principal manufactures are those of tobacco and linen cloth; and it enjoys a considerable trade in butter, corn, tallow, honey, and wax.

Morlaix lays claim to considerable antiquity, and was already an important town when taken by the English, near the close of the 14th century. During the two succeeding centuries it suffered greatly from the ravages of civil war.

MOROCCO (EMPIRE OF), (Arab. *Maghrib-ul-Aks*, "the extreme West") a tract of country in the N.W. of Africa, between the 28th and 36th degs. of N. lat. and the 2d and 12th degs. of W. long., comprising the *Maghribians* of the ancients. It is bounded N. by the Mediterranean sea and the straits of Gibraltar, E. by the Atlas range, which separates it from the Algerine territory and Bilad-ul-Jerid, S. by the river Akassa, and Sahara desert, and W. by the Atlantic ocean. Length of coast-line along the Mediterranean, 250 m.; ditto along the Atlantic ocean, 600 m.; estimated area, 219,300 sq. m., distributed into four kingdoms, the area and population of which are estimated as under:

Kingdoms.	Prov. Inces.	Area in sq. m.	Population.	Chief Towns.
Fes . .	7	85,457	3,200,000	Fes, Tangier, Mequinez
Morocco .	7	51,280	3,600,000	Morocco, Algiers
Spain . .	2	26,656	720,000	
Taflet . .	1	50,897	1,800,000	
Total of empire		219,300	8,300,000	

Of the above population Græbyg von Hesse states that 3,550,000 are Moors, 3,750,000 Berbers, and 380,000 (chiefly devoted to agricultural and pastoral pursuits), 740,000 Bedouin Arabs, 330,500 Jews, 120,000 negroes, and 500 Christians and renegades.

Surface, &c.—Morocco is mostly bounded on the E. by the stupendous chain of the high Atlas, which commences with mount Beni-Ammer, S. of the desert of Angad, on the Algerine frontier, and extends S. as far as capes Geer and N. The most elevated parts of the range occur between 30° and 33° lat.: the highest point, mount Hentet, was estimated by Mr. Jackson at about 29,600 feet, but this is as doubt a gross exaggeration. Captain Washington mentioned a point called Mitlin, in lat. 31° 13' N., and long. 7° 29' W., which he found to be 11,400 feet above the sea, and this was the highest in the S. portion of the chain. It is probable, however, that the highest summits will be found more to the N. in the province of Tedia: but their height, which has never been ascertained by measurement, cannot much exceed 13,000 feet. (See *Geogr. Jour.*, i., p. 146.) A subordinate range, sometimes called the little Atlas, branches N.W. and N.W. towards Centa, C. Sparak, &c.: and other chains, either continuous or detached, are thickly sprinkled over the country S. of Fes and Mequinez. The geological constitution of these mountains is granitic in the central ridges, on which are superimposed secondary and even tertiary formations in the less elevated parts of the chain. Silver, iron, and lead mines are wrought to some little extent. Mineral salt is found in great abundance throughout Morocco, and is a considerable article of export to Soudan. But notwithstanding the gigantic mountains by which it is in part bounded and in part overspread, Morocco has a large extent of comparatively level land. Some of

MOROCCO.

the plains and valleys are of great extent, and extraordinary fertility, especially those of Showiya, Tamsena, Decilla, and Tarran between Fez and Morocco. The principal rivers are, 1, the Saba, rising by several sources on the W. side of the Atlas range, falling into the Atlantic, close to Mehedja, having a probable length of 250 m.; 2, the Wad Oum er-Reg, rising by two principal branches in the high Atlas, and flowing W. and W.N.W. to its mouth at Asamor, after a course of about 300 m.; and 3, the Wad-Tensift, rising about 40 m. E. of Morocco, takes a general course W. by N. to lat. 33° 7' N., and long. 9° 19' W., where it falls into the Atlantic ocean. The climate of the country is healthy and genial; the heat is less intense than might be expected from its geographical position, and epidemics are of rare occurrence. The thermometer, even in the hottest season, except during the occasional prevalence of hot winds from the desert, seldom exceeds 25° Reaum. (94° Fahr.); the barometer averages throughout the year 28.30 inches; and the annual fall of rain (chiefly confined to October and November), as calculated on a series of years, amounts to 29 inches. (*G. von Humeß*, p. 28.) These observations, however, apply chiefly to the N. and W. portions of the empire, or E. of the Atlas range, the heat is intense, and rain seldom falls. The soil is now, as in antiquity, proverbial for its fertility. Meis says of it, *Ceterum solo etiam ditius et adeo fertilis est, ut frugum genera non cum arantur modo benignissimi procreant; sed quodam profundum etiam non est.* (Lib. iii. cap. 16.) In some favoured spots three crops of corn are reaped in the same year; the soil in many parts is purely alluvial, and in others of clay, sand, and loam, mingled in the most advantageous proportions. (*G. von Humeß*, 29, 30.)

Agriculture, however, owing, perhaps, to the extreme fertility of the land, which produces luxuriant crops, with little care or attention, is in the most backward state: fallows and rotations of crops are wholly unknown; indeed, the system of culture has remained almost unchanged since the invasion of the Arabs in the 11th century; and it consists of little more, generally speaking, than grubbing up and burning the weeds before the autumnal rains, and afterward ploughing the land about 6 inches deep, with a machine of the most simple description, drawn by a heifer or ass, and in the S. provinces by a camel. Except in the gardens, the Moors never think of using manure or other means of assisting the soil, and consequently, the land near the towns is more impoverished than in less populous districts, where, from the abundance of unemployed land, it is allowed to remain in fallow two or three years, and in the mean time other parts are brought under the plough. The wheat is white, transparent, almost without husk, having a large and exceedingly hard grain, producing a flour superior in fineness and colour to that of the northern countries. A second crop is rarely obtained; but in the S. provinces, when the harvest commences very early, a spontaneous crop springs up. According to Major Beaulieu, "The plains of Duquella alone are capable of producing in one year as much corn as the united kingdoms of Great Britain. Immense crops of corn yearly overstock the markets of Mogador: a bushel of corn may be procured for a partridge, or a coin worth an English shilling; and such is the profusion of grain, that, in many instances, it does not repay the labour of harvesting." (*Journey to Morocco*, p. 286.) Yet, with all this productiveness, so little industry and providence are exercised, that the inhabitants are sometimes, in bad seasons, reduced to the greatest privations, and hundreds of Berbers often die of famine!

Barley is used chiefly for horses and cattle, oats not being raised in any part of the country. Maize and Turkish millet are raised near the towns and along the coast in the S. provinces, and potatoes near Tangiers. On the whole, however, not more than a third part of the arable land is cultivated, and this in so superficial a manner, that the produce might be trebled, or even quadrupled, by a better system of tillage. Holme-oaks, cork and juniper trees are found on the mountains; and immense quantities of date-palms, vines, olive trees, sugar-canes, cotton, tobacco, and the fruits of S. Europe, are found in the level country. Throughout Morocco, however, there is a general scarcity of building timber: the white cedar grows to a tolerable size in the province of Riffe; but when large timber is wanted, it is usually imported from Gibraltar. Land is usually rented by the number of oxen required for its cultivation, at the rate of about seven dollars for the yoke of oxen; but in lands belonging to the sultan and allotted out to his soldiery, the same portion of land would be rented at about four dollars a year, and, if sold by auction, would fetch at Tetuan about 200 dollars. (*Str. J. C. Breke, Spain and Morocco*, i. 400.) The pasture-grounds, also, are extremely rich, the grass often attaining a height unequalled except in the prairies of America. The horses in the country are estimated at 400,000; but the breed once so esteemed under the name of Barbs is greatly deteriorated. A few milk-white, small, and finely proportioned horses, with black manes and tails, are occasionally

to be met with, belonging to the Arab chiefs; but the mass, though active, hardy, and with good action, are poor and meagre-looking; their exportation is entirely forbidden. Mules (of which there are upwards of 1,000,000) are equally well adapted for riding and draught: they are almost universally employed in long journeys, and a good mule, especially if of a bright chestnut colour, with a black cross, is valued higher than a horse. Neither the asses nor mules, however, are at all comparable to those of Andalusia. It is said, though we suspect the statement is exaggerated, that about 40,000,000 sheep and 12,000,000 goats are reared; the wool of the former being of the finest quality, and the hides of the latter furnishing the celebrated Morocco leather. Oxen and camels also are bred in great quantities. A duty of about 16 dollars a head is imposed on the exportation of cattle, which being tantamount to a prohibition, the farmer is discouraged from taking any pains farther than to supply his own or his neighbour's wants. The wild animals comprise dogs, hyenas, lions, ounces, panthers, lynxes, gazelles, boars, and different varieties of game; the principal birds being ostriches, storks, quails, snipes, ducks, &c. Fish of many varieties are found in most of the rivers; bees, wasps, and mosquitoes swarm throughout the country, and locusts of large size commit fearful ravages, occasionally devouring every green leaf, and leaving the ground over which they have passed absolutely barren.
